*Dedicated to all
past and present contributors
and
supporters of Essential Med Notes
who have made the production of the 2015 edition possible!*

The *Essential Med Notes* is dedicated to helping fund many charitable endeavors and medical student initiatives at the University of Toronto's Faculty of Medicine. Programs that have received *Essential Med Notes* funding include:

Community Affairs Projects

- Saturday Program for Inner City High School and Grade 8 students
- St. Felix Mentorship Program for Inner City children
- Parkdale Mentorship Program for Grade 10-12 students
- WoodGreen Community Centre
- Let's Talk Science
- Growing Up Healthy

Annual Faculty Showcase Events

- Bruce Tovee Lecture Series
- Daffydil, in support of the Canadian Cancer Society
- Earthtones Benefit Concert
- Convocation and Ceremonies

Medical School Clubs

- Books with Wings
- Women in Medicine
- University of Toronto International Health Program
- Complementary and Alternative Medicine
- Peer Support for Students
- History of Medicine Society
- Faculty of Medicine Yearbook

Scholarships and Bursaries

- Nishant Fozdar Memorial Award
- Graduating Medical Class Scholarships and Bursaries

NOTE:

Many of you have wondered about the *Toronto Notes* logo, which is based on the rod of Asclepius, the Greek god of medicine. The rod of Asclepius consists of a single serpent entwined around a staff. This icon symbolizes both rebirth, by way of a snake shedding its skin, and also authority, by way of the staff.

In ancient Greek mythology, Asclepius was the son of Apollo and a skilled practitioner of medicine who learned the medical arts from the centaur Chiron. Asclepius' healing abilities were so great that he was said to be able to bring back people from the dead. These powers displeased the gods, who punished Asclepius by placing him in the sky as the constellation Orphiuchus.

The rod of Asclepius is at times confused with the caduceus, or wand, of Hermes, a staff entwined with two serpents and often depicted with wings. The caduceus is often used as a symbol of medicine or medical professionals, but there is little historical basis for this symbolism.

As you may have guessed, our logo uses the rod of Asclepius that is modified to also resemble the CN Tower – our way of recognizing the university and community in which we have been privileged to learn the art and science of medicine.

Thomas O'Brien, MD
Class of 2009
M.D. Program, University of Toronto

Preface – From the Editors

Dear Readers,

As Editors-in-Chief of *Essential Med Notes 2015*, we are proud to present the current edition.

First produced in 1985 from a set of study notes drafted by medical students at the University of Toronto, *Toronto Notes* and its international version, *Essential Med Notes*, have grown to be one of the premier study resources for generations of medical graduates in Canada and abroad. This rich history is rooted in our commitment to publish a student-edited, comprehensive study resource to serve students across clinical rotations and in preparation for the USMLE Step 2 and the Canadian MCCQE Part I.

For 30 years, we have remained committed to our original vision. With each successive edition, we strive to enhance the features of our print and online resources by listening to the feedback of our users. The focus of *Essential Med Notes 2015* is to make medical knowledge accessible and retainable by distilling information into high-quality figures, tables, algorithms, and clinical pearls. This edition of *Essential Med Notes* offers new and exciting changes. We feature a consistent and easy-to-view layout across 30 chapters including the new Vascular Surgery chapter. Moreover, we have updated the text to reflect current best practice guidelines and clinically-relevant advances in medical research. As well, the text has been revised to reflect the new DSM-5 clinical guidelines. We are particularly excited to present the new accompanying *Essential Med Notes Handbook*. In response to user feedback, the Handbook has been streamlined to provide you with the most essential and up-to-date information on clinical scenarios commonly encountered while on the ward, in the clinic, or in the operating room. Finally, we have enhanced the *Essential Med Notes eBook* to include additional high-quality color images for a superior mobile learning experience.

Essential Med Notes 2015 is produced by Toronto Notes for Medical Students Inc., a non-for-profit organization supporting various medical student initiatives including community outreach programs and medical school clubs through the

University of Toronto Medical Society, charitable events, and student bursaries and scholarships.

The production of this text would not have been possible without the commitment, energy, and passion of our dedicated team of over 150 students, artists, and faculty members at the University of Toronto's Faculty of Medicine as well as numerous faculty members at top-ranked U.S. institutions. We are grateful for the dedication and significant contributions of our lead editors: Amin Bahubeshi, Jillian Bardsley, Mandeep Pinky Gaidhu, Amanda Huynh, Jessica Huynh, Vahagn Karapetyan, Evan Lilly, Khaled Ramadan, and Karim Virani. We would also like to thank our Production Managers, Charles He and Ilya Mukovozov, for their hard work and efforts toward making this year's edition a success. Our website team has been invaluable in improving our online resources to offer our users an enhanced electronic experience. We appreciate the creativity put forth by the Biomedical Communications artists in conceptualizing and developing numerous new illustrations as well as the innovative three-dimensional cover rendering. We would also like to acknowledge our partners at Type & Graphics, particularly Enrica Aguilera, for their continued guidance in the production of this text. Finally we would like to express our deepest gratitude to all previous Editors-in-Chief of *Essential Med Notes*.

We hope you find *Essential Med Notes* to be an indispensable resource. We encourage your feedback and place tremendous importance on making changes based on the user experience. On behalf of the 2015 editorial team, we wish you the best in your studies and hope that you will find *Essential Med Notes 2015* a valuable asset to your success.

Sincerely,

Justin Hall, MSc, MPH and Azra Premji, MSc, RRT
Editors-in-Chief, *Essential Med Notes 2015*
MD Program, University of Toronto

Acknowledgements

We would like to acknowledge the exceptional work of all previous *Essential Med Notes* and *Toronto Notes* (formerly MCCQE Notes) Editors-in-Chief and their editorial teams. The 2015 edition of this text was made possible with their contributions.

How to Use This Book

This book has been designed to remain as one book or to be taken apart into smaller booklets. Identify the beginning and end of a particular section, then carefully bend the pages along the perforated line next to the spine of the book. Then tear the pages out along the perforation.

The layout of *Essential Med Notes 2015* allows easy identification of important information. These items are indicated by icons interspersed throughout the text:

Icon	Icon Name	Significance
	Key Objectives	This icon is found next to headings in the text. It identifies key objectives and conditions as determined by the Medical Council of Canada or the National Board of Medical Examiners in the USA. If it appears beside a dark title bar, all subsequent subheadings should be considered key topics.
	Clinical Pearl	This icon is found in sidebars of the text. It identifies concise, important information which will aid in the diagnosis or management of conditions discussed in the accompanying text.
	Memory Aid	This icon is found in sidebars of the text. It identifies helpful mnemonic devices and other memory aids.
	Clinical Flag	This icon is found in sidebars of the text. It indicates information or findings that require urgent management or specialist referral.
	Cross-Reference	This icon is found in sidebars of the text. It indicates a cross-reference for information that is discussed in a separate chapter.
	Evidence Based Medicine	This icon is found in sidebars of the text. It identifies key research studies for evidence-based clinical decision making related to topics discussed in the accompanying text.
	Colour Photo Atlas	This icon is found next to headings in the text. It indicates topics that correspond with images found in the Colour Photo Atlas available online (www.torontonotes.ca).
	Radiology Atlas	This icon is found next to headings in the text. It indicates topics that correspond to images found in the Radiology Atlas available online (www.torontonotes.ca).
	Online Resources	This icon is found next to headings in the text. It indicates topics that correspond with electronic resources such as Functional Neuroanatomy or ECGs Made Simple, available online (www.torontonotes.ca).

Chapter Divisions

To aid in studying and finding relevant material quickly, each chapter is organized in the following general framework:

Basic Anatomy/Physiology Review

- features the high-yield, salient background information students are often assumed to have remembered from their early medical school education

Common Differential Diagnoses

- aims to outline a clinically useful framework to tackle the common presentations and problems faced in the area of expertise

Diagnoses

- the bulk of the book
- etiology, epidemiology, pathophysiology, clinical features, investigations, management, complications, and prognosis

Common Medications

- a quick reference section for review of medications commonly prescribed

Common Unit Conversions

To convert from the conventional unit to the SI unit, **multiply** by conversion factor

To convert from the SI unit to the conventional unit, **divide** by conversion factor

	Conventional Unit	Conversion Factor	SI Unit
ACTH	pg/mL	0.22	pmol/L
Albumin	g/dL	10	g/L
Bilirubin	mg/dL	17.1	μmol/L
Calcium	mg/dL	0.25	mmol/L
Cholesterol	mg/dL	0.0259	mmol/L
Cortisol	μg/dL	27.59	nmol/L
Creatinine	mg/dL	88.4	μmol/L
Creatinine clearance	mL/min	0.0167	mL/s
Ethanol	mg/dL	0.217	mmol/L
Ferritin	ng/mL	2.247	pmol/L
Glucose	mg/dL	0.0555	mmol/L
HbA1c	%	0.01	proportion of 1.0
Hemoglobin	g/dL	10	g/L
HDL cholesterol	mg/dL	0.0259	mmol/L
Iron, total	μg/dL	0.179	μmol/L
Lactate (lactic acid)	mg/dL	0.111	mmol/L
LDL cholesterol	mg/dL	0.0259	mmol/L
Leukocytes	x 10 ³ cells/mm ³	1	x 10 ⁹ cells/L
Magnesium	mg/dL	0.411	mmol/L
MCV	μm ³	1	fL
Platelets	x 10 ³ cells/mm ³	1	x 10 ⁹ cells/L
Reticulocytes	% of RBCs	0.01	proportion of 1.0
Salicylate	mg/L	0.00724	mmol/L
Testosterone	ng/dL	0.0347	nmol/L
Thyroxine (T ₄)	ng/dL	12.87	pmol/L
Total Iron Binding Capacity	μg/dL	0.179	μmol/L
Triiodothyronine (T ₃)	pg/dL	0.0154	pmol/L
Triglycerides	mg/dL	0.0113	mmol/L
Urea nitrogen	mg/dL	0.357	mmol/L
Uric acid	mg/dL	59.48	μmol/L
Celsius → Fahrenheit	F = (C x 1.8) + 32		
Fahrenheit → Celsius	C = (F – 32) x 0.5555		
Kilograms → Pounds	1 kg = 2.2 lbs		
Pounds → Ounces	1 lb = 16 oz		
Ounces → Grams	1 oz = 28.3 g		
Inches → Centimetres	1 in = 2.54 cm		

Commonly Measured Laboratory Values

Test	Conventional Units	SI Units
Arterial Blood Gases		
pH	7.35-7.45	7.35-7.45
PCO ₂	35-45 mmHg	4.7-6.0 kPa

American law applicable to medical practice varies between state jurisdictions and changes over time. Criminal law is nationwide, but non-criminal (civil) law varies between states. This section is meant to serve only as a guide. Students and physicians should ensure that their practices conform to local and current laws.

The US Health Care System

Acronyms

AE	adverse event
AMA	American Medical Association
ART	advanced reproductive technologies
OECD	Organization for Economic Co-operation and Development
POA	power of attorney
SDM	surrogate decision-maker

Overview of US Health Care System

- the United States health care system is primarily market-based
- it is funded and delivered by a mixture of the public, private, and voluntary sectors; private-for-profit is the prevailing method of delivery
- public funding is derived from taxes raised at both the federal and state government levels

History

- | | |
|-----------------|---|
| 1901 | American Medical Association established as the national organization of state and local medical groups |
| 1929 | Baylor Plan developed <ul style="list-style-type: none">• created by Dr. Justin Ford Kimball to ensure that teachers could pay their medical bills• teachers pay 50 cents/mo in exchange for guarantee of medical services for 21 d |
| 1930s | more hospitals adopt medical insurance plans as per the Baylor Plan |
| 1939 | Community hospitals work together to create health-care plans <ul style="list-style-type: none">• American Hospital Association (AHA) uses the term “Blue Cross” to describe health care plans that meet their standards• emergence of prepaid plans covering physician and surgeon services |
| 1946 | Blue Shield created and represents physician sponsored health-care plans, which became the official designation for AHA health care plans in 1960 |
| 1954 | Social Security coverage begins to include disability benefits |
| 1965 | Medicare and Medicaid programs introduced government funded health-care plans |
| 1970s/
1980s | <ul style="list-style-type: none">• emergence of Health Maintenance Organizations (HMOs)• HMOs offer managed care plans: health care packages that are provided by an HMO approved network of health care providers |
| 1993 | Universal health care system proposed but rejected by Congress |
| 1996 | <i>Mental Health Parity Act</i> passed <ul style="list-style-type: none">• invoked to decrease discrimination in health care coverage for mental health illnesses• aggregate annual and lifetime limits for mental health services must match aggregate annual and lifetime limits for medical and surgical services |
| 1996 | <i>Health Insurance Portability and Accountability Act</i> passed <ul style="list-style-type: none">• Title 1: Health Care Access, Portability, and Renewability<ul style="list-style-type: none">• provides protection of health care coverage to employees and their families if they change or lose their job• Title 2: Preventing Health Care Fraud and Abuse; Administrative Simplification; Medical Liability Reform<ul style="list-style-type: none">• addresses and establishes national standards for electronic health care transactions and security and privacy of health data |
| 1997 | State Children's Health Insurance Program (SCHIP) created <ul style="list-style-type: none">• states extend health coverage to uninsured children |
| 1999 | <i>Ticket to Work and Work Incentives Improvement Act</i> <ul style="list-style-type: none">• enables people with disabilities to be employed without affecting their Medicaid or Medicare coverage |
| 2010 | <i>Affordable Care Act</i> <ul style="list-style-type: none">• reform to health care to improve access to affordable health coverage and creates regulations on activities of private health insurance providers |

Health Care Reform

- *Patient Protection and Affordable Care Act* and the *Health Care and Education Reconciliation Act* of 2010 are federal statutes signed into law in March 2010 that include a number of new health care provisions to be implemented over 8 yr
 - expand Medicaid eligibility, provide subsidies for insurance premiums and incentives for businesses to provide health care benefits, prohibit denial of coverage/claims for pre-existing conditions, and establish health-insurance exchanges
 - costs are offset by a number of health care related taxes, including a tax penalty for citizens with no health insurance (low income persons and persons from a recognized religious sect are exempt)

Health Care Expenditure and Delivery in the US

- health care spending in the US represents a large economic sector
 - health care comprises over 17.9% of the gross domestic product (GDP) (highest in the OECD), amounting to \$8,608 USD per capita in 2011
 - one advantage is the widespread availability of technology – the US has 4 times as many MRI machines per capita than Canada
- the US scores poorly on some indicators of population health, with a life expectancy below the OECD average and infant mortality above the OECD average; possible factors that account for this discrepancy are:
 - poor health of large uninsured population
 - high cost of health care administration
 - the provision of inefficient high-cost, high-intensity care
 - the higher-spending regions in the US do not provide any better quality of care, access to care, health outcomes, or satisfaction with care when compared to the lower-spending regions
- the US has the highest level of obesity of all OECD nations at 34.3%; this has major implications for future health care spending

Health Care Funding

- over 60% of healthcare provisions and spending come from universal programs such as Medicare, Medicaid, TRICARE, the Children's Health Insurance Program, and the Veterans Health Administration
- based on the total expenditure on health care, 31% goes to hospital care, 21% goes to physicians/clinical services, 10% to pharmaceuticals, 4% to dental, 6% to nursing homes, 3% to home health care, 3% for other retail products, 3% for government public health activities, 7% to administrative costs, 7% to investment, and 6% to other professional services

Health Care Delivery

- health care facilities are largely operated by the private sector
- it is estimated that approximately 62% of hospitals are non-profit, 20% are government owned, and 18% are for-profit

Access to Health Services

- 70% of Americans under the age of 65 have private health insurance, either employer-sponsored or individually purchased; 12% receive health care through public health insurance; 18%, mainly the poor, have no health insurance
- access to publicly funded health services occurs primarily through two programs, Medicare and Medicaid, which were created by the 1965 *Social Security Act*
- other federal government-funded health programs include the Military Health Services System, the Veterans Affairs Health Services System, the Indian Health Service, and the Prison Health Service

Table 1. Medicare and Medicaid Program Information

	Medicare	Medicaid
Eligibility	> 65 yr People with end stage renal disease People of any age meeting the Medicare definition of disability	People who receive funds through social assistance programs Pregnant women People with developmental disabilities Low-income children through the 1997 State Children's Health Insurance Program
Coverage	Basic "Part A" providing inpatient hospital care, home care, limited skilled nursing facility care, and hospice care Supplemental "Part B" covers outpatient physician and clinic services, and requires payment of a further monthly fee	Basic coverage involves inpatient and outpatient hospital care, laboratory and x-ray services, skilled nursing care, home care, physician services, dental services, and family planning Financing for Medicaid is provided jointly by the federal and state governments, and program details vary greatly between states
Co-payment	To help pay for out-of-pocket expenditures, and to cover many of the services not insured by Medicare, the majority of Medicare beneficiaries buy supplemental private health insurance	States may impose deductibles, coinsurance, or co-payments on some Medicaid recipients for certain services Medicaid is not health insurance – coverage is unreliable as improvement in an individual's financial status can lead to a loss of Medicaid eligibility

Ethical and Legal Issues in Medicine

Introduction to the Principles of Ethics

- ethics addresses
 - 1) principles and values that help define what is morally right and wrong
 - 2) rights, duties, and obligations of individuals and groups

The practice of medicine assumes there is one code of professional ethics for all doctors and that they will be held accountable by that code and its implications

Table 2. The Four Principles of Medical Ethics

Principle	Definition
Autonomy	<ul style="list-style-type: none"> Recognizes an individual's right and ability to decide for himself/herself according to his/her beliefs and values Not applicable in situations where informed consent and choice are not possible or may not be appropriate
Beneficence	<ul style="list-style-type: none"> The patient-based 'best interests' standard that combines doing good, avoiding harm, taking into account the patient's values, beliefs, and preferences (so far as these are known) Autonomy should be integrated with the physician's conception of a patient's medically-defined best interests The aim is to minimize harmful outcomes and maximize beneficial ones Paramount in situations where consent/choice is not possible or may not be appropriate
Non-Maleficence	<ul style="list-style-type: none"> Obligation to avoid causing harm; <i>primum non nocere</i> ("First, do no harm") A limit condition of the Beneficence principle
Justice	<ul style="list-style-type: none"> Fair distribution of benefits and harms within a community Concept of fairness: Is the patient receiving what he/she deserves – his/her fair share? Is he/she treated the same as equally situated patients? How do one set of treatment decisions impact on others? Respects basic human rights, such as freedom from persecution and the right to have one's interests considered and respected

- the AMA has a **Code of Medical Ethics**
 - articulates the values of medicine as a profession and defines medicine's integrity
 - source of the profession's authority to self-regulate
 - evolving document that changes as new questions arise; AMA policy positions ("AMA Policy") address current health care issues, the health care system, internal organizational structure, decision-making processes, and medical science and technology

Autonomy vs. Competence

Autonomy: the right that patients have to make decisions according to their beliefs and preferences

Competence: the ability or capacity to make a specific decision for oneself

Confidentiality

Overview of Confidentiality

- a full and open exchange of information between patient and physician is central to a therapeutic relationship
- privacy is the right of patients (which they may forego) while confidentiality is the duty of doctors (which they must respect barring patient consent or the requirements of the law)

- if inappropriately breached by a doctor, he/she can be sanctioned by the hospital, court, or regulatory authority
- based on the ethical principle of patient autonomy, patients have the right to the following:
 - control of their own information
 - the expectation that information concerning them will receive proper protection from unauthorized access by others (see *Privacy of Medical Records*)
 - confidentiality may be ethically and legally breached in certain circumstances (i.e. the threat of harm to others)
 - unlike the solicitor-client privilege, there is no 'physician-patient privilege' by which a physician, even a psychiatrist, can promise the patient absolute confidentiality
 - physicians failing to abide by such regulations could be subject to professional or civil actions

Statutory Reporting Obligations

- legislation has defined specific instances where public interest overrides the patient right to confidentiality. These vary by state, but often include the following:
 1. suspected child or elder abuse or neglect – report to local child welfare authorities
 2. fitness to drive a vehicle or fly an airplane – report to Department of Motor Vehicles
 3. communicable diseases – report to public health authority and identifiable people at risk
 4. improper conduct of other physicians or health professionals – report to college or regulatory body of the health professional
 5. gunshot and knife wounds – notify police
 6. vital statistics must be reported; reporting varies by jurisdiction
- physicians who fail to report in these situations in the manner prescribed by state jurisdiction are subject to prosecution and penalty, and may be liable if a third party has been harmed

Duty to Protect/Warn

- the physician has a duty to protect the public from a known (or potential) dangerous patient; this may involve taking appropriate clinical action (e.g. involuntary detainment of violent patients for clinical assessment), informing the police, or warning the potential victim(s) if a patient expresses an intent to harm
- first established by a Supreme Court of California decision in 1976; known as the Tarasoff decision
- concerns of breaching confidentiality should not prevent the MD from exercising the duty to protect; however, the disclosed information should not exceed that required to protect others
- applies in a situation where:
 1. there is a clear risk to identifiable person(s);
 2. there is a risk of serious bodily harm or death; and
 3. the danger is imminent (i.e. more likely to occur than not)

Disclosure for Legal Proceedings

- disclosure of health records can be compelled by a court order, warrant, or subpoena

Privacy of Medical Records

- privacy of health information is protected by professional codes of ethics, legislation, and the physician's fiduciary duty
- the legal duties of physicians involving patient confidentiality of medical records are outlined in the Health Insurance Portability and Accountability Act (HIPPA), which establishes principles for the collection, use, and disclosure of information that is part of commercial activity (i.e. physician practices, pharmacies, private labs)
- other aspects involving confidentiality are governed by state policy

Duties of Physicians with Regards to the Privacy of Health Information

- inform patients of information-handling practices through various means (i.e. posting notices, brochures and pamphlets, and/or through discussions with patients)
- obtain the patient's expressed consent to disclose information to third parties
- provide the patient with access to their entire medical record; exceptions include instances where there is potential for serious harm to the patient or a third party
- provide secure storage of information and implement measures to limit access to patient records
- ensure proper destruction of information that is no longer necessary

Physicians should seek advice from their local health authority or the American Medical Association before disclosing the status of a patient to someone else

Reasons to Breach Confidentiality

- Child abuse
- Fitness to drive
- Communicable disease
- Coroner report
- Duty to inform/warn

When confidentiality is breached in the interest of the public welfare, the minimum relevant information should be disclosed, and the number of persons privy to the information should be kept at a minimum

Reports of possible cases of violence should include information pertaining to the threat, the situation, the physician's opinion and the information upon which it is based

Consent and Capacity

Ethical Principles Underlying Consent and Capacity

- consent is the autonomous authorization of a medical intervention by a patient
- usually, the principle of respect for patient autonomy overrides the principle of beneficence
- where a patient cannot make an autonomous decision (i.e. incapable), it is the duty of the SDM (or the physician in an emergency) to act on the patient's known prior wishes or, failing that, to act in the patient's best interests

- there is a duty to discover, if possible, what the patient would have wanted when capable
- central to determining best interests is understanding the patient's values, beliefs, and cultural or religious background
- more recently expressed wishes take priority over remote ones
- patient wishes may be verbal or written
- patients found incapable to make a specific decision should still be involved in that decision as much as possible
- agreement or disagreement with medical advice does not determine findings of capacity/incapacity
- however, patients opting for care that puts them at risk of serious harm that most people would want to avoid should have their capacity carefully assessed

Four Basic Requirements of Valid Consent

1. Voluntary

- consent must be given free of coercion or pressure (i.e. from parents or other family members who might exert 'undue influence')
- the physician must not deliberately mislead the patient about the proposed treatment

2. Capable

- the patient must be able to understand and appreciate the nature and effect of the proposed treatment

3. Specific

- the consent provided is specific to the procedure being proposed and to the provider who will carry out the procedure (i.e. the patient must be informed if students will be involved in providing the treatment)

4. Informed

- sufficient information and time must be provided to allow the patient to make choices in accordance with their wishes; information should include:
 - ♦ the nature of the treatment or investigation proposed and its expected effects
 - ♦ all significant risks and special or unusual risks
 - ♦ alternative treatments or investigations and their anticipated effects and significant risks
 - ♦ the consequences of declining treatment
 - ♦ risks that are common sense need not be disclosed (i.e. bruising after venipuncture)
 - ♦ answers to any questions the patient may have
- the reasonable person test – the physician must provide all information that would be needed "by a reasonable person in the patient's position" to be able to make a decision
- disclose common adverse events (>1/200 chance of occurrence) and serious risks (e.g. death) even if remote
- it is the physician's responsibility to make reasonable attempts to ensure that the patient understands the information
- physicians should not withhold information about a legitimate therapeutic option based on personal conscience (i.e. not discussing the option of emergency contraception)

4 Basic Elements of Consent

- Voluntary
- Capable
- Specific
- Informed

Obtaining Legal Consent

- consent of the patient must be obtained before any medical intervention is provided; consent can be:
 - verbal or written, although written is usually preferred
 - ♦ a signed consent form is only evidence of consent – it does not replace the process for obtaining valid consent
 - ♦ what matters is what the patient understands and appreciates, not what the signed consent form states
 - implied (e.g. a patient holding out their arm for an immunization) or expressed
- consent is an ongoing process and can be withdrawn or changed after it is given, unless stopping a procedure would put the patient at risk of serious harm

Exceptions to Consent

1. Emergencies

- treatment can be provided without consent where a patient is experiencing severe suffering, or where a delay in treatment would lead to serious harm or death and consent cannot be obtained from the patient or their surrogate decision-maker (SDM)
- emergency treatment should not violate a prior expressed wish of the patient (i.e. a signed Jehovah's Witness card)
- if patient is incapable, MD must document reasons for incapacity and why situation is emergent
- patients have a right to challenge a finding of incapacity as it removes their decision-making ability
- if a SDM is not available, MD can treat without consent until the SDM is available or the situation is no longer emergent

Major Exceptions to Consent

- Emergencies
- Communicable diseases
- Mental health legislation

2. Legislation

- mental health legislation allowing for involuntary commitment is state governed. In general, an individual may be detained if he/she poses a threat to the self or others
- public health legislation allows medical officers of health to detain, examine, and treat patients without their consent (e.g. a patient with TB refusing to take medication) to prevent transmission of communicable diseases (see [Population Health and Epidemiology, PH19](#))

3. Special Situations

- public health emergencies (i.e. an epidemic or communicable disease treatment)
- warrant for information by police

Consequences of Failure to Obtain Valid Consent

- treatment without consent is battery (an offense in tort), even if the treatment is life-saving (excluding situations outlined in exceptions section above)
- treatment of a patient on the basis of poorly informed consent may constitute negligence, also an offense in tort
- the onus of proof that valid consent was not obtained rests with the plaintiff (usually the patient)

Consent

- treatment without consent = battery, including if NO consent or if WRONG procedure
- treatment with poor or invalid consent = negligence

Overview of Capacity

- capacity is the ability to
 - understand information relevant to a treatment decision
 - appreciate the reasonably foreseeable consequences of a decision or lack of a decision
- capacity is specific for each decision (i.e. a person may be capable to consent to having a chest x-ray, but not for a bronchoscopy)
- capacity can change over time (i.e. temporary incapacity secondary to delirium)
- a person is presumed capable unless there is good evidence to the contrary
- capable patients are entitled to make their own decisions
- capable patients can refuse treatment even if it leads to serious harm or death; however, decisions that put patients at risk of serious harm or death require careful scrutiny

Assessment of Capacity

- capacity assessments must be conducted by a physician and, if appropriate, in consultation with other health care professionals (e.g. another physician, a mental health nurse)
- clinical capacity assessment may include:
 - specific capacity assessment (i.e. capacity specific to the decision at hand)
 1. effective disclosure of information and evaluation of patient's reason for decision
 2. understanding of:
 - his/her condition
 - the nature of the proposed treatment
 - alternatives to the treatment
 - the consequences of accepting and rejecting the treatment
 - the risks and benefits of the various options
 3. for the appreciation needed for decision making capacity, a person must:
 - acknowledge the condition that affects him/herself
 - be able to assess how the various options would affect him or her
 - be able to reach a decision and adhere to it, and make a choice, not based primarily upon delusional belief (test: are their beliefs responsive to evidence?)
- general impressions
- input from psychiatrists, neurologists, etc.
- employ "Aid to Capacity Evaluation"
 - a decision of incapacity may warrant further assessment by psychiatrist(s) or the courts

Table 3. Aid to Capacity Evaluation

Ability to understand the medical problem
Ability to understand the proposed treatment
Ability to understand the alternatives (if any) to the proposed treatment
Ability to understand the option of refusing treatment or of it being withheld or withdrawn
Ability to appreciate the reasonably foreseeable consequences of accepting the proposed treatment
Ability to appreciate the reasonably foreseeable consequences of refusing the proposed treatment
Ability to make a decision that is not substantially based on delusions or depression

Adapted from Etchells E, et al. *CMAJ* 1996;155:657-661

Administration of treatment for an incapable patient in an emergency situation is applicable if the patient is:

- Experiencing extreme suffering
- At risk of sustaining serious bodily harm if treatment is not administered promptly

Patients may also ask to waive the right to choice (e.g. "You know what's best for me, doctor") or delegate their right to choose to someone else (e.g. a family member)

Competency refers to a person's legal capacity (which is assessed by the courts) to make decisions and be held accountable by the court of law

Capacity is a medical term (assessed by the appropriate physician) that refers to an individual's ability to understand relevant information, the severity of the medical situation and its consequences, and be able to communicate a choice and his/her rationale about the decision being made

Treatment of the Incapable Patient in a Non-Emergent Situation

- obtain informed consent from SDM
- criteria for detaining a patient against his/her will to receive treatment are state specific. In most circumstances, the physician must:
 - document assessment by psychiatrist or other qualified agent in chart
 - notify patient and agent verbally or in writing of assessment
 - if the patient objects to the determination, healthcare professionals cannot override the patient's wishes without obtaining a court order

Surrogate Decision-Makers (SDM)

- SDM are appointed if no living will or POA exists and must follow the following principles when giving informed consent:
 - act in accordance with wishes previously expressed by the patient while capable
 - if wishes unknown, act in the patient's best interest, taking the following into account:
 1. values and beliefs held by the patient while capable
 2. whether well-being is likely to improve with vs. without treatment
 3. whether the expected benefit outweighs the risk of harm
 4. whether a less intrusive treatment would be as beneficial as the one proposed
 - the final decision of the SDM may and should be challenged by the MD if the MD believes the SDM is not abiding by the above principles

INSTRUCTIONAL ADVANCE DIRECTIVES

- allow patients to exert control over their care once they are no longer capable
- the patient sets out their decisions about future health care, including who they would allow to make treatment decisions on their behalf and what types of interventions they would want
- takes effect once the patient is incapable with respect to treatment decisions
- patients should be encouraged to review these documents with their family and physicians and to reevaluate them often to ensure they are current with their wishes

Powers of Attorney

- all Guardians and Attorneys have fiduciary duties for the dependent person

Definitions

- **Power of Attorney for Personal Care**
 - a legal document in which one person gives another the authority to make personal care decisions (health care, nutrition, shelter, clothing, hygiene, safety) on their behalf if they become mentally incapable
- **Guardian of the Person**
 - someone who is appointed by the Court to make decisions on behalf of an incapable person in some or all areas of personal care, in the absence of a POA for personal care
- **Continuing Power of Attorney for Property**
 - a legal document in which a person gives another the legal authority to make decisions about their finances if they become unable to make those decisions
- **Guardian of Property**
 - someone who is appointed by the Public Guardian and Trustee or the Courts to look after an incapable person's property or finances
- **Public Guardian and Trustee**
 - acts as a SDM of last resort on behalf of mentally incapable people who do not have another individual to act on their behalf
- **Pediatric Aspects of Capacity**
 - age of consent is state specific
 - physicians treating pediatric patients generally must obtain informed consent from a parent or a legal guardian
 - emancipated or mature minors may provide consent to their own medical care
 - infants and children are assumed to lack mature decision-making capacity for consent but they should still be involved (i.e. be provided with information appropriate to their comprehension level)
 - adolescents are usually treated as adults
 - preferably, assent should still be obtained from patient, even if not capable of giving consent
 - in the event that the physician believes the SDM is not acting in the child's best interest, an appeal must be made to the local child welfare authorities
 - under normal circumstances, parents have right of access to the child's medical record

When disagreements occur, institutional policies for timely conflict resolution should be followed, and may be followed by consultation with an ethics committee, pastoral service, or other counseling resource; resolution of disagreements in the courts should be pursued only as a last resort

Negligence

Ethical Basis

- the doctor-patient relationship is formed on trust, which is recognized in the concept of **fiduciary duty/responsibility** of physician towards patient
- negligence or malpractice is a form of failure on the part of the physician in fulfilling his/her fiduciary duty in providing appropriate care and leading to harm of the patient (and/or abuse of patient's trust)

Legal Basis

- physicians are legally liable to their patients for causing harm (tort) through a failure to meet the standard of care applicable under the circumstances
- standard/duty of care is defined as one that would reasonably be expected under similar circumstances of an ordinary, prudent physician of the same training, experience, specialization, and standing
- liability arises from physician's common law duty of care to his/her patients in the doctor/patient relationship
- action(s) in negligence (or civil liability) against a physician must be launched by a patient within a specific prescribed period required by the respective state in which the actions occurred

A fiduciary duty is a legal duty to act solely in another party's interest and may not profit from relationship with principals unless they have the principal's express consent

Four basic elements for action against a physician to succeed in negligence/malpractice

1. A duty of care owed to the patient (doctor/patient relationship must be established)
2. A breach of the duty of care
3. Some harm or injury to the patient
4. The harm or injury must have been caused by the breach of the duty of care

Truth-Telling

Ethical Basis

- helps to promote and maintain a trusting physician-patient relationship
- patients have a right to be told important information that physicians have regarding their care
- enables patients to make informed decisions about health care and their lives

Legal Basis

- required for valid patient consent (see *Consent and Capacity*, ELOAM5)
 - goal is to disclose information that a reasonable person in the patient's position would need in order to make an informed decision ("standard of disclosure")
- withholding information can be a breach of fiduciary duty and duty of care
- obtaining consent by using misleading information can be seen as negligent

Evidence about Truth-Telling

- most patients want to know what is wrong with them
- although many patients want to protect family members from bad news, they themselves would want to be informed in the same situation
- truth-telling improves compliance and health outcomes
- informed patients are more satisfied with their care
- negative consequences of truth-telling can include decreased emotional well-being, anxiety, worry, social stigmatization, and loss of insurability

Challenges in Truth-Telling

Medical Error

- medical error may be defined as 'preventable adverse events' caused by the patient's medical care and not the patient's underlying illness. Some errors may be identified before they harm the patient, so not all error is truly 'adverse'
 - serious adverse events (i.e. those resulting in death, hospitalization, or medical or surgical intervention) must be reported to the Food and Drug Administration (FDA)
- many jurisdictions and professional associations expect and require physicians to disclose medical error; that is, any event that harms or threatens to harm patients must be disclosed to the patient or the patient's family and reported to the appropriate health authorities
- physicians should disclose to patients the occurrence of adverse events or errors caused by medical management, but should not suggest that they resulted from negligence because:
 - negligence is a legal determination
 - error is not equal to negligence
- disclosure allows the injured patient to seek appropriate corrective treatment promptly
 - physicians should avoid simple attributions as to cause and sole responsibility of others or oneself
 - physicians should offer apologies or empathic expressions of regret ("I wish things had turned out differently") as these can increase trust and are not admissions of guilt or liability

Breaking Bad News

- 'bad news' may be any information that reveals conditions or illnesses threatening the patient's sense of well-being
- caution patients in advance of serious tests about possible bad findings

Adverse Event (AE)

An unintended injury or complication from health care management resulting in disability, death, or prolonged hospital stay

Protocol to Break Bad News: SPIKES

- S** Setting the scene and listening skills
- P** Patient's **p**erception of condition and seriousness
- I** Invitation from patient to give information
- K** Knowledge – giving medical facts
- E** Explore emotions and empathize
- S** Strategy and summary

Baile WF, Buckman R. 2000

- give warnings of impending bad news (see sidebar for example) and make sure you provide time for the patient
- poorly done disclosure may be as harmful as non-disclosure
- truth-telling may be a process requiring multiple visits
- adequate support should be provided along with the disclosure of difficult news
- SPIKES protocol was developed to facilitate “breaking bad news”

Arguments Against Truth-Telling

- may go against certain cultural norms and expectations
- may lead to patient harm and increased anxiety
- 10-20% of patients prefer not to be informed
- medical uncertainty may result in the disclosure of uncertain or inaccurate information

Exceptions to Truth-Telling

- patients may ‘waive’ the right to know: patient declines information that would normally be disclosed
- a patient may waive their right to know the truth about their situation when
 - the patient clearly declines to be informed
 - a strong cultural component exists that should be respected and acknowledged
 - the patient may wish others to be informed and make the medical decisions for him/her
- the more weighty the consequences for the patient from non-disclosure, the more carefully one must consider the right to ignorance
- ‘Emergencies’: an urgent need to treat may legitimately delay full disclosure; the presumption is that most people would want such treatment and the appropriate SDM cannot be found
- ‘therapeutic privilege’
 - withholding information by the clinician in the belief that disclosure of the information would itself lead to severe anxiety, psychological distress, or physical harm to the patient
 - clinicians should avoid invoking therapeutic privilege due to its paternalistic overtones and is a defense of non-disclosure that is rarely accepted anymore
 - it is often not the truth that is unpalatable; it is how it is conveyed that can harm the patient

Open Disclosure of AEs: Transparency and Safety in Health Care

Surg Clin North Am 2012;92(1):63-77

Health care providers have a fiduciary duty to disclose adverse events to their patients. Professional societies codify medical providers' ethical requirement to disclose adverse events to patients in accordance with the 4 principles of biomedical ethics. Transparency and honesty in relationships with patients create opportunities for learning that lead to systems improvements in health care organizations. Disclosure invariably becomes a component of broad systems improvement and is closely linked to improving patient safety.

Truth-Telling in Discussing Prognosis in Advanced Life-Limiting Illnesses

Palliat Med 2007;21(6):507-517

Many physicians express discomfort at having to broach the topic of prognosis, including limited life expectancy, and may withhold information or not disclose prognosis. A systematic review of 46 studies relating to truth-telling in discussing prognosis with patients with progressive, advanced life-limiting illnesses and their caregivers showed that although the majority of physicians believed that patients and caregivers should be told the truth about the prognosis, in practice, many either avoid discussing the topic or withhold information. Reasons include perceived lack of training, stress, no time to attend to the patient's emotional needs, fear of a negative impact on the patient, uncertainty about prognostication, requests from family members to withhold information, a feeling of inadequacy, or hopelessness regarding the unavailability of further curative treatment. Evidence suggests that patients can discuss the topic without it having a negative impact on them.

Ethical Issues in Health Care

Managing Controversial and Ethical Issues in Practice

- discuss in a non-judgmental manner
- ensure patients have full access to relevant and necessary information
- identify if certain options lie outside of your moral boundaries and refer to another physician if appropriate
- consult with appropriate ethics committees or boards
- protect freedom of moral choice for students or trainees

Reproductive Technologies

Overview of the Maternal-Fetal Relationship

- in general, maternal and fetal interests align
- in some situations, a conflict between maternal autonomy and the best interests of the fetus may arise

Ethical Issues and Arguments

- principle of reproductive freedom: women have the right to make their own reproductive choices
- coercion of a woman to accept efforts to promote fetal well-being is an unacceptable infringement of her personal autonomy

Legal Issues and Arguments

- the law upholds a woman's right to life, liberty, and security of person and does not recognize fetal rights; key aspects of the mother's rights include:
 - if a woman is competent and refuses medical advice, her decision must be respected even if the fetus will suffer
 - the fetus does not have legal rights until it is born alive and with complete delivery from the body of the woman

The fetus does not have legal rights until it is born alive and with complete delivery from the body of the woman

ART

- includes non-coital insemination, hormonal ovarian stimulation, and *in vitro* fertilization (IVF)
- topics with ethical concerns
 - donor anonymity vs. child-centered reproduction (i.e. knowledge about genetic medical history)
 - preimplantation genetic testing for diagnosis before pregnancy
 - use of new techniques without patients appreciating their experimental nature
 - access to ART
 - private vs. public funding of ART
 - social factors limiting access to ART (i.e. same-sex couples)
 - the 'commercialization' of reproduction

Fetal Tissue

- pluripotent stem cells can currently be derived from human embryonic and fetal tissue
- potential uses of stem cells in research
 - studying human development and factors that direct cell specialization
 - evaluating drugs for efficacy and safety in human models
 - cell therapy: using stem cells grown *in vitro* to repair or replace degenerated/destroyed/malignant tissues (e.g. Parkinson's disease)
 - genetic treatment aimed at altering somatic cells (i.e. myocardial or immunological cells) is acceptable and ongoing

ART: Ethically Appropriate Actions

- educate patients and address contributors to infertility (e.g. stress, alcohol, medications, etc.)
- investigate and treat underlying health problems causing infertility
- wait at least 1 yr before initiating treatment with ART (exceptions – advanced age or specific indicators of infertility)
- educate and prepare patients for potential negative outcomes of ART

Induced Abortion

- induced abortion: the active termination of a pregnancy before fetal viability
- fetal viability: fetus >500 g or >20 wk gestational age

Prenatal/Antenatal Genetic Testing

- uses
 - to confirm a clinical diagnosis
 - to detect genetic predisposition to a disease
 - allows preventative steps to be taken and helps patient prepare for the future
 - gives parents the option to terminate a pregnancy or begin early treatment
- ethical dilemmas arise because of the sensitive nature of genetic information. Important considerations of genetic testing include:
 - the individual and familial implications
 - its pertaining to future disease
 - its ability to identify disorders for which there are no effective treatments or preventive steps
 - its ability to identify the sex of the fetus
- ethical issues and arguments regarding the use of prenatal/antenatal genetic testing include:
 - obtaining informed consent is difficult due to the complexity of genetic information
 - doctor's duty to maintain confidentiality vs. duty to warn family members
 - risk of social discrimination (e.g. insurance) and psychological harm
- legal aspects
 - testing requires informed consent
 - no standard of care exists for clinical genetics but physicians are legally obligated to inform patients that prenatal testing exists and is available
 - where a genetic defect is found in the fetus, prospective parents may request or refuse an abortion
 - a physician is required to alert prospective parents when a potential genetic problem exists

Genetic Testing: Ethically Appropriate Actions

- thorough discussion and realistic planning with patient before testing is done
- genetic counseling for delivery of complex information

Once outside the mother's body, the neonate becomes a member of society with all the rights and protections other vulnerable persons receive.

- Non-treatment of a neonate born alive is only acceptable if <22 wk GA
- 23-25 wk GA: treatment should be a consensual decision between physician and parents
- 25 wk GA and more: neonate should receive full treatment unless major anomalies or conditions incompatible with life are present

Source: *Paed Child Health* 2012:443

AMA Principles of Medical Ethics do not prohibit a physician from performing an abortion in accordance with good medical practice and under circumstances that do not violate the law. Physicians should inform themselves of state laws surrounding the topic of abortions

End-of-Life Care

Overview of Palliative and End-of-Life Care

- focus of care is comfort and respect for person nearing death and maximizing quality of life for patient, family, and loved ones
- appropriate for any patient at any stage of a life-threatening illness
- may occur in a hospital, hospice, in the community, or at home
- often involves an interdisciplinary team of caregivers
- addresses the medical, psychosocial, and spiritual dimensions of care

Euthanasia and Physician-Assisted Suicide

- **euthanasia**: a deliberate act undertaken by one person with the intention of ending the life of another person to relieve that person's suffering where the act is the cause of death
- **physician-assisted suicide**: the act of intentionally killing oneself with the assistance of a physician who deliberately provides the knowledge and/or the means

Common ethical arguments/opinions

- patient has right to make autonomous choices about the time and manner of own death
- belief that there is no ethical difference between the acts of euthanasia/assisted suicide and foregoing life-sustaining treatments
- belief that these acts benefit terminally ill patients by relieving suffering
- patient autonomy has limits
- death should be the consequence of the morally justified withdrawal of life-sustaining treatments only in cases where there is a fatal underlying condition, and it is the condition (not the withdrawal of treatment) that causes death

Legal aspects

- in the United States, euthanasia is considered an illegal act
- physician-assisted suicide is currently only legal in the state of Oregon

Acceptable use of palliative and end-of-life care

- the use of palliative sedation with opioids in end-of-life care, knowing that death may occur as an unintended consequence (principle of double effect) is distinguished from euthanasia and assisted suicide where death is the primary intent
- the appropriate withdrawal of life-support is distinguished from euthanasia and assisted suicide as it is seen as allowing the underlying disease to take its 'natural course'
- refusals of care by the patient that may lead to death ought to be carefully explored by the physician to rule out any 'reversible factors' (poor palliation, depression, poverty, ill-education, isolation) that may be hindering authentic choice

Physician Responsibilities Regarding Death

- physicians are required by law to complete a medical certificate of death unless the coroner needs notification; failure to report death is a criminal offence
- coroner investigates these deaths, as well as deaths that occur in psychiatric institutions, jails, foster homes, nursing homes, hospitals to which a person was transferred from a facility, institution or home, etc.
- in consultation with forensic pathologists and other specialists, the coroner establishes:
 - the identity of the deceased
 - where and when the death occurred
 - the medical cause of death
 - the means of death (i.e. natural, accidental, suicide, homicide, or undetermined)
- coroners do not make decisions regarding criminality or legal responsibility
- in a number of jurisdictions, any death not certified by the person's physician must be referred to the medical examiner

Know the Difference

Palliative care assists patients who are dying, but unlike euthanasia or physician-assisted suicide, it does not aim directly at or intend to end the person's life

Euthanasia: Ethically Appropriate Actions

- Respect competent decisions to forego treatment
- Provide appropriate palliative measures
- Decline requests for euthanasia and assisted suicide
- Try to assess reasons for such requests from patients to see if there are 'reversible factors' (such as depression, pain, loneliness, anxiety)

Notify Coroner if Death Occurs due to:

- Violence, negligence, misconduct
- Pregnancy
- Sudden or unexpected causes
- Disease not treated
- Cause other than disease
- Suspicious circumstances

Physician Competence and Professionalism

Legal Considerations

- physicians' conduct and competence are legally regulated to protect patients and society via mandatory membership to governing bodies
- physicians are legally required to maintain a license with the appropriate authority and are thus legally bound to outlined policies on matters of conduct within his/her medical practice

Common Policies on Physician Conduct

- physicians must ensure that patients have access to continuous on-call coverage and are never abandoned

- sexual conduct with patients, even when consented to by the patient, is a serious matter that can lead to accusations of battery by the patient and college. Important notes on this topic include:
 - inappropriate sexual conduct includes intercourse, undue touching, references to sexual matters, sexual jokes, and physician presence when capable patients undress or dress
 - in specified situations physicians may have a personal relationship with a patient provided a year has passed since the last therapeutic contact
 - physicians are permanently prohibited from personal relationships with patients whom they saw for psychotherapy
- physicians must maintain adequate records for each patient, which include:
 - demonstration that care has been continuous and comprehensive
 - minimal standards for record-keeping, including diagnosis, differential diagnosis, appropriate tests and referrals, coherent patient record
 - records storage for 10 years in most jurisdictions
 - although the medical record is the property of the physician or an institution, the patient or the patient's delegate must be allowed full access to information in the medical record upon (usually written) request
- in the hospital, physicians must ensure their own competence, respect hospital by-laws and regulations, practice only within the limits of granted privileges, cooperate with other hospital personnel, and maintain adequate hospital records

AMA Guidelines for Impaired, Incompetent, or Unethical Colleagues

- **Impairment:** it may be necessary to report an impaired physician who continues to practice despite reasonable offers of assistance and referral to a hospital or state physician health program. The duty to report under such circumstances may entail reporting to the licensing authority
- **Incompetence:** initial reports of incompetence should be made to the appropriate clinical authority who would be empowered to assess the potential impact on patient welfare and to facilitate remedial action. The hospital peer review body should be notified where appropriate. Incompetence that poses an immediate threat to the health and safety of patients should be reported directly to the state licensing board
- **Unethical conduct:** unethical conduct that violates state licensing provision should be reported to the state licensing board. It is appropriate to report unethical conduct that potentially violates criminal statutes to law enforcement authorities

AMA Code of Medical Ethics

Physicians have an ethical obligation to report impaired, incompetent, and/or unethical colleagues in accordance with the legal requirements in each state

Research Ethics

- involves the systematic analysis of ethical dilemmas arising during research involving human subjects to ensure that:
 - study participants are protected
 - clinical research is conducted to serve the interests of the participants and/or society as a whole
- major ethical dilemmas arise when a physician's obligation to the patient comes into conflict with other obligations and incentives
- any exceptions to disclosure for therapeutic consent do not apply in an experimental situation

Ethical Considerations for Research Involving Human Subjects

- patient's participation in research should not put him/her at a known or probable disadvantage with respect to medical care
- participant's voluntary and informed choice is usually required
- participants should have access to the treatment that is considered standard
- scientists must employ a scientifically valid design to answer the research question
- scientists must demonstrate sufficient value to justify the risk posed to participants
- research must be conducted honestly (i.e. carried out as stated in the approved protocol)
- patients must not be enticed into risky research by the lure of money and investigators must not trade the interests of patients for disproportionate recompense by a sponsor

Informed Consent for Research

- Purpose of study
- Sum of funding
- Name and probability of harm and benefits
- Nature of physician's participation including compensation

Proposals for research must be submitted to a research ethics board

Physician-Industry Relations

- health care delivery in the United States involves collaboration between physicians and the pharmaceutical and health supply industries in the areas of research, education, and clinical evaluation packages (i.e. product samples)
- physicians have a responsibility to ensure that their participation in such collaborative efforts is in keeping with their duties to their patients and society
- AMA Guidelines on the acceptance of gifts or free products from industry include:
 - any gifts accepted by physicians should primarily entail a benefit to patients and should not be of substantial value (e.g. textbooks as they serve a genuine educational function)

The AMA Code of Medical Ethics has a number of opinions on "Practice Matters" including "Industry representatives in clinical settings," "Financial incentives and the practice of medicine," and "Gifts to physicians from industry," (see <http://www.ama-assn.org/ama/pub/physician-resources/medical-ethics/code-medical-ethics.shtml>)

- cash payments should not be accepted
- individual gifts on minimal value are acceptable as long as they are related to the physician's work
- appropriate disclosure of financial support or conflict of interest should be made at conferences and/or meetings
- subsidies to underwrite costs of continuing education conference or meetings are acceptable
- payments to defray costs of a conference should not be accepted directly by the physician attending a conference
- no gifts should be accepted if there are strings attached

Resource Allocation

Definition: the distribution of goods and services to programs and people

- physicians have the duty to inform patients about therapeutic options even if they are not available
- physicians must make health care resources available to patients in a manner which is fair and equitable, without bias or discrimination
 - need and benefit are morally relevant criteria for resource allocation
 - gender, sexual orientation, religion, level of education, or age alone are morally irrelevant criteria
- ethical dilemmas can arise when deciding how best to allocate resources. Common ethical dilemmas include:
 - fair chances vs. best outcome: best outcome generally favoured vs. giving all patients fair access to limited resources (e.g. transplant list prioritization)
 - priorities problem: how much priority should the sickest patients receive?
 - aggregation problem: modest benefits to many vs. significant benefits to few
 - democracy problem: when to rely on a fair democratic process to arrive at a decision

Guidelines for Appropriately Allocating Resources

- the physician's primary obligation is to
 - protect and promote the welfare and best interests of his or her patients
 - choose interventions known to be beneficial on the basis of evidence of effectiveness
 - seek the tests or treatments that will accomplish the diagnostic or therapeutic goal for the least cost
 - advocate for one's patients but avoid manipulating the system to gain unfair advantage for them
 - resolve conflicting claims for scarce resources justly, on the basis of morally relevant criteria such as need and benefit, using fair and publicly defensible procedures
 - inform patients of the impact of cost constraints on care, but in a sensitive way
 - seek resolution of unacceptable shortages at the level of hospital management or government

AMA Policy on Resource Allocation

- physicians have the "duty to do all that [they] can for the benefit of the individual patient"
- decisions regarding the allocation of limited resources among patients should consider ethically appropriate criteria, which includes:
 - likelihood of benefit
 - urgency of need
 - changes in quality of life
 - duration of benefit
 - the amount of resources required for successful treatment

Professional Considerations

Elderly Patient

- identify their resuscitation options (CPR or DNR), if applicable
- check for documentation of advance directives and POA where applicable
- for further details see [ELOAM8](#)

Pediatric Patient

- identify the primary decision-maker (parents, guardian, wards-of-state, emancipated)
- be wary of custody issues if applicable

Terminally Ill or Palliative Patient

- consider the SPIKES approach to breaking bad news
- what are their goals of care, i.e. disease vs. symptom management?
- identify advance directives, POA, or SDM, if applicable
- check for documentation of resuscitation options (CPR or DNR) and likelihood of success
- for further details, see [Geriatric Medicine](#), [GM12](#)

Incapable Patient

- if not already present, perform a formal capacity assessment
- identify if the patient has a SDM or who has their POA

**Recommendations for Working with Families Who Refuse Childhood Immunization**

Pediatrics 2011;128:S167-174

1. Provide clear information about the risks and benefits of immunization and the diseases targeted.
2. Inform parents when their beliefs are unsupported by evidence.
3. Physicians can discontinue professional services but must comply with legal and ethical requirements. Parents are entitled to refuse treatment that a physician recommends; not every disagreement should result in discharge from practice.
4. Vaccine education for Complementary and Alternative Medicine Providers.
5. Public education campaigns regarding immunization.
6. No-fault compensation for vaccine-related injury.

Conscientious Objection**Patients Refusing Treatment**

- in accordance with the principle of autonomy, it is acceptable for competent patients to refuse medical interventions for themselves or others; exceptions may occur
- if parents or SDMs make decisions that are clearly not in the “best interests” of an incapable child, thereby risking mortality or serious morbidity, physicians may seek a court order to provide treatment against parental wishes
- in emergent scenarios, physicians may initiate treatment on the basis of legal precedent if withholding treatment places child at serious health risk
- in lower risk scenarios, such as refusing childhood immunization in a developed nation, there is a stronger obligation to respect the autonomy of the decision-makers

Physicians Refusing to Provide Treatment

- physicians may refuse to provide treatment or discontinue relationships with patients, but must ensure these patients can access services elsewhere
- for example, a pediatrician who refuses to treat an unvaccinated child should refer the family to another practice. In this case, it is recommended the pediatrician continue working with the family in the hopes that further education might help parents to make more informed decisions regarding their child's health

Overview of Anesthesia

- anesthesia: lack of sensation/perception
- **approach to anesthesia**
 1. pre-operative assessment
 2. patient optimization
 3. plan anesthetic
 - various types of anesthesia
 - pre-medication
 - airway management
 - monitors
 - induction
 - maintenance
 - extubation
 4. post-operative care

6 As of General Anesthesia

Anesthesia
Anxiolysis
Amnesia
Areflexia (muscle relaxation not always required)
Autonomic stability
Analgesia

Pre-Operative Assessment

Purpose

- identify patient's medical and surgical issues
- arrange further investigations, consultations and treatments for patients not yet optimized
- plan and consent for anesthetic techniques

History and Physical

History

- age, gender
- indication for surgery
- surgical/anesthetic Hx: previous anesthetics, any complications, previous intubations, medications, drug allergies, post-operative N/V
- FHx: abnormal anesthetic reactions, malignant hyperthermia, pseudocholinesterase deficiency (see *Uncommon Complications, A26*)
- PMHx
 - CNS: seizures, TIA/strokes, raised ICP, spinal disease, aneurysm
 - CVS: angina/CAD, MI, CHF, HTN, valvular disease, dysrhythmias, peripheral vascular disease (PVD), conditions requiring endocarditis prophylaxis, exercise tolerance, CCS/NYHA class (see *Cardiology and Cardiac Surgery, C34* for NYHA classification)
 - respiratory: smoking, asthma, COPD, recent upper respiratory tract infection, sleep apnea
 - GI: GERD, liver disease, NPO status
 - renal: insufficiency, dialysis, chronic kidney disease
 - hematologic: anemia, coagulopathies, blood dyscrasias
 - MSK: conditions associated with difficult intubations – arthritides (e.g. rheumatoid arthritis), cervical tumors, cervical infections/abscesses, trauma to cervical spine, previous cervical spine surgery, Trisomy 21, scleroderma, conditions affecting neuromuscular junction (e.g. myasthenia gravis)
 - endocrine: diabetes, thyroid disorders, adrenal disorders
 - other: morbid obesity, pregnancy, ethanol/other drug use

Physical Exam

- weight, height, BP, pulse, respiratory rate
- focused physical exam of the CNS, CVS, and respiratory systems
- general assessment of nutrition, hydration, and mental status
- airway assessment
 - done to determine intubation difficulty (no single test is specific or sensitive)
 - cervical spine stability and neck movement – upper cervical spine extension, lower cervical spine flexion ("sniffing position")
 - Mallampati classification
 - "3-2-1 rule"
 - ♦ thyromental distance (distance of lower mandible in midline from the mentum to the thyroid notch); <3 finger breadths (<6 cm) is associated with difficult intubation
 - ♦ mouth opening (<2 finger breadths is associated with difficult intubation)
 - ♦ anterior jaw subluxation (<1 finger breadth is associated with difficult intubation)
 - tongue size
 - dentition, dental appliances/prosthetic caps, existing chipped/loose teeth – must inform patients of rare possibility of damage
 - nasal passage patency (if planning nasotracheal intubation)
 - assess difficulty of ventilation
- examination of anatomical sites relevant to lines and blocks
 - bony landmarks and suitability of anatomy for regional anesthesia (if relevant)
 - sites for IV, central venous pressure (CVP), and pulmonary artery (PA) catheters

Evaluation of Difficult Airway

LEMON

Look – obesity, beard, dental/facial abnormalities, neck, facial/neck trauma
Evaluate – 3-2-1 rule
Mallampati score
Obstruction – stridor, foreign bodies
Neck mobility

To Assess for Ventilation Difficulty

BONES

Beard
Obesity (BMI > 26)
No teeth
Elderly (age > 55)
Snoring Hx (sleep apnea)

Figure 1. Mallampati classification of oral opening

Pre-Operative Investigations

- routine pre-operative investigations are only necessary if there are comorbidities, or certain indications

Table 1. Suggested Indications for Specific Investigations in the Pre-Operative Period

Test	Indications
CBC	Major surgery requiring group and screen or cross and match; chronic cardiovascular, pulmonary, renal, or hepatic disease; malignancy; known or suspected anemia; bleeding diathesis or myelosuppression; patient less than 1 yr of age
Sickle Cell Screen	Genetically predisposed patient (hemoglobin electrophoresis if screen is positive)
INR, aPTT	Anticoagulant therapy, bleeding diathesis, liver disease
Electrolytes and Creatinine	HTN, renal disease, diabetes, pituitary or adrenal disease; digoxin, diuretic, or other drug therapies affecting electrolytes
Fasting Glucose Level	Diabetes (repeat on day of surgery)
Pregnancy (β-hCG)	Women of reproductive age
ECG	Heart disease, diabetes, other risk factors for cardiac disease; subarachnoid or intracranial hemorrhage, cerebrovascular accident, head trauma
Chest Radiograph	Cardiac or pulmonary disease, malignancy

Guidelines to the Practice of Anesthesia Revised Edition 2013. Supplement to the Canadian Journal of Anesthesia, Vol 60, Dec. 2013. Reproduced with permission © Canadian Anesthesiologists' Society

American Society of Anesthesiology Classification

- common classification of physical status at the time of surgery
- a gross predictor of overall outcome, NOT used as stratification for anesthetic risk (mortality rates)
- ASA 1: a healthy, fit patient
- ASA 2: a patient with mild systemic disease
 - e.g. controlled type 2 diabetes mellitus (DM), controlled essential HTN, obesity, smoker
- ASA 3: a patient with severe systemic disease that limits activity
 - e.g. stable CAD, COPD, DM, obesity
- ASA 4: a patient with incapacitating disease that is a constant threat to life
 - e.g. unstable CAD, renal failure, acute respiratory failure
- ASA 5: a moribund patient not expected to survive 24 h without surgery
 - e.g. ruptured abdominal aortic aneurysm (AAA), head trauma with increased ICP
- ASA 6: declared brain dead, a patient whose organs are being removed for donation purposes
- for emergency operations, add the letter E after classification (e.g. ASA 3E)

Impact of Anesthesia Management Characteristics on Severe Morbidity and Mortality
Anesth 2005;102:257-268
Study: Case-control study of patients undergoing anesthesia.
Patients: 807 cases and 883 controls were analyzed among a cohort of 869,483 patients undergoing anesthesia between 1995-1997. Cases were defined as patients who either remained comatose or died within 24 h of receiving anesthesia. Controls were defined as patients who neither remained comatose nor died within 24 h of receiving anesthesia.
Intervention: General, regional, or combined anesthesia to patients undergoing a surgical procedure.
Main Outcome: Coma or death within 24 h of receiving anesthesia.
Results: The incidence of 24 h post-operative death was 8.8 per 10,000 anesthetics (95% CI 8.2-9.5) and the incidence of coma was 0.5 (95% CI 0.3-0.6). Anesthesia management risk factors that were associated with a decreased risk of morbidity and mortality were equipment check with protocol and documentation, directly available anesthesiologist with no change during anesthesia, 2 persons present at emergence of anesthesia, reversal of muscle relaxation, and post-operative pain medication.

Pre-Operative Optimization

- in general, prior to elective surgery
 - any fluid and/or electrolyte imbalance should be corrected
 - extent of existing comorbidities should be understood and these conditions should be optimized prior to surgery
 - medications may need to be adjusted

Medications

- pay particular attention to cardiac and respiratory medications, opioids and drugs with many side effects and interactions
- **pre-operative medications to consider**
 - prophylaxis
 - ♦ risk of GE reflux: sodium citrate 30 mL PO or ranitidine 150-300 mg PO or metoclopramide 10 mg PO 30 min to 1 h pre-operatively
 - ♦ risk of infective endocarditis, GI/GU interventions: antibiotics
 - ♦ risk of adrenal suppression: steroid coverage
 - ♦ anxiety: consider benzodiazepines
 - ♦ COPD, asthma: bronchodilators
 - ♦ CAD risk factors: nitroglycerin and β -blockers
- **pre-operative medications to stop**
 - oral hypoglycemics: stop on morning of surgery
 - antidepressants: stop on morning of surgery
 - ACE inhibitors and angiotension receptor blockers: stop on morning of surgery
 - warfarin (consider bridging with heparin), anti-platelet agents (e.g. clopidogrel)
 - ♦ discuss perioperative use of ASA, NSAIDs with surgeon
 - ♦ in patients undergoing noncardiac surgery, starting or continuing low-dose aspirin in the perioperative period does not appear to protect against post-operative MI or death, but increases the risk of major bleeding
 - Note: this does not apply to patients with bare metal stents or drug-eluting coronary stents
- pre-operative medication to adjust
 - insulin (consider insulin/dextrose infusion or holding dose), prednisone, bronchodilators

Aspirin® in Patients Undergoing Non-Cardiac Surgery

NEJM 2014; 370:1494-1503

Purpose: This study evaluated the effect of low-dose ASA on the risk of death or non-fatal MI in 10,010 patients undergoing non-cardiac surgery. Patients were randomized into two groups in a double-blind process.

Method: RCT: ASA or placebo to be taken shortly before surgery and in the early post-operative period. The primary outcome was a composite of death or non-fatal MI.

Results: Death or non-fatal MI occurred in 7.0% in the ASA group and 7.1% in the placebo group. Major bleeding was more common in the ASA group than the placebo group.

Conclusion: Administration of ASA before surgery and throughout the early post-surgical period had no significant effect on the incidence of death or MI but increased the risk of major bleeding.

Effects of Extended-Release Metoprolol Succinate in Patients Undergoing Non-Cardiac Surgery (POISE Trial): A Randomized Controlled Trial

Lancet 2008;371:1839-1847

Purpose: To investigate the role of β -blockers (metoprolol) perioperatively in patients with known vascular disease undergoing non-cardiac surgery.

Methods: Patients from 190 centers in 23 countries were eligible if they were age >45 , undergoing non-cardiac surgery, and were known to have significant vascular disease. Patients were randomized to either the metoprolol group or placebo. Participants received metoprolol (or placebo) 100 mg 2-4 h prior to surgery, 6 h after surgery, and then 20 mg daily for 30 d. The primary endpoint was a composite of cardiovascular death, non-fatal myocardial infarction, and non-fatal cardiac arrest. Analysis was by intention to treat.

Results: 8,351 patients were recruited into the study, with 8,331 completing the 30 d course. Use of metoprolol was found to significantly reduce the risk of cardiovascular death, non-fatal MI, or non-fatal cardiac arrest vs. placebo (hazard ratio 0.84, $p<0.05$) but significantly increased the rate of stroke (hazard ratio 2.17, $p<0.01$) and overall risk of death (hazard ratio 1.33, $p<0.05$).

Conclusion: Use of perioperative β -blockers (metoprolol) in patients with known vascular disease provides both risks and benefits, and these must be considered for each patient individually.

Hypertension

- BP $<180/110$ is not an independent risk factor for perioperative cardiovascular complications
- target sBP <180 mmHg, dBP <110 mmHg
- assess for end-organ damage and treat accordingly

Coronary Artery Disease

- ACC/AHA Guidelines (2007) recommend postponing elective surgery 4-6 wk following an MI
 - this period carries an increased risk of reinfarction/death
- if operative procedure is essential and cannot be delayed, invasive intra- and post-operative ICU monitoring reduces the risk of reinfarction
- mortality with perioperative MI is 20-50%
- perioperative β -blockers
 - may \downarrow cardiac events and mortality (controversial, as recent data suggests \uparrow stroke risk)
 - continue β -blocker if patient is routinely taking it prior to surgery
 - consider initiation of β -blocker in:
 - ♦ patients with CAD or indication for β -blocker
 - ♦ intermediate risk surgery, especially vascular surgery

Endocrine Disorders

- diabetes mellitus
 - clarify type I vs. type II
 - assess glucose control with history and HbA1c; well controlled diabetics have more stable glucose levels intraoperatively
 - end organ damage: be aware of damage to CVS, renal, and nervous systems, including autonomic neuropathy
 - formulate intraoperative glucose management plan based on type (I vs. II), glucose control, and extent of end organ damage

- hyperthyroidism
 - can experience sudden release of thyroid hormone (thyroid storm)
 - treatment: β -blockers and pre-operative prophylaxis
- adrenocortical insufficiency (Addison's, exogenous steroid use)
 - consider intraoperative steroid supplementation

Respiratory Diseases

- smoking
 - adverse effects: altered mucus secretion and clearance, decreased small airway caliber, and altered immune response
 - abstain at least 8 wk pre-op if possible
 - if unable, abstaining even 24 h pre-operatively has shown benefit
- asthma
 - pre-operative management depends on degree of baseline asthma control
 - increased risk of bronchospasm from intubation, delivery of desflurane
 - ♦ administration of short course (up to 1 wk) pre-operative corticosteroids and inhaled β_2 -agonists decreases the risk of bronchospasm and does not increase the risk of infection, or delay wound healing
 - avoid non-selective β -blockers; cardioselective β -blockers (metoprolol, atenolol) do not increase risk of bronchospasm in the short-term
 - delay elective surgery for poorly controlled asthma (increased cough or sputum production, active wheezing)
 - delay elective surgery by a minimum of 6 wks if patient develops URTI
- COPD
 - anesthesia, surgery and analgesia predispose the patient to atelectasis, bronchospasm, pneumonia, prolonged need for mechanical ventilation, and respiratory failure
 - optimize with bronchodilators \pm ICS \pm antibiotics
 - pre-operative ABG for all COPD stage II and III patients to assess baseline respiratory acidosis and plan post-operative management of hypercapnea
 - cancel/delay elective surgery for acute exacerbation

β -blockers

- β_1 receptors are located primarily in the heart and kidneys
- β_2 receptors are located in the lungs
- Non-selective β -blockers block β_1 and β_2 receptors (labetalol, carvedilol, nadolol). Caution is required with non-selective β -blockers, particularly in patients with respiratory conditions where β_2 blockade can result in airway reactivity

Obesity and Obstructive Sleep Apnea

- assess for comorbid conditions in obese patient (independent risk factor for CVD, diabetes, OSA, cholelithiasis, HTN)
- previously undiagnosed conditions may require additional testing to characterize severity
- both obesity and OSA increase risk of difficult ventilation, intubation, and post-operative respiratory complications
 - risk may be magnified with both diseases present

Hematological Disorders

- history of congenital or acquired conditions (sickle cell anemia, factor VIII deficiency, ITP, liver disease)
- evaluate hemoglobin, hematocrit and coagulation profiles when indicated (Table 1)
- anemia
 - pre-operative treatments to increase hemoglobin (erythropoietin or pre-admission blood collection in certain populations)
- coagulopathies
 - discontinue or modify anticoagulation therapies (warfarin, clopidogrel, ASA) in advance of elective surgeries
 - administration of reversal agents if necessary: vitamin K, FFP, prothrombin complex concentrate, recombinant activated factor VII

Aspiration

- increased risk of aspiration with:
 - decreased LOC
 - trauma
 - meals within 8 h
 - suspected sphincter incompetence (GERD, hiatus hernia, nasogastric tube)
 - increased abdominal pressure (pregnancy, obesity, bowel obstruction, acute abdomen)
 - laryngeal mask vs. endotracheal tube (ETT)

- management
 - reduce gastric volume and acidity
 - delay inhibiting airway reflexes with muscular relaxants
 - employ rapid sequence induction (see *Rapid Sequence Induction*, A16)

Fasting Guidelines

Fasting Guidelines Prior to Surgery (American Society of Anesthesiologists)

- 8 h after a meal that includes meat, fried or fatty foods
- 6 h after a light meal (such as toast or crackers) or after ingestion of infant formula or non-human milk
- 4 h after ingestion of breast milk
- 2 h after clear fluids (water, black coffee, tea, carbonated beverages, juice without pulp)

Monitoring

Guidelines to the Practice of Anesthesia and Patient Monitoring

- an anesthetist present: "the only indispensable monitor"
- a completed pre-anesthetic checklist: including ASA class, NPO policy, Hx and investigations
- a perioperative anesthetic record: HR and BP every 5 min, dose and route of drugs and fluids
- continuous monitoring: see *Routine Monitors for All Cases*

Routine Monitors for All Cases

- pulse oximeter, apparatus to measure BP, electrocardiography, capnography and temperature monitoring are required for general anesthesia and sedation (Ramsey Sedation Scale 4-6), agent-specific anesthetic gas monitor when inhalational anesthetic agents are used
- the following must also be available: temperature probe, peripheral nerve stimulator, stethoscope, appropriate lighting, spirometer

Elements to Monitor

- anesthetic depth
 - inadequate: blink reflex present when eyelashes lightly touched, HTN, tachycardia, tearing or sweating
 - excessive: hypotension, bradycardia
- oxygenation: pulse oximetry, fraction of inspired O₂ (FiO₂)
- ventilation: verify correct position of ETT, chest excursions, breath sounds, ETCO₂ analysis, monitor inhaled and exhaled concentrations of inhaled anesthetics
- circulation: pulse, heart sounds, BP, telemetry, oximetry, CVP, pulmonary capillary wedge pressure
- temperature

Pre-Anesthetic Checklist

SAMMM

Suction: connected and working

Airways: laryngoscope and blades, ETT, syringe, stylet, oral and nasal airways, tape, bag, and mask

Machine: connected, pressures okay, all meters functioning, vaporizers full

Monitors: available, connected, and working

Medications: IV fluids and kit ready, emergency medicines in correct location and accessible

Figure 2. Typical anesthesia monitor

Airway Management

Airway Anatomy

- resistance to airflow through nasal passages accounts for approximately 2/3 of total airway resistance
- pharyngeal airway extends from posterior aspect of the nose to cricoid cartilage
- glottic opening (triangular space formed between the true vocal cords) is the narrowest segment of the laryngeal opening in adults
- the glottic opening is used as the space through which one visualizes proper placement of the ETT
- the trachea begins at the level of the thyroid cartilage, C6, and bifurcates into the right and left main bronchi at T4-T5 (approximately the sternal angle)

© Barbara Brehovsky 2012

Figure 3. Landmarks for intubation

Methods of Supporting Airways

1. Non-definitive airway (patent airway)
 - Jaw thrust/chin lift
 - Oropharyngeal and nasopharyngeal airway
 - Bag mask ventilation
 - Laryngeal mask airway
2. Definitive airway (patent and protected airway)
 - Endotracheal tube
 - Surgical airway (cricothyrotomy or tracheostomy)

Table 2. Methods of Supporting the Airway

	Bag and Mask	Laryngeal Mask Airway (LMA)	Endotracheal Tube (ETT)
Advantages/Indications	<ul style="list-style-type: none"> • Basic • Non-invasive • Readily available 	<ul style="list-style-type: none"> • Easy to insert • Less airway trauma/irritation than ETT • Frees up hands (vs. face mask) • Primarily used in spontaneously ventilating patient 	Indications for intubation (5 Ps): <ul style="list-style-type: none"> • Patent airway • Protects against aspiration • Positive pressure ventilation • Pulmonary toilet (suction) • Pharmacologic administration also hemodynamic instability
Disadvantages/Contraindications	<ul style="list-style-type: none"> • Risk of aspiration if decreased LOC • Cannot ensure airway patency • Inability to deliver precise tidal volume • Operator fatigue 	<ul style="list-style-type: none"> • Risk of gastric aspiration • PPV <20 cm H₂O needed • Oropharyngeal/retropharyngeal pathology or foreign body • Does not protect against laryngospasm or gastric aspiration 	<ul style="list-style-type: none"> • Insertion can be difficult • Muscle relaxant usually needed • Most invasive – see <i>Complications During Laryngoscopy and Intubation, A9</i>
Other	<ul style="list-style-type: none"> • Facilitate airway patency with jaw thrust and chin lift • Can use oropharyngeal/nasopharyngeal airway 	Sizing by body weight (approx): <ul style="list-style-type: none"> 40-50 kg: 3 50-70 kg: 4 70-100 kg: 5 	<ul style="list-style-type: none"> • Auscultate to avoid endobronchial intubation • Sizing (approx): <ul style="list-style-type: none"> Male: 8.0-9.0 mm Female: 7.0-8.0 mm Pediatric: (age/4) + 4 mm

Tracheal Intubation

Preparing for Intubation

- failed attempts at intubation can make further attempts more difficult due to tissue trauma
- plan, prepare, and assess for potential difficulties (see *Pre-Operative Assessment, A2*)
- ensure equipment is available and working (test ETT cuff, check laryngoscope light, machine check)
- pre-oxygenate/denitrogenate: patient breathes 100% O₂ for 3-5 min or for 4 vital capacity breaths
- may need to suction mouth and pharynx first

Proper Positioning for Intubation

- align the three axes (mouth, pharynx, and larynx) to allow visualization from oral cavity to glottis
 - “sniffing position”: flexion of lower C-spine (C5-C6), bow head forward, and extension of upper C-spine at atlanto-occipital joint (C1), nose in the air
 - contraindicated in known/suspected C-spine fracture/instability
- proper position for laryngoscope tip to visualize cords is in epiglottic vallecula

Figure 5. Sagittal view of airway with laryngoscope in vallecula

Tube Insertion

- ETT insertion can incite a significant sympathetic response due to a “foreign body reflex” in the trachea, including tachycardia, dysrhythmias, myocardial ischemia, increased BP, and coughing
- a malpositioned ETT is a potential hazard for the intubated patient
 - if too deep, may result in right endobronchial intubation, which is associated with left-sided atelectasis and right-sided tension pneumothorax
 - if too shallow, may lead to accidental extubation, vocal cord trauma, or laryngeal paralysis as a result of pressure injury by the ETT cuff
- the tip of ETT should be located at the midpoint of the trachea at least 2 cm above the carina and the proximal end of the cuff should be placed at least 2 cm below the vocal cords
 - approximately 20-23 cm mark at the right corner of the mouth for men and 19-21 cm for women

Confirmation of Tracheal Placement of ETT

- direct
 - visualization of ETT passing through cords
 - bronchoscopic visualization of ETT in trachea
- indirect
 - ET_{CO2} in exhaled gas measured by capnography
 - auscultate for equal breath sounds bilaterally and absent breath sounds over epigastrium
 - bilateral chest movement, condensation of water vapor in ETT visible during exhalation and no abdominal distention
 - refilling of reservoir bag during exhalation
 - CXR (rarely done): ETT tip at midpoint of thoracic inlet and carina (lateral CXR more sensitive and specific)
- esophageal intubation suspected when
 - ET_{CO2} zero or near zero on capnograph
 - abnormal sounds during assisted ventilation
 - impairment of chest excursion
 - hypoxia/cyanosis
 - presence of gastric contents in ETT
 - distention of stomach/epigastrium with ventilation

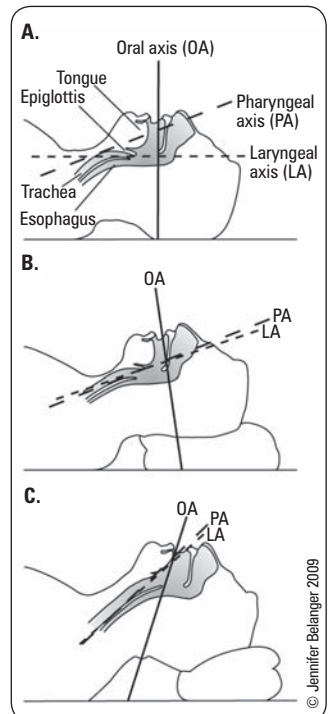

Figure 4. Anatomic considerations in laryngoscopy

- A. Neutral position
- B. C-spine flexion
- C. C-spine flexion with atlanto-occipital extension

Equipment for Intubation

MDSOLES

Monitors
Drugs
Suction
Oxygen source and self-inflating bag with oropharyngeal and nasopharyngeal airways
Laryngoscope
Endotracheal tubes (appropriate size and one size smaller)
Stylet, Syringe for tube cuff inflation

Medications that can be Given Through the ETT

NAVEL

Naloxone
Atropine
Ventolin
Epinephrine
Lidocaine

Complications During Laryngoscopy and Intubation

- dental damage
- laceration (lips, gums, tongue, pharynx, esophagus)
- laryngeal trauma
- esophageal or endobronchial intubation
- accidental extubation
- insufficient cuff inflation or cuff laceration: results in leaking and aspiration
- laryngospasm (see *Extubation*, A18 for definition)
- bronchospasm

Differential Diagnosis of Poor Bilateral Breath Sounds after Intubation

DOPE

Displaced ETT
Obstruction
Pneumothorax
Esophageal intubation

Predicting Difficult Intubation in Apparently Normal Patients

Anesth 2005;103:429-437

Purpose: To assess widely available bedside tests and widely used laryngoscopic techniques in the prediction of difficult intubations.

Study: Meta-analysis.

Patients: 35 studies encompassing 50,760 patients.

Definitions: Difficult intubation was defined usually as Cormack-Lehane grade of 3 or greater, but some authors reported the requirement of a special technique, multiple unsuccessful attempts, or a combination of these as the accepted standard for difficult intubation.

Results: The overall incidence of difficult intubation was 5.8% (95% CI 4.5-7.5%) for the overall patient population, 6.2% (95% CI 4.6-8.3%) for normal patients excluding obstetric and obese patients, 3.1% (95% CI 1.7-5.5%) for obstetric patients, and 15.8% (95% CI 14.3-17.5%) for obese patients.

Mallampati score: SN:49% SP:86% PLR:3.7
NLR:0.5; thyromental distance: SN:20% SP:94% PLR:3.4 NLR:0.8; sternomental distance: SN:62% SP:82% PLR:5.7 NLR:0.5; mouth opening: SN:22% SP:97% PLR: 4.0 NLR:0.8; Wilson risk-sum: SN:46% SP:89% PLR:5.8 NLR:0.6; combination Mallampati and thyromental distance: SN:36% SP:87% PLR:9.9 NLR:0.6.

Conclusions: A combination of the Mallampati score and thyromental distance is the most accurate at predicting difficult intubation. The PLR (9.9) is supportive of the test as a good predictor of difficult intubation.

PLR: positive likelihood ratio; **NLR:** negative likelihood ratio; **SN:** sensitivity; **SP:** specificity

Difficult Airway

- difficulties with bag-mask ventilation, supraglottic airway, endotracheal intubation, infraglottic airway or surgical airway
- algorithms exist for difficult airways (*Can J Anesth* 2013;60:1119-1138; *Anesth* 2003;98:3273; *Anesth* 2013;118:251-270), see *Figures 14 and 15*, A30, A31
- pre-operative assessment (history of previous difficult airway, airway examination) and pre-oxygenation are important preventative measures
- if difficult airway expected, consider
 - awake intubation
 - intubating with bronchoscope, trachlight (lighted stylet), fiber optic laryngoscope, glidescope, etc.
- if intubation unsuccessful after induction
 1. CALL FOR HELP
 2. ventilate with 100% O₂ via bag and mask
 3. consider returning to spontaneous ventilation and/or waking patient
- if bag and mask ventilation inadequate
 1. CALL FOR HELP
 2. attempt ventilation with oral airway
 3. consider/attempt LMA
 4. emergency invasive airway access (e.g. rigid bronchoscope, cricothyrotomy, or tracheostomy)

Oxygen Therapy

- in general, the goal of oxygen therapy is to maintain arterial oxygen saturation (SaO₂) >90%
- small decrease in saturation below SaO₂ of 90% corresponds to a large drop in arterial partial pressure of oxygen (PaO₂)
- in intubated patients, oxygen is delivered via the ETT
- in patients not intubated, there are many oxygen delivery systems available; the choice depends on oxygen requirements (FiO₂) and the degree to which precise control of delivery is needed
- cyanosis can be detected at SaO₂ <85%, frank cyanosis at SaO₂ = 67%

Low Flow Systems

- acceptable if tidal volume 300-700 mL, respiratory rate (RR) <25, consistent ventilation pattern
- provide O₂ at flows between 0-10 L/min
- dilution of oxygen with room air results in a decrease in FiO₂
- an increase in minute ventilation (tidal volume x RR) results in a decrease in FiO₂
 - e.g. nasal cannula (prong)
 - well tolerated if flow rates <5-6 L/min; drying of nasal mucosa at higher flows
 - nasopharynx acts as an anatomic reservoir that collects O₂
 - delivered oxygen concentration (FiO₂) can be estimated by adding 4% for every additional liter of O₂ delivered
 - provides FiO₂ of 24-44% at O₂ flow rates of 1-6 L/min

Reservoir Systems

- use a volume reservoir to accumulate oxygen during exhalation thus increasing the amount of oxygen available for the next breath
- simple face mask
 - covers patient's nose and mouth and provides an additional reservoir beyond nasopharynx
 - fed by small bore O₂ tubing at a rate of at least 6 L/min to ensure that exhaled CO₂ is flushed through the exhalation ports and not rebreathed
 - provides FiO₂ of 55% at O₂ flow rates of 10 L/min
- non-rebreather mask
 - a reservoir bag and a series of one-way valves prevent expired gases from re-entering the bag
 - during the exhalation phase, the bag accumulates with oxygen
 - provides FiO₂ of 80% at O₂ flow rates of 10-15 L/min

Figure 6. HbO₂ saturation curve

Composition of Air

78.1% nitrogen
20.9% oxygen
0.9% argon
0.04% carbon dioxide

High Flow Systems

- generate flows of up to 50-60 L/min
- meet/exceed patient's inspiratory flow requirement
- deliver consistent and predictable concentration of O₂
- Venturi mask
 - delivers specific FiO₂ by varying the size of air entrainment
 - oxygen concentration determined by mask's port and NOT the wall flow rate
 - enables control of gas humidity
 - FiO₂ ranges from 24-50%

Changes in peak pressures in ACV and tidal volumes in PCV may reflect changes in lung compliance and/or airway resistance – patient may be getting better or worse

Positive End Expiratory Pressure (PEEP)

- Positive pressure applied at the end of ventilation that opens up collapsed alveoli decreasing V/Q mismatch
- Used with all invasive modes of ventilation

Tracheostomy

- Tracheostomy should be considered in patients who require ventilator support for extended periods of time
- Shown to improve patient comfort and give patients a better ability to participate in rehabilitation activities

Monitoring Ventilatory Therapy

- Pulse oximetry, end-tidal CO₂ concentration
- Regular arterial blood gases
- Assess tolerance regularly

Management of pneumothorax in patients on mechanical ventilation → chest tube

Causes of Intraoperative Hypoxia

Inadequate oxygen supply: e.g. breathing system disconnection, obstructed or malpositioned ETT, leaks in the anesthetic machine, loss of oxygen supply

Hypoventilation

Ventilation-perfusion inequalities: e.g. atelectasis, pneumonia, pulmonary edema, pneumothorax

Reduction in oxygen carrying capacity: e.g. anemia, carbon monoxide poisoning, methemoglobinemia, hemoglobinopathy

Leftward shift of the hemoglobin-oxygen saturation curve: e.g. hypothermia, decreased 2,3-BPG, alkalosis, hypocarbia, carbon monoxide poisoning

Right-to-left cardiac shunt

Ventilation

- ventilation is maintained with PPV in patients given muscle relaxants
- assisted or controlled ventilation can also be used to assist spontaneous respirations in patients not given muscle relaxants as an artificial means of supporting ventilation and oxygenation

Mechanical Ventilation

- indications for mechanical ventilation
 - apnea
 - hypoventilation/acute respiratory acidosis
 - intraoperative positioning limiting respiratory excursion (e.g. prone, Trendelenburg)
 - required hyperventilation (to lower ICP)
 - deliver positive end expiratory pressure (PEEP)
 - increased intrathoracic pressure (e.g. laparoscopic procedure)
- complications of mechanical ventilation
 - airway complications
 - ♦ tracheal stenosis, laryngeal edema
 - ♦ alveolar complications
 - ♦ ventilator-induced lung injury, ventilator-associated pneumonia (nosocomial pneumonia), barotrauma, volutrauma, inflammation, auto-PEEP, patient-ventilator asynchrony
 - cardiovascular complications
 - ♦ reduced venous return (secondary to increased intrathoracic pressure), reduced cardiac output, hypotension
 - neuromuscular complications
 - ♦ muscle atrophy
 - ♦ increased intracranial pressure
 - metabolic
 - ♦ decreased CO₂ due to hyperventilation
 - ♦ alkalemia with over correction of chronic hypercarbia

Ventilator Strategies

- mode and settings are determined based on patient factors (e.g. ideal body weight, compliance, resistance) and underlying reason for mechanical ventilation
- hypoxemic respiratory failure: ventilator provides supplemental oxygen, recruits atelectatic lung segments, helps improve V/Q mismatch, and decreases intrapulmonary shunt
- hypercapnic respiratory failure: ventilator augments alveolar ventilation; may decrease the work of breathing, allowing respiratory muscles to rest

Modes of Ventilation

- assist-control ventilation (ACV)
 - every breath is delivered with a pre-set tidal volume and rate or minute ventilation
 - extra controlled breaths may be triggered by patient effort; if no effort is detected within a specified amount of time the ventilator will initiate the breath
- pressure control ventilation (PCV)
 - a minimum frequency is set and patient may trigger additional breaths above the ventilator
 - all breaths delivered at a preset constant inspiratory pressure
- synchronous intermittent mandatory ventilation (SIMV)
 - ventilator provides controlled breaths (either at a set volume or pressure)
 - patient can breathe spontaneously (these breaths may be pressure supported) between controlled breaths
- pressure support ventilation (PSV)
 - patient initiates all breaths and the ventilator supports each breath with a pre-set inspiratory pressure
 - useful for weaning off ventilator
- high-frequency oscillatory ventilation (HFOV)
 - high breathing rate (up to 900 breaths/min in an adult), very low tidal volumes
 - used commonly in neonatal and pediatric respiratory failure
 - used in adults when conventional mechanical ventilation is failing

- non-invasive positive pressure ventilation (NPPV)
 - achieved without intubation by using a nasal or face mask with
 - ♦ BiPAP: increased pressure (like PSV) on inspiration and lower constant pressure on expiration
 - ♦ CPAP: delivers constant pressure on both inspiration and expiration

Table 3. Causes of Abnormal CO₂ Levels

Hypocapnea (Decreased CO ₂)	Hypercapnea (Increased CO ₂)
Hyperventilation	Hypoventilation
Hypothermia (decreased metabolic rate)	Hyperthermia
Decreased pulmonary blood flow (decreased cardiac output)	Improved pulmonary blood flow after resuscitation or hypotension
Technical issues: Incorrect placement of sampling catheter Inadequate sampling volume	Technical issues: Water in capnography device Anesthetic breathing circuit error <ul style="list-style-type: none"> • Inadequate fresh gas flow • Rebreathing • Exhausted soda lime • Faulty circuit absorber valves
V/Q mismatch <ul style="list-style-type: none"> • Pulmonary thromboembolism • Incipient pulmonary edema • Air embolism 	Low bicarbonate

A Comparison of Four Methods of Weaning Patients from Mechanical Ventilation

NEJM 1995;332:345-350

Study: Prospective, randomized, multicenter trial.
Participants: 130 of 546 patients who received mechanical ventilation and were considered ready for weaning but had respiratory distress during a 2 h trial of spontaneous breathing.

Intervention: One of four weaning techniques following standardized protocol.

Outcome: Median duration of weaning.

Results: The median duration of weaning for intermittent mandatory ventilation, pressure-support ventilation, intermittent (multiple) trials of spontaneous breathing, and once-daily trial of spontaneous breathing was 5 d, 4 d, and 3 d, respectively. The rate of successful weaning was higher with once-daily trial of spontaneous breathing than with intermittent mandatory ventilation (rate ratio 2.83; 95%CI 1.36-5.89; $p < 0.006$) or pressure-support ventilation (ratio 2.05; 95%CI 1.04-4.04; $p < 0.04$). There was no significant difference in the rate of success between once-daily trials and multiple trials of spontaneous breathing.

Conclusions: Once-daily or multiple trials of spontaneous breathing led to extubation more quickly than intermittent mandatory or pressure-support ventilation.

Impact of Hypothermia (<36°C)

- **Increased** risk of wound infections due to impaired immune function
- **Increases** the period of hospitalization by delaying healing
- **Reduces** platelet function and impairs activation of coagulation cascade **increasing** blood loss and transfusion requirements
- **Tripled** the incidence of VT and morbid cardiac events
- **Decreases** the metabolism of anesthetic agents prolonging post-operative recovery

Intraoperative Monitoring

Temperature

Causes of Hypothermia (<36.0°C)

- intraoperative temperature losses are common (e.g. 90% of intraoperative heat loss is transcutaneous), due to:
 - OR environment (cold room, IV fluids, instruments)
 - open wound
- prevent with inflated warming blanket and warmed IV fluids

Causes of Hyperthermia (>37.5-38.3°C)

- drugs (e.g. atropine)
- blood transfusion reaction
- infection/sepsis
- medical disorder (e.g. thyrotoxicosis)
- malignant hyperthermia (see *Uncommon Complications*, A26)
- over-zealous warming efforts

Heart Rate

Intraoperative Tachycardia

- tachycardia = HR >150 bpm; divided into narrow complex supraventricular tachycardias (SVT) or wide complex tachycardias
- SVT: sinus tachycardia, atrial fibrillation/flutter, accessory pathway mediated tachycardia, paroxysmal atrial tachycardia
- wide complex tachycardia: VT, SVT with aberrant conduction
- causes of sinus tachycardia:
 - shock/hypovolemia/blood loss
 - anxiety/pain/light anesthesia
 - full bladder
 - anemia
 - febrile illness/sepsis
 - drugs (e.g. atropine, cocaine, dopamine, epinephrine, ephedrine, isoflurane, isoproterenol, pancuronium)
 - Addisonian crisis, hypoglycemia, transfusion reaction, malignant hyperthermia
- for management of tachycardia, see *ACLS Guidelines* (Figure 16), A32

Intraoperative Bradycardia

- bradycardia = HR <50 bpm; most concerning are 2nd degree (Type 2 Mobitz) and 3rd degree heart block, which can both degenerate into asystole
- causes of sinus bradycardia
 - increased parasympathetic tone vs. decreased sympathetic tone
 - must rule out hypoxemia
 - arrhythmias (see [Cardiology and Cardiac Surgery, C15](#))
 - baroreceptor reflex due to increased ICP or increased BP
 - vagal reflex (oculocardiac reflex, carotid sinus reflex, airway manipulation)
 - drugs (e.g. SCH, opioids, edrophonium, neostigmine, halothane, digoxin, β -blockers)
 - high spinal/epidural anesthesia
- for management of bradycardia, see [ACLS Guidelines \(Figure 16\)](#), A32

Cardiac Arrest

- pulseless arrest occurs due to 4 cardiac rhythms divided into shockable and non-shockable rhythms
 - shockable: ventricular fibrillation (VF) and ventricular tachycardia (VT)
 - non-shockable: asystole and pulseless electrical activity (PEA)
- for VF/VT, key to survival is good early CPR and defibrillation
- for asystole/PEA, key to survival is good early CPR and exclude all reversible causes
- reversible causes of PEA arrest (5 Hs and 5 Ts)
 - 5 Hs: hypothermia, hypovolemia, hypoxia, hydrogen ions (acidosis), hypo/hyperkalemia
 - 5 Ts: tamponade (cardiac), thrombosis (pulmonary), thrombosis (coronary), tension pneumothorax, toxins (overdose/poisoning)
- for management of cardiac arrest, see [ACLS Guidelines \(Figure 16\)](#), A32

Blood Pressure

Table 4. Assessment of Hemorrhagic Shock

	Class I	Class II	Class III	Class IV
Percentage Blood Loss	0-15%	15-30%	30-40%	> 40%
Percentage TBW Loss	0-3%	3-6%	6-9%	> 9%
Heart Rate	<100	>100	>120	>140
Blood Pressure	Normal	Normal	Decreased	Decreased
Treatment	Rapid infusion of 1-2 L of crystalloid (e.g. Ringer's lactate), maintenance fluids	Rapid infusion of 2 L of crystalloid and re-evaluate	Rapid infusion of 2 L of crystalloid, replace losses with crystalloid (1:3) or pRBCs, colloid (1:1)	Rapid infusion of 2 L of crystalloid, replace losses with crystalloid (1:3) or pRBCs, colloid (1:1)
Note			Goal is to maintain urine output at >0.5 mL/kg/h	Goal is to maintain urine output at >0.5 mL/kg/h

Causes of Intraoperative Hypotension/Shock

- shock: condition characterized by inability of cardiovascular system to maintain adequate end-organ perfusion
- a) hypovolemic/hemorrhagic shock
 - most common form of shock, due to decrease in intravascular volume
- b) obstructive shock
 - obstruction of blood into or out of the heart
 - increased JVP, distended neck veins, increased systemic vascular resistance, insufficient cardiac output (CO)
 - e.g. tension pneumothorax, cardiac tamponade, pulmonary embolism
- c) cardiogenic shock
 - myocardial dysfunction
 - increased JVP, distended neck veins, increased systemic vascular resistance, decreased CO
 - e.g. dysrhythmias, ischemia/infarct, cardiomyopathy, acute valvular dysfunction
- d) septic shock
 - see [Infectious Diseases, ID22](#)
 - bacterial, viral, fungal, endotoxins/mediators cause vasodilation and capillary leakage
 - associated with contamination of open wounds, intestinal injury or penetrating trauma
 - signs: fever, decreased JVP, wide pulse pressure, increased CO, increased HR, decreased systemic vascular resistance \pm pressors
 - initial treatment: antibiotics, volume expansion
- e) spinal/neurogenic shock
 - decreased sympathetic tone
 - hypotension without tachycardia or peripheral vasoconstriction (warm skin)

Intraoperative Shock

SHOCKED

Sepsis or Spinal shock
Hypovolemic/Hemorrhagic
Obstructive
Cardiogenic
anaphylactic
Extra/other
Drugs

BP = CO x SVR, where CO = SV x HR

SV is a function of preload, afterload, and contractility

f) anaphylactic shock

- see [Emergency Medicine, ER30](#)
- acute/subacute generalized allergic reaction due to an inappropriate or excessive immune response (type I hypersensitivity)
- treatment of anaphylactic shock
 - ♦ moderate reaction: generalized urticaria, angioedema, wheezing, tachycardia
 - epinephrine (1:1000) 0.3-0.5 mg SC
 - antihistamines: diphenhydramine (Benadryl®) 25-50 mg IM
 - salbutamol (Ventolin®) 1 cc via MDI
 - ♦ severe reaction/evolution: severe wheezing, laryngeal/pulmonary edema, shock
 - ABCs, may need ETT due to airway edema
 - epinephrine (1:1000) 0.1-0.3 mg IV (or via ETT if no IV access) to start, repeat as needed
 - antihistamines: diphenhydramine (Benadryl®) 50 mg IV (~1 mg/kg)
 - steroids: hydrocortisone 100 mg IV (~1.5 mg/kg) or methylprednisolone (Solumedrol®) 1 mg/kg IV q6h x 24 h
 - large volumes of crystalloid may be required

g) drugs

- vasodilators, high spinal anesthetic interfering with sympathetic outflow

h) other

- transfusion reaction, Addisonian crisis, thyrotoxicosis, hypothyroid, aortocaval syndrome
- see [Hematology, H54](#) and [Endocrinology, E35, E22, E26](#)

**Causes of Intraoperative HTN**

- inadequate anesthesia causing pain and anxiety
- pre-existing HTN, coarctation or preeclampsia
- hypoxemia/hypercarbia
- hypervolemia
- drugs (e.g. ephedrine, epinephrine, cocaine, phenylephrine, ketamine)
- allergic/anaphylactic reaction
- hypermetabolic states: malignant hyperthermia, neuroleptic malignant syndrome, thyroid storm, pheochromocytoma (see [Endocrinology, E25, E36](#))

Fluid Balance and Resuscitation

- total requirement = maintenance + deficit + ongoing loss
- in surgical settings this formula must take into account multiple factors including pre-operative fasting/decreased fluid intake, increased losses during or before surgery, fluid shifting during surgery, fluids given with blood products and medications

What is the Maintenance?

- average healthy adult requires approximately 2500 mL water/d
 - 200 mL/d GI losses
 - 800 mL/d insensible losses (respiration, perspiration)
 - 1500 mL/d urine (beware of renal failure)
- 4:2:1 rule to calculate maintenance requirements (applies to crystalloids only)
 - 4 mL/kg/h first 10 kg
 - 2 mL/kg/h second 10 kg
 - 1 mL/kg/h for remaining weight >20 kg
- increased requirements with fever, sweating, GI losses (vomiting, diarrhea, NG suction), adrenal insufficiency, hyperventilation, and polyuric renal disease
- decreased requirements with anuria/oliguria, SIADH, highly humidified atmospheres, and CHF
- maintenance electrolytes
 - Na⁺: 3 mEq/kg/d
 - K⁺: 1 mEq/kg/d
- 50 kg patient maintenance requirements
 - fluid = 40 + 20 + 30 = 90 mL/h = 2160 mL/d = 2.16 L/d
 - Na⁺ = 150 mEq/d (therefore 150 mEq / 2.16 L/d ≈ 69 mEq/L)
 - K⁺ = 50 mEq/d (therefore 50 mEq / 2.16 L/d ≈ 23 mEq/L)
- above patient's requirements roughly met with 2/3 D5W, 1/3 NS
 - 2/3 + 1/3 at 100 mL/h with 20 mEq KCl per liter

What is the Deficit?

- patients should be adequately hydrated prior to anesthesia
- total body water (TBW) = 60% or 50% of total body weight for an adult male or female, respectively (e.g. for a 70 kg adult male TBW = 70 x 0.6 = 42 L)
- total Na⁺ content determines ECF volume; [Na⁺] determines ICF volume

- hypovolemia due to volume contraction
 - extra-renal Na^+ loss
 - ♦ GI: vomiting, NG suction, drainage, fistulae, diarrhea
 - ♦ skin/resp: insensible losses (fever), sweating, burns
 - ♦ vascular: hemorrhage
 - renal Na^+ and H_2O loss
 - ♦ diuretics
 - ♦ osmotic diuresis
 - ♦ hypoaldosteronism
 - ♦ salt-wasting nephropathies
 - renal H_2O loss
 - ♦ diabetes insipidus (central or nephrogenic)
 - hypovolemia with normal or expanded ECF volume
 - ♦ decreased CO
 - ♦ redistribution
 - hypoalbuminemia: cirrhosis, nephrotic syndrome
 - capillary leakage: acute pancreatitis, rhabdomyolysis, ischemic bowel, sepsis, anaphylaxis
- replace water and electrolytes as determined by patient's needs
- with chronic hyponatremia, correction must be done gradually over >48 h to avoid central pontine myelinolysis

Table 5. Signs and Symptoms of Dehydration

Percentage of Body Water Loss	Severity	Signs and Symptoms
3%	Mild	Decreased skin turgor, sunken eyes, dry mucous membranes, dry tongue, reduced sweating
6%	Moderate	Oliguria, orthostatic hypotension, tachycardia, low volume pulse, cool extremities, reduced filling of peripheral veins and CVP, hemoconcentration, apathy
9%	Severe	Profound oliguria or anuria and compromised CNS function with or without altered sensorium

What are the Ongoing Losses?

- tubes
 - Foley catheter, NG, surgical drains
- third-spacing (other than ECF, ICF)
 - pleura, GI, retroperitoneal, peritoneal
 - evaporation via exposed viscera, burns
- blood loss
- ongoing loss due to surgical exposure and evaporative losses

IV Fluids

- replacement fluids include crystalloid and colloid solutions
- IV fluids improve perfusion but NOT O_2 carrying capacity of blood

Initial Distribution of IV Fluids

- H_2O follows ions/molecules to their respective compartments

Crystalloid Infusion

- salt-containing solutions that distribute within ECF
- maintain euolemia in patient with blood loss: 3 mL crystalloid infusion per 1 mL of blood loss for volume replacement (i.e. 3:1 replacement)
- if large volumes are to be given, use balanced fluids such as Ringer's lactate or Plasmalyte®, as too much normal saline (NS) may lead to hyperchloremic metabolic acidosis

Colloid Infusion

- includes protein colloids (albumin and gelatin solutions) and non-protein colloids (dextrans and starches e.g. hydroxyethyl starch [HES])
- distributes within intravascular volume
- 1:1 ratio (infusion: blood loss) only in terms of replacing intravascular volume
- HES colloids remain in intravascular space (metabolized by plasma serum amylase and renally excreted)
- the use of HES solutions is controversial because of recent RCTs and meta-analyses highlighting their renal and coagulopathic side effects, as well as a lack of specific indications for their use
 - colloids are being used based on mechanistic and experimental evidence but there is a paucity of definitive studies investigating their safety and efficacy; routine use of colloids should be avoided

**Figure 7. Total body water division in a 70 kg adult****Colloids vs. Crystalloids for Fluid Resuscitation in Critically Ill Patients**

Cochrane DB Syst Rev 2012;6:CD000567

Purpose: To evaluate the effects of colloids compared to crystalloids for fluid resuscitation, specifically when used in critically ill patients.

Methods: A meta-analysis was performed looking at randomized controlled trials comparing colloid vs. crystalloid use in patients requiring volume replacement. Pregnant women and neonates were excluded. Primary outcome was overall mortality.

Results: Results were broken down based on specific colloid. For albumin (or plasma protein fraction) the relative risk (RR) was 1.01 (95% CI 0.93-1.10) as compared to crystalloid. For hydroxyethyl starch the RR was 1.10 (95% CI 0.91-1.32). Modified gelatin had a RR of 0.91 (95% CI 0.49-1.72) and Dextran had a RR of 1.24 (95% CI 0.94-1.65). For colloids mixed in a hypertonic crystalloid as compared to isotonic crystalloid the RR was 0.88 (91% CI 0.71-1.06).

Conclusions: There is no evidence that use of colloids improves survival in trauma patients, burn patients, or post-operative patients when compared to crystalloid solutions. Given the increased cost of colloids as compared to crystalloids, it is recommended that crystalloids be the fluid of choice in these patients.

Table 6. IV Fluid Solutions

	ECF	Ringer's Lactate	0.9% NS	0.45% NS in D5W	D5W	2/3 D5W + 1/3 NS	Plasmalyte
mEq/L							
Na ⁺	142	130	154	77	-	51	140
K ⁺	4	4	-	-	-	-	5
Ca ²⁺	4	3	-	-	-	-	-
Mg ²⁺	3	-	-	-	-	-	3
Cl ⁻	103	109	154	77	-	51	98
HCO ₃ ⁻	27	28*	-	-	-	-	27
mOsm/L	280-310	273	308	154	252	269	294
pH	7.4	6.5	5.0	4.5	4.0	4.3	7.4

*Converted from lactate

Table 7. Colloid HES Solutions

	Concentration	Plasma Volume Expansion	Duration (h)	Maximum Daily Dose (mL/kg)
Hespan®	6%	1:1	4-6	33-50
Pentaspán®	10%	1:1.2-1.5	18-24	28

Blood Products

- see [Hematology, H52](#)

Red Blood Cells (RBCs)

- 1U RBCs (approx. 300 ml) increases Hb by 10 g/L in a 70 kg patient
- RBCs may be diluted with colloid/crystalloid to decrease viscosity
- decision to transfuse based on initial blood volume, premonitory Hb level, present volume status, expected further blood loss, patient health status, patient consent
- massive transfusion $\geq 1 \times$ blood volume/24 h

Autologous RBCs

- replacement of blood volume with one's own RBCs
- may decrease complications (infectious, febrile, etc.)
- alternative to homologous transfusion in elective procedures, but only if adequate Hb and no infection
- pre-operative phlebotomy prior to elective surgery (up to 3U collected 3-5 wk before surgery)
- intraoperative salvage and filtration (cell saver); contraindicated in contaminated (e.g. bowel, abscess) or cancer cases

Non-RBC Products

- fresh frozen plasma (FFP)
 - contains all plasma clotting factors and fibrinogen close to normal plasma levels
 - to prevent/treat bleeding due to coagulation factor depletion/deficiencies, liver impairment
- cryoprecipitate
 - contains Factors VIII and XIII, von Willebrand Factor (vWF), fibrinogen
- platelets
 - used in thrombocytopenia, massive transfusions, impaired platelet function
- albumin
 - selective intravascular volume expander
- erythropoietin
 - can be used pre-operatively to stimulate erythropoiesis

Complications Due to Transfusion

- infectious risks: HIV, hepatitis B/C, Epstein-Barr virus (EBV), cytomegalovirus (CMV), brucellosis, malaria, salmonellosis, measles, syphilis
- hypervolemia
- electrolyte changes: increased K⁺ in stored blood
- dilutional coagulopathy
- dilutional thrombocytopenia
- hypothermia
- citrate toxicity
- hypocalcemia
- iron overload
- transfusion-related immunosuppression: perioperative transfusion may be associated with increased risk of post-operative infection, increased short-term mortality and possible cancer recurrence
- see [Hematology, H54](#) for list of transfusion reactions

Calculating Acceptable Blood Losses (ABL)

- Blood volume
 - term infant 80 mL/kg
 - adult male 70 mL/kg
 - adult female 60 mL/kg
- Calculate estimated blood volume (EBV) (e.g. in a 70 kg male, approx. 70 mL/kg)

$$EBV = 70 \text{ kg} \times 70 \text{ mL/kg} = 4900 \text{ mL}$$
- Decide on a transfusion trigger, i.e. the Hb level at which you would begin transfusion, (e.g. 70 g/L for a person with Hb(i) = 150 g/L)

$$Hb(f) = 70 \text{ g/L}$$
- Calculate

$$ABL = \frac{Hct(Hi) - Hct(Hf)}{Hct(Hi)} \times EBV$$

$$= \frac{150 - 70}{150} \times 4900$$

$$= 2613 \text{ mL}$$
- Therefore in order to keep the Hb level above 70 g/L, RBCs would have to be given after approximately 2.6 L of blood has been lost

Transfusion Infection Risks

Virus	Risk per 1 unit pRBCs
HIV	1 in 8-12 million
Hepatitis C virus	1 in 5-7 million
Hepatitis B virus	1 in 1.1-1.7 million
HTLV	1 in 1-1.3 million
Syphilis	<1 in 100 million
West Nile virus	No cases since 2003

Transfusion and risk of infection in Canada: Update 2012. *Paediatr Child Health* 2012;17:e102-e111

A Multicenter, Randomized, Controlled Clinical Trial of Transfusion Requirements in Critical Care

NEJM 1999;340:409-417

Purpose: To determine whether a restrictive strategy of RBC transfusion and a liberal strategy produce equivalent results in critically ill patients.

Study: Randomized controlled trial with 60 d follow-up.

Patients: 838 critically ill patients with euvoolemia after initial treatment who had Hb concentrations of <90 g/L within 72 h after admission to the ICU. Mean age 57.5 yr, 62.5% male.

Intervention: Patients were randomly assigned to either a restrictive strategy of transfusion, in which RBCs were transfused if the Hb dropped <70 g/L and Hb concentrations were maintained between 70-90 g/L, or to a liberal strategy, in which transfusions were given when the Hb dropped <100 g/L and Hb concentrations were maintained between 100-120 g/L.

Main Outcomes: All cause mortality rates at 30 d and 60 d, mortality rates during the stay in ICU and hospitalization, survival times during the first 30 d, and rates of organ failure and dysfunction.

Results: Overall, 30 d mortality was similar in the two groups. However, the rates were significantly lower with the restrictive transfusion strategy among patients who were less acutely ill (8.7% vs. 16.1%) and who were less than 55 yr of age (5.7% vs. 13%), but not among patients with clinically significant cardiac disease. The mortality rate during hospitalization was significantly lower in the restrictive strategy group (22.2% vs. 28.1%).

Conclusions: With the possible exception of patients with acute MI and unstable angina, a restrictive strategy of RBC transfusion is as effective as, and possibly superior to, a liberal transfusion strategy in critically ill patients.

Types of Anesthesia

- **general**
 - general anesthesia (GA)
 - total IV anesthesia (TIVA)
- **regional**
 - spinal, epidural
 - peripheral nerve block
 - IV regional
- **local**
 - local infiltration
 - topical
- **sedation**
 - monitored anesthesia care
 - note that different types of anesthesia can be combined (general + regional)

General Anesthesia

- induction, maintenance and extubation

6 As of General Anesthesia
Anesthesia
Anxiolysis
Amnesia
Areflexia (muscle relaxation not always required)
Autonomic stability
Analgesia

Induction

Routine Induction vs. Rapid Sequence Induction

- routine induction is the standard in general anesthesia, however a RSI is indicated in patients at risk of regurgitation/aspiration (see *Aspiration, A5*)
- RSI uses pre-determined doses of induction drugs given at set times

Table 8. Comparison of Routine Induction vs. RSI

Steps	Routine Induction	RSI
1. Equipment Preparation	Check equipment, drugs, suction, and monitors; prepare an alternative laryngoscope blade and a second ETT tube one size smaller	
2. Pre-Oxygenation/Denitrogenation	100% O ₂ for 3 min or 4 vital capacity breaths	
3. Pre-Treatment Agents	Use agent of choice to blunt physiologic responses to airway manipulation 3 min prior to laryngoscopy	Use agent of choice to blunt physiologic responses to airway manipulation; if possible, give 3 min prior to laryngoscopy, but can skip this step in an emergent situation
4. Induction Agents	Use IV or inhalation induction agent of choice	Use pre-determined dose of fast acting induction agent of choice
5. Muscle Relaxants	Muscle relaxant of choice given after the onset of the induction agent	Pre-determined dose of fast acting muscle relaxant (e.g. SCH) given IMMEDIATELY after induction agent
6. Ventilation	Bag-mask ventilation	DO NOT bag ventilate – can increase risk of aspiration
7. Cricoid Pressure	Backwards upwards rightwards pressure (BURP) to assist visualization if indicated	Sellick maneuver, also known as cricoid pressure, to prevent regurgitation and assist in visualization (2 kg pressure with drowsiness, 3 kg with loss of consciousness)
8. Intubation	Intubate, inflate cuff, confirm ETT position	Intubate once paralyzed (~45 s after SCH given), inflate cuff, confirm ETT position; cricoid pressure maintained until ETT cuff inflated and placement confirmed
9. Secure Machines	Secure ETT, and begin manual/ machine ventilation	

Check equipment, drugs, suction, and monitors; prepare an alternative laryngoscope blade and a second ETT tube one size smaller

100% O₂ for 3 min or 4 vital capacity breaths

Secure ETT, and begin manual/ machine ventilation

Induction Agents

- induction in general anesthesia may be achieved with intravenous agents, volatile inhalation agents, or both

Intravenous Agents

- see Table 11, A27
- IV induction agents are non-opioid drugs used to provide amnesia and blunt reflexes
- these are initially used to draw the patient into the maintenance phase of general anesthesia rapidly, smoothly and with little adverse effects
 - examples include propofol, sodium thiopental (not available in North America), or ketamine
 - a continuous propofol infusion may also be used for the maintenance phase of GA

Solubility of Volatile Anesthetics in Blood Least Soluble to Most Soluble
Nitrous oxide < desflurane < sevoflurane < isoflurane < halothane

Volatile Inhalational Agents

- examples include sevoflurane, desflurane, isoflurane, enflurane, halothane, and nitrous oxide
- see Table 14, A28

MAC (Minimum Alveolar Concentration)

- the alveolar concentration of a volatile anesthetic at one atmosphere (atm) of pressure that will prevent movement in 50% of patients in response to a surgical stimulus (e.g. abdominal incision)
- 1.2-1.3 times MAC will often ablate response to stimuli in the general population
- potency of inhalational agents is compared using MAC
- MAC values are roughly additive when mixing N₂O with another volatile agent; however, this only applies to movement, not other effects such as BP changes (e.g. 0.5 MAC of a potent agent + 0.5 MAC of N₂O = 1 MAC of potent agent)
- MAC-intubation: the MAC of anesthetic that will inhibit movement and coughing during endotracheal intubation, generally 1.3 MAC
- MAC-block adrenergic response (MAC-BAR): the MAC necessary to blunt the sympathetic response to noxious stimuli, generally 1.5 MAC
- MAC-awake: the MAC of a given volatile anesthetic at which a patient will open their eyes to command, usually 0.3-0.4 of the usual MAC value

Determinants of Speed of Onset of Volatile Anesthetics

- **Solubility:** decrease solubility → increase rate of induction
- **Cardiac output (CO):** as CO increases, anesthetic uptake to blood increases and alveolar gas concentration decreases, thus delaying induction
- **Partial pressure difference between alveolar and venous blood:** increase gradient → decrease rate of induction
- **Inspired gas concentration:** increase inspired concentration → increase rate of induction
- **Alveolar ventilation:** increase alveolar ventilation → increase rate of induction
- **Second gas effect:** when 2 gases are administered together, uptake of the first gas (e.g. N₂O) increases the alveolar concentration of the second gas (e.g. desflurane), increasing rate of induction

Muscle Relaxants and Reversing Agents

Figure 8. Review of anatomy and physiology of the neuromuscular junction (NMJ)

Muscle Relaxants

- two types of muscle relaxants
 1. depolarizing muscle relaxants: succinylcholine (SCh)
 2. non-depolarizing muscle relaxants: rocuronium, mivacurium, vecuronium, cisatracurium, pancuronium
- see Tables 15 and 16, A29 for more details including mechanism of action
- block nicotinic cholinergic receptors in NMJ
- provides skeletal muscle paralysis, including the diaphragm, but spares involuntary muscles such as the heart and smooth muscle
- never use muscle relaxants without adequate preparation and equipment to maintain airway and ventilation
- muscle relaxation produces the following desired effects
 1. facilitates intubation
 2. assists with mechanical ventilation
 3. prevents muscle stretch reflex and decreases muscle tone
 4. allows access to the surgical field (intracavitary surgery)
- nerve stimulator (i.e. train of four) is used intraoperatively to assess the degree of nerve block; no twitch response seen with complete neuromuscular blockade

Plasma Cholinesterase

Plasma cholinesterase is produced by the liver and metabolizes SCh, ester local anesthetics, and mivacurium. A prolonged duration of blockade by SCh occurs with:

- (a) decreased quantity of plasma cholinesterase, e.g. liver disease, pregnancy, malignancy, malnutrition, collagen vascular disease, hypothyroidism
- (b) abnormal quality of plasma cholinesterase, e.g. normal levels but impaired activity of enzymes, genetically inherited

Reversing Agents

- neostigmine, pyridostigmine, edrophonium (see Table 17, A30)
- reversal agents are acetylcholinesterase inhibitors
 - inhibits enzymatic degradation of ACh; increases amount of ACh at nicotinic and muscarinic receptors, displacing non-depolarizing muscle relaxant
 - administer reversal agents when there has been some recovery of blockade (i.e. muscle twitch)
 - can only reverse the effect of non-depolarizing muscle relaxants
- anticholinergic agents (e.g. atropine, glycopyrrolate) are simultaneously administered to minimize muscarinic effect of reversal agents (i.e. bradycardia, salivation and increased bowel peristalsis)

Analgesia

- options include opioids (e.g. morphine, fentanyl, hydromorphone), NSAIDs, acetaminophen, local, and regional anesthetic (see Table 12, A28)

Maintenance

- general anesthesia is maintained using volatile inhalation agents and/or IV agents (i.e. propofol infusion)
- analgesia (usually IV opioids) and muscle relaxants are also given as needed

Extubation

- criteria
 - patient must no longer have intubation requirements (see Table 2, A7)
 - patency: airway must be patent
 - protection: airway reflexes intact
 - patient must be oxygenating and ventilating spontaneously
- general guidelines
 - ensure patient has normal neuromuscular function (peripheral nerve stimulator monitoring) and hemodynamic status
 - ensure patient is breathing spontaneously with adequate rate and tidal volume
 - allow ventilation (spontaneous or controlled) with 100% O₂ for 3-5 min
 - suction secretions from pharynx
 - deflate cuff, remove ETT on inspiration (vocal cords abducted)
 - ensure patient is breathing adequately after extubation
 - ensure face mask for O₂ delivery available
 - proper positioning of patient during transfer to recovery room (supine, head elevated)

Complications of Extubation

- early extubation
 - aspiration
 - laryngospasm
- late extubation
 - transient vocal cord incompetence
 - edema (glottic, subglottic)
 - pharyngitis, tracheitis

Laryngospasm

- defined as forceful involuntary spasm of laryngeal muscles caused by stimulation of superior laryngeal nerve (by oropharyngeal secretions, blood, extubation)
- causes partial or total airway obstruction
- more likely to occur in semi-conscious patients
- prevention: extubate while patient is still deeply under anesthesia or fully awake
- treatment: bag-mask ventilation with 100% oxygen, low-dose propofol (0.5-1.0 mg/kg) optional, low-dose succinylcholine (0.25-1 mg/kg) and reintubation if hypoxia develops

Regional Anesthesia

- local anesthetic agent (LA) applied around a peripheral nerve at any point along the length of the nerve (from spinal cord up to, but not including, the nerve endings) for the purpose of reducing or preventing impulse transmission
- no CNS depression (unless overdose of local anesthetic); patient remains conscious
- regional anesthetic techniques categorized as follows:
 - epidural and spinal anesthesia (neuraxial anesthesia)
 - peripheral nerve blocks
 - IV regional anesthesia (e.g. Bier block)

Patient Preparation

- sedation may be indicated before block
- monitoring should be as extensive as for general anesthesia

Relative Indications for Regional Anesthesia

- patient preference
- superior postoperative analgesia
- decreased incidence of PONV
- shorter recovery and improved rehabilitation
- general anesthesia not available/contraindicated
- differential blockade (to block pain but preserve motor function)

Complications of Regional Anesthesia

- failure of technique/inadequate anesthesia
- unintentional total spinal anesthesia
- systemic drug toxicity due to overdose or intravascular injection (see *Local Anesthesia, A21*)
- injury to nerve root/spinal cord (nerve deficit), epidural vein (hematoma), peripheral nerve (intra-neural injection)
- infection (e.g. osteitis, epidural abscess, meningitis)

Epidural and Spinal Anesthesia

- most useful for surgeries performed below level of umbilicus

Anatomy of Spinal/Epidural Area

- spinal cord extends to L2, dural sac to S2 in adults
- nerve roots (cauda equina) from L2 to S2
- needle inserted below L2 should not encounter cord, thus L3-L4, L4-L5 interspace commonly used
- structures penetrated
 - skin
 - subcutaneous fat
 - supraspinous ligament
 - interspinous ligament
 - ligamentum flavum (last layer before epidural space)
 - dura + arachnoid for spinal anesthesia

Table 9. Epidural vs. Spinal Anesthesia

	Epidural	Spinal
Deposition Site	LA injected in epidural space (space between ligamentum flavum and dura) Initial blockade is at the spinal roots followed by some degree of spinal cord anesthesia as LA diffuses into the subarachnoid space through the dura	LA injected into subarachnoid space in the dural sac surrounding the spinal cord and nerve roots
Onset	Significant blockade requires 10-15 min Slower onset of side effects	Rapid blockade (onset in 2-5 min)
Effectiveness	Effectiveness of blockade can be variable	Very effective blockade
Difficulty	Technically more difficult; greater failure rate	Easier to perform due to visual confirmation of CSF flow
Patient Positioning	Position of patient not as important; specific gravity not an issue	Hyperbaric LA solution – position of patient important

Benefits of Regional Anesthesia

- Reduced perioperative pulmonary complications
- Reduced perioperative analgesia requirements
- Decreased PONV
- Reduced perioperative blood loss
- Ability to monitor CNS status during procedure
- Improved perfusion
- Lower incidence of VTE

Figure 9. Landmarks for placement of epidural/spinal

Landmarking Epidural/Spinal Anesthesia

Spinous processes should be maximally flexed

L4 spinous processes found between iliac crests

Common sites of insertion are L3-L4 and L4-L5

Table 9. Epidural vs. Spinal Anesthesia (continued)

	Epidural	Spinal
Specific Gravity/Spread	Epidural injections spread throughout the potential space; specific gravity of solution does not affect spread	LA solution may be made hyperbaric (of greater specific gravity than the cerebrospinal fluid by mixing with 10% dextrose, thus increasing spread of LA to the dependent (low) areas of the subarachnoid space)
Dosage	Larger volume/dose of LA (usually > toxic IV dose)	Smaller dose of LA required (usually < toxic IV dose)
Continuous Infusion	Use of catheter allows for continuous infusion or repeat injections	None
Complications	Failure of technique Hypotension Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), e.g. "high spinal" Epidural or subarachnoid hematoma Accidental subarachnoid injection can produce spinal anesthesia (and any of the above complications) Systemic toxicity of LA (accidental intravenous) Catheter complications (shearing, kinking, vascular or subarachnoid placement) Infection Dural puncture	Failure of technique Hypotension Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), e.g. "high spinal" Epidural or subarachnoid hematoma Post-spinal headache (CSF leak) Transient paresthesias Spinal cord trauma, infection
Combined Spinal-Epidural	Combines the benefits of rapid, reliable, intense blockade of spinal anesthesia together with the flexibility of an epidural catheter	

Contraindications to Spinal/Epidural Anesthesia

- absolute contraindications
 - lack of trained personnel
 - lack of resuscitative drugs/equipment
 - patient refusal
 - allergy to local anesthetic
 - infection at puncture site or underlying tissues
 - coagulopathies/bleeding diathesis
 - raised ICP
 - sepsis/bacteremia
 - severe hypovolemia
 - cardiac lesion with fixed output states (e.g. severe mitral/aortic stenosis)
 - lack of IV access
- relative contraindications
 - pre-existing neurological disease (demyelinating lesions)
 - previous spinal surgery, severe spinal deformity
 - prolonged surgery
 - major blood loss or maneuvers that can compromise reaction

Peripheral Nerve Blocks

- deposition of LA around the target nerve or plexus
- ultrasound guidance and peripheral nerve stimulation (needle will stimulate target nerve/plexus) may be used to guide needle to target nerve while avoiding neural trauma or intraneural injection
- approximately 2-4 per 10,000 risk of late neurologic injury
- most major nerves or nerve plexi can be targeted (e.g. brachial plexus block, femoral nerve block, sciatic nerve block, etc.)
- performed with standard monitors
- resuscitation equipment must be available

Contraindications to Peripheral Nerve Blockade

- absolute contraindications
 - allergy to LA
 - patient refusal
- relative contraindications
 - certain types of pre-existing neurological dysfunction (e.g. ALS, MS, diabetic neuropathy)
 - local infection at block site
 - bleeding disorder

**Classic Presentation of Dural Puncture Headache**

- Onset 6 h-3 d after dural puncture
- Postural component (worse sitting)
- Occipital or frontal localization
- ± tinnitus, diplopia

**Reduction of Post-Operative Mortality and Morbidity with Epidural or Spinal Anaesthesia: Results from Overview of Randomized Trials**
BMJ 2000;321:1-12

Purpose: To obtain reliable estimates of the effects of neuraxial blockade with epidural or spinal anesthesia on post-operative morbidity and mortality after various surgeries with or without general anesthesia.

Study: Systematic review of all trials with randomization to intraoperative neuraxial blockade vs. control group.

Patients: 141 trials including 9,559 patients.

Main Outcomes: All cause mortality, MI, PE, DVT, transfusion requirements, pneumonia, other infections, respiratory depression, and renal failure.

Results: With neuraxial blockade, overall mortality was reduced by about one third. Neuraxial blockade reduced the risk of PE by 55%, DVT by 44%, transfusion requirements by 50%, pneumonia by 39%, and respiratory depression by 59%. There were also reductions in MI and renal failure. These mortality reductions are irrespective of surgical group, type of blockade (epidural or spinal), or whether neuraxial blocker was combined with general anesthetic.

Conclusions: Neuraxial blockade reduces post-operative mortality, and other serious complications.

Local Anesthesia

Local Anesthetic Agents

- see Table 18, A30 for list of LA agents

Definition and Mode of Action

- LA are drugs that block the generation and propagation of impulses in excitable tissues: nerves, skeletal muscle, cardiac muscle, brain
- LA bind to receptors on the cytosolic side of the Na⁺ channel, inhibiting Na⁺ flux and thus blocking impulse conduction
- different types of nerve fibers undergo blockade at different rates

Absorption, Distribution, Metabolism

- LA readily crosses the blood-brain barrier (BBB) once absorbed into the bloodstream
- ester-type LA (procaine, tetracaine) are broken down by plasma and hepatic esterases; metabolites excreted via kidneys
- amide-type LA (lidocaine, bupivacaine) are broken down by hepatic mixed-function oxidases (P450 system); metabolites excreted via kidneys

Selection of LA

- choice of LA depends on
 - onset of action: influenced by pKa (the lower the pKa, the higher the concentration of the base form of the LA, and the faster the onset of action)
 - duration of desired effects: influenced by protein binding (longer duration of action when protein binding of LA is strong)
 - potency: influenced by lipid solubility (agents with high lipid solubility penetrate the nerve membrane more easily)
 - unique needs (e.g. sensory blockade with relative preservation of motor function by bupivacaine at low doses)
 - potential for toxicity

Systemic Toxicity

- see Table 18, A30 for maximum doses, potency, and duration of action for common LA agents
- occurs by accidental intravascular injection, LA overdose, or unexpectedly rapid absorption
- CNS effects
 - CNS effects first appear to be excitatory due to initial block of inhibitory fibers, then subsequent block of excitatory fibers
 - effects in order of appearance
 - ♦ numbness of tongue, perioral tingling, metallic taste
 - ♦ disorientation, drowsiness
 - ♦ tinnitus
 - ♦ visual disturbances
 - ♦ muscle twitching, tremors
 - ♦ unconsciousness
 - ♦ convulsions, seizures
 - ♦ generalized CNS depression, coma, respiratory arrest
- CVS effects
 - vasodilation, hypotension
 - decreased myocardial contractility
 - dose-dependent delay in cardiac impulse transmission
 - ♦ prolonged PR, QRS intervals
 - ♦ sinus bradycardia
 - CVS collapse
- treatment of systemic toxicity
 - early recognition of signs, get help
 - 100% O₂, manage ABCs
 - diazepam or sodium thiopental may be used to increase seizure threshold
 - manage arrhythmias (see *ACLS Guidelines*, A32)
 - Intralipid® 20% to bind local anesthetic in circulation

Figure 10. Local anesthetic systemic toxicity

Local Infiltration and Hematoma Blocks

Local Infiltration

- injection of tissue with LA, producing a lack of sensation in the infiltrated area due to LA acting on nerves
- suitable for small incisions, suturing, excising small lesions
- can use fairly large volumes of dilute LA to infiltrate a large area
- low concentrations of epinephrine (1:100,000-1:200,000) cause vasoconstriction, thus reducing bleeding and prolonging the effects of LA by reducing systemic absorption

Fracture Hematoma Block

- special type of local infiltration for pain control during manipulation of certain fractures
- hematoma created by fracture is infiltrated with LA to anesthetize surrounding tissues
- sensory blockade may only be partial
- no muscle relaxation

Where Not to Use LA with Epinephrine
"Ears, Fingers, Toes, Penis, Nose"

Topical Anesthetics

- various preparations of local anesthetics available for topical use, may be a mixture of agents (EMLA cream is a combination of 2.5% lidocaine and prilocaine)
- must be able to penetrate the skin or mucous membrane

Post-Operative Care

- pain management should be continuous from OR to post-anesthetic care unit (PACU) to hospital ward and home

Common Post-Operative Anesthetic Complications

Nausea and Vomiting

- hypotension and bradycardia must be ruled out
- pain and surgical manipulation also cause nausea
- often treated with dimenhydrinate (Gravol®), metoclopramide (Maxeran®; not with bowel obstruction), prochlorperazine (Stemetil®), ondansetron (Zofran®), granisetron (Kytril®)

Confusion and Agitation

- ABCs first – confusion or agitation can be caused by airway obstruction, hypercapnea, hypoxemia
- neurologic status (Glasgow Coma Scale, pupils), residual paralysis from anesthetic
- pain, distended bowel/bladder
- fear/anxiety/separation from caregivers, language barriers
- metabolic disturbance (hypoglycemia, hypercalcemia, hyponatremia – especially post-TURP)
- intracranial cause (stroke, raised intracranial pressure)
- drug effect (ketamine, anticholinergics)
- elderly patients are more susceptible to post-operative delirium

Respiratory Complications

- susceptible to aspiration of gastric contents due to PONV and unreliable airway reflexes
- airway obstruction (secondary to reduced muscle tone from residual anesthetic, soft tissue trauma and edema, or pooled secretions) may lead to inadequate ventilation, hypoxemia, and hypercapnia
- airway obstruction can often be relieved with head tilt, jaw elevation, and anterior displacement of the mandible. If the obstruction is not reversible, a nasal or oral airway may be used

Hypotension

- must be identified and treated quickly to prevent inadequate perfusion and ischemic damage
- reduced cardiac output (hypovolemia, most common cause) and/or peripheral vasodilation (residual anesthetic agent)
- first step in treatment is usually the administration of fluids ± inotropic agents

Hypertension

- pain, hypercapnia, hypoxemia, increased intravascular fluid volume, and sympathomimetic drugs can cause HTN
- sodium nitroprusside or beta-blocking drugs (e.g. esmolol and metoprolol) can be used to treat HTN

Risk Factors for Post-Operative Nausea and Vomiting (PONV)

- Young age
- Female
- History of PONV
- Non-smoker
- Type of surgery: ophtho, ENT, abdo/pelvic, plastics
- Type of anesthetic: N₂O, opioids, volatile agents

Drugs for Preventing Post-Operative Nausea and Vomiting

Cochrane DB Syst Rev 2006;3:CD004125

Purpose: To evaluate the efficacy of antiemetics in preventing PONV.

Methods: A meta-analysis was performed looking at randomized controlled trials comparing an antiemetic to either a second antiemetic or placebo. Trials looking at dosing and/or timing of medication administration were also included. PONV was used as the primary outcome.

Results: 737 studies involving 103,237 patients. Eight drugs significantly reduced the occurrence of PONV, namely: droperidol, metoclopramide, ondansetron, tropisetron, dolasetron, dexamethasone, cyclizine, and granisetron. Relative risk (RR) vs. placebo varied between 0.60-0.80. Side effects included a significant increase in drowsiness for droperidol (RR 1.32) and headache for ondansetron (RR 1.16). The cumulative number needed to treat was 3.57.

Conclusion: Antiemetic medication is effective for reducing the occurrence of PONV. However, further investigation needs to be done to determine whether antiemetics can cause more severe (and likely rare) side effects, which could alter how liberally they are used.

Pain Management

Definitions

- pain: perception of nociception, which occurs in the brain
- nociception: detection, transduction, and transmission of noxious stimuli

Pain Classifications

- temporal: acute vs. chronic
- mechanism: nociceptive vs. neuropathic

Acute Pain

- pain of short duration (<6 wk) usually associated with surgery, trauma, or acute illness; often associated with inflammation
- usually limited to the area of damage/trauma and resolves with healing

Figure 11. Acute pain mechanism

Pharmacological Management of Acute Pain

- ask the patient to rate the pain out of 10, or use visual analog scale, to determine severity
- pharmacological treatment guided by WHO analgesia ladder
- patient controlled analgesia (PCA)
 - involves the use of computerized pumps that can deliver a constant infusion as well as bolus breakthrough doses of parenterally-administered opioid analgesics
 - limited by lockout intervals
 - most commonly used agents: morphine and hydromorphone
 - see Table 13, A28 for suggested infusion rate, PCA dose and lockout intervals

Table 10. Commonly Used Analgesics

	Acetaminophen	NSAIDs	Opioids
Examples	• Tylenol®	• Aspirin®, ibuprofen, naproxen • ketorolac (IV)	• Oral: codeine, oxycodone, morphine, hydromorphone • Parenteral: morphine, hydromorphone, fentanyl
Indications	• First-line for mild acute pain	• Mild-moderate pain	• Oral: moderate acute pain • Parenteral: moderate-severe acute pain
Mechanism of Action	• Unclear, hypothesized cyclooxygenase-2 (COX-2) inhibition • Unclear, hypothesized modulation of endogenous cannabinoid system	• Non-selective COX-1 and 2 inhibition reducing proinflammatory prostaglandin synthesis	• Dampens nociceptive transmission between 1st and 2nd order neurons in the dorsal horn • Activates ascending modulatory pathways resulting in release of inhibitory neurotransmitters • Inhibits peripheral inflammatory response and hyperalgesia • Affects mood and anxiety – alleviates the affective component of perceived pain

Opioid Conversion

	Parenteral (IV)	Equivalent Oral Dose
Morphine	10 mg	30 mg
Hydromorphone	2 mg	4 mg
Codeine	120 mg	200 mg
Oxycodone	N/A	20 mg
Fentanyl IV	100 mcg	N/A

Figure 12. WHO analgesia ladder

Cautionary Use of NSAIDs in Patients with:

- Asthma
- Coagulopathy
- GI ulcers
- Renal insufficiency
- Pregnancy, 3rd trimester

Common Side Effects of Opioids

- N/V
- Constipation
- Sedation
- Pruritus
- Abdominal pain
- Urinary retention
- Respiratory depression

When prescribing opioids, consider:

- Breakthrough dose
- Anti-emetics
- Laxative

PCA Parameters

- Loading dose
- Bolus dose
- Lockout interval
- Continuous infusion (optional)
- Maximum 4 h dose (limit)

Advantages of PCA

- Improved patient satisfaction
- Fewer side effects
- Accommodates patient variability
- Accommodates changes in opioid requirements

Table 10. Commonly Used Analgesics (continued)

	Acetaminophen	NSAIDs	Opioids
Dosing/Administration	<ul style="list-style-type: none"> Limited by analgesic ceiling beyond which there is no additional analgesia Opioid-sparing Max dose of 4 g/24 h 	<ul style="list-style-type: none"> Limited by analgesic ceiling beyond which there is no additional analgesia Opioid-sparing Significant inter-individual variation in efficacy 	<ul style="list-style-type: none"> No analgesic ceiling (except for codeine) Can be administered intrathecally (spinal block) or by continuous infusion
Side Effects/Toxicity	<ul style="list-style-type: none"> Considered relatively safe Liver toxicity in elevated doses 	<ul style="list-style-type: none"> Gastric ulceration/bleeding Decreased renal perfusion Photosensitivity Premature closure of the ductus arteriosus in pregnancy 	<ul style="list-style-type: none"> Respiratory depression Constipation and abdominal pain Sedation N/V Pruritus Confusion (particularly in the elderly) Dependence

Opioid Antagonists (naloxone, naltrexone)

- indication: opioid overdose (manifests primarily at CNS, e.g. respiratory depression)
- mechanism of action: competitively inhibit opioid receptors, predominantly μ receptors
 - naloxone is short-acting ($t_{1/2} = 1$ h); effects of narcotic may return when naloxone wears off; therefore, the patient must be observed closely following its administration
 - naltrexone is longer-acting ($t_{1/2} = 10$ h); less likely to see return of opioid effects
- side effects: relative overdose of naloxone may cause nausea, agitation, sweating, tachycardia, HTN, re-emergence of pain, pulmonary edema, seizures (essentially opioid withdrawal)

Neuropathic Pain

- pain caused by peripheral or central nervous system injury, often described as burning, lancinating, shooting, or tingling
- results in allodynia (pain in response to normally painless stimuli) or hyperalgesia (increased sensitivity to painful stimuli)
- consider adding anticonvulsants (gabapentin, pregabalin) or low-dose tricyclic antidepressant as opioids are ineffective

Chronic Pain

- chronic pain: greater than 3 mo, or recurrent pain that occurs at least 3 times throughout three month period
- pain of duration or intensity that persists beyond normal tissue healing and adversely affects functioning
- may have nociceptive and neuropathic components; dysregulation of analgesic pathways implicated
- in the perioperative period, consider continuing regular long-acting analgesics and augmenting with regional techniques, adjuvants, additional opioid analgesia, and non-pharmacological techniques

Obstetrical Anesthesia

Physiologic Changes in Pregnancy

- Airway
 - possible difficult airway as tissues become edematous and friable especially in labor
- Respiratory
 - decreased FRC and increased O_2 consumption \rightarrow desaturation occurs more quickly during apnea
- Cardiovascular system
 - increased blood volume $>$ increased RBC mass \rightarrow mild anemia
 - decreased SVR proportionately greater than increased CO \rightarrow decreased BP
 - prone to decreased BP due to aortocaval compression – therefore for surgery, a pregnant patient is positioned in left uterine displacement using a wedge under her right flank
- Central nervous system
 - decreased MAC due to hormonal effects
 - increased block height due to engorged epidural veins
- Gastrointestinal system
 - delayed gastric emptying
 - increased volume and acidity of gastric fluid
 - decreased LES tone
 - increased abdominal pressure
 - combined, these lead to an increased risk of aspiration – therefore for surgery, a pregnant patient is given sodium citrate 30 cc PO immediately before surgery to neutralize gastric acidity

Patient Controlled Opioid Analgesia vs. Conventional Opioid Analgesia for Post-Operative Pain

Cochrane DB Syst Rev 2006;4:CD003348

Purpose: To evaluate the efficacy of patient controlled analgesia (PCA) as compared to conventional 'as-needed' analgesia administration providing pain relief in post-operative patients.

Methods: Meta-analyses of randomized controlled trials comparing PCA vs. conventional administration of opioid analgesia. Assessment employed a visual analog scale (VAS) for pain intensity along with overall analgesic consumption, patient satisfaction, length of stay, and adverse side effects.

Results: 55 studies with a total of 2,023 patients receiving PCA and 1,838 patients with standard as-needed opioid administration. PCA provided significantly better pain control through 72 h post-operatively, but patients consumed significantly more opioids (>7 mg morphine/24 h, $p < 0.05$). Significantly more patients reported pruritus in the PCA group compared to control with a number needed to harm of 13. No significant difference in overall length of stay in hospital, sedation level, N/V, or urinary retention.

Conclusions: PCA is more effective than standard as-needed administration for reducing post-operative pain. However, patients using PCA consume more opioids overall, and have more pruritus.

The Effect of Epidural Analgesia on Labor, Maternal, and Neonatal Outcomes: A Systematic Review

Am J Obstet Gynecol 2002;186:S69-77

Study: Meta-analysis of 14 studies with 4,324 women.

Selection Criteria: RCTs and prospective cohort studies between 1980-2001 comparing epidural analgesia to parenteral opioid administration during labor.

Types of Participants: Healthy women with uneventful pregnancies.

Intervention: Participants were randomized to either epidural analgesia or parenteral opioid administration during labor.

Outcomes and Results: Maternal – there were no differences between the 2 groups in first-stage labor length, incidence of Cesarean delivery, incidence of instrumented vaginal delivery for dystocia, nausea, or mid-to-low back pain post-partum. However, second-stage labor length was longer (mean = 15 min) and there were greater reports of fever and hypotension in the epidural group. Also, lower pain scores and greater satisfaction with analgesia were reported among the epidural group. There was no difference in lactation success at 6 wk and urinary incontinence was more frequent in the epidural group immediately post-partum, but not at 3 mo or 1 yr (evidence from PC studies only). Neonatal – there were no differences between the 2 groups for incidence of fetal heart rate abnormalities, intrapartum meconium, poor 5-min Apgar score, or low umbilical artery pH. However, the incidence of poor 1-min Apgar scores and need for neonatal naloxone were higher in the parenteral opioid group.

Conclusions: Epidural analgesia is a safe intrapartum method for labor pain relief and women should not avoid epidural analgesia for fear of neonatal harm, Cesarean delivery, breastfeeding difficulties, long-term back pain, or long-term urinary incontinence.

Options for Analgesia during Labor

- Psychoprophylaxis – Lamaze method
 - patterns of breathing and focused attention on fixed object
- Systemic medication
 - easy to administer, but risk of maternal or neonatal depression
 - opioids most commonly used if delivery is not expected within 4 h
- Inhalational analgesia
 - easy to administer, makes uterine contractions more tolerable, but does not relieve pain completely
 - 50% nitrous oxide
- Neuraxial anesthesia
 - provides excellent analgesia with minimal depressant effects
 - hypotension is the most common complication
 - maternal BP monitored q2-5 min for 15-20 min after initiation and regularly thereafter
 - epidural usually given as it preferentially blocks sensation, leaving motor function intact

Options for Caesarean Section

- neuraxial: spinal or epidural
- general: used if contraindications or time precludes regional blockade

Nociceptive Pathways in Labor and Delivery

Labor

- Cervical dilation and effacement stimulates visceral nerve fibers entering the spinal cord at T10-L1

Delivery

- Distention of lower vagina and perineum causes somatic nociceptive impulses via the pudendal nerve entering the spinal cord at S2-S4

Pediatric Anesthesia

Respiratory System

- in comparison to adults, anatomical differences in infants include:
 - large head, short trachea/neck, large tongue, adenoids, and tonsils
 - narrow nasal passages (obligate nasal breathers until 5 mo)
 - narrowest part of airway at the level of the cricoid vs. glottis in adults
 - epiglottis is longer, U shaped and angled at 45 degrees; carina is wider and is at the level of T2 (T4 in adults)
- physiologic differences include
 - faster RR, immature respiratory centers which are depressed by hypoxia/hypercapnea (airway closure occurs in the neonate at the end of expiration)
 - less oxygen reserve during apnea – decreased total lung volume, vital and functional reserve capacity together with higher metabolic needs
 - greater V/Q mismatch – lower lung compliance due to immature alveoli (mature at 8 yr)
 - greater work of breathing – greater chest wall compliance, weaker intercostals/diaphragm, and higher resistance to airflow

Cardiovascular System

- blood volume at birth is approximately 80 mL/kg; transfusion should be started if >10% of blood volume lost
- children have a high HR and low BP
- CO is dependent on HR, not stroke volume because of low heart wall compliance; therefore, bradycardia → severe compromise in CO

Temperature Regulation

- vulnerable to hypothermia
- minimize heat loss by use of warming blankets, covering the infant's head, humidification of inspired gases, and warming of infused solutions

Central Nervous System

- MAC of halothane is increased compared to the adult (0.75% adult, 1.2% infant, 0.87% neonate)
- NMJ is immature for the first 4 wk of life and thus there is an increased sensitivity to non-depolarizing relaxants
- parasympathetics mature at birth, sympathetics mature at 4-6 mo → autonomic imbalance
- infant brain is 12% of body weight and receives 34% of CO (adult: 2% body weight and 14% CO)

Glucose Maintenance

- infants less than 1 yr old can become seriously hypoglycemic during pre-operative fasting and post-operatively if feeding is not recommenced as soon as possible
- after 1 yr, children are able to maintain normal glucose homeostasis in excess of 8 h

Pharmacology

- higher dose requirements because of higher TBW (75% vs. 60% in adults) and greater volume of distribution
- barbiturates/opioids more potent due to greater permeability of BBB
- muscle relaxants

Adult Upper Airway

Child Upper Airway

1. Large head
2. Newborns are obligate nasal breathers
3. Adenoid and tonsils
4. Larger tongue in proportion to mouth
5. Smaller pharynx
6. Larger and more flaccid epiglottis
7. Larynx is more superior and anterior
8. Narrowest point at cricoid cartilage
9. Trachea is more narrow and less rigid

Figure 13. Comparison of pediatric vs. adult airway

To increase alveolar minute ventilation in neonates, increase respiratory rate, not tidal volume.

Neonate: 30-40 breaths/min

Age 1-13: (24 – [age/2]) breaths/min

- non-depolarizing
 - ♦ immature NMJ, variable response
- depolarizing
 - ♦ must pre-treat with atropine or may experience profound bradycardia and/or sinus node arrest due to PNS > SNS (also dries oral secretions)
 - ♦ more susceptible to arrhythmias, hyperkalemia, rhabdomyolysis, myoglobinemia, masseter spasm and malignant hyperthermia

**ETT Sizing in Pediatrics**

Diameter (mm) of tracheal tube in children after 1 year = (age/4) + 4
 Length (cm) of tracheal tube = (age/2) + 12

Uncommon Complications

Malignant Hyperthermia

- hypermetabolic disorder of skeletal muscle due to an uncontrolled increase in intracellular Ca^{2+}
- pathogenesis: Genetic anomaly (autosomal dominant) of ryanodine receptor which regulates the Ca^{2+} channel in the sarcoplasmic reticulum of skeletal muscle
- incidence of 1-5 per 100,000; may be associated with skeletal muscle abnormalities such as dystrophy or myopathy
- anesthetic drugs triggering MH include:
 - all inhalational agents except nitrous oxide
 - depolarizing muscle relaxant – SCh

Clinical Picture

- onset: immediate or hours after contact with trigger agent
 - increased oxygen consumption
 - increased ET_{CO_2} on capnograph
 - tachycardia/dysrhythmia
 - tachypnea/cyanosis
 - diaphoresis
 - HTN
 - increased temperature (late sign)
- muscular symptoms
 - trismus (masseter spasm) common but not specific for MH (occurs in 1% of children given SCh with halothane anesthesia)
 - tender, swollen muscles due to rhabdomyolysis
 - trunk or total body rigidity

Complications

- coma
- DIC
- rhabdomyolysis
- myoglobinuric renal failure/hepatic dysfunction
- electrolyte abnormalities (e.g. hyperkalemia) and secondary arrhythmias
- ARDS
- pulmonary edema
- can be fatal if untreated

Prevention

- suspect MH in patients with a family history of problems/death with anesthetic
- avoid all trigger medications, use vapour free equipment, use regional anesthesia if possible
- central body temp and ET_{CO_2} monitoring

Malignant Hyperthermia Management (Based on Malignant Hyperthermia Association of the U.S. [MHAUS] Guidelines, 2008)

1. notify surgeon, discontinue volatile agents and succinylcholine, hyperventilate with 100% oxygen at flows of 10 L/min or more, halt the procedure as soon as possible
2. dantrolene 2.5 mg/kg IV, through large-bore IV if possible
 - repeat until there is control of signs of MH; sometimes up to 30 mg/kg is necessary
3. bicarbonate 1-2 mEq/kg if blood gas values are not available for metabolic acidosis
4. cool patients with core temperature $>39^\circ\text{C}$
 - lavage open body cavities, stomach, bladder, rectum; apply ice to surface; infuse cold saline IV
 - stop cooling if temperature is $<38^\circ\text{C}$ to prevent drift to $<36^\circ\text{C}$
5. dysrhythmias usually respond to treatment of acidosis and hyperkalemia
 - use standard drug therapy except Ca^{2+} channel blockers as they may cause hyperkalemia and cardiac arrest in presence of dantrolene

**Signs of Malignant Hyperthermia**

- Unexplained rise in ET_{CO_2}
- Increase in minute ventilation
- Tachycardia
- Rigidity
- Hyperthermia (late sign)

**Basic Principles of MH Management****"Some Hot Dude Better Get Iced Fluids Fast"**

Stop all triggering agents, give 100% O_2
 Hyperventilate
 Dantrolene 2.5 mg/kg every 5 min
 Bicarbonate
 Glucose and insulin
 IV fluids; cool patient to 38°C
 Fluid output; consider furosemide
 Tachycardia: be prepared to treat VT

6. hyperkalemia
 - treat with hyperventilation, bicarbonate, glucose/insulin, calcium
 - bicarbonate 1-2 mEq/kg IV, calcium chloride 10 mg/kg or calcium gluconate 10-50 mg/kg for life-threatening hyperkalemia and check glucose levels hourly
7. follow ET_{CO_2} , electrolytes, blood gases, creatine kinase (CK), core temperature, urine output/color with Foley catheter, coagulation studies
 - if CK and/or potassium rises persistently or urine output falls to <0.5 mL/kg/h, induce diuresis to >1 mL/kg/h urine to avoid myoglobinuric renal failure
8. maintain anesthesia with benzodiazepines, opioids, and propofol
9. transfer to ICU bed

Abnormal Pseudocholinesterase

- pseudocholinesterase hydrolyzes SCh and mivacurium
- individuals with abnormal pseudocholinesterase will have prolonged muscular blockade
- SCh and mivacurium are contraindicated in those with abnormal pseudocholinesterase
- if SCh or mivacurium are given accidentally, treat with mechanical ventilation until function returns to normal (do not use cholinesterase inhibitors)

Common Medications

Table 11. Intravenous Induction Agents

	Propofol (Diprivan®)	Thiopental (sodium thiopental, sodium thiopentone)	Ketamine (Ketalar®, Ketaject®)	Benzodiazepines (midazolam [Versed®], diazepam [Valium®], lorazepam [Ativan®])
Class	• Alkylphenol – hypnotic	• Ultra-short acting thiobarbiturate – hypnotic	• Phencyclidine (PCP) derivative – dissociative	• Benzodiazepines – anxiolytic
Action	• Inhibitory at GABA synapse • Decreased cerebral metabolic rate and blood flow, decreased ICP, decreased SVR, decreased BP, and decreased SV	• Decreased time Cl^- channels open, facilitating GABA and suppressing glutamic acid • Decreased cerebral metabolism and blood flow, decreased CPP, decreased CO , decreased BP, decreased reflex tachycardia, decreased respiration	• May act on NMDA, opiate, and other receptors • Increased HR, increased BP, increased SVR, increased coronary flow, increased myocardial O_2 uptake • CNS and respiratory depression, bronchial smooth muscle relaxation	• Causes increased glycine inhibitory neurotransmitter, facilitates GABA • Produces antianxiety and skeletal muscle relaxant effects • Minimal cardiac depression
Indications	• Induction • Maintenance • Total intravenous anesthesia (TIVA)	• Induction • Control of convulsive states	• Major trauma, hypovolemia, severe asthma because sympathomimetic	• Used for sedation, amnesia, and anxiolysis
Caution	• Allergy (egg, soy) • Patients who cannot tolerate sudden decreased BP (e.g. fixed cardiac output or shock)	• Allergy to barbiturates • Uncontrolled hypotension, shock, cardiac failure • Porphyria, liver disease, status asthmaticus, myxedema	• Ketamine allergy • TCA medication (interaction causes HTN and dysrhythmias) • History of psychosis • Patients who cannot tolerate HTN (e.g. CHF, increased ICP, aneurysm)	• Marked respiratory depression
Dosing	• IV induction: 2.5-3.0 mg/kg (less with opioids) • Unconscious <1 min • Lasts 4-6 min • $t_{1/2}$ = 55 min • Decreased post-operative sedation, recovery time, N/V	• IV induction: 3-5 mg/kg • Unconscious about 30 s • Lasts 5 min • Accumulation with repeat dosing – not for maintenance • $t_{1/2}$ = 5-10 h • Post-operative sedation lasts hours	• IV induction 1-2 mg/kg • Dissociation in 15 s, analgesia, amnesia, and unconsciousness in 45-60 s • Unconscious for 10-15 min, analgesia for 40 min, amnesia for 1-2 h • $t_{1/2}$ = ~3 h	• Onset less than 5 min if given IV • Duration of action long but variable/somewhat unpredictable
Additional Notes	• 0-30% decreased BP due to vasodilation • Reduce burning at IV site by mixing with lidocaine	• Combining with rocuronium causes precipitates to form	• High incidence of emergence reactions (vivid dreaming, out-of-body sensation, illusions) • Pretreat with glycopyrrolate to decrease salivation	• Antagonist: flumazenil (Romazicon®) competitive inhibitor, 0.2 mg IV over 15 s, repeat with 0.1 mg/min (max of 2 mg), $t_{1/2}$ of 60 min • Midazolam also has amnesic (antegrade) effect and decreased risk of thrombophlebitis

Table 12. Opioids

Agent	Relative Dose to 10 mg Morphine IV	Moderate Dose	Onset	Duration	Special Considerations
Codeine	200 mg PO	15-30 mg PO	Late (30-60 min)	Moderate (4-6 h)	Primarily post-operative use, not for IV use
Meperidine (Demerol®)	75 mg IV	2-3 mg/kg IV	Moderate (10 min)	Moderate (2-4 h)	Anticholinergic, hallucinations, less pupillary constriction than morphine, metabolite build up may cause seizures
Morphine	10 mg IV 20 mg PO	0.2-0.3 mg/kg IV 0.4-0.6 mg/kg PO	Moderate (5-10 min)	Moderate (4-5 h)	Histamine release leading to decrease in BP
Oxycodone Controlled Release	15 mg PO	10-20 mg PO (no IV)	Late (30-45 min)	Long (8-12 h)	Do not split, crush, or chew tablet
Oxycodone Regular Tablet	15 mg PO (no IV)	5-15 mg PO	Moderate (15 min)	Moderate (3-6 h)	Percocet® = oxycodone 5 mg + acetaminophen 325 mg
Hydromorphone (Dilaudid®)	2 mg IV 10 mg PO	40-60 µg/kg IV 2-4 mg PO	Moderate (15 min)	Moderate (4-5 h)	
Fentanyl	100 µg IV	2-3 µg/kg IV	Rapid (<5 min)	Short (0.5-1 h)	Transient muscle rigidity in very high doses
Remifentanyl	100 µg IV	0.5-1.5 µg/kg IV	Rapid (1-3 min)	Ultra short (<10 min)	Only use during induction and maintenance of anesthesia

In general, parenteral route is 2-3x more potent than oral

Table 13. Opioid PCA Doses

Agent	PCA Dose	PCA Lockout Interval	PCA 4 h Maximum
Morphine	1 mg	5 min	30 mg
Fentanyl	25-50 µg	5 min	400 µg
Hydromorphone	0.2 mg	5 min	6 mg

Table 14. Volatile Inhalational Agents

	Sevoflurane	Desflurane	Isoflurane	Enflurane	Halothane	Nitrous oxide (N ₂ O)*
MAC (% gas in O ₂)	2.0	6.0	1.2	1.7	0.8	104
CNS	Increased ICP	Increased ICP	Decreased cerebral metabolic rate Increased ICP	ECG seizure-like activity Increased ICP	Increased ICP and cerebral blood flow	—
Resp	Respiratory depression (severely decreased TV, increased RR), decreased response to respiratory CO ₂ reflexes, bronchodilation					—
CVS	Less decrease of contractility, stable HR	Tachycardia with rapid increase in concentration	Decreased BP and CO, increased HR, theoretical chance of coronary steal**	Stable HR, decreased contractility	Decreased BP, CO, HR, and conduction Sensitizes myocardium to epinephrine-induced arrhythmias	Can cause decreased HR in pediatric cases in those with existing heart disease
MSK	Muscle relaxation, potentiation of other muscle relaxants, uterine relaxation					

*Properties and Adverse Effects of N₂O

Due to its high MAC, nitrous oxide is combined with other anesthetic gases to attain surgical anesthesia. A MAC of 104% is possible in a pressurized chamber only
Second Gas Effect: see *Determinants of Speed of Onset of Volatile Anesthetics sidebar, A17*

Expansion of closed spaces: closed spaces such as a pneumothorax, the middle ear, bowel lumen and ETT cuff will markedly enlarge if N₂O is administered
Diffusion hypoxia: during anesthesia, the washout of N₂O from body stores into alveoli can dilute the alveolar [O₂], creating a hypoxic mixture if the original [O₂] is low

**Coronary steal: isoflurane causes small vessel dilation which may compromise blood flow to areas of the heart with fixed perfusion (e.g. stents, atherosclerosis)

Table 15. Depolarizing Muscle Relaxants (Non-Competitive): Succinylcholine (SCh)

Mechanism of Action	Mimics ACh and binds to ACh receptors causing prolonged depolarization; initial fasciculation may be seen, followed by temporary paralysis secondary to blocked ACh receptors by SCh
Intubating Dose	1-1.5 mg/kg
Onset	30-60 s – RAPID (fastest of all muscle relaxants)
Duration	3-5 min – SHORT (no reversing agent for SCh)
Metabolism	SCh is hydrolyzed by plasma cholinesterase (pseudocholinesterase), found only in plasma and not at the NMJ
Indications	<ul style="list-style-type: none"> • Assist intubation • Increased risk of aspiration (need rapid paralysis and airway control) • Short procedures (e.g. full stomach), hiatus hernia, obesity, pregnancy, trauma • Electroconvulsive therapy (ECT) • Laryngospasm
Side Effects	<ol style="list-style-type: none"> 1. SCh also stimulates muscarinic cholinergic autonomic receptors (in addition to nicotinic receptors) <ul style="list-style-type: none"> • May cause bradycardia, dysrhythmias, sinus arrest, increased secretions of salivary glands (especially in children) 2. Hyperkalemia <ul style="list-style-type: none"> • Disruption of motor nerve activity causes proliferation of extrajunctional (outside NMJ) cholinergic receptors • Depolarization of an increased number of receptors by SCh may lead to massive release of potassium out of muscle cells • Patients at risk: <ul style="list-style-type: none"> ▪ 3rd degree burns 24 h-6 mo after injury ▪ Traumatic paralysis or neuromuscular diseases (e.g. muscular dystrophy) ▪ Severe intra-abdominal infections ▪ Severe closed head injury ▪ Upper motor neuron lesions 3. Can trigger MH 4. Increased ICP/intraocular pressure/intragastric pressure (no increased risk of aspiration if competent lower esophageal sphincter) 5. Fasciculations, post-operative myalgia – may be minimized if small dose of non-depolarizing agent given before SCh administration
Contraindications	
Absolute	Known hypersensitivity or allergy, positive history of malignant hyperthermia, myotonia (m. congenita, m. dystrophica, paramyotonia congenital), high risk for hyperkalemic response
Relative	Known history of plasma cholinesterase deficiency, myasthenia gravis, myasthenic syndrome, familial periodic paralysis, open eye injury

Table 16. Non-Depolarizing Muscle Relaxants (Competitive)

Mechanism of Action	Competitive blockade of postsynaptic ACh receptors preventing depolarization				
Classification	Short	Intermediate			Long
	Mivacurium	Rocuronium	Vecuronium	Cisatracurium	Pancuronium
Intubating Dose (mg/kg)	0.2	0.6-1.0	0.1	0.2	0.1
Onset (min)	2-3	1.5	2-3	3	3-5
Duration (min)	15-25	30-45	45-60	40-60	90-120
Metabolism	Plasma cholinesterase	Liver (major) Renal (minor)	Liver	Hofmann Eliminations	Renal (major) Liver (minor)
Indications	Assist intubation, assist mechanical ventilation in some ICU patients, reduce fasciculations and post-operative myalgias secondary to SCh				
Side Effects:					
Histamine Release	Yes	No	No	No	No
Other	—	—	—	—	Tachycardia
Considerations	Increased duration of action in renal or liver failure	Quick onset of rocuronium allows its use in rapid sequence induction Cisatracurium is good for patients with renal or hepatic insufficiency			Pancuronium if increased HR and BP desired

Table 17. Reversal Agents for Non-Depolarizing Relaxants

Cholinesterase Inhibitor	Neostigmine	Pyridostigmine	Edrophonium
Onset and Duration	Intermediate	Longest	Shortest
Mechanism of Action	Inhibits enzymatic degradation of ACh, increases ACh at nicotinic and muscarinic receptors, displaces non-depolarizing muscle relaxants Muscarinic effects of reversing agents include unwanted bradycardia, salivation, and increased bowel peristalsis*		
Dose	0.04-0.08 mg/kg	0.1-0.4 mg/kg	0.5-1 mg/kg
Recommended Anticholinergic	Glycopyrrolate	Glycopyrrolate	Atropine
Dose of Anticholinergic per mg	0.2 mg	0.05 mg	0.014 mg

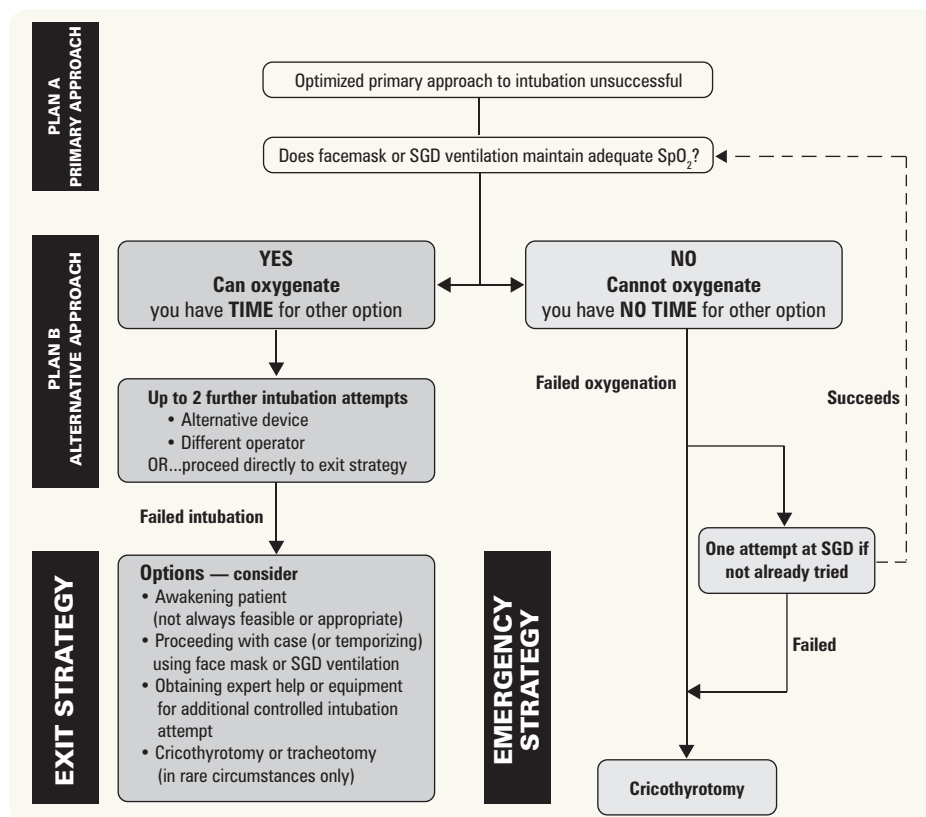

*Atropine and glycopyrrolate are anticholinergic agents administered during the administration of reversal agents to minimize muscarinic effects

Table 18. Local Anesthetic Agents

	Maximum Dose	Maximum Dose with Epinephrine	Potency	Duration
chlorprocaine	11 mg/kg	14 mg/kg	Low	15-30 min
lidocaine	5 mg/kg	7 mg/kg	Medium	1-2 h
bupivacaine	2.5 mg/kg	3 mg/kg	High	3-8 h
ropivacaine	2.5 mg/kg	3 mg/kg	High	2-8 h

Basic Anatomy Review

Coronary Circulation

- conventional arterial supply to the heart arises from the right and left coronary arteries, which originate from the root of the aorta
 - right coronary artery (RCA)
 - acute marginal branches
 - atrioventricular (AV) nodal artery
 - posterior interventricular artery (PIV) = posterior descending artery (PD)
 - left main coronary artery (LCA): two major branches
 - left anterior descending artery (LAD)
 - septal branches
 - diagonal branches
 - left circumflex artery (LC)
 - obtuse marginal branches
- dominance of circulation
 - right-dominant circulation: PIV and at least one posterolateral branch arise from RCA (80%)
 - left-dominant circulation: PIV and at least one posterolateral branch arise from LC (15%)
 - balanced circulation: dual supply of posteroinferior LV from RCA and LC (5%)
- the sinoatrial (SA) node is supplied by the SA nodal artery, which may arise from the RCA (60%) or LCA (40%)
- most venous blood from the heart drains into the RA through the coronary sinus, although a small amount drains through Thebesian veins into all four chambers, contributing to the physiologic R-L shunt

Figure 1. Anatomy of the coronary arteries (right anterior oblique projection)

Figure 2a. Cardiac cycle
 Gray shaded bars indicate isovolumic contraction (left) and isovolumic relaxation (right)

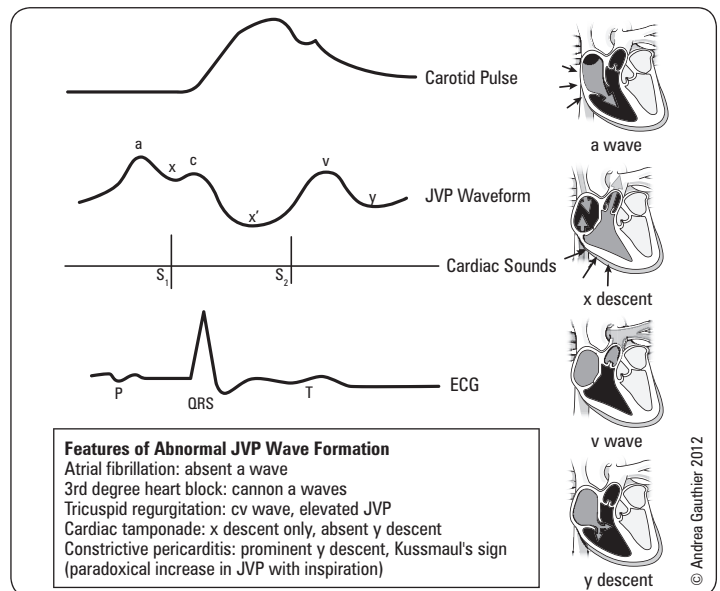

Figure 2b. JVP waveform

Cardiac Anatomy

• layers of the heart

- endocardium
- myocardium
- epicardium
- visceral pericardium
- pericardial cavity
- parietal pericardium

• valves

- semilunar valves: no subvalvular apparatus present
 - ♦ aortic valve, 3 valve leaflets: separates LV and ascending aorta
 - ♦ pulmonic valve, 3 valve leaflets: separates RV and main pulmonary artery (PA)
- atrioventricular valves: subvalvular apparatus present in the form of chordae tendinae and papillary muscles
 - ♦ tricuspid valve, 3 valve leaflets: separates RA and RV
 - ♦ mitral valve, 2 valve leaflets: separates LA and LV

• conduction system

- SA node governs pacemaking control
- anterior-, middle-, and posterior-internal nodal tracts carry impulses in the right atrium and along Bachmann's bundle in the left atrium
- atrial impulses converge at the AV node
 - ♦ the AV node is the only conducting tract from the atria to the ventricles because of electrical isolation by the annulus fibrosus (except when accessory pathways are present)
- the bundle of His bifurcates into left and right bundle branches (LBB and RBB)
- LBB further splits into anterior and posterior fascicles
- RBB and fascicles of LBB give off Purkinje fibers which conduct impulses into the ventricular myocardium

Figure 3. Conduction system of the heart

Figure 4. Blood vessel structure

- **cardiovascular innervation**

- sympathetic nerves
 - ♦ innervate the SA node, AV node, ventricular myocardium and vasculature
 - ♦ SA node (β_1) fibers increase pacemaking activity (chronotropy)
 - ♦ cardiac muscle (β_1) fibers increase contractility (inotropy) to help increase cardiac output
 - ♦ stimulation of β_1 - and β_2 -receptors in the skeletal and coronary circulation causes vasodilatation
- parasympathetic nerves
 - ♦ innervate the SA node, AV node, atrial myocardium but few vascular beds
 - ♦ basal vagal tone dominates the tonic sympathetic stimulation of the SA node and AV node resulting in slowing of pacemaker activity and conduction (i.e. reduced dromotropy – if only affecting AV node conduction)
 - ♦ parasympathetics have very little impact on total peripheral vascular resistance

Differential Diagnoses of Common Presentations

Note: **bold** text indicates most common, underlined text indicates life threatening

Chest Pain

- cardiac
 - **MI/angina**
 - myocarditis
 - pericarditis/Dressler's syndrome
 - cardiac tamponade
- pulmonary
 - **pneumonia**
 - PE
 - pneumothorax/hemothorax, tension pneumothorax
 - empyema
 - pulmonary neoplasm
 - bronchiectasis
 - TB
- gastrointestinal
 - esophageal: spasm, **GERD**, esophagitis, ulceration, achalasia, neoplasm, Mallory-Weiss syndrome, esophageal rupture
- gastrointestinal
 - PUD
 - gastritis
 - pancreatitis
 - biliary colic
- mediastinal
 - lymphoma
 - thymoma
- vascular
 - dissecting aortic aneurysm
 - aortic rupture
- surface structures
 - costochondritis
 - rib fracture
 - skin (bruising, herpes zoster)
 - breast
- anxiety/psychosomatic

Loss of Consciousness

- **hypovolemia**
- cardiac
 - structural or obstructive causes
 - ♦ ACS
 - ♦ AS
 - ♦ HCM
 - ♦ cardiac tamponade, constrictive pericarditis
 - arrhythmias (see *Arrhythmias*, C15)
- respiratory
 - massive pulmonary embolism
 - pulmonary HTN
 - hypoxia
 - hypercapnia
- neurologic
 - stroke/TIA (esp. vertebrobasilar insufficiency)
 - migraine
 - seizure
- metabolic
 - **anemia**
 - **hypoglycemia**
- drugs
 - antihypertensives
 - antiarrhythmics
 - diuretics
- **vasovagal**
- autonomic dysfunction
 - diabetic neuropathy
- psychiatric
 - panic attack

Local Edema

- inflammation/infection
- venous or lymphatic obstruction
 - thrombophlebitis/deep vein thrombosis
 - venous insufficiency
 - chronic lymphangitis
 - lymphatic tumor infiltration
 - filariasis

Generalized Edema

- increased hydrostatic pressure/fluid overload
 - **heart failure**
 - pregnancy
 - drugs (e.g. CCBs)
 - **iatrogenic** (e.g. IV fluids)
- decreased oncotic pressure/hypoalbuminemia
 - nephrotic syndrome
- **liver cirrhosis**
 - malnutrition
- increased capillary permeability
 - severe sepsis
- hormonal
 - hypothyroidism
- exogenous steroids
 - pregnancy
 - estrogens

Palpitations

- cardiac
 - arrhythmias (PAC, PVC, SVT, VT)
 - valvular heart disease
 - HCM
- endocrine
 - thyrotoxicosis
 - pheochromocytoma
 - hypoglycemia
- systemic
 - fever
 - anemia
- drugs
 - stimulants and anticholinergics
- psychiatric
 - panic attack

Dyspnea

- cardiovascular
 - acute MI
 - CHF/LV failure
 - aortic/mitral stenosis
 - aortic/mitral regurgitation
 - arrhythmia
 - cardiac tamponade
 - constrictive pericarditis
 - left-sided obstructive lesions (e.g. left atrial myxoma)
 - elevated pulmonary venous pressure
- respiratory
 - airway disease
 - ♦ asthma
 - ♦ COPD exacerbation
 - ♦ upper airway obstruction (anaphylaxis, foreign body, mucus plugging)
 - parenchymal lung disease
 - ♦ ARDS
- pneumonia
 - ♦ interstitial lung disease
- pulmonary vascular disease
 - ♦ PE
 - ♦ pulmonary HTN
 - ♦ pulmonary vasculitis
- pleural disease
 - ♦ pneumothorax
 - ♦ pleural effusion
- neuromuscular and chest wall disorders
 - C-spine injury
 - polymyositis, myasthenia gravis, Guillain-Barré syndrome
 - kyphoscoliosis
- anxiety/psychosomatic
- hematological/metabolic
 - anemia, acidosis, hypercapnia

Cardiac Diagnostic Tests

Electrocardiography Basics

- the electrocardiogram (ECG) is a graphic representation of the electrical activity of the heart recorded from the surface of the body
- on the ECG graph
 - the horizontal axis represents time (at usual paper speed 25 mm/s)
 - ♦ 1 mm (1 small square) = 40 msec
 - ♦ 5 mm (1 large square) = 200 msec
 - the vertical axis represents voltage (at usual standard gain setting)
 - ♦ 1 mm (1 small square) = 0.1 mV
 - ♦ 10 mm (2 large squares) = 1 mV
- leads
 - standard 12-lead ECG
 - ♦ limb leads: I, II, III, aVL, aVR, aVF
 - ♦ precordial leads: V1-V6 (V1-V2 septal, V3-V4 anterior, V5-V6 lateral)
 - additional leads
 - ♦ right-sided leads: V3R-V6R (useful in RV infarction and dextrocardia)
 - lateral = I, aVL, V5, V6; inferior = II, III, aVF; anterior = V1-V4

Figure 5. ECG lead placement

Figure 6. ECG waveforms and normal values

Approach to ECGs

Introduction

Historically, the electrocardiogram has been a tricky subject for medical students. For many years, the classical approach has been taught in medical schools, which has demystified the ECG. Below, we are presenting both the Classical Approach and the newer PQRSTU Approach to provide students with different ways to view the ECG. Despite methodological differences, the rigor and final result is the same. These two approaches should help you better understand the concepts of ECG interpretation and equip you with the necessary skills to interpret ECGs in exam scenarios and clinical practice.

Classical Approach to ECGs

RATE

- normal = 60-100 bpm (atrial rate: 150-250 bpm = paroxysmal tachycardia, 250-350 bpm = atrial flutter, >350 bpm = AFib)
- regular rhythm
 - to calculate the rate, divide 300 by number of large squares between 2 QRS complexes (there are 300 large squares in 1 min: $300 \times 200 \text{ msec} = 60 \text{ s}$)

Rate Calculations

- Examples, practice

Classical Approach to ECG

- Rate
- Rhythm
- Axis
- Conduction abnormalities
- Hypertrophy/chamber enlargement
- Ischemia/infarction
- Miscellaneous ECG changes

For more examples and practice visit www.ecgmadesimple.com

- or remember 300-150-100-75-60-50-43 (rate falls in this sequence with the number of large squares between 2 QRS complexes)
- irregular rhythm
 - rate = 6 x number of R-R intervals in 10 s (the “rhythm strips” are 10 s recordings)
 - types: wandering pacemaker, multifocal atrial tachycardia, AFib
- atrial escape = 60-80 bpm; junctional escape = 40-60 bpm; ventricular escape = 20-40 bpm

RHYTHM

- regular: R-R interval is the same across the tracing
- irregular: R-R interval varies across the tracing
- regularly irregular: repeating pattern of varying R-R intervals
- irregularly irregular: R-R intervals vary erratically
- normal sinus rhythm (NSR)
 - P wave precedes each QRS; QRS follows each P wave
 - P wave axis is normal (positive in leads I, aVF)
 - rate between 60-100 bpm

AXIS

- mean axis indicates the direction of the mean vector
- can be determined for any waveform (P, QRS, T)
- the standard ECG reported QRS axis usually refers to the mean axis of the frontal plane – it indicates the mean direction of ventricular depolarization forces
- QRS axis in the frontal plane
 - normal axis: -30° to 90° (i.e. positive QRS in leads I and II)
 - left axis deviation (LAD): axis $< -30^{\circ}$
 - right axis deviation (RAD): axis $> 90^{\circ}$
- QRS axis in the horizontal plane is not routinely calculated – it is directed posteriorly and to the left
 - transition from negative to positive is usually in lead V3

Table 1. Conduction Abnormalities

Left Bundle Branch Block (LBBB)	Right Bundle Branch Block (RBBB)
Complete LBBB <ul style="list-style-type: none"> • QRS duration > 120 msec • Broad notched or slurred R waves in leads I, aVL, and usually V5 and V6 • Deep broad S waves in leads V1-2 • Secondary ST-T changes (-ve in leads with broad R waves, +ve in V1-2) are usually present • LBBB can mask ECG signs of MI 	Complete RBBB <ul style="list-style-type: none"> • QRS duration > 120 msec • Positive QRS in lead V1 (rSR' or occasionally broad R wave) • Broad S waves in leads I, V5-6 (> 40 msec) • Usually secondary T wave inversion in leads V1-2

Left Anterior Fascicular Block (LAFB) (Left Anterior Hemiblock)	Left Posterior Fascicular Block (LPFB) (Left Posterior Hemiblock)	Bifascicular Block
Left Axis Deviation (-30° to -90°) <ul style="list-style-type: none"> • Small q and prominent R in leads I and aVL • Small r and prominent S in leads II, III, and aVF 	Right Axis Deviation (110° to 180°) <ul style="list-style-type: none"> • Small r and prominent S in leads I and aVL • Small q and prominent R in leads II, III, and aVF 	RBBB pattern <ul style="list-style-type: none"> • Small q and prominent R • The first 60 msec (1.5 small squares) of the QRS shows the pattern of LAFB or LPFB • Bifascicular block refers to impaired conduction in two of the three fascicles, most commonly a RBBB and left anterior hemiblock; the appearance on an ECG meets the criteria for both types of blocks

Nonspecific Intraventricular Block

- QRS duration > 120 msec
- absence of criteria for LBBB or RBBB

Differential Diagnosis for Left Axis Deviation

- Left anterior hemiblock
- Inferior MI
- WPW
- RV pacing
- Normal variant
- Elevated diaphragm
- Lead misplacement
- Endocardial cushion defect

Differential Diagnosis for Right Axis Deviation

- RVH
- Left post hemiblock
- PE
- COPD
- Lateral MI
- WPW
- Dextrocardia
- Septal defects

Figure 7. Axial reference system

Each lead contains a (+) area displayed by the bold arrows. Impulses traveling toward the positive region of the lead results in an upward deflection in that lead. Normal QRS axis is between -30° and $+90^{\circ}$

Table 2. Hypertrophy/Chamber Enlargement

Left Ventricular Hypertrophy (LVH)	Right Ventricular Hypertrophy (RVH)
<ul style="list-style-type: none">• S in V1 + R in V5 or V6 > 35 mm above age 40, (>40 mm for age 31-40, >45 mm for age 21-30)• R in aVL >11 mm• R in I + S in III >25 mm• Additional criteria:<ul style="list-style-type: none">▪ LV strain pattern (ST depression and T wave inversion in leads I, aVL, V4-V6)▪ Left atrial enlargement	<ul style="list-style-type: none">• Right axis deviation• R/S ratio > 1 or qR in lead V1• RV strain pattern: ST segment depression and T wave inversion in leads V1-2
Left Atrial Enlargement (LAE)	Right Atrial Enlargement (RAE)
<ul style="list-style-type: none">• Biphasic P wave with the negative terminal component of the P wave in lead V1 ≥1 mm wide and ≥1 mm deep• P wave > 120 msec, notched in lead II ("P mitrale")	<ul style="list-style-type: none">• P wave >2.5 mm in height in leads II, III, or aVF ("P pulmonale")

ISCHEMIA/INFARCTION

- look for the anatomic distribution of the following ECG abnormalities (see Table 3)
- ischemia
 - ST segment depression
 - T wave inversion (most commonly in V1-V6)
- injury
 - transmural (involving the epicardium)
 - ♦ ST elevation in the leads facing the area injured/infarcted
 - ♦ transient ST elevation may occur in patients with coronary artery spasm (e.g. Prinzmetal angina) which can be slight or prominent (>10 mm)
 - subendocardial
 - ♦ marked ST depression in the leads facing the affected area
 - ♦ may be accompanied by enzyme changes and other signs of MI
 - ♦ may also occur with angina

Figure 10. Typical ECG changes with infarction

- evolving infarction (ST elevation in contiguous leads = acute MI)
- "typical" sequential changes of evolving MI
 1. hyperacute T waves (tall, symmetric T waves) in the leads facing the infarcted area, with or without ST elevation
 2. ST elevation (injury pattern) in the leads facing the infarcted area
 - ♦ usually in the first hours post infarct
 - ♦ in acute posterior infarction, there is ST depression in V1-V3 (reciprocal to ST elevation in the posterior leads, that are not recorded in the standard 12-lead ECG)
 3. significant Q waves: >40 msec or >1/3 of the total QRS (hours to days post-infarct)
 4. inverted T waves (one day to weeks after infarction)
- this classical sequence does not always occur
 - ♦ Q waves of infarction may appear in the very early stages, with or without ST changes
 - ♦ non-Q wave infarction: there may be only ST or T changes despite clinical evidence of infarction
- completed infarction
 - abnormal Q waves (wide Q waves may be found in III and aVL in normal individuals)
 - ♦ duration >40 msec (>30 msec in aVF for inferior infarction)
 - ♦ Q/QRS voltage ratio is >33%
 - abnormal R waves (R/S ratio >1, duration >40 msec) in V1 and more frequently in V2 are found in posterior infarction (usually in association with signs of inferior and/or lateral infarction)

Figure 8. Complete LBBB, RBBB, LVH, and RVH (please see online examples for the full range of waveforms and the text for additional characteristics)

Figure 9. LAE, RAE (please see online examples and the text for characteristics)

Table 3. Areas of Infarction(Q wave)/Ischemia (in right dominant anatomy)

Vessel Usually Involved	Infarct Area (LAD and LC)	Leads (LAD and LC)
Left anterior descending (LAD)	Anteroseptal	V1, V2
	Anterior	V3, V4
	Anterolateral	I, aVL, V3-6
	Extensive anterior	I, aVL, V1-6
Right coronary artery (RCA)	Inferior	II, III, aVF
	Right ventricle	V3R, V4R (right sided chest leads)
	Posterior MI (assoc. with inf. MI)	V1, V2 (prominent R waves)
Left circumflex (LCX)	Lateral	I, aVL, V5-6
	Isolated posterior MI	V1, V2 (prominent R waves)

MISCELLANEOUS ECG CHANGES

Electrolyte Disturbances

- hyperkalemia
 - mild to moderate (K^+ 5-7 mmol/L): tall peaked T waves
 - severe (K^+ >7 mmol/L): progressive changes whereby P waves flatten and disappear, QRS widens and may show bizarre patterns, axis shifts left or right, ST shift with tall T waves, eventually becomes a “sine wave” pattern
- hypokalemia
 - ST segment depression, prolonged QT interval, low T waves, prominent U waves ($U > T$)
 - enhances the toxic effects of digitalis
- hypercalcemia
 - shortened QT interval (more extracellular Ca^{2+} means shorter plateau in cardiac action potential)
- hypocalcemia
 - prolonged QT interval (less extracellular Ca^{2+} means longer plateau in cardiac action potential)

**Figure 11. Hyperkalemia****Figure 12. Hypokalemia**

Hypothermia

- sinus bradycardia
- when severe, prolonged QRS and QT intervals
- AFib with slow ventricular response and other atrial/ventricular dysrhythmias
- Osborne J waves: “hump-like” waves at the junction of the J point and the ST segment

Pericarditis

- early: diffuse ST segment elevation \pm PR segment depression, upright T waves
- later: isoelectric ST segment, flat or inverted T waves
- \pm tachycardia

Drug Effects

- digitalis
 - therapeutic levels may be associated with “digitalis effect”:
 - ST downsloping or “scooping”
 - T wave depression or inversion
 - QT shortening \pm U waves
 - slowing of ventricular rate in AFib
 - toxic levels associated with
 - arrhythmias: paroxysmal atrial tachycardia (PAT) with conduction block, severe bradycardia in AFib, accelerated junctional rhythms, PVCs, ventricular tachycardia (see *Arrhythmias*, C15)
 - “regularization” of ventricular rate in AFib due to a junctional rhythm and AV dissociation
- amiodarone, quinidine, phenothiazines, tricyclic antidepressants, antipsychotics, some antihistamines, some antibiotics: prolonged QT interval, U waves

Low Voltage

- Definition: total QRS height in precordial leads <10 mm and/or limb leads <5 mm
- Differential diagnosis
 - Myocardial disease
 - Ischemia
 - Cardiomyopathy (usually infiltrative type), myocarditis
 - Pericardial effusion
 - Thick chest wall/barrel chest: COPD, obesity
 - Generalized edema
 - Hypothyroidism/myxedema
 - Inappropriate voltage standardization

**Figure 13. Osborne J waves of a hypothermic patient**

Digitalis Side Effects

Palpitations, fatigue, visual changes (yellow vision), decreased appetite, hallucinations, confusion, and depression

Pacemakers

- Demand pacemaker has discharge (narrow vertical spike on ECG strip) prior to widened QRS
- Atrial pacemaker has discharge prior to P wave
- Triggered pacemaker has discharge following the P wave but prior to the widened QRS
- Atrial and ventricular pacing have discharge before the P wave and widened QRS wave

Figure 14. Atrial fibrillation, ST change due to digitalis ("digitalis effect")

Pulmonary Disorders

- cor pulmonale (often secondary to COPD)
 - low voltage, RAD, poor R wave progression
 - RAE and RVH with strain
 - multifocal atrial tachycardia (MAT)
- massive PE
 - sinus tachycardia and AFib/atrial flutter are the most common arrhythmias
 - RAD, RVH with strain – most specific sign is S1Q3T3 (S in I, Q and inverted T wave in III)

Alternative PQRSTU Approach to ECGs

Note: The information seen in this alternative approach – the PQRSTU Approach – is the same as the information in the Classical Approach. It is just organized in a slightly different way based on the Anatomy of the ECG.

PQRSTU approach to ECGs

P wave
P-R interval
QRS complex
ST segment
T wave
Q-T interval
U wave

Figure 15. ECG correlations with heart activity

P WAVE

- the P wave provides a view into the atria of the heart and represents atrial contraction
- the best leads to view the P waves are II and V1
- assess the P waves for rate (based on the P-P interval relative to the R-R interval), rhythm (rounded, flutter/sawtooth, fibrillation) and axis
- lead II: the P wave should be rounded, <120 msec and <2.5 mm in height
- lead V1: the P wave is biphasic with a negative phase slightly greater than the positive phase

Common P Wave Pathology

- atrial flutter: sawtooth P wave (HINT: flip the ECG upside-down to see it better if unclear)
- atrial fibrillation: absent P wave, may have fibrillatory wave, irregular rhythm
- right atrial enlargement: tall P wave (>2.5 mm) in II or V1 (P pulmonale)
- left atrial enlargement: negative deflection >1 mm deep or >1 mm wide in V1, wide (>120 msec) notched P wave in II (P mitrale)

P-R INTERVAL

- the P-R interval shows the delay between atrial and ventricular contraction that is mediated by the AV node; the magnitude of the delay is referred to as "dromotropy"
- positive dromotropy increases conduction velocity (e.g. epinephrine stimulation), negative dromotropy decreases velocity (e.g. vagal stimulation)
- P-R interval should be 120-200 msec
- long P-R interval (>200 msec)
 - heart block: first degree (fixed, prolonged P-R interval), second degree Mobitz I/Wenckebach (steadily prolonging to eventual dropped beat)
 - heart block
 - first degree: fixed, prolonged P-R interval
 - second degree Mobitz I/Wenckebach: steadily prolonging P-R interval to eventual dropped beat
 - second degree Mobitz II/Hay: fixed P-R interval with ratio of beat to dropped beat (e.g. for every 3 beats, there is one dropped beat [3:1])
 - third degree/complete: variable P-R intervals, P-P and R-R intervals individually constant but not in sync
 - atrial flutter
 - sinus bradycardia (normal to have long P-R if heart rate slow)
 - hypokalemia
 - trifascicular block
- short P-R interval (<120 msec)
 - pre-excitation syndrome (delta wave: upswinging of the P-R segment into the QRS complex indicating pre-excitation)
 - accessory pathways
 - WPW

QRS COMPLEX

- the QRS is where ventricular contraction is visualized
- rate: check the R-R interval to see if it matches the PP interval
- amplitude: check for hypertrophy (see Table 2, C7)
- narrow width (<120 msec) QRS means that the His-Purkinje system is being used
- wide width (>120 msec) QRS means that the His-Purkinje system is being bypassed or is diseased
 - BBB, VT, ventricular hypertrophy, cardiomyopathy, WPW, ectopic ventricular beat, hyperkalemia, drugs (e.g. TCAs, antiarrhythmics)
- Q wave: the first downward deflection of the QRS complex
 - significant Q wave: >40 msec or $>33\%$ of total QRS amplitude; indicate myocardial necrosis (new or historical)
- R and S wave abnormalities typically show pathology in terms of BBB or intraventricular abnormalities

ST SEGMENT

- one of the more famous ECG personas mostly due to its role in detecting MI
- located between QRS complex and the T wave
- corresponds to the completion of ventricular depolarization
- normally at the same level as "baseline/TP segment"
- ST elevation: at least 1 mm in 2 adjacent limb leads or at least 1-2 mm in adjacent precordial leads in STEMI (signifies occlusion and transmural ischemic injury) vs. diffuse pattern in early pericarditis
- ST depression: ischemia
 - ischemia which causes ST depression can result in myocardial damage (NSTEMI)
 - lateral wall ST depression (leads I, aVL, V5, V6) may actually indicate a STEMI in the right heart

T WAVE

- this is the repolarization phase of the ventricles (repolarization of the atria are obscured by the QRS complex)
- typically positive (except in aVR and V1) on ECG but normal isolated negative T waves may be present
- pathology when T wave variation occur in consecutive leads
 - inversion: BBB, ischemia, hypertrophy, drugs (e.g. digitalis), pulmonary embolism (lead III as part of S1Q3T3 sign)

Significant ECG Changes

- Look for ST changes starting at 60 msec from J point
- J point = the junction between the QRS complex and the ST segment
- ST elevation: at least 1 mm in 2 adjacent limb leads, or at least 1-2 mm in adjacent precordial leads
- ST depression: downsloping or horizontal
- Q Wave: pathological if Q wave ≥ 1 small square (≥ 40 msec) or $>33\%$ of the total QRS

Insignificant Q Wave

- Septal depolarization by the left bundle
- Seen in leads I, II, III, aVL, V5, V6
- <40 msec

Differential Diagnosis of ST Segment Changes

ST Elevation I HELP A PAL

Ischemia with reciprocal changes
Hypothermia (Osborne waves)
Early repolarization (normal variant, need old ECGs to confirm)
LBBB
Post-MI
Acute STEMI
Prinzmetal's (Vasospastic) angina
Acute pericarditis (diffuse changes)
Left/right ventricular aneurysm

ST Depression WAR SHIP

WPW syndrome
Acute NSTEMI
RBBB/LBBB
STEMI with reciprocal changes
Hypertrophy (LVH or RVH) with strain
Ischemia
Post-MI

- elevation: infarction (STEMI, Prinzmetal, hyperacute), hyperkalemia (wider, peaked)
- flattened: hypokalemia, pericarditis, drugs (e.g. digitalis), pericardial effusion
- variations: T wave alternans; beat-to-beat variations due to PVC overlap (R on T phenomenon which may precipitate VT or VFib)
- appropriate T wave discordance: in BBB, T wave deflection should be opposite to that of the terminal QRS deflection (i.e. T wave negative if ends with R or R'; positive if ends with S)
 - inappropriate T wave concordance suggests ischemia or infarction

Q-T INTERVAL

- this represents the duration of ventricular depolarization and repolarization and is often difficult to interpret
- corrected QT (QTc) is often used instead in practice to correct for the repolarization duration; $QTc = QT \div \sqrt{RR}$
- normal QTc is 360-450 msec for males and 360-460 for females
 - increased (>450 msec for males and >460 for females): risk of Torsades de Pointes (a lethal tachyarrhythmia)
 - ♦ genetic Long QT Syndrome (often a channelopathy)
 - ♦ drugs: antibiotics, SSRIs, antipsychotics, antiarrhythmics
 - ♦ electrolytes: low Ca^{2+} , low Mg^{2+} , low K^{+}
 - ♦ others: hypothyroidism, hypothermia, cardiomyopathy
 - decreased (<360 msec): risk of VFib
 - ♦ electrolytes: high Ca^{++}
 - ♦ drugs: digoxin
 - ♦ others: hyperthyroidism

U WAVE

- origin unclear but may be repolarization of Purkinje fibers or delayed/prolonged repolarization of the myocardium
- more visible at slower heart rates
- deflection follows T wave with <25% of the amplitude
- variations from norm could indicate pathologic conditions:
 - prominent (>25% of T wave): electrolyte (low K^{+}), drugs (digoxin, antiarrhythmics)
 - inverted (from T wave): ischemia, volume overload

Cardiac Biomarkers

- provide diagnostic and prognostic information in acute coronary syndromes and in heart failure

Table 4. Cardiac Enzymes

Enzyme	Peak	Duration Elevated	DDx of Elevation
Troponin I, Troponin T	1-2 d	Up to 2 wk	MI, CHF, AFib, acute PE, myocarditis, chronic renal insufficiency, sepsis, hypovolemia
CK-MB	1 d	3 d	MI, myocarditis, pericarditis, muscular dystrophy, cardiac defibrillation, chronic renal insufficiency, etc.

- check troponin I at presentation and 8 h later \pm creatine kinase-MB (CK-MB; depends on local laboratory protocol)
- new CK-MB elevation can be used to diagnose re-infarction
- other biomarkers of cardiac disease
 - AST and LDH also increased in MI (low specificity)
 - BNP and NT-proBNP: secreted by ventricles in response to increased end-diastolic pressure and volume
 - ♦ DDx of elevated BNP: CHF, AFib, PE, COPD exacerbation, pulmonary HTN

Ambulatory ECG

- indications for outpatient testing: palpitations, syncope, antiarrhythmic drug monitoring, arrhythmia surveillance in patients with documented or potentially abnormal rhythms, and surveillance of non-sustained arrhythmias that can lead to prophylactic intervention
- available technologies
 - Holter monitor
 - ♦ battery operated, continually records up to 3 leads for 24-48 h
 - ♦ symptoms recorded by patient on Holter clock for correlation with ECG findings
 - continuous loop recorder (diagnostic yield 66-83%)
 - ♦ worn continuously and can record data before and after patient activation for symptomatic episodes (usually worn for 2 wk)

Figure 16. Cardiac enzymes

Use of B-Type Natriuretic Peptide in the Evaluation and Management of Acute Dyspnea (BASEL)

NEJM 2004;350:647-654

Study: Prospective, RCT.

Population: 452 patients (mean age 71 yr, 58% male) with acute dyspnea; patients with severe renal disease or cardiogenic shock were excluded.

Intervention: Assessment including measurement of B-type natriuretic peptide or standard assessment.

Outcome: Time to discharge and total cost of treatment.

Results: Median time to discharge was significantly shorter in the intervention group when compared with the control group (8.0 vs. 11.0 d, $p=0.001$). Total cost was also significantly lower in the intervention group (\$5,410 vs. \$7,264, $p=0.006$). In addition, the measurement of B-type natriuretic peptide significantly reduced the need for admission to hospital and intensive care. The 30-d mortality rates were similar (10% vs. 12%, $p=0.45$).

Conclusions: In patients with acute dyspnea, measurement of B-type natriuretic peptide improves clinical outcomes (need for hospitalization or intensive care) and reduces time to discharge and total cost of treatment.

- external and implantable devices
 - ♦ external devices can be transtelephonically downloaded
 - ♦ implantable loop recorder (ILR): cannot be transtelephonically downloaded; left in place for 14 to 18 mo

Echocardiography

Transthoracic Echocardiography

- ultrasound beams are directed across the chest wall to obtain images of the heart
- indications: evaluation of LVEF, wall motion abnormalities, myocardial ischemia and complications of MI, chamber size, wall thickness, valve morphology, proximal great vessel morphology, pericardial effusion, unexplained hypotension, murmurs, syncope, congenital heart disease
- use with Doppler to quantify degree of valvular stenosis or regurgitation

Transoesophageal Echocardiography

- ultrasound probe inserted into the esophagus to allow for better resolution of the heart and structures
- better visualization of posterior structures, including left atrium, mitral and aortic valves, interatrial septum
- invasive procedure used to complement transthoracic echocardiography
- indications: intracardiac thrombi, tumors, valvular vegetations (infective endocarditis), aortic dissection, aortic atheromas, prosthetic valve function, shunt, technically inadequate transthoracic study
- use with Doppler to quantify degree of valvular stenosis or regurgitation

Stress Echocardiography

- echocardiography in combination with either physiologic (exercise treadmill or bike testing) or pharmacologic (dobutamine infusion) stress
- validated in demonstrating myocardial ischemia and assessing viability
- provides information on the global left ventricular response to exercise
- used for valvular heart disease evaluation

Contrast Echocardiography

- contrast agents injected into the bloodstream to improve imaging of the heart
- conventional agent: agitated saline (contains microbubbles of air)
- allows visualization of right heart and intracardiac shunts, most commonly patent foramen ovale (PFO) and sometimes intrapulmonary shunt
- newer contrast agents are capable of crossing the pulmonary bed and achieving left heart opacification following intravenous injection; these contrast agents improve visualization of endocardial borders and enhance evaluation of LV ejection fraction, wall motion abnormalities, and intracardiac mass

Stress Testing

EXERCISE TESTING

- cardiovascular stress test that uses treadmill or bicycle exercise with electrocardiographic and blood pressure monitoring
- guidelines for use
 - patients with intermediate (10-90%) pretest probability of CAD based on age, gender, and symptoms
 - ST depression <1 mm at rest, no left bundle branch block, no digoxin or estrogen use
- exercise test results stratify patients into risk groups
 - low risk patients can be treated medically without invasive testing
 - intermediate risk patients may need additional testing in the form of exercise imaging studies or cardiac catheterization
 - high risk patients should be referred for cardiac catheterization

Indications for Terminating Exercise Stress Test

- drop in systolic blood pressure of >10 mmHg from baseline despite an increase in workload, when accompanied by other evidence of ischemia
- moderate to severe angina
- ST elevation (>1 mm) in leads without diagnostic Q-waves (other than V1 or aVR)
- increasing nervous system symptoms (e.g. ataxia, dizziness, or near syncope)
- signs of poor perfusion (cyanosis or pallor)
- technical difficulties in monitoring ECG or systolic blood pressure
- patient's desire to stop
- sustained ventricular tachycardia

Most Commonly Used Treadmill Stress Test Protocols

- **The Bruce Protocol:** 7 stage test with each stage lasting 3 min. With each successive stage, the treadmill increases in both speed (2.7 km/h to 9.6 km/h) and grade (10% with a 2% increase per stage up to 22%)
- **The Modified Bruce, Modified Naughton Protocol:** for older individuals or those with limited exercise capacity

Important Contraindications to Exercise Testing

- Acute MI, aortic dissection, pericarditis, myocarditis, PE
- Severe AS, arterial HTN
- Inability to exercise adequately

Interpretation

- the most commonly used ECG criteria for a positive exercise test: ≥ 1 mm of horizontal or downsloping ST-segment depression or elevation (at least 60-80 msec after the end of the QRS complex)

NUCLEAR CARDIOLOGY

- myocardial perfusion imaging (MPI) with ECG-gated single photon emission computed tomography (SPECT), using radiolabelled tracer
- evaluates myocardial viability, detects ischemia, and assesses perfusion and LV function simultaneously
- predicts the likelihood of further cardiac event rates independent of the patient's history, examination, resting ECG, and stress ECG
- often denoted as MIBI scan with reference to radiolabelled tracer (sestamibi)
- stress with either treadmill or IV vasodilator stress (dipyridamole [Persantine[®]], adenosine)
- images of the heart obtained during stress and at rest 3-4 h later
 - fixed defect: impaired perfusion at rest and during stress (infarcted/hibernating)
 - reversible defect: impaired perfusion only during stress (ischemic)
- tracers
 - thallium-201 (²⁰¹Tl, a K⁺ analogue)
 - technetium-99 (⁹⁹Tc)-labelled tracer (sestamibi/Cardiolite[®] or hexamibi/Myoview[®])

STRESS ECHOCARDIOGRAPHY

- see *Stress Echocardiography*, C12

INDICATIONS FOR STRESS TESTING

- exercise ECG
 - initial evaluation in patients who are able to exercise
- exercise stress echo
 - when ECG is uninterpretable
 - intermediate pre-test probability with normal/equivocal exercise ECG
 - post-ACS when used to decide on potential efficacy of revascularization
 - to evaluate the clinical significance of valvular heart disease
- dobutamine stress echo (DSE)
 - pharmacologic stress for patients who are physically unable to exercise; same indications as exercise stress echo
 - low dose DSE can be used to assess myocardial viability and for assessing aortic stenosis with LV systolic dysfunction
- exercise MPI
 - when ECG is uninterpretable
 - intermediate pre-test probability with normal/equivocal exercise ECG
 - in patients with previous imaging whose symptoms have changed
 - to diagnose ischemia
- dipyridamole/adenosine MPI
 - to diagnose CAD in possible ACS patients with non-diagnostic ECG and negative serum biomarkers
 - when ECG is uninterpretable due to LBBB or V-paced rhythm
 - among patients unable to exercise, with the same indications as exercise MPI

**Important Prognostic Factor
Duke Treadmill Score (DTS)****Weighted Index Score:**

- Treadmill exercise time using standard Bruce protocol
- Maximum net ST segment deviation (depression or elevation)
- Exercise-induced angina provides diagnostic and prognostic information (such as 1 yr mortality)

DTS = exercise time – (5 x MaxST) – (4 x angina index)

Angina index: 0 (no angina), 1 (angina but not exercise-limiting), 2 (exercise-limiting angina)

DTS ≥ 5 : 0.25% 1 yr mortality

DTS 4 to -10: 1.25% 1 yr mortality

DTS ≤ -11 : 5.25% 1 yr mortality

Ann Intern Med 1987;106:793-800

Patients with normal imaging (nuclear perfusion or stress echo) studies at peak stress have a <1%/yr incidence of death or nonfatal MI and are thus often spared further invasive evaluation

Cardiac Catheterization and Angiography

- risks of procedure related complications: vascular injury (including dissection), renal failure, stroke, MI
- mortality rate 0.1-0.2%
- invasive: catheters are introduced percutaneously into arterial and venous circulation under conscious sedation and contrast is injected
- arterial access most commonly through the femoral artery; radial approach gaining favor especially for obese patients and outpatients dependent on driving and ambulation
- venous access through the femoral vein or internal jugular vein (for patients also undergoing right heart catheterization)
- same day procedure as outpatient
 - indications for prehospitalization: anticoagulation, renal failure, diabetes, contrast allergy
- catheterization permits direct measurement of intracardiac pressures, transvalvular and mean peak pressure gradients, valve areas, cardiac output, shunt data, oxygen saturations, and visualization of coronary arteries, cardiac chambers, and great vessels
- angiography may provide valuable information regarding lesion severity, complexity, location, and prognosis

Right Heart Catheterization (Swan-Ganz Catheter)

- right atrial, right ventricular, and pulmonary artery pressures are recorded
- can also be used to measure the Cardiac Index (CI)
 - $CI = CO / \text{Body Surface Area}$
 - cardiac index is a measure of cardiac function
 - ♦ $<1.8 \text{ L/min/m}^2$ usually means cardiogenic shock
 - ♦ $2.6\text{--}4.2 \text{ L/min/m}^2$ is considered normal
- pulmonary capillary wedge pressure (PCWP)
 - obtained by advancing the catheter to wedge in the distal pulmonary artery
 - ♦ records pressure measured from the pulmonary venous system
 - ♦ in the absence of pulmonary venous disease reflects left atrial pressure

Figure 17. Swan-Ganz catheter placement

Left Heart Catheterization

- systolic and end-diastolic pressure tracings recorded
- LV size, wall motion and ejection fraction can be assessed by injecting contrast into the LV (left ventriculography) via femoral/radial artery catheterization
- cardiac output (measured by the Fick oxygen method or the indicator dilution method)

Coronary Angiography

- coronary vasculature accessed via the coronary ostia
- contraindicated in severe renal failure (due to contrast agent toxicity) – must check renal status

Figure 18. Coronary angiogram schematic

AM = acute marginal; LAD = left anterior descending; OM = obtuse marginal; RCA = right coronary artery

Chambers	Pressure (systolic; mmHg)
Right atrium/central venous	1-8
Right ventricle	1-8 (15-30)
Pulmonary artery	4-12 (15-30)
Left atrium/pulmonary capillary wedge	4-12
Left ventricle end diastolic	4-12

ACC/AHA 2011 Recommended Indications for Coronary Angiography

- Disabling (CCS classes III and IV) chronic stable angina despite medical therapy
- High-risk criteria on clinical assessment or non-invasive testing
- Serious ventricular arrhythmia or CHF
- Uncertain diagnosis or prognosis after non-invasive testing
- Inability to undergo non-invasive testing

Coronary Angiography

Gold standard for localizing and quantifying CAD

Hemodynamically significant stenosis is defined as 70% or more narrowing of the luminal diameter

Diagnostic Catheterization

- complications for diagnostic catheterization <1%
- inadequate diagnostic procedures occur in fewer than 1% of cases
- provocative pharmacological agents can be used to unmask pathology
 - fluid loading may unmask latent pericardial constriction
 - afterload reduction or inotropic stimulation may be used to increase the outflow tract gradient in HCM
 - coronary vasoreactive agents (e.g. methylergonovine, acetylcholine)
 - a variety of pulmonary vasoreactive agents in primary pulmonary HTN (e.g. oxygen, calcium channel blockers, adenosine, nitric oxide, or prostacyclin)

Contrast-Enhanced CT Coronary Angiography

- fast ECG-synchronized multi-slice CT image acquisition in the heart has enabled non-invasive imaging of the coronary arterial tree
- often used to assess coronary artery and previous graft stenosis/viability that could not be seen during coronary angiography
- sensitivity = 85%, specificity = 90% for the diagnosis of obstructive coronary disease with >50% stenosis

Magnetic Resonance Imaging

- offers high spatial resolution, eliminates the need for iodinated contrast, and does not involve exposure to ionizing radiation
- valuable in assessment of congenital cardiac anomalies, abnormalities of the aorta, and assessment of viable myocardium

CARDIAC DISEASE**Arrhythmias****Mechanisms of Arrhythmias****(I) Alterations in Impulse Formation****A. Abnormal Automaticity**

- automaticity is a property of certain cardiomyocytes to spontaneously depolarize to their threshold voltage to generate action potentials in a rhythmic fashion
- under normal circumstances only cells in the specialized conduction system (SA node, AV node, and ventricular conduction system) exhibit natural automaticity. These cells are pacemaking cells. The automaticity of these cells can become abnormally increased or decreased
- in disease (e.g. post-MI ventricular ischemia) cells in the myocardium outside the conduction system may inappropriately acquire the property of automaticity and contribute to abnormal depolarization. If these ectopic generators depolarize at a rate that is greater than the SA node, they assume pacemaking control and become the source of abnormal rhythm
- automaticity can be influenced by:
 - ♦ neurohormonal tone (sympathetic and parasympathetic stimulation)
 - ♦ abnormal metabolic conditions (hypoxia, acidosis, hypothermia)
 - ♦ electrolyte abnormalities
 - ♦ drugs (e.g. digitalis)
 - ♦ local ischemia/infarction
 - ♦ other cardiac pathology
- this mechanism is responsible for the accelerated idioventricular rhythm and ventricular tachycardia that often occurs 24-72 h post MI

B. Triggered Activity due to Afterdepolarizations**1. Early Afterdepolarizations**

- occur in the context of action potential prolongation
- consequence of the membrane potential becoming more positive during repolarization (e.g. not returning to baseline)
- result in self-maintaining depolarizing oscillations of action potential, generating a tachyarrhythmia (e.g. new baseline voltage is greater than threshold, which automatically triggers a new action potential after the refractory period ends)
- basis for the degeneration of QT prolongation, either congenital or acquired, into Torsades de Pointes

2. Delayed Afterdepolarizations

- occur after the action potential has fully repolarized, but before the next usual action potential, thus called a delayed afterdepolarization
- commonly occurs in situations of high intracellular calcium (digitalis intoxication, ischemia) or during enhanced catecholamine stimulation (e.g. "twitchy" pacemaker cells)

(II) Alterations in Impulse Conduction

A. Re-Entry Circuits

- the presence of self-sustaining re-entry circuit causes rapid repeated depolarizations in a region of myocardium (see Figure 26, C21, for an example in the context of AV nodal re-entrant tachycardia)
 - e.g. myocardium that is infarcted/ischemic will consist of non-excitable and partially excitable zones which will promote the formation of re-entry circuits

B. Conduction Block

- ischemia, fibrosis, trauma, and drugs can cause transient, permanent, unidirectional or bidirectional block
- most common cause of block is due to refractory myocardium (cardiomyocytes are in refractory period or zone of myocardium unexcitable due to fibrosis)
- if block occurs along the specialized conduction system distal zones of the conduction system can assume pacemaking control
- conduction block can lead to bradycardia or tachycardia when impaired conduction leads to re-entry phenomenon

C. Bypass Tracts

- normally the only conducting tract from the atria to the ventricles is the AV node into the His-Purkinje system
- congenital/acquired accessory conducting tracts bypass the AV node and facilitate premature ventricular activation before normal AV node conduction
- see *Pre-Excitation Syndromes*, C21

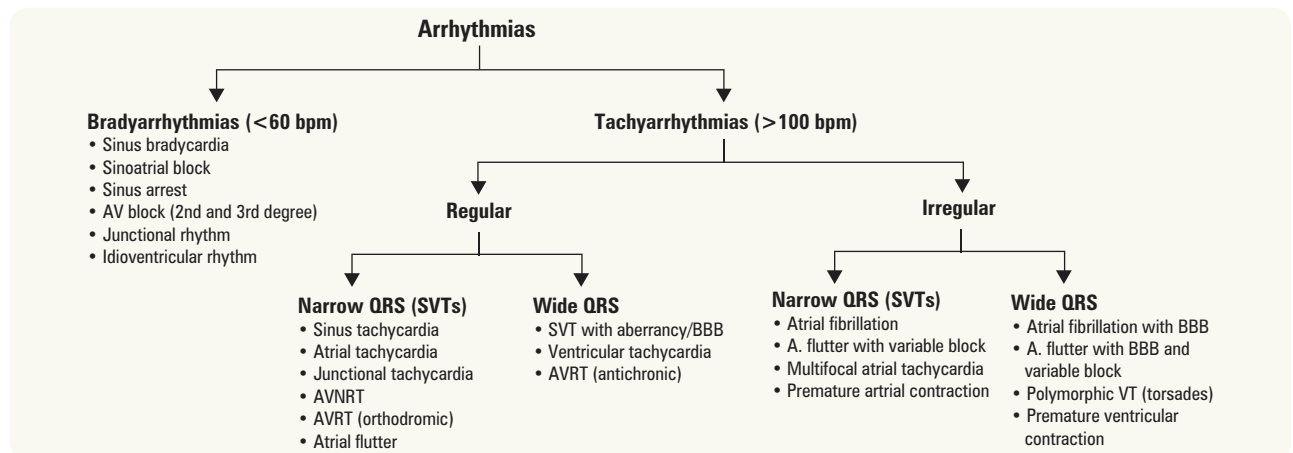

Figure 19. Clinical approach to arrhythmias

Bradyarrhythmias

SA NODAL DYSFUNCTION

Sinus Bradycardia

- P axis normal (P waves positive in I and aVF)
- rate <60 bpm
- marked sinus bradycardia (<50 bpm) may be seen in normal adults, particularly athletes, and in elderly individuals
- caused by
 - increased vagal tone or vagal stimulation
 - vomiting
 - episodes of myocardial ischemia or infarction (inferior MI)
 - sick sinus syndrome
 - increased intracranial pressure
 - hypothyroidism
 - hypothermia
 - drugs (β-blockers, calcium channel blockers, etc.)

Bradyarrhythmias
• Examples

- treatment: if symptomatic, atropine during acute episodes; pacing for sick sinus syndrome; if drug-induced, reduction or withdrawal of drugs

Sinus Block, Pause, and Arrest

- three disorders involving the SA node in which the sinus pacemaker fires but the impulse fails to depolarize the atrial myocardium resulting in no initial P wave (and consequently no QRS complex, ST segment, or T wave)
- sinus block (SA block): a complete block or failure of the sinus node to depolarize the atria; the block can last one or more cardiac cycles and is a multiple of the normal P-P interval
- sinus pause: a delay in the formation of a sinus impulse in the SA node resulting in a temporary pause (usually >3 s)
- sinus arrest: a longer delay in the formation of a sinus impulse in the SA node
 - there is no clear cut-off between sinus pause vs. arrest – if the pause lasts greater than 3x the normal P-P interval then it may be called an arrest
 - the P-P prolongation is not phasic or gradual (unlike sinus arrhythmia) and is not a multiple of the normal P-P interval (unlike sino-atrial block)
- escape beats or rhythm may occur:
 - atrial escape: P waves with abnormal morphology
 - junctional escape: P waves not seen, or follow the QRS (retrograde P), rate 40-60 bpm
 - ventricular escape: no P wave; wide, abnormal QRS; slow rate 20-40 bpm

Sick Sinus Syndrome

- characterized by sinus node dysfunction (marked bradycardia, sinus pause/arrest, sinoatrial block), mainly in the elderly
 - when symptomatic, electronic pacemaker is indicated
- frequently associated with episodes of atrial tachyarrhythmias (“tachy-brady syndrome”)
- usually require a combination of a pacemaker for bradycardia and medications (β-blocker, calcium channel blocker, and/or digoxin, initiated after pacemaker insertion) for tachycardia

Sinus Arrhythmia (SA)

- Normal P waves, with variation of the P-P interval by >120 msec due to varying rate of SA node

Respiratory SA

- Seen more often in young adults (<30 yr old)
- Normal, results from changes in autonomic tone during respiratory cycle
- Rate increases with inspiration, slows with expiration

Non-Respiratory SA

- Seen more often in the elderly
- Can occur in the normal heart; if marked may be due to sinus node dysfunction (e.g. in heart disease, or after digitalis toxicity)
- Usually does not require treatment

AV Conduction Blocks

First Degree AV Block

- prolonged PR interval (>200 msec)
- frequently found among otherwise healthy adults
- no treatment required

Second Degree AV Block

- some of the atrial impulses are not conducted to the ventricles
- can describe block by ratio of number of P waves to number of QRS (e.g. 2:1, 3:1, 4:1 increases in severity)
- second degree AV block is further subdivided into Type I and Type II block:
 - Type I (Mobitz I) second degree AV block
 - ♦ a gradual prolongation of the PR interval precedes the failure of conduction of a P wave (Wenckebach phenomenon)
 - ♦ AV block is usually in AV node (proximal)
 - triggers (usually reversible): increased vagal tone (e.g. following surgery), RCA-mediated ischemia
 - not an indication for temporary or permanent pacing

Figure 20. Second degree AV block with Wenckebach phenomenon (Mobitz I) (4:3 conduction) (lead V₁)

- Type II (Mobitz II) second degree AV block
 - ♦ the PR interval is constant; there is an abrupt failure of conduction of a P wave
 - ♦ AV block is usually distal to the AV node (i.e. bundle of His)
 - ♦ increased risk of high grade or 3rd degree AV block

Figure 21. Second degree AV block (Mobitz II) (3:2 conduction) (lead V₁)

2:1 AV Block

- often not possible to determine whether the block is type I or type II
- prolonged or repeated recordings may clarify the diagnosis

Figure 22. 2:1 AV block (lead II)

Third Degree AV Block

- complete failure of conduction of the supraventricular impulses to the ventricles
- ventricular depolarization initiated by an escape pacemaker distal to the block
- QRS can be narrow or wide (junctional vs. ventricular escape rhythm)
- P-P and R-R intervals are constant, variable PR intervals
- no relationship between P waves and QRS complexes (P waves “marching through”)
- management (see *Electrical Pacing*, C24)

Figure 23. Third degree AV block (complete heart block) (lead II)

Supraventricular Tachyarrhythmias

Tachyarrhythmias
• Examples

Presentation for SVT (and pre-excitation syndromes)

- presentation can include: palpitations, dizziness, dyspnea, chest discomfort, presyncope/syncope
- may precipitate CHF, hypotension, or ischemia in patients with underlying disease
- untreated tachycardias can cause cardiomyopathy (rare, potentially reversible with treatment of SVTs)
- includes supraventricular and ventricular rhythms

Supraventricular Tachyarrhythmias

- tachyarrhythmias that originate in the atria or AV junction
- this term is used when a more specific diagnosis of mechanism and site of origin cannot be made
- characterized by narrow QRS, unless there is pre-existing bundle branch block or aberrant ventricular conduction (abnormal conduction due to a change in cycle length)

Sinus Tachycardia

- sinus rhythm with rate >100 bpm
- occurs in normal subjects with increased sympathetic tone (exercise, emotions, pain), alcohol use, caffeinated beverages, drugs (e.g. β -adrenergic agonists, anticholinergic drugs, etc.)
- etiology: fever, hypotension, hypovolemia, anemia, thyrotoxicosis, CHF, MI, shock, PE, etc.
- treatment: treat underlying disease; consider β -blocker if symptomatic, calcium channel blocker if β -blockers contraindicated

Premature Beats

- premature atrial contraction
 - ectopic supraventricular beat originating in the atria
 - P wave morphology of the PAC usually differs from that of a normal sinus beat
- junctional premature beat
 - ectopic supraventricular beat that originates in the vicinity of the AV node
 - P wave is usually not seen or an inverted P wave is seen and may be before or closely follow the QRS complex (referred to as a retrograde, or “traveling backward” P wave)
- treatment usually not required

Atrial Flutter

- rapid, regular atrial depolarization from a macro re-entry circuit within the atrium (most commonly the right atrium)
- atrial rate 250-350 bpm, usually 300 bpm
- AV block usually occurs; it may be fixed (2:1, 3:1, 4:1, etc.) or variable
- etiology: CAD, thyrotoxicosis, mitral valve disease, cardiac surgery, COPD, PE, pericarditis
- ECG: sawtooth flutter waves (most common type of flutter) in inferior leads (II, III, aVF); narrow QRS (unless aberrancy); commonly see HR of 150

Figure 24. Atrial flutter with variable block

- in atrial flutter with 2:1 block, carotid sinus massage (first check for bruits), Valsalva maneuver, or adenosine may decrease AV conduction and bring out flutter waves
- treatment of acute atrial flutter
 - acute and if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
 - if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
 - if stable
 - (1) rate control: β -blocker, diltiazem, verapamil, or digoxin
 - (2) chemical cardioversion: sotalolol, amiodarone, type I antiarrhythmics, or electrical cardioversion
 - anticoagulation guidelines same as for patients with AFib
- treatment of long-term atrial flutter: antiarrhythmics, catheter radiofrequency (RF) ablation (success rate dependent on site of origin of atrial flutter – i.e. whether right-sided isthmus-dependent or left-sided origin)

Multifocal Atrial Tachycardia

- irregular rhythm caused by presence of 3 or more atrial foci (may mimic AFib)
- atrial rate 100-200 bpm – at least 3 distinct P wave morphologies and PR intervals vary, some P waves may not be conducted
- occurs more commonly in patients with COPD, and hypoxemia; less commonly in patients with hypokalemia, hypomagnesemia, sepsis, theophylline, or digitalis toxicity
- treatment: treat the underlying cause; calcium channel blockers may be used (e.g. diltiazem, verapamil), β -blockers may be contraindicated because of severe pulmonary disease
- no role for electrical cardioversion, antiarrhythmics, or ablation

Atrial Fibrillation

- see 2014 AHA/ACC/HRS guideline for the management of patients with atrial fibrillation for details
- most common sustained arrhythmia
- incidence increases with age (10% of population >80 yr old)
- symptoms: palpitations, fatigue, syncope, may precipitate or worsen heart failure
- classification
 - chronic/permanent: continuous atrial fibrillation that is unresponsive to cardioversion; cardioversion will not be reattempted
 - persistent: atrial fibrillation sustained for more than 7 d or atrial fibrillation that terminates only with cardioversion
 - paroxysmal: episodes that terminate spontaneously or with intervention within 7 d of onset; may recur with variable frequency
 - nonvalvular: not caused by valvular disease, prosthetic heart valves, or valve repair
 - secondary: caused by a separate underlying condition or event (e.g. myocardial infarction, cardiac surgery, pulmonary disease, hyperthyroidism)
 - may be associated with thromboembolic events (stroke risk can be assessed by CHADS2 score in nonvalvular AFib)
- initiation
 - single circuit re-entry and/or ectopic foci act as aberrant generators producing atrial tachycardia (350-600 bpm)
 - impulses conduct irregularly across the atrial myocardium to give rise to fibrillation
 - in some cases, ectopic foci have also been mapped to the pulmonary vein ostia and can be ablated
- maintenance
 - the tachycardia causes atrial structural and electrophysiological remodelling changes that further promote AFib; the longer the patient is in AFib the more difficult it is to convert back to sinus rhythm
- consequences
 - the AV node irregularly filters incoming atrial impulses producing an irregular ventricular response of <200 bpm and the tachycardia leads to suboptimal cardiac output
 - fibrillatory conduction of the atria promotes blood stasis increasing the risk of thrombus formation – AFib is an important risk factor for stroke

Table 5. CHADS2 Risk Prediction for Non-Valvular AFib and Refer to AHA/ACC/HRS AFib Guidelines 2014 for more details

Risk Factor	Points	CHADS2 Score	Stroke Risk (%/Yr)	Anticoagulation Recommendation
Congestive Heart Failure	1	0	1.9 (low)	ASA 81-325 mg OD
HTN	1	1	2.8 (low-mod)	oral anticoagulants*
Age >75	1	2-3	4.0-5.9 (mod)	oral anticoagulants*
Diabetes	1	4-6	8.5-18.2 (high)	oral anticoagulants*
Stroke/TIA (prior)	2			

JAMA 2001;285:2864-70 and Can J Cardiol 2012;28:125-136

Oral anticoagulants *currently includes warfarin (INR 2-3) and direct oral anticoagulants (DOACs) e.g. apixaban, dabigatran, rivaroxaban

CHA2DS2-VASc Score

The European Society of Cardiology (ESC) and the Canadian Cardiovascular Society (CCS) have incorporated the Birmingham 2009 schema (CHA2DS2-VASc) for the prediction of stroke risk in latest guidelines. The CHADS2 (Table 5) score is to be applied first; followed by the VASc schema if the score is <2 to further grade the risk of stroke in patients at low risk. A score of 0 indicates the patient is very low risk of stroke and may require either ASA alone or no antithrombotic therapy, with the latter preferred. A score of 1 indicates the utility of either ASA or an oral anticoagulant, with the latter preferred. A patient with a score of ≥ 2 should receive an oral anticoagulant. For more information, please see Focused 2012 Update of the CCS AFib Guidelines, Can J Cardiol 2012;28:125-136.

Rivaroxaban for Stroke Prevention in AFib – ROCKET-AF Trial

NEJM 2011;365:883-891

Study: Prospective, non-inferiority, double blind, RCT, median follow-up of 1.9 yr.

Population: 14,264 patients with AFib (mean CHADS2 = 3.5). Patients either had previous thromboembolism or ≥ 3 risk factors.

Intervention: Patients were randomized to receiving rivaroxaban or warfarin.

Outcome: Composite of strokes and systemic thromboembolic event (STE).

Results: The hazard ratio of the primary outcome for rivaroxaban compared to warfarin was 0.88; 95% CI 0.74-1.03; $p < 0.001$ for noninferiority; $p = 0.12$ for superiority. Furthermore, the hazard ratio for major and non-major, but clinically relevant, bleeding was 1.03; 95% CI 0.96-1.11; $p = 0.44$. There were also significant reductions in intracranial hemorrhage (0.5% vs. 0.7%, $p = 0.02$) and fatal bleeding (0.2% vs. 0.5%, $p = 0.003$) for rivaroxaban.

Conclusions: In patients with AFib, rivaroxaban is non-inferior to warfarin for stroke prevention and major and non-major bleeding.

AFib on ECG

- no organized P waves due to rapid atrial activity (350-600 bpm) causing a chaotic fibrillatory baseline
- irregularly irregular ventricular response (typically 100-180 bpm), narrow QRS (unless aberrancy or previous BBB)
- wide QRS complexes due to aberrancy may occur following a long-short cycle sequence ("Ashman phenomenon")
- loss of atrial contraction, thus no "a" wave seen in JVP, no S4 on auscultation

**Figure 25. Atrial fibrillation (lead II)****Management**

Major objectives (RACE): all patients with AF (paroxysmal, persistent, or permanent), should be stratified using a predictive index for stroke risk and for the risk of bleeding, and most patients should receive either an oral anticoagulant or ASA (see Table 5)

1. **Rate control:** β -blockers, diltiazem, verapamil (in patients with heart failure: digoxin, amiodarone)
2. **Anticoagulation:** use either warfarin or direct oral anticoagulant (DOACs) e.g. apixaban, dabigatran, rivaroxaban, to prevent thromboembolism
3. **Cardioversion (electrical)**
 - if AFib <24-48 h, can usually cardiovert without anticoagulation if at low thromboembolic risk
 - if AFib >24-48 h, anticoagulate for 3 wk prior and 4 wk after cardioversion due to risk of unstable intra-atrial thrombus
 - if patient unstable (hypotensive, active angina due to tachycardia, uncontrolled heart failure) should cardiovert immediately
4. **Etiology**
 - HTN, CAD, valvular disease, pericarditis, cardiomyopathy, myocarditis, ASD, post-operative, PE, COPD, thyrotoxicosis, sick sinus syndrome, alcohol ("holiday heart")
 - may present in young patients without demonstrable disease ("lone AFib") and in the elderly without underlying heart disease

Additional Management Points Regarding AFib

- studies of patients with AFib suggest that there is no difference in long-term survival when treating patients with a rhythm-control vs. rate-control strategy
- however, many patients with a significant underlying structural heart lesion (e.g. valve disease, cardiomyopathy) will not tolerate AFib well (since may be dependent on atrial kick) and these patients should be cardioverted (chemical or electrical) as soon as possible

Newly Discovered AFib

- anticoagulants may be beneficial if high risk for stroke
- if the episode is self-limited and not associated with severe symptoms, no need for antiarrhythmic drugs
- if AFib persists, 2 options
 1. rate control and anticoagulation (as indicated above)
 2. cardioversion (as above)

Recurrent AFib/Permanent AFib

- if episodes are brief or minimally symptomatic, antiarrhythmic drugs may be avoided; rate control and anticoagulation are appropriate
- patients who have undergone at least one attempt to restore sinus rhythm may remain in AFib after recurrence; permanent AFib may be accepted (with rate control and antithrombotics as indicated by CHADS2 score) in certain clinical situations
- if symptoms are bothersome or episodes are prolonged, antiarrhythmic drugs should be used
 - no or minimal heart disease: flecainide, propafenone, or sotalol
 - LV dysfunction: amiodarone
 - CAD: β -blockers, amiodarone

AV Nodal Re-Entrant Tachycardia

- re-entrant circuit using dual pathways (fast conducting β -fibers and slow conducting α -fibers) within or near the AV node; often found in the absence of structural heart disease – cause is commonly idiopathic, although familial AVNRT has been reported
- sudden onset and offset
- fast regular rhythm: rate 150-250 bpm
- usually initiated by a supraventricular or ventricular premature beat

**Atrial Fibrillation – AFFIRM Trial**

NEJM 2002;347:1825-1833

Study: Randomized, multicenter trial with mean follow-up of 3.5 yr.

Population: 4,060 patients (mean age 70 yr, 61% male, 89% white) with AF and a high risk of stroke or death.

Intervention: Rate control (β -blockers, calcium channel blockers, or digoxin alone or in combination) vs. rhythm control (antiarrhythmic drug chosen by the treating physician).

Primary Outcome: All cause mortality.

Results: There was no difference in mortality or disabling stroke, anoxic encephalopathy, major bleeding, and cardiac arrest between the two groups. There were more incidents of hospitalizations (80.1% vs. 73%, $p < 0.001$) and adverse events (Torsades de Pointes (12 vs. 2, $p = 0.007$), pulseless or bradycardic arrest (9 vs. 1, $p = 0.01$), pulmonary event (108 vs. 24, $p < 0.001$), gastrointestinal event (127 vs. 35, $p < 0.001$), prolonged QT interval (31 vs. 4, $p \leq 0.001$), bradycardia (105 vs. 64, $p = 0.001$) in the rhythm-control group.

Conclusion: Rate-control was as effective as rhythm-control in AF and was better tolerated. There were more hospitalization incidents in the rhythm-control group.

**Oral Anticoagulants vs. Antiplatelet Therapy for Preventing Stroke in Patients with Non-Valvular Atrial Fibrillation and No History of Stroke or Transient Ischemic Attacks**

Cochrane DB Syst Rev 2009;3:CD006186

Study: Cochrane DB Syst Rev 8 RCTs with mean 1.9 yr of follow-up.

Population: 9,598 total patients with non-valvular AF and no history of stroke or transient ischemic attack.

Intervention: Long-term adjusted-dose warfarin vs. ASA (dose ranging from 75-325 mg).

Outcome: All cause mortality, all stroke, vascular death, MIs.

Results: Dose-adjusted warfarin therapy significantly reduced all stroke (OR 0.68, 95% CI 0.54-0.85), ischemic stroke (OR 0.53, 95% CI 0.41-0.68), and systemic emboli risk (OR 0.48, 95% CI 0.25-0.90). There was no significant difference in disabling or fatal strokes, MI, vascular death, or all cause mortality. There was a significantly increased risk of intracranial hemorrhage with warfarin therapy vs. ASA (OR 1.98, 95% CI 1.20-3.28).

Conclusion: Long-term adjusted-dose warfarin significantly reduces all stroke and embolic risks but does not reduce risk of disability or mortality and carries a significant intracranial hemorrhage risk. The threshold of benefit for anticoagulation vs. antiplatelet therapy remains controversial.

- AVNRT accounts for 60-70% of all paroxysmal SVTs
- retrograde P waves may be seen but are usually lost in the QRS complex
- treatment
 - acute: Valsalva or carotid massage, adenosine is first choice if unresponsive to vagal maneuvers; if no response, try metoprolol, digoxin, diltiazem, electrical cardioversion if patient hemodynamically unstable (hypotension, angina, or CHF)
 - long-term: 1st line – β -blocker, diltiazem, digoxin; 2nd line – flecainide, propafenone; 3rd line – catheter ablation

The carotid massage is a constant pressure directed posteriorly against the carotid artery for 5-10 s; always listen for bruits before palpation

Figure 26. Mechanism for AVNRT

Figure 27. AVNRT

Pre-Excitation Syndromes

- refers to a subset of SVTs mediated by an accessory pathway which can lead to ventricular pre-excitation

Wolff-Parkinson-White Syndrome

- congenital defect present in 1.5-2/1,000 of the general population
- an accessory conduction tract (Bundle of Kent; can be in right or left atrium) abnormally allows early electrical activation of part of one ventricle
- impulses travel at a greater conduction velocity across the Bundle of Kent thereby effectively 'bypassing' AV node
- since the ventricles are activated earlier, the ECG shows early ventricular depolarization in the form of initial slurring of the QRS complex – the so-called "delta wave"
- atrial impulses that conduct to the ventricles through both the Bundle of Kent and the normal AV node/His-Purkinje system generate a broad "fusion complex"
- ECG features of WPW
 - PR interval <120 msec
 - delta wave: slurred upstroke of the QRS (the leads with the delta wave vary with site of bypass)
 - widening of the QRS complex due to premature activation
 - secondary ST segment and T wave changes
 - tachyarrhythmias may occur – most often AVRT and AFib

AFib in WPW Patients

- AFib is the index arrhythmia in up to 20% of patients with WPW syndrome
 - it is usually intermittent rather than persistent or permanent
- rapid atrial depolarizations in AFib are conducted through the bypass tract which is not able to filter impulses like the AV node can
- consequently the ventricular rate becomes extremely rapid (>200 bpm) and the QRS complex widens
- treatment: electrical cardioversion, IV procainamide, or IV amiodarone
 - do not use drugs that slow AV node conduction (digoxin, β -blockers) as this may cause preferential conduction through the bypass tract and precipitate VF
 - long-term: ablation of bypass tract if possible

Figure 28. Accessory pathway conduction in WPW. Early ventricular activation leads to the appearance of a delta wave (slurred upstroke of the QRS) on the ECG before usual conduction across the AV node

AV Re-Entrant Tachycardia

- re-entrant loop via accessory pathway and normal conduction system
- initiated by a premature atrial or ventricular complex
- **orthodromic** AVRT: stimulus from a premature complex travels up the bypass tract (V to A) and down the AV node (A to V) with narrow QRS complex (no delta wave because stimulus travels through normal conduction system)
 - comprises 95% of the reentrant tachycardias associated with WPW syndrome
- **antidromic** AVRT: more rarely the stimulus goes up the AV node (V to A) and down the bypass tract (A to V); wide and abnormal QRS as ventricular activation is only via the bypass tract
- treatment
 - acute: similar to AVNRT except avoid long-acting AV nodal blockers, e.g. digoxin and verapamil
 - long-term: for recurrent arrhythmias ablation of the bypass tract is recommended
 - ♦ drugs such as flecainide and procainamide can be used

Figure 29. PVC (with bigeminy pattern) and PAC. Note the difference between the normal QRS/T wave and the PVC-generated QRS/T wave

Ventricular Tachyarrhythmias

Premature Ventricular Contraction (PVC) or Ventricular Premature Beat (VPB)

- QRS width >120 msec, no preceding P wave, bizarre QRS morphology
- origin: LBBB morphology of VT = RV origin; RBBB morphology of VT = LV origin
- PVCs may be benign but are usually significant in the following situations:
 - consecutive ($\geq 3 = VT$) or multiform (varied origin)
 - PVC falling on the T wave of the previous beat ("R on T phenomenon"): may precipitate ventricular tachycardia or VF

Accelerated Idioventricular Rhythm

- ectopic ventricular rhythm with rate 50-100 bpm
- more frequently occurs in the presence of sinus bradycardia and is easily overdriven by a faster supraventricular rhythm
- frequently occurs in patients with acute MI or other types of heart disease (cardiomyopathy, hypertensive, valvular) but it does not affect prognosis and does not usually require treatment

Ventricular Tachycardia

- 3 or more consecutive ectopic ventricular complexes
 - rate >100 bpm (usually 140-200)
 - ventricular flutter: if rate >200 bpm and complexes resemble a sinusoidal pattern
 - "sustained VT" if it lasts longer than 30 s
 - ECG characteristics: wide regular QRS tachycardia (QRS usually >140 msec)
 - AV dissociation; bizarre QRS pattern
 - also favor Dx of VT: left axis or right axis deviation, nonspecific intraventricular block pattern, monophasic or biphasic QRS in V1 with RBBB, QRS concordance in V1-V6
 - occasionally during VT supraventricular impulses may be conducted to the ventricles generating QRS complexes with normal or aberrant supraventricular morphology ("ventricular capture") or summation pattern ("fusion complexes")
- **monomorphic VT**
 - identical complexes with uniform morphology
 - more common than polymorphic VT
 - typically result from intraventricular re-entry circuit
 - potential causes: chronic infarct scarring, acute MI/ischemia, cardiomyopathies, myocarditis, arrhythmogenic right ventricular dysplasia, idiopathic, drugs (e.g. cocaine), electrolyte disturbances
- **polymorphic VT**
 - complexes with constantly changing morphology, amplitude, and polarity
 - more frequently associated with hemodynamic instability due to faster rates (typically 200-250 bpm) vs. monomorphic VT
 - potential causes: acute MI, severe or silent ischemia, and predisposing factors for QT prolongation (see *Torsades de Pointes*, C23)
- treatment
 - sustained VT (>30 s) is an emergency, requiring immediate treatment
 - hemodynamic compromise: electrical cardioversion
 - no hemodynamic compromise: electrical cardioversion, lidocaine, amiodarone, type Ia agents (procainamide, quinidine)

Figure 31. Ventricular tachycardia (monomorphic)

Figure 30. Orthodromic vs. antidromic AVRT

Table 6. Wide Complex Tachycardia: Clues for Differentiating VT vs. SVT with Aberrancy*

Clinical Clues		ECG Clues	
Presenting symptoms	Not helpful	AV dissociation	VT
History of CAD and previous MI	VT	Capture or fusion beats	VT
Physical exam		QRS width > 140 msec	VT
Cannon "a" waves Variable S1	VT	Extreme axis deviation (left or right superior axis)	VT
Carotid sinus massage/adenosine terminates arrhythmia	SVT**	Positive QRS concordance (R wave across chest leads)	VT
		Negative QRS concordance (S wave across chest leads)	May suggest VT
		Axis shift during arrhythmia	VT (polymorphic)

*If patient > 65 yr and previous MI or structural heart disease, then chance of VT > 95%

**May terminate VT in some patients with no structural heart disease

Arrhythmias that May Present as a Wide QRS Tachycardia

- VT
- SVT with aberrant conduction (rate related)
- SVT with preexisting BBB or nonspecific intraventricular conduction defect
- AV conduction through a bypass tract in WPW patients during an atrial tachyarrhythmia (e.g. atrial flutter, atrial tachycardia)
- Antidromic AVRT in WPW patients (see *Pre-Excitation Syndromes*, C21)

Torsades de Pointes

- a variant of polymorphic VT that occurs in patients with baseline QT prolongation – “twisting of the points”
- looks like usual VT except that QRS complexes “rotate around the baseline” changing their axis and amplitude
- ventricular rate > 100 bpm, usually 150-300 bpm
- etiology: predisposition in patients with prolonged QT intervals
 - congenital long QT syndromes
 - drugs: e.g. class IA (quinidine), class III (sotalol), phenothiazines (TCAs), erythromycin, quinolones, antihistamines
 - electrolyte disturbances: hypokalemia, hypomagnesemia
 - nutritional deficiencies causing above electrolyte abnormalities
- treatment: IV magnesium, temporary pacing, isoproterenol and correct underlying cause of prolonged QT, electrical cardioversion if hemodynamic compromise

Figure 32. Torsades de pointes

Ventricular Fibrillation (VFib)

- chaotic ventricular arrhythmia, with very rapid irregular ventricular fibrillatory waves of varying morphology
- terminal event, unless advanced cardiac life-support (ACLS) procedures are promptly initiated to maintain ventilation and cardiac output, and electrical defibrillation is carried out
- most frequent cause of sudden death
- refer to ACLS algorithm for complete therapeutic guidelines

Figure 33. Ventricular fibrillation

Electrophysiology Studies

- invasive test for the investigation and treatment of cardiac rhythm disorders using intracardiac catheters
- provide detailed analysis of the arrhythmia mechanism and precise site of origin when ECG data are nondiagnostic or unobtainable
- bradyarrhythmias: define the mechanisms of SA node dysfunction and localize site of AV conduction block
- tachyarrhythmias: map for possible ablation or to assess inducibility of VT

Electrical Pacing

- the decision to implant a pacemaker usually is based on symptoms of a bradyarrhythmia or tachyarrhythmia in the setting of heart disease

Pacemaker Indications

- SA node dysfunction (most common): symptomatic bradycardia \pm hemodynamic instability
- common manifestations include: syncope, presyncope, or severe fatigue
- SA node dysfunction is commonly caused by: intrinsic disease within the SA node (e.g. idiopathic degeneration, fibrosis, ischemia, or surgical trauma), abnormalities in autonomic nervous system function, and drug effects
- AV nodal-infranodal block: Mobitz II, complete heart block

Pacemaker Complications

- complications related to surgical implantation include venous access (pneumothorax, hemothorax, air embolism), pacemaker leads (perforation, malposition), pocket hematomas and infection
- complications specific to the pacemaker include a failure to pace, failure to sense, pulse generator failure, pacemaker syndrome and pacemaker mediated tachycardia

Pacing Techniques

- temporary: transvenous (jugular, subclavian, femoral) or external (transcutaneous) pacing
- permanent: transvenous into RA, apex of RV, or both
- can sense and pace atrium, ventricle, or both
- new generation: rate responsive, able to respond to physiologic demand
- biventricular

Implantable Cardioverter Defibrillators

- sudden cardiac death (SCD) usually results from ventricular fibrillation (VFib), sometimes preceded by monomorphic or polymorphic ventricular tachycardia (VT)
- ICDs detect ventricular tachyarrhythmias and are highly effective in terminating VT/VFib and in aborting SCD
- mortality benefit vs. antiarrhythmics in secondary prevention
- benefit seen in patients with ischemic and non-ischemic cardiomyopathy, depressed left ventricular ejection fraction (LVEF), prolonged QRS
- see *Heart Failure, C33* for current treatment recommendations

Catheter Ablation

Techniques

- radiofrequency (RF) energy: a low-voltage high-frequency form of electrical energy (similar to cautery); RF energy produces small, homogeneous, necrotic lesions approximately 5-7 mm in diameter and 3-5 mm in depth
- cryoablation: new technology which uses a probe with a tip that can decrease in temperature to -20°C and -70°C . Produces small, necrotic lesions similar to RF ablation. When brought to -20°C , the catheter tip reversibly freezes the area. Bringing the tip down to -70°C for 5 min permanently scars the tissue
 - advantage: can "test" areas before committing to an ablation
 - disadvantage: takes much longer than RF (5 min per cryoablation vs. 1 min per RF ablation)

Indications

- paroxysmal SVT
 - AVNRT: accounts for more than half of all cases
- accessory pathway (orthodromic reciprocating tachycardia): 30% of SVT
 - re-entrant rhythm, with an accessory AV connection as the retrograde limb
 - corrected by targeting the accessory pathway
- atrial flutter: flutter focus in RA
- AFib: potential role for pulmonary vein ablation
- ventricular tachycardia: focus arises from the right ventricular outflow tract and less commonly originates in the inferoseptal left ventricle near the apex (note: majority of cases of VT are due to scarring from previous MI and cannot be ablated)

Major Complications

- 1% of patients
- death: 0.1-0.2%

CCS Consensus Conference 2003: Assessment of the Cardiac Patient for Fitness to Drive and Fly – Executive Summary

Can J Cardiol 2004;20:1313-1323

In both primary and secondary prevention ICD patients with private driving licenses, no restrictions to drive directly following implantation or an inappropriate shock are warranted. However, following an appropriate shock these patients are at an increased risk to cause harm to other road users and therefore should be restricted to drive for a period of 2 and 4 mo, respectively. In addition, all ICD patients with commercial driving licenses have a substantial elevated risk to cause harm to other road users during the complete follow-up after both implantation and shock and should therefore be restricted to drive permanently.

Systematic Review: Implantable Cardioverter Defibrillators for Adults with Left Ventricular Systolic Dysfunction

Ann Intern Med 2007;147:251-262

Study: Meta-review of 12 RCTs used for ICD efficacy, 5 RCTs and 48 observational studies for effectiveness, and 21 RCTs and 43 observational studies for safety review.

Population: 8,516 patients for ICD efficacy, 26,840 patients for effectiveness, and 86,809 patients for safety review with left ventricular ejection fraction ≤ 0.35 .

Intervention: ICD implantation.

Outcomes: All-cause mortality and adverse events.

Results: ICDs reduced all-cause mortality by 20% (95% CI 10%-29%; $I^2=44.4\%$) with greatest reduction (54%) in sudden cardiac death (CI 37%-63%; $I^2=0\%$). Observational studies had a reduced relative risk of 0.54 for all-cause mortality vs. RCTs (CI 0.43-0.58, $I^2=60.4\%$). Rates of success of ICD implantation were 99% (CI 98.8%-99.3%) with a 1.2% (CI 0.9%-1.5%) chance of perimplantation death. Post-implantation complications (per 100 patient yr) were: 1.4 (CI 1.2-1.6) device malfunctions; 1.5 (CI 1.3-1.8) lead problems; 0.6 (CI 0.5-0.8) implant site infection and 19.1 (CI 16.5-22.0) inappropriate discharges in RCTs vs. a rate of 4.9 (CI 4.5-5.3) inappropriate discharges in observational studies.

Conclusion: ICDs are safe and effective in reducing mortality in adult patients with LV systolic dysfunction but carry significant risks of inappropriate discharges. Differences between RCTs and observational studies show that improved risk stratification of patients may further improve outcomes and reduce adverse events.

- cardiac: high grade AV block requiring permanent pacemaker (less risk with cryoablation), tamponade, pericarditis
- vascular: hematoma, vascular injury, thromboembolism, TIA/stroke
- pulmonary: PE

Ischemic Heart Disease

Epidemiology

- most common cause of cardiovascular morbidity and mortality
- atherosclerosis and thrombosis are the most important pathogenetic mechanisms
- M:F = 2:1 with all age groups included (Framingham study), 8:1 for age <40, 1:1 for age >70
 - according to the Framingham Heart Study, men develop coronary heart disease at a rate double that of women for age <60; incidence in women triples shortly after menopause
- peak incidence of symptomatic IHD is age 50-60 (men) and 60-70 (women)
- for primary prevention of ischemic heart disease please see [Family Medicine, FM7](#)

Table 7. Risk Factors and Markers for Atherosclerotic Heart Disease

Non-Modifiable Risk Factors	Modifiable Risk Factors	Markers of Disease
Age Male, postmenopausal female Family history (FHx) of MI* First degree male relative <55 First degree female relative <65	Hyperlipidemia* HTN* DM* Cigarette smoking* Metabolic syndrome Obesity Sedentary lifestyle Heavy alcohol intake	Elevated lipoprotein(a) Hyperhomocysteinemia Elevated high-sensitivity C-reactive protein (hsCRP) Coronary artery calcification

* Major risk factor

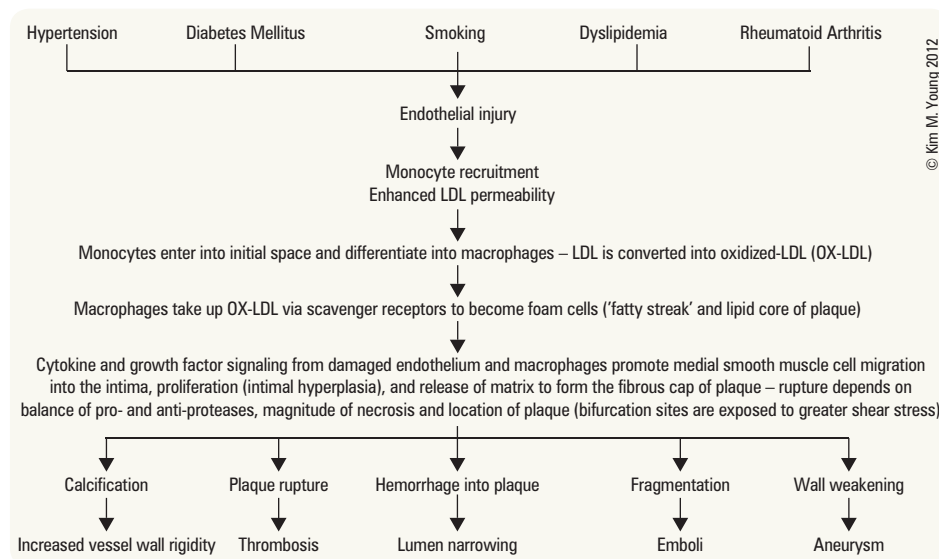

Figure 34. Pathophysiology of atherosclerosis

Chronic Stable Angina

Definition

- symptom complex resulting from an imbalance between oxygen supply and demand in the myocardium

Etiology and Pathophysiology

- factors that decrease myocardial oxygen supply
 - decreased luminal diameter: atherosclerosis, vasospasm
 - decreased duration of diastole: tachycardia (decreased duration of diastolic coronary perfusion)
 - decreased hemoglobin: anemia
 - decreased SaO₂: hypoxemia
 - congenital anomalies

Chronic stable angina is most often due to a fixed stenosis caused by an atheroma

Acute coronary syndromes are the result of plaque rupture

- factors that increase myocardial oxygen demand
 - increased heart rate: hyperthyroidism
 - increased contractility: hyperthyroidism
 - increased wall stress: myocardial hypertrophy, aortic stenosis

Signs and Symptoms

- typical: (1) retrosternal chest pain, tightness or discomfort radiating to left (\pm right) shoulder/arm/neck/jaw, associated with diaphoresis, nausea, anxiety; (2) predictably precipitated by the “3 Es”: exertion, emotion, eating; (3) brief duration, lasting <10-15 min and typically relieved by rest and nitrates
- atypical/probable angina (meets 2 of the above); non-cardiac chest pain (meets <1 of the above)
- Levine’s sign: clutching fist over sternum when describing chest pain
- anginal equivalents: dyspnea, acute LV failure, flash pulmonary edema

Clinical Assessment

- history including directed risk factor assessment and physical exam
- labs: Hb, fasting glucose, fasting lipid profile
- ECG (at rest and during episode of chest pain if possible)
- CXR (suspected heart failure, valvular disease, pericardial disease, aortic dissection/aneurysm, or signs or symptoms of pulmonary disease)
- stress testing (see *Cardiac Diagnostic Tests, C5*) or angiography
- echo
 - to assess systolic murmur suggestive of aortic stenosis, mitral regurgitation, and/or HCM
 - to assess LV function in patients with Hx of prior MI, pathological Q waves, signs or symptoms of CHF

Differential Diagnosis

- see *Differential Diagnoses of Common Presentations, C4*

Treatment of Chronic Stable Angina

1. General measures

- goals: to reduce myocardial oxygen demand and/or increase oxygen supply
- lifestyle modification (diet, exercise)
- treatment of risk factors: statins (see *Endocrinology, E5, Family Medicine, FM9* for target lipid guidelines), antihypertensives, etc.
- pharmacological therapy to stabilize the coronary plaque to prevent rupture and thrombosis

2. Antiplatelet therapy (first-line therapy)

- ASA
- clopidogrel when ASA absolutely contraindicated

3. β -blockers (first-line therapy – improve survival in patients with HTN)

- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- cardioselective agents preferred (e.g. metoprolol, atenolol) to avoid peripheral effects (inhibition of vasodilation and bronchodilation via β_2 receptors)
- avoid intrinsic sympathomimetics (e.g. acebutolol) which increase demand

4. Nitrates (symptomatic control, no clear impact on survival)

- decrease preload (venous dilatation) and afterload (arteriolar dilatation), and increase coronary perfusion
- maintain daily nitrate-free intervals to prevent tolerance (tachyphylaxis)

5. Calcium channel blockers (CCBs, second-line or combination)

- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- caution: verapamil/diltiazem combined with β -blockers may cause symptomatic sinus bradycardia or AV block

6. ACE inhibitors (ACEI, not used to treat symptomatic angina)

- angina patients tend to have risk factors for CV disease which warrant use of an ACEI (e.g. HTN, DM, proteinuric renal disease, previous MI with LV dysfunction)
- benefit in all patients at high risk for CV disease (concomitant DM, renal dysfunction, or LV systolic dysfunction)
- angiotensin II receptor blockers (ARBs) can be used when ACEI contraindicated (e.g. hypersensitivity, angioedema)

7. Invasive strategies

- revascularization (see *Coronary Revascularization, C31* and *COURAGE trial sidebar*)

VARIANT ANGINA (Prinzmetal’s Angina)

- myocardial ischemia secondary to coronary artery vasospasm, with or without atherosclerosis
- uncommonly associated with infarction or LV dysfunction
- typically occurs between midnight and 8 AM, unrelated to exercise, relieved by nitrates
- typically ST elevation on ECG
- diagnosed by provocative testing with ergot vasoconstrictors (rarely done)
- treat with nitrates and CCBs

SYNDROME X

- typical symptoms of angina but normal angiogram
- may show definite signs of ischemia with exercise testing
- thought to be due to inadequate vasodilator reserve of coronary resistance vessels
- better prognosis than overt epicardial atherosclerosis

Canadian Cardiovascular Society (CCS) Functional Classification of Angina

- **Class I:** ordinary physical activity (walking, climbing stairs) does not cause angina; angina with strenuous, rapid, or prolonged activity
- **Class II:** slight limitation of ordinary activity: angina brought on at >2 blocks on level or climbing >1 flight of stairs or by emotional stress
- **Class III:** marked limitation of ordinary activity: angina brought on at <2 blocks on level or climbing <1 flight of stairs
- **Class IV:** inability to carry out any physical activity without discomfort; angina may be present at rest

Optimal Medical Therapy With or Without PCI for Stable Coronary Disease. COURAGE Trial

NEJM 2007;356:1503-1516

Study: Randomized, controlled trial with median follow-up of 4.6 yr.

Population: 2,287 patients who had objective evidence of myocardial ischemia and significant stable coronary artery disease.

Intervention: Patients were randomized to receive intensive pharmacologic therapy and lifestyle intervention with or without percutaneous coronary intervention (PCI).

Outcome: Primary outcome was all-cause mortality and nonfatal myocardial infarction (MI). Secondary outcome had additional events of stroke, all MI, and hospitalization for unstable angina with negative biomarkers.

Results: There was no significant difference in primary (unadjusted hazard ratio: 1.05; $p=0.62$) or secondary outcomes (hazard ratio: 1.05; $p=0.62$) between the PCI and non-PCI intervention groups. The PCI group had significantly lower rates of subsequent revascularization at 4.6 yr of follow-up (hazard ratio 0.60, $p<0.001$) and was more angina-free in the first 4 yr of follow-up.

Conclusions: PCI as an adjunct in initial management in patients with significant stable coronary artery disease does not reduce mortality, MI, stroke, or hospitalization for ACS, but does provide angina relief and reduced risk of revascularization.

Acute Coronary Syndromes

Definition

- ACS includes the spectrum of UA, NSTEMI, and STEMI; this distinction aids in providing the appropriate therapeutic intervention
 - MI** is defined by evidence of myocardial necrosis. It is diagnosed by a rise/fall of serum markers plus any one of:
 - symptoms of ischemia (chest/upper extremity/mandibular/epigastric discomfort; dyspnea)
 - ECG changes (ST-T changes, new BBB or pathological Q waves)
 - imaging evidence (myocardial loss of viability, wall motion abnormality, or intracoronary thrombus)
 - if biomarker changes are unattainable, cardiac symptoms combined with new ECG changes is sufficient
 - NSTEMI** meets criteria for myocardial infarction without ST elevation or BBB
 - STEMI** meets criteria for myocardial infarction characterized by ST elevation or new BBB
- UA** is clinically defined by any of the following:
 - accelerating pattern of pain: increased frequency, increased duration, decreased threshold of exertion, decreased response to treatment
 - angina at rest
 - new-onset angina
 - angina post-MI or post-procedure (e.g. percutaneous coronary intervention [PCI], coronary artery bypass grafting [CABG])

Investigations

- history and physical
 - note that up to 30% of MIs are unrecognized or "silent" due to atypical symptoms – more common in women, DM, elderly, post-heart transplant (because of denervation)
- ECG
- CXR
- labs
 - serum cardiac biomarkers for myocardial damage (repeat 8 h later) (see *Cardiac Biomarkers*, C11)
 - CBC, INR/PTT, electrolytes and magnesium, creatinine, urea, glucose, serum lipids
 - draw serum lipids within 24-48 h because values are unreliable from 2-48 d post-MI

MANAGEMENT OF ACUTE CORONARY SYNDROMES

1. General measures

- ABCs: assess and correct hemodynamic status first
- bed rest, cardiac monitoring, oxygen
- nitroglycerin SL followed by IV
- morphine IV

2. Anti-platelet and anticoagulation therapy

- ASA (81mg) chewed
- NSTEMI
 - ticagrelor in addition to ASA or if ASA contraindicated, subcutaneous low molecular weight heparin or IV unfractionated heparin (UFH) (LMWH preferable, except in renal failure or if CABG is planned within 24 h)
 - clopidogrel used if patient ineligible for ticagrelor
- if PCI is planned: ticagrelor or prasugrel and IV GP IIb/IIIa inhibitor (e.g. abciximab)
 - clopidogrel used if patient ineligible for ticagrelor and prasugrel
 - prasugrel contraindicated in those with a history of stroke/TIA, and avoidance of or lower dose is recommended for those >75 yr old or weighing <60 kg (TRITON-TIMI 38)
- anticoagulation options depend on reperfusion strategy
 - primary PCI: UFH during procedure; bivalirudin is a possible alternative
 - thrombolysis: LMWH (enoxaparin) until discharge from hospital; can use UFH as alternative because of possible rescue PCI
 - no reperfusion: LMWH (enoxaparin) until discharge from hospital
- continue LMWH or UFH followed by oral anticoagulation at discharge if at high risk for thromboembolic event (large anterior MI, AFib, severe LV dysfunction, CHF, previous DVT or PE, or echo evidence of mural thrombus)

3. β -blockers

- first dose IV followed by oral administration
- STEMI: contraindications include signs of heart failure, low output states, risk of cardiogenic shock, heart block, asthma or airway disease; initiate orally within 24 h of diagnosis when indicated

Is this Patient Having a Myocardial Infarction? From The Rational Clinical Examination

JAMA 2009; <http://www.jamaevidence.com/content/3484335>

Study: Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of an acute myocardial infarction.

Results: In patients with normal or non-diagnostic ECG, no established CAD, and prolonged or recurrent chest pain typical of their usual discomfort, radiation of pain to the shoulder OR both arms had the highest positive likelihood ratio (+LR) of 4.1 (95% CI 2.5-6.5) and a negative likelihood ratio (-LR) of 0.68 (95% CI 0.52-0.89). Radiation to right arm had a +LR of 3.8 (95% CI 2.2-6.6) and -LR of 0.86 (95% CI 0.77-0.96), vomiting had a +LR of 3.5 (95% CI 2.0-6.2) and -LR of 0.87 (95% CI 0.79-0.97), while radiation to left arm only had a +LR of 1.3 (95% CI 0.93-1.8) and a -LR of 0.9 (95% CI 0.76-1.1).

Conclusions: The most compelling features that increase likelihood of an MI are ST-segment and cardiac enzyme elevation, new Q-wave, and presence of an S3 heart sound. In patients where the diagnosis of MI is uncertain, radiation of pain to the shoulder OR both arms, radiation to the right arm, and vomiting had the best predictive values, while radiation to the left arm is relatively non-diagnostic.

TIMI Risk Score for UA/NSTEMI

Characteristics	Points
Historical	
Age ≥ 65 yr	1
≥ 3 risk factors for CAD	1
Known CAD (stenosis $\geq 50\%$)	1
Aspirin [®] use in past 7 d	1
Presentation	
Recent (≤ 24 h) severe angina	1
ST-segment deviation ≥ 0.5 mm	1
Increased cardiac markers	1

Risk Score = Total Points

If TIMI risk score ≥ 3 , consider early LMWH and angiography

TIMI = thrombolysis in myocardial infarction

UA = unstable angina

JAMA 2000;284:835-842

Treatment of NSTEMI

BEMOAN

β -blocker

Enoxaparin

Morphine

O₂

ASA

Nitrates

- if β -blockers are contraindicated or if β -blockers/nitrates fail to relieve ischemia, non-dihydropyridine calcium channel blockers (e.g. diltiazem, verapamil) may be used as second-line therapy in the absence of severe LV dysfunction or pulmonary vascular congestion (calcium channel blockers do not prevent MI or decrease mortality)

4. Invasive strategies and reperfusion options

- UA/NSTEMI: early coronary angiography \pm revascularization if possible is recommended with any of the following high-risk indicators:
 - ♦ recurrent angina/ischemia at rest despite intensive anti-ischemic therapy
 - ♦ CHF or LV dysfunction
 - ♦ hemodynamic instability
 - ♦ high (≥ 3) TIMI risk score (tool used to estimate mortality following an ACS)
 - ♦ sustained ventricular tachycardia
 - ♦ dynamic ECG changes
 - ♦ high-risk findings on non-invasive stress testing
 - ♦ PCI within the previous 6 mo
 - ♦ repeated presentations for ACS despite treatment and without evidence of ongoing ischemia or high risk features
 - ♦ note: thrombolysis is NOT administered for UA/NSTEMI
- STEMI
 - ♦ after diagnosis of STEMI is made, do not wait for results of further investigations before implementing reperfusion therapy
 - ♦ goal is to re-perfuse artery: thrombolysis ("EMS-to-needle") within 30 min or primary PCI ("EMS-to-balloon") within 90 min (depending on capabilities of hospital and access to hospital with PCI facility)
 - ♦ thrombolysis
 - preferred if patient presents ≤ 12 h of symptom onset, and < 30 min after presentation to hospital, has contraindications to PCI, or PCI cannot be administered within 90 min
 - ♦ PCI
 - early PCI (≤ 12 h after symptom onset and < 90 min after presentation) improves mortality vs. thrombolysis with fewer intra-cranial hemorrhages and recurrent MIs
 - primary PCI: without prior thrombolytic therapy – method of choice for reperfusion in experienced centers (*JAMA* 2004;291:736-39)
 - rescue PCI: following failed thrombolytic therapy (diagnosed when following thrombolysis, ST segment elevation fails to resolve below half its initial magnitude and patient still having chest pain)

Enoxaparin vs. Unfractionated Heparin with Fibrinolysis for ST-Elevation Myocardial Infarction

NEJM 2006;354:1477-1488

Study: Prospective multicenter RCT.

Patients: 20,479 patients (median age 60 yr, 77% male) with STEMI who were scheduled to undergo fibrinolysis.

Intervention: Patients were randomized to receive either enoxaparin or weight based unfractionated heparin in addition to thrombolysis and standard therapies.

Primary Outcome: Death or recurrent nonfatal MI 30 d post-event.

Results: The composite primary outcome occurred less often in the enoxaparin group compared with those who received unfractionated heparin (9.9% vs. 12.0%, $p < 0.001$, NNT=47). Taken separately, there was a trend toward reduced mortality (6.9% vs. 7.5%, $p=0.11$) and a significant reduction in nonfatal reinfarction (3.0% vs. 4.5%, $p < 0.001$) in the enoxaparin group. The risk of major bleeding was significantly increased in the enoxaparin group (2.1% vs. 1.4%, $p < 0.001$, NNH=142).

Conclusion: In patients with STEMI receiving thrombolysis, enoxaparin is superior to unfractionated heparin in preventing recurrent nonfatal MI and may lead to a small reduction in mortality.

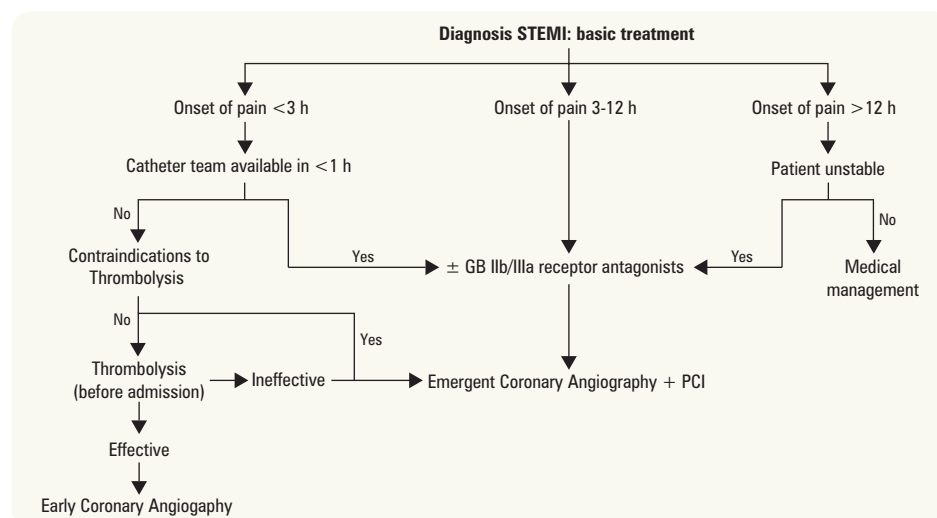

Figure 35. Reperfusion strategy in STEMI

Table 8. Contraindications to Thrombolysis in STEMI

Absolute	Relative
Prior intracranial hemorrhage	Chronic, severe, poorly controlled HTN
Known structural cerebral vascular lesion	Uncontrolled HTN (sBP > 180, dBP > 110)
Known malignant intracranial neoplasm	Current anticoagulation
Significant closed-head or facial trauma (≤ 3 mo)	Noncompressible vascular punctures
Ischemic stroke (≤ 3 mo)	Ischemic stroke (≥ 3 mo)
Active bleeding	Recent internal bleeding ($\leq 2-4$ wk)
Suspected aortic dissection	Prolonged CPR or major surgery (≤ 3 wk)
	Pregnancy
	Active peptic ulcer disease

Long-Term Management of ACS

- risk of progression to MI or recurrence of MI or death is highest within 1 mo
- at 1-3 mo after the acute phase, most patients resume a clinical course similar to that in patients with chronic stable coronary disease
- pre-discharge workup: ECG and echo to assess residual LV systolic function
- drugs required in hospital to control ischemia should be continued after discharge in all patients
- other medications for long-term management of ACS are summarized below

1. General Measures

- education
- risk factor modification

2. Antiplatelet and Anticoagulation Therapy

- ECASA 81 mg daily
- ticagrelor 90 mg twice daily or prasugrel 10 mg daily (at least 1 mo, up to 9-12 mo, if stent placed at least 12 mo)
- clopidogrel 75 mg daily can be used as alternatives to ticagrelor and prasugrel when indicated
- \pm warfarin x 3 mo if high risk (large anterior MI, LV thrombus, LVEF <30%, history of VTE, chronic AFib)

3. β -Blockers (e.g. metoprolol 25-50 mg bid or atenolol 50-100 mg daily)

4. Nitrates

- alleviate ischemia but do not improve outcome
- use with caution in right-sided MI patients who have become preload dependent

5. Calcium Channel Blockers (NOT recommended as first line treatment, consider as alternative to β -blockers)

6. Angiotensin-Converting Enzyme Inhibitors

- prevent adverse ventricular remodelling
- recommended for asymptomatic high-risk patients (e.g. diabetics), even if LVEF >40%
- recommended for symptomatic CHF, reduced LVEF (<40%), anterior MI
- use ARBs in patients who are intolerant of ACEI

7. \pm Aldosterone Antagonists

- if on ACEI and β -blockers and LVEF <40% and CHF or DM
- significant mortality benefit shown with eplerenone by 30 d

8. Statins (early, intensive, irrespective of cholesterol level; e.g. atorvastatin 80 mg daily)

9. Invasive Cardiac Catheterization if indicated (risk stratification)

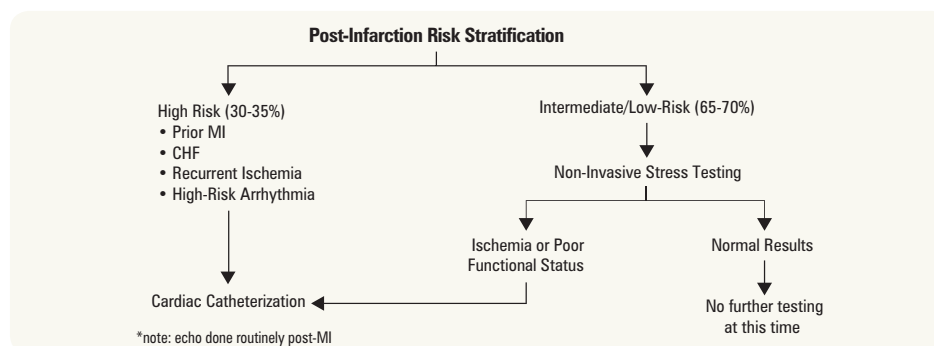

Figure 36. Post-MI risk stratification

Prognosis following STEMI

- 5-15% of hospitalized patients will die
 - risk factors
 - ♦ infarct size/severity
 - ♦ age
 - ♦ comorbid conditions
 - ♦ development of heart failure or hypotension
- post-discharge mortality rates
 - 6-8% within first year, half of these within first 3 mo
 - 4% per year following first yr
 - risk factors
 - ♦ LV dysfunction
 - ♦ residual myocardial ischemia
 - ♦ ventricular arrhythmias
 - ♦ history of prior MI

Intensive vs. Moderate Lipid Lowering with Statins after Acute Coronary Syndromes

NEJM 2004;350:1495-1504

Study: Prospective, double blind, RCT; mean follow-up of 2 yr.

Population: 4,162 patients who had been hospitalized for an ACS within the preceding 10 d.

Intervention: Patients were randomized to receiving pravastatin 40 mg or atorvastatin 80 mg daily.

Primary Outcome: Composite of death from any cause, myocardial infarction, documented unstable angina requiring rehospitalization, revascularization (performed at least 30 d after randomization), and stroke.

Results: High dose atorvastatin was associated with a 16% hazard ratio reduction ($p=0.005$; 95% CI 5-26%) in the primary outcome compared to standard dose pravastatin.

Conclusions: In patients who recently experienced an ACS, high dose statin therapy provides greater protection against death and major cardiovascular events than standard dose therapy.

Resting LVEF is a useful prognostic factor

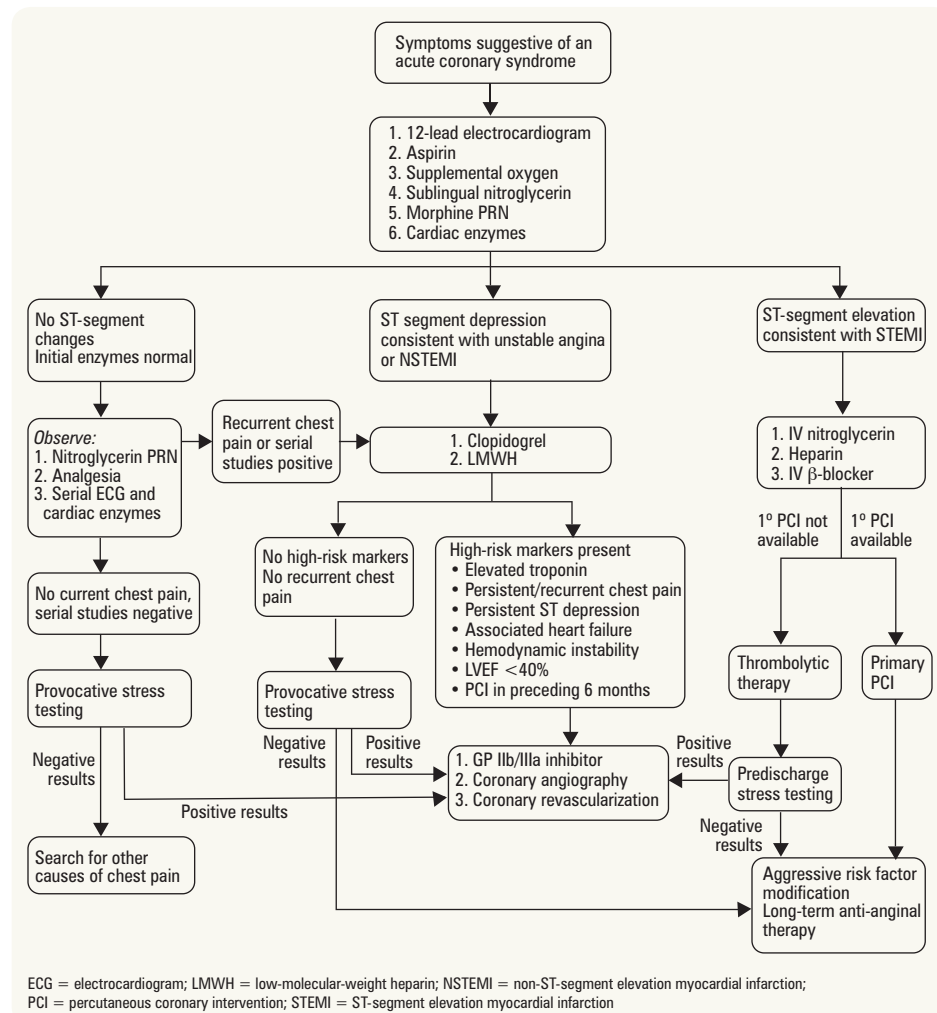

Table 9. Complications of Myocardial Infarction

Complication	Etiology	Presentation	Therapy
Arrhythmia 1. Tachycardia 2. Bradycardia	Sinus, AFib, VT, VFib Sinus, AV block	First 48 h First 48 h	See <i>Arrhythmias</i> , C15
Myocardial Rupture 1. LV free wall 2. Papillary muscle (→ MR) 3. Ventricular septum (→ VSD)	Transmural infarction Inferior infarction Septal infarction	1-7 d 1-7 d 1-7 d	Surgery Surgery Surgery
Shock/CHF	Infarction or aneurysm	Within 48 h	Inotropes, intra-aortic balloon pump
Post-Infarct Angina	Persistent coronary stenosis Multivessel disease	Anytime	Aggressive medical therapy PCI or CABG
Recurrent MI	Reocclusion	Anytime	Aggressive medical therapy PCI or CABG
Thromboembolism	Mural/apical thrombus DVT	7-10 d, up to 6 mo	Anticoagulation
Pericarditis	Inflammatory	1-7 d	ASA
Dressler's Syndrome	Autoimmune	2-8 wk

Sudden Cardiac Arrest

Definition

- unanticipated, non-traumatic cardiac death in a stable patient which occurs within 1 h of symptom onset; VFib is most common cause

Etiology

- primary cardiac pathology
 - ischemia/MI
 - LV dysfunction
 - severe ventricular hypertrophy
 - ♦ HCM
 - ♦ AS
 - long QT syndrome
 - congenital heart disease
 - mutations in cardiac ion channels

Management

- acute: resuscitate with prompt CPR and defibrillation
- investigate underlying cause (cardiac catheterization, electrophysiologic studies, echo)
- treat underlying cause
- antiarrhythmic drug therapy: amiodarone, β -blockers
- implantable cardioverter defibrillator (ICD)
- refer to ACLS guidelines (see [Anesthesia, A32](#))

Coronary Revascularization

PERCUTANEOUS CORONARY INTERVENTION

- interventional cardiology technique aimed at relieving significant coronary stenosis
- main techniques: balloon angioplasty, stenting
- less common techniques: rotational/directional/extraction atherectomy

Indications

- medically refractory angina
- NSTEMI/UA with high risk features (e.g. high TIMI risk score)
- primary/rescue PCI for STEMI

Balloon Angioplasty and Intracoronary Stenting

- coronary lesions dilated with balloon inflation
- major complication is restenosis (approximately 15% at 6 mo), felt to be due to elastic recoil and neointimal hyperplasia
- majority of patients receive intracoronary stent(s) to prevent restenosis
 - bare metal stent (BMS)
 - drug-eluting stent (DES)
 - ♦ coated with antiproliferative drugs (sirolimus, paclitaxel)
 - ♦ reduced rate of neointimal hyperplasia and restenosis compared to BMS (5% vs. 20%)
 - ♦ complication: late stent thrombosis (5 events per 1,000 stents implanted)

Adjunctive Therapies

- ASA and heparin decrease post-procedural complications
- further reduction in ischemic complications has been demonstrated using GPIIb/IIIa inhibitors (abciximab, eptifibatide, tirofiban) in coronary angiography and stenting
- following stent implantation
 - dual antiplatelet therapy (ASA and clopidogrel) for 1 mo with BMS or ≥ 12 mo with DES
 - ASA and prasugrel can be considered for those at increased risk of stent thrombosis

Procedural Complications

- mortality and emergency bypass rates $< 1\%$
- nonfatal MI: approximately 2-3%

CORONARY ARTERY BYPASS GRAFT SURGERY

- objective of CABG is complete reperfusion of the myocardium

Indications

- CABG
 - $\geq 50\%$ diameter stenosis in the left main coronary artery
 - $\geq 70\%$ diameter stenosis in three major coronary arteries
 - $\geq 70\%$ diameter stenosis in the proximal LAD artery plus one other major coronary artery

Safety and Efficacy of Drug-Eluting and Bare Metal Stents

Circulation 2009;119:3198-3206

Study: Meta-analysis of RCTs and observational studies. 22 RCTs and 34 observational studies.

Population: 9,470 and 182,901 patients in RCTs and observational studies respectively who underwent percutaneous coronary intervention.

Intervention: Drug-Eluting Stents (DES) vs. Bare Metal Stents (BMS).

Outcome: All-cause mortality, myocardial infarction (MI), and target vessel revascularization (TVR).

Results: No difference in mortality was found between DES vs. BMS by RCTs, while observational studies showed significantly lower mortality rates in DES-treated patients (hazard ratio (HR) 0.78, $p < 0.001$). No difference in MI incidence was found in RCTs, while lower incidences of MI were found in observational studies (HR 0.87, $p = 0.014$). DES has a significantly lower TVR rate in both RCT (HR 0.45, $p < 0.001$) and observational studies (HR 0.46, $p < 0.001$).

Conclusions: DES significantly reduces rates of TVR compared to BMS. Although there is no difference in mortality or MI incidence as found by RCTs, observational studies suggest lowered mortality and MI rates in patients with DES over BMS.

- survivors of sudden cardiac arrest with presumed ischemia-mediated VT caused by significant ($\geq 70\%$ diameter) stenosis in a major coronary artery
- other
 - $\geq 70\%$ diameter stenosis in two major coronary arteries (without proximal LAD disease) and evidence of extensive ischemia
 - $\geq 70\%$ diameter stenosis in the proximal LAD artery and evidence of extensive ischemia
 - multivessel CAD in patients with diabetes
 - LV systolic dysfunction (LVEF 35-50%) and significant multivessel CAD or proximal LAD stenosis where viable myocardium is present in the region of intended revascularization
- PCI
 - UA/NSTEMI if not a CABG candidate
 - STEMI when PCI can be performed more rapidly and safely than CABG
- CABG or PCI
 - one or more significant ($\geq 70\%$ diameter) coronary artery stenosis amenable to revascularization and unacceptable angina despite medical therapy

Table 10. Choice of Revascularization Procedure

	PCI	CABG
Advantages	Less invasive technique Decreased periprocedural morbidity and mortality Shorter periprocedural hospitalization	Greater ability to achieve complete revascularization Decreased need for repeated revascularization procedures
Indications	Single or double-vessel disease Inability to tolerate surgery	Triple-vessel or left main disease DM Plaque morphology unfavorable for PCI

Table 11. Conduits for CABG

Graft	Occlusion/Patency Rate	Considerations
Saphenous Vein Grafts (SVG)	At 10 yr, 50% occluded, 25% stenotic, 25% angiographically normal	Used when arterial grafts are not available or many grafts are required, such as triple or quadruple bypass
Left Internal Thoracic/Mammary Artery (LITA/LIMA) (LIMA to LAD)	90-95% patency at 15 yr	Most preferred option because of excellent patency Improved event-free survival (angina, MI) Decreased late cardiac events No increase in operative risk
Right Internal Thoracic/Mammary Artery (RITA/RIMA)	Pedicle RIMA patency comparable to LIMA Free RIMA patency less	Used in bilateral ITA/IMA grafting Patients receiving bilateral ITAs/IMAs have less risk of recurrent angina, late MI, angioplasty
Radial Artery (free graft)	85-90% patency at 5 yr	Prone to severe vasospasm post-operatively due to muscular wall
Right Gastroepiploic Artery	80-90% patency at 5 yr	Primarily used as an <i>in situ</i> graft to bypass the RCA Use limited because of the fragile quality of the artery, other technical issues, increased operative time (laparotomy incision), and incisional discomfort with associated ileus
Complete Arterial Revascularization		For younger patients (<60 yr of age) Is preferred due to longer term graft patency
Redo Bypass Grafting		Operative mortality 2-3x higher than first operation 10% perioperative MI rate Reoperation undertaken only in symptomatic patients who have failed medical therapy and in whom angiography has documented progression of the disease Increased risk with redo-sternotomy secondary to adhesions which may result in laceration to aorta, RV, IMA/ITA, and other bypass grafts

Operative Issues

- left ventricular (LV) function is an important determinant of outcome of all heart diseases
- patients with severe LV dysfunction usually have poor prognosis, but surgery can sometimes dramatically improve LV function
- assess viability of non-functioning myocardial segments in patients with significant LV dysfunction using delayed thallium myocardial imaging, PET scanning, or MRI

CABG and Antiplatelet Regimens

- please refer to 2011 ACCF/AHA Guideline for Coronary Artery Bypass Graft Surgery for more information
- prior to CABG, clopidogrel and ticagrelor should be discontinued for 5 d and prasugrel for 7 d before surgery
- dual antiplatelet therapy should be continued for 12 mo in patients with ACS within 48-72 h after CABG
- ASA (81mg) continued indefinitely (can be started 6 h after surgery)
- patients requiring CABG after PCI should continue their dual antiplatelet therapy as recommended in the post-PCI guidelines

Percutaneous Coronary Intervention vs. Coronary Artery Bypass Grafting for Severe Coronary Artery Disease: The SYNTAX Trial
NEJM 2009;360:961-972

Study: Prospective RCT.

Population: 1,800 patients with untreated three-vessel or left main coronary artery disease and anatomically equivalent for both Percutaneous Intervention (PCI) and Coronary Artery Bypass Graft (CABG).

Intervention: PCI vs. CABG.

Outcome: Composite of death from any cause, stroke, MI, or repeat revascularization in 12 mo post-intervention.

Results: Incidence of primary outcome was lower in the CABG intervention vs. PCI (12.4% vs. 17.8%, $p=0.002$, NNT=19). PCI was associated with significantly higher rates of repeat revascularization (13.5% vs. 5.9%, $p<0.001$) and cardiac death (3.7% vs. 2.1%, $p=0.05$), while CABG had higher rates of stroke (2.2% vs. 0.6%, $p=0.03$).

Conclusions: In patients with three-vessel or left main coronary artery disease CABG is superior to PCI in preventing major adverse cardiovascular and cerebrovascular events within 12 mo of intervention.

Effect of Perioperative Glucose-Insulin-Potassium Infusions on Mortality and Atrial Fibrillation After Coronary Artery Bypass Grafting: A Systematic Review and Meta-Analysis
Can J Cardiol 2010;26:178-184

Perioperative use of glucose-insulin-potassium or glucose-insulin infusions does not significantly reduce mortality or atrial fibrillation in patients undergoing CABG surgery. Unless future trial data in support of GIK/IGI infusions become available, the routine use of these treatments in patients undergoing CABG surgery should be discouraged because the safety of these infusions has not been systematically examined.

Table 12. Risk Factors for CABG Mortality and Morbidity (decreasing order of significance)

Risk Factors for CABG Mortality	Risk Factors for CABG Post-Operative Morbidity or Increased Length of Stay
Urgency of surgery (emergent or urgent)	Reoperation
Reoperation	Emergent procedure
Older age	Pre-operative intra-aortic balloon pump (IABP)
Poor left ventricular function (see below)	CHF
Female gender	CABG + valve surgery
Left main disease	Older age
Others include catastrophic conditions (cardiogenic shock, ventricular septal rupture, ongoing CPR), dialysis-dependent renal failure, end-stage COPD, DM, cerebrovascular disease, and peripheral vascular disease	Renal dysfunction
	COPD
	DM
	Cerebrovascular disease

Procedural Complications

- CABG using cardiopulmonary bypass (CPB)
 - stroke and neurocognitive defects (microembolization of gaseous and particulate matter)
 - immunosuppression
 - systemic inflammatory response leading to:
 - myocardial dysfunction
 - renal dysfunction
 - neurological injury
 - respiratory dysfunction
 - coagulopathies

OFF-PUMP CORONARY ARTERY BYPASS SURGERY**Procedure**

- avoids the use of CPB by allowing surgeons to operate on a beating heart
 - stabilization devices (e.g. Genzyme Immobilizer®) hold heart in place allowing operation while positioning devices (Medtronic Octopus® and Starfish® system) allow the surgeon to lift the beating heart to access the lateral and posterior vessels
 - procedure is safe and well tolerated by most patients; however, this surgery remains technically more demanding

Indications

- used in poor candidates for CPB who have: calcified aorta, poor LVEF, severe peripheral vascular disease (PVD), severe COPD, chronic renal failure, coagulopathy, transfusion objections (e.g. Jehovah's Witness), good target vessels, anterior/lateral wall revascularization, target revascularization in older, sicker patients
- absolute contraindications:** hemodynamic instability, poor quality target vessels including intramyocardial vessels, diffusely diseased vessels, and calcified coronary vessels
- relative contraindications:** cardiomegaly/CHF, critical left main disease, small distal targets, recent or current acute MI, cardiogenic shock, LVEF <35%

Outcomes

- OPCAB decreases in-hospital morbidity (decreased incidence of chest infection, inotropic requirement, supraventricular arrhythmia), blood product transfusion, ICU stay, length of hospitalization, and CK-MB and troponin I levels
- no significant difference in terms of survival at 2 yr, frequency of cardiac events (MI, PCI, CHF, recurrent angina, redo CABG), or medication usage compared to on-pump CABG

Heart Failure

Congestive Heart Failure

Definitions

- heart failure: a complex clinical syndrome, resulting from almost any cardiac disorder that impairs the ability of the ventricle to fill with or eject blood
- forward heart failure: heart unable to maintain adequate cardiac output to meet demand or is able to do so only by elevating filling pressure
- backward heart failure: heart unable to accommodate venous return resulting in elevated filling pressures and vascular congestion (systemic or pulmonary)
- heart failure can involve left side of heart (left heart failure), right side (right heart failure), or both (biventricular failure) (see Table 13)
- heart failure can also have components of ineffective ventricular filling (diastolic dysfunction) and/or contraction (systolic dysfunction)
- most cases associated with poor cardiac output (low-output heart failure); however, some cases of CHF not due to intrinsic cardiac disease but instead due to increased demand (high-output heart failure)

**Does this Dyspneic Patient in the Emergency Department have Congestive Heart Failure?**

JAMA 2005;294:1944-1956

	LR + (95% CI)	LR - (95% CI)

Any abnormal finding	2.2 (1.6-3.1)	0.64 (0.47-0.88)

Table 13. Signs and Symptoms of Left vs. Right Heart Failure

	Left Failure	Right Failure
Low Cardiac Output (Forward)	Fatigue Syncope Systemic hypotension Cool extremities Slow capillary refill Peripheral cyanosis Pulsus alternans Mitral regurgitation S3	Left failure symptoms if decreased RV output leads to LV underfilling Tricuspid regurgitation S3 (right-sided)
Venous Congestion (Backward)	Dyspnea, orthopnea, PND Cough Crackles	Peripheral edema Elevated JVP with abdominojugular reflux, and Kussmaul's sign Hepatomegaly Pulsatile liver

Pathophysiology

- primary insults (myocyte loss, overload) → pump dysfunction, which leads to:
 - remodeling (dilatation, hypertrophy)
 - neurohumoral activation → necrosis and apoptosis
- both pathways result in further damage (re-starting the cycle), edema, tachycardia, vasoconstriction, congestion
- compensatory response to myocardial stress (perpetuate disease process)
 - increased end-systolic ventricular pressure (pressure overload)
 - e.g. HTN, aortic stenosis → hypertrophy
 - increased end-diastolic ventricular volume (volume overload)
 - e.g. aortic regurgitation → cardiac dilatation
- systemic response to ineffective circulating volume
 - activation of sympathetic nervous and renin-angiotensin-aldosterone systems results in:
 - salt and water retention with intravascular expansion
 - increased heart rate and myocardial contractility
 - increased afterload

Systolic Dysfunction

- impaired myocardial contractile function → decreased LVEF and SV → decreased CO
- findings: apex beat displaced, S3, increased heart size on CXR, decreased LVEF, LV dilatation
- causes
 - ischemic (e.g. extensive CAD, previous MI)
 - non-ischemic
 - HTN
 - DM
 - alcohol (and other toxins)
 - myocarditis
 - dilated cardiomyopathy (multiple causes – see *Dilated Cardiomyopathy, C39*)

Heart Failure with Preserved Ejection Fraction

- previously known as “diastolic dysfunction”
- up to 1/2 of all HF patients have normal systolic function (i.e. normal ejection fraction) and the cause of heart failure is impaired diastolic filling; prevalence higher in older patients
- increased LV filling pressures produce venous congestion upstream (i.e. pulmonary and systemic venous congestion)
- findings: HTN, apex beat sustained, S4, normal-sized heart on CXR, LVH on ECG/echo, normal LVEF
- causes of decreased compliance:
 - transient: ischemia (relaxation of myocardium is active and requires ATP)
 - permanent
 - severe hypertrophy (HTN, aortic stenosis, HCM)
 - restrictive cardiomyopathy (e.g. amyloid)
 - MI

High-Output Heart Failure

- caused by demand for increased cardiac output
- often exacerbates existing heart failure or decompensates a patient with other cardiac pathology
- differential diagnosis: anemia, thiamine deficiency (beriberi), hyperthyroidism, A-V fistula or L-R shunting, Paget's disease, renal disease, hepatic disease

**Dichotomies of Heart Failure**

- Forward vs. backward
- Left-sided vs. right-sided
- Systolic vs. diastolic dysfunction
- Low output vs. high output

**Use Ejection Fraction to Grade LV Dysfunction**

- Grade I (EF > 60%) (Normal)
- Grade II (EF = 40-59%)
- Grade III (EF = 21-39%)
- Grade IV (EF ≤ 20%)

A Validated Clinical and Biochemical Score for the Diagnosis of Acute Heart Failure: the ProBNP Investigation of Dyspnea in the Emergency Department (PRIDE) Acute Heart Failure Score
Am Heart J 2006;151:48-54

Predictor	Possible Score
Age > 75 yr	1
Orthopnea present	2
Lack of cough	1
Current loop diuretic use (before presentation)	1
Rales on lung exam	1
Lack of fever	2
Elevated NT-proBNP (> 450 pg/mL if < 50 yr, > 900 pg/mL if > 50 yr)	4
Interstitial edema on chest x-ray	2
Total	/14
Likelihood of heart failure	
Low = 0-5	
Intermediate = 6-8	
High = 9-14	

Brain natriuretic peptide (BNP) is secreted by ventricles due to LV stretch and wall tension. Cardiomyocytes secrete BNP precursor that is cleaved into proBNP. After secretion into ventricles, proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP. The above scoring algorithm developed by Baggish et al. is commonly used. A score of < 6 has a negative predictive value of 98%, while scores ≥ 6 had a sensitivity of 96% and specificity of 84% (p < 0.001) for the diagnosis of acute heart failure.

**New York Heart Association (NYHA) Functional Classification of Heart Failure**

- Class I:** ordinary physical activity does not cause symptoms of HF
- Class II:** comfortable at rest, ordinary physical activity results in symptoms
- Class III:** marked limitation of ordinary activity; less than ordinary physical activity results in symptoms
- Class IV:** inability to carry out any physical activity without discomfort; symptoms may be present at rest

Etiologies of Primary Insults

- consider predisposing, precipitating, and perpetuating factors

Precipitants of Symptomatic Exacerbations

- consider natural progression of disease vs. new precipitant
- always search for reversible cause
- differential diagnosis can also be organized as follows:
 - new cardiac insult/disease: MI, arrhythmia, valvular disease
 - new demand on CV system: HTN, anemia, thyrotoxicosis, infection, etc.
 - failure to take medications as prescribed

Investigations

- identify and assess precipitating factors and treatable causes of CHF
- blood work: CBC, electrolytes (including calcium and magnesium), BUN, creatinine, fasting blood glucose, HbA1c, lipid profile, liver function tests, serum TSH, \pm ferritin, BNP, uric acid
- ECG: look for chamber enlargement, arrhythmia, ischemia/infarction
- CXR: cardiomegaly, pleural effusion, redistribution, Kerley B lines, bronchiolar-alveolar cuffing
- echo: LVEF, cardiac dimensions, wall motion abnormalities, valvular disease, pericardial effusion
- radionuclide angiography: LVEF
- myocardial perfusion scintigraphy (thallium or sestamibi SPECT)

Acute Treatment of Pulmonary Edema

- treat acute precipitating factors (e.g. ischemia, arrhythmias)
- **L** – Lasix® (furosemide) 40-500 mg IV
- **M** – morphine 2-4 mg IV: decreases anxiety and preload (venodilation)
- **N** – nitroglycerin: topical/IV/SL
- **O** – oxygen: in hypoxemic patients
- **P** – positive airway pressure (CPAP/BiPAP): decreases preload and need for ventilation when appropriate
- **P** – position: sit patient up with legs hanging down unless patient is hypotensive
- in ICU setting or failure of LMNOPP, other interventions may be necessary
 - nitroprusside IV
 - hydralazine PO
 - sympathomimetics
 - ♦ dopamine
 - low dose: selective renal vasodilation (high potency D1 agonist)
 - medium dose: inotropic support (medium potency β 1 agonist)
 - high dose: increases SVR (low potency β 1 agonist), which is undesirable
 - ♦ dobutamine
 - selective inotrope (β 1 agonist) and arterial vasodilator (β 1 antagonist)
 - ♦ phosphodiesterase inhibitors (milrinone)
 - inotropic effect and vascular smooth muscle relaxation (decreased SVR), similar to dobutamine
- consider pulmonary artery catheter to monitor pulmonary capillary wedge pressure (PCWP) if patient is unstable or a cardiac etiology is uncertain (PCWP >18 indicates likely cardiac etiology)
- mechanical ventilation as needed
- rarely used, but potentially life-saving measures:
 - intra-aortic balloon pump (IABP)
 - left or right ventricular assist device (LVAD/RVAD)
 - cardiac transplant

Long-Term Management

- note that most evidence-based management applies to HFPEF
- priorities in HFPEF focus on controlling systolic and diastolic HTN, as a risk factor control measure

Conservative Measures

- symptomatic measures: oxygen in hospital, bedrest, elevate the head of bed
- lifestyle measures: diet, exercise, DM control, smoking cessation, decrease alcohol consumption, patient education, sodium and fluid restriction
- multidisciplinary heart failure clinics: for management of individuals at higher risk, or with recent hospitalization

Five Most Common Causes of CHF

- CAD (60-70%)
- HTN
- Idiopathic (often dilated cardiomyopathy)
- Valvular (e.g. AS, AR, and MR)
- Alcohol (dilated cardiomyopathy)

Precipitants of Heart Failure

HEART FAILED

- Hypertension (common)
- Endocarditis/environment (e.g. heat wave)
- Anemia
- Rheumatic heart disease and other valvular disease
- Thyrotoxicosis
- Failure to take meds (very common)
- Arrhythmia (common)
- Infection/Ischemia/Infarction (common)
- Lung problems (PE, pneumonia, COPD)
- Endocrine (pheochromocytoma, hyperaldosteronism)
- Dietary indiscretions (common)

Various clinical guidelines, including the Acute Heart Failure Syndromes AHA 2010 Guidelines, and the 2012 Canadian Cardiovascular Society (CCS) Heart Failure Management Guidelines, indicate the current approach of acute heart failure exacerbation may be too homogenous. The CCS guidelines in particular offer several suggestions, including cautious use of oxygen in normoxic patients due to the possible risk of causing increased systemic resistance and reduced cardiac output, reserving the use of non-invasive ventilation for patients not responding to medical therapy, as well as preference for high dose rather than low dose diuretic therapy

The most common cause of right heart failure is left heart failure

Measuring NT-Pro BNP

BNP is secreted by ventricles due to LV stretch and wall tension. Cardiomyocytes secrete BNP precursor that is cleaved into proBNP. After secretion into ventricles proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP portion.

NT-proBNP levels (pg/mL)	
Age	HF very likely
<50	>450
50-75	>900
>75	>1800

Limitations: Age, body habitus, renal function, pulmonary embolism

Non-Pharmacological Management

- cardiac rehabilitation: participation in a structured exercise program for NYHA class I-III after clinical status assessment to improve quality of life (HF-ACTION trial)

Pharmacological Therapy

1. Vasodilators

- ACEI: standard of care – slows progression of LV dysfunction and improves survival
 - all symptomatic patients functional class II-IV
 - all asymptomatic patients with LVEF <40%
 - post-MI
- angiotensin II receptor blockers
 - second-line to ACEI if not tolerated, or as adjunct to ACEI if β -blockers not tolerated – hydralazine and nitrates
 - second-line to ACEI, decrease in mortality not as great as with ACEI
 - may consider in acute renal failure until creatinine stabilizes

2. β -blockers: slow progression and improve survival

- class I-III with LVEF <40%
- stable class IV patients
- note: should be used cautiously, titrate slowly because may initially worsen CHF**

3. Diuretics: symptom control, management of fluid overload

- furosemide (40-500 mg daily) for potent diuresis
- metolazone may be used with furosemide to increase diuresis
- furosemide, metolazone, and thiazides oppose the hyperkalemia that can be induced by β -blockers, ACEI, ARBs, and aldosterone antagonists

4. Mineralocorticoid receptor (aldosterone) antagonists: mortality benefit in symptomatic heart failure and severely depressed ejection fraction

- spironolactone for class IIIb and IV CHF already on ACEI and loop diuretic
- eplerenone may be considered if intolerable endocrine side effects
- note: potential for life threatening hyperkalemia**
 - monitor K^+ after initiation and avoid if $Cr > 2.9$ mg/dL or $K^+ > 5.2$ mEq/L

5. Digoxin and cardiac glycosides: digoxin improves symptoms and decreases hospitalizations, no effect on mortality

- indications: patient in sinus rhythm and symptomatic on ACEI, or CHF and AFib
- patients on digitalis glycosides may worsen if these are withdrawn

6. Antiarrhythmic drugs: for use in CHF with arrhythmia

- can use amiodarone, β -blocker, or digoxin

7. Anticoagulants: warfarin for prevention of thromboembolic events

- prior thromboembolic event or AFib, presence of LV thrombus on echo
- possible benefit in other patients with LVEF <30% (controversial)

Procedural Interventions

- resynchronization therapy: symptomatic improvement with biventricular pacemaker
 - consider if QRS >130 msec, LVEF <35%, and severe symptoms despite optimal therapy
 - greatest benefit likely with marked LV enlargement, mitral regurgitation, QRS >150 msec, high diuretic requirement
- ICD: mortality benefit in 1° prevention of sudden cardiac death
 - prior MI, optimal medical therapy, LVEF <30%, clinically stable
 - prior MI, non-sustained VT, LVEF 30-40%, EPS inducible VT
- LVAD/RVAD (see *Ventricular Assist Devices*, C38)
- cardiac transplantation (see *Cardiac Transplantation*, C37)
- valve repair if patient is surgical candidate and has significant valve disease contributing to CHF (see *Valvular Heart Disease*, C41)

Features of Heart Failure on CXR

HERB-B

Heart enlargement (cardiothoracic ratio >0.50)

Pleural Effusion

Re-distribution (alveolar edema)

Kerley B lines

Bronchiolar-alveolar cuffing

Patients on β -blocker therapy who have acute decompensated heart failure should continue β -blockers where possible (provided they are not in cardiogenic shock or in severe pulmonary edema)

Can the Clinical Examination Diagnose Left-Sided Heart Failure in Adults?

From The Rational Clinical Examination

JAMA 2009; <http://www.jamaevidence.com/content/3478992>

Study: Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of CHF.

Results: The diagnosis of left ventricular dysfunction in patient after an MI based on the presence of radiographic pulmonary venous congestion with edema, raises one-third up the lung fields in the absence of a chronic pulmonary disease, or a 3rd heart sound had a positive likelihood ratio (+LR) of 3.1 (95% CI 1.7-5.8) and a negative likelihood ratio (-LR) of 0.62 (95% CI 0.46-0.83). In inpatients the combination of clinical findings, ECG, and CXR had a +LR of 2.0 (95% CI 1.6-2.5) and a -LR of 0.41 (95% CI 0.30-0.56). Female sex (+LR, 1.6 [95% CI 1.2-2.2]) and sBP ≥ 160 mmHg (+LR, 1.8 [95% CI 1.3-2.6]) were most indicative for diastolic dysfunction. Heart rate ≥ 100 /min (+LR 0.43 [95% CI 0.28-0.65]) and left atrial ECG abnormality (+LR 0.42 [95% CI 0.26-0.63]) were most indicative for systolic dysfunction.

Conclusions: Patients with signs, symptoms, and risk factors for systolic dysfunction should receive an ECG and CXR. Female sex and sBP ≥ 160 mmHg are suggestive of diastolic dysfunction; heart rate ≥ 100 /min and left atrial ECG abnormality suggest systolic dysfunction.

Chronic Treatment of CHF

- ACEI*
- β -blockers*
- \pm Mineralocorticoid receptor antagonists* (if severe CHF)
- Diuretic
- \pm Inotrope
- \pm Antiarrhythmic
- \pm Anticoagulant

*Mortality benefit

Figure 38. Effect of heart failure treatment on the Frank-Starling curve

Sleep-Disordered Breathing

- 45-55% of patients with CHF have sleep disturbances, including Cheyne-Stokes breathing and sleep apnea (central or obstructive)
- associated with a worse prognosis and greater LV dysfunction
- nasal continuous positive airway pressure (CPAP) is effective in treating symptoms of sleep apnea with secondary beneficial effects in cardiac function and symptoms

Cardiac Transplantation

- treatment for end-stage heart disease; due to ischemic or non-ischemic cardiomyopathy
- worldwide 1 yr survival is 85-90%, 5 yr survival about 60%, annual mortality rate of 4%
- matching is according to blood type, body size and weight (should be within 25%), and HLA tissue matching (if time allows)

Indications for Surgery

- severe cardiac disability despite maximal medical therapy (recurrent hospitalizations for CHF, NYHA III or IV, peak metabolic oxygen consumption <14 mL/kg/min in absence of β -blocker)
- symptomatic cardiac ischemia refractory to conventional treatment (unstable angina not amenable to CABG or PCI with LVEF $<30\%$; recurrent, symptomatic ventricular arrhythmias)
- exclusion of all surgical alternatives to cardiac transplantation

Prerequisites

- emotionally stable with social support
- medically compliant and motivated
- relative contraindications: incurable malignancy, major systemic illness, irreversible major organ disease, active systemic infection (e.g. hepatitis C, HIV), obesity, irreversible pulmonary HTN (pulmonary vascular resistance [PVR] >6 Wood units), severe COPD ($FEV_1 <1$ L) or active drug addiction or alcoholism

Complications

- rejection
 - common, $<5\%$ have serious hemodynamic compromise
 - gold standard to detect rejection: endomyocardial biopsy
 - no noninvasive tests to detect rejection
 - risk of acute rejection is greatest during the first 3 mo after transplant
- infection
 - leading cause of morbidity and mortality after cardiac transplantation
 - risk peaks early during the first few months after transplantation and then declines to a low persistent rate
- allograft CAD
 - approximately 50% develop graft CAD within 5 yr of transplantation
 - most common cause of late death following transplantation
- malignancy
 - develops in 15% of cardiac transplant recipients due to immunosuppressive medication

Influence of Ejection Fraction on Cardiovascular Outcomes in a Broad Spectrum of Heart Failure Patients

Circulation 2005;112:3738-3744

Purpose: Understand the relationship between ejection fractions and cardiovascular risk in patients with heart failure.

Methods: 7,599 patients from the CHARM study (Candesartan in Heart failure: Assessment of Reduction in Mortality and morbidity; RCT comparing placebo vs. candesartan in patients with NYHA class II to IV). Compared LVEF to cardiovascular outcomes and causes of death.

Results: All-cause mortality increased by 39% per 10% reduction in LVEF below 45% (Hazard ratio 1.39, 95% CI 1.32-1.46). For LVEF $>45\%$, ejection fraction does not further contribute to assessment of cardiovascular risk in HF patients.

Conclusions: At LVEF $<45\%$, lower ejection fractions were associated with poorer cardiovascular outcomes.

LVEF	CHF Hospitalization	All-Cause Mortality
$\leq 22\%$	14.9%	15.4%
23-32%	10.9%	10.8%
33-42%	7.2%	7.4%
43-52%	5.7%	5.2%
$>52\%$	6.9%	5.7%

Higher New York Heart Association Classes and Increased Mortality and Hospitalization in Patients with Heart Failure and Preserved Left Ventricular Function

Am Heart J 2006;151:444-450

Purpose: To establish the association between NYHA class and outcomes with heart failure and preserved systolic function.

Methods: Retrospective follow-up study (median 38.5 mo) of 988 patients with heart failure with ejection fraction $>45\%$. Estimated risks of various outcomes using Cox proportional hazard models.

Results: Adjusted hazard ratio for all-cause mortality for NYHA class II, III, IV patients was 1.54, 2.56, and 8.46, respectively. Adjusted hazard ratio for all-cause hospitalization for NYHA class II, III, IV patients was 1.23, 1.71, and 3.4, respectively.

Conclusions: Higher NYHA classes were associated with poorer outcomes in patients with heart failure and preserved systolic function. Proportions of NYHA I, II, III, and IV patients who died of all causes during the study were 14.3%.

NYHA	Proportion of All-Cause Hospitalization	Proportion of All-Cause Mortality
I	60.7%	14.3%
II	65.2%	21.3%
III	77.7%	35.9%
IV	75.0%	58.3%

Effects of Donor Pre-Treatment with Dopamine on Survival After Heart Transplantation: A Cohort Study of Heart Transplant Recipients Nested in a Randomized Controlled Multicenter Trial

J Am Coll Cardiol 2010;58:1768-1777

Treatment of brain-dead donors with dopamine of 4 μ g/kg/min will not harm cardiac allografts but appears to improve the clinical course of the heart allograft recipient.

- second most common cause of late death following transplantation
- cutaneous neoplasms most common, followed by non-Hodgkin's lymphoma and lung cancer
- immunosuppressive medication side effects (prednisone, cyclosporine, tacrolimus, sirolimus)

Ventricular Assist Devices

- work to unload the ventricle while maintaining output; also results in decreased myocardial oxygen consumption permitting recovery of the myocardium that is not irreversibly injured
- can support the left (LVAD), right (RVAD), or both ventricles (BiVAD)
- indications
 - bridge to transplantation
 - post-operative mechanical support when unable to separate from cardiopulmonary bypass despite inotropic and intra-aortic balloon pump (IABP) support
 - ♦ IABP is a catheter based device inserted into the aorta via the femoral artery that decreases myocardial O₂ demand and increases blood flow to coronary arteries
 - post-operative cardiogenic shock

Myocardial Disease

Definition of Cardiomyopathy

- intrinsic or primary myocardial disease not secondary to congenital, hypertensive, coronary, valvular, or pericardial disease
- functional classification: dilated, hypertrophic, or restrictive
- LV dysfunction 2° to MI often termed "ischemic cardiomyopathy", is not a true cardiomyopathy (i.e. primary myocardial disorder) since the primary pathology is obstructive CAD

Table 14. Summary Table for CHF and Myocardial Disease

SYSTOLIC HEART FAILURE		DIASTOLIC HEART FAILURE		
Dilated Cardiomyopathy	Secondary Causes	Hypertrophic Cardiomyopathy	Restrictive Cardiomyopathy	Secondary Causes
Idiopathic, infectious (e.g. myocarditis), alcohol, familial, collagen vascular disease, etc.	CAD, MI, DM, valvular (e.g. AR, MR)	Genetic disorder affecting cardiac sarcomeres (most common cause of sudden cardiac death in young athletes)	Amyloidosis, sarcoidosis, scleroderma, hemochromatosis, Fabry's, Pompe's Disease, Loeffler's, etc.	HTN, DM, valvular (e.g. AS), post-MI, transiently by ischemia, etc.

REMATCH Trial

NEJM 2001;345:1435-1443

Increased survival of 23% vs. 8% with LVAD vs. medical management of heart failure after 2 yr. Heartmate VAD has a biologic surface therefore does not require long-term anticoagulation but higher risk of infection.

Myocarditis

Definition

- inflammatory process involving the myocardium ranging from acute to chronic; an important cause of dilated cardiomyopathy

Etiology

- idiopathic
- infectious
 - viral (most common): parvovirus B19, influenza, coxsackie B, echovirus, poliovirus, HIV, mumps
 - bacterial: *S. aureus*, *C. perfringens*, *C. diphtheriae*, *Mycoplasma*, *Rickettsia*
 - fungi
 - spirochetal (Lyme disease – *Borrelia burgdorferi*)
 - Chagas disease (*Trypanosoma cruzi*), toxoplasmosis
- toxic: catecholamines, chemotherapy, cocaine
- hypersensitivity/eosinophilic: drugs (antibiotics, diuretics, lithium, clozapine), insect/snake bites
- systemic diseases: collagen vascular diseases (SLE, rheumatoid arthritis, others), sarcoidosis, autoimmune
- other: giant cell myocarditis, acute rheumatic fever

Signs and Symptoms

- constitutional symptoms
- acute CHF
- chest pain – due to pericarditis or cardiac ischemia
- arrhythmias
- systemic or pulmonary emboli
- sudden death

Cardiomyopathy

HARD

Hypertrophic cardiomyopathy
Arrhythmogenic right ventricular cardiomyopathy
Restrictive cardiomyopathy
Dilated cardiomyopathy

Investigations

- ECG: non-specific ST-T changes \pm conduction defects
- blood work
 - increased CK, troponin, LDH, and AST with acute myocardial necrosis \pm increased WBC, ESR, ANA, rheumatoid factor, complement levels
 - blood culture, viral titres and cold agglutinins for *Mycoplasma*
- CXR: enlarged cardiac silhouette
- echo: dilated, hypokinetic chambers, segmental wall motion abnormalities
- cardiovascular magnetic resonance: functional and morphological abnormalities as well as tissue pathology (gadolinium enhancement)
- myocardial biopsy

Management

- supportive care
- restrict physical activity
- treat CHF
- treat arrhythmias
- anticoagulation
- treat underlying cause if possible

Prognosis

- usually self-limited and often unrecognized, many recover
- sudden death in young adults
- may progress to dilated cardiomyopathy

Dilated Cardiomyopathy

Definition

- unexplained dilation and impaired systolic function of one or both ventricles

Etiology

- idiopathic (presumed viral or idiopathic) ~50% of DCM
- alcohol
- familial/genetic
- uncontrolled tachycardia (e.g. persistent rapid AFib)
- collagen vascular disease: SLE, polyarteritis nodosa, dermatomyositis, progressive systemic sclerosis
- infectious: viral (coxsackie B, HIV), Chagas disease, Lyme disease, Rickettsial diseases, acute rheumatic fever, toxoplasmosis
- neuromuscular disease: Duchenne muscular dystrophy, myotonic dystrophy, Friedreich's ataxia
- metabolic: uremia, nutritional deficiency (thiamine, selenium, carnitine)
- endocrine: hyper/hypothyroidism, DM, pheochromocytoma
- peripartum
- toxic: cocaine, heroin, organic solvents
- drugs: chemotherapies (doxorubicin, cyclophosphamide), antiretrovirals, chloroquine, clozapine, TCA
- radiation

Signs and Symptoms

- may present as
 - CHF
 - systemic or pulmonary emboli
 - arrhythmias
 - sudden death (major cause of mortality due to fatal arrhythmia)

Investigations

- blood work: CBC, electrolytes, Cr, bicarbonate, BNP, CK, troponin, LFTs, TSH, TIBC
- ECG: variable ST-T wave abnormalities, poor R wave progression, conduction defects (e.g. BBB), arrhythmias (non-sustained VT)
- CXR: global cardiomegaly (globular heart), signs of CHF, pleural effusion
- echo: chamber enlargement, global hypokinesis, depressed LVEF, MR and TR, mural thrombi
- endomyocardial biopsy: not routine, used to rule out a treatable cause
- coronary angiography: in selected patients to exclude ischemic heart disease

Management

- treat underlying disease: e.g. abstinence from alcohol
- treat CHF: see [Heart Failure, C33](#)
- thromboembolism prophylaxis: anticoagulation with warfarin
 - indicated for: AFib, history of thromboembolism or documented thrombus
 - LVEF <30% (controversial)
- treat symptomatic or serious arrhythmias
- immunize against influenza and *S. pneumoniae*
- consider surgical options (e.g. LVAD, transplant, volume reduction surgery) in appropriate candidates with severe, drug refractory disease
- consider ICD among patients with a LVEF <30%

Major Risks Factors for DCM
Alcohol, cocaine, family history

Abnormal Labs in DCM
• High BNP
• High Cr
• High LFTs
• Low bicarbonate
• Low Na⁺

Prognosis

- depends on etiology
- better with reversible underlying cause, worst with infiltrative diseases, HIV, drug-induced
- cause of death usually CHF (due to pump failure) or sudden death 2° to ventricular arrhythmias
- systemic emboli are significant source of morbidity
- 20% mortality in 1st yr, 10% per year after

Hypertrophic Cardiomyopathy

- see 2011 ACCF/AHA Guideline for the Diagnosis and Treatment of Hypertrophic Cardiomyopathy for details

Definition

- defined as unexplained ventricular hypertrophy
- various patterns of HCM are classified, but most causes involve pattern of septal hypertrophy

Etiology and Pathophysiology

- histopathologic features include myocyte disarray, myocyte hypertrophy, and interstitial fibrosis
- cause is felt to be a genetic defect involving one of the cardiac sarcomeric proteins (>400 mutations associated with autosomal dominant inheritance, incomplete penetrance)
- prevalence of 1/500-1/1,000 in general population
- generally presents in early adulthood

Hemodynamic Classification

- hypertrophic obstructive cardiomyopathy (HOCM): dynamic LV outflow tract (LVOT) obstruction, either at rest or with provocation, defined as LVOT gradient of at least 30 mmHg
- non-obstructive HCM: no LVOT obstruction
- many patients have diastolic dysfunction (impaired ventricular filling secondary to LV hypertrophy which decreases compliance)

Signs and Symptoms

- clinical manifestations: asymptomatic (common, therefore screening is important), SOB on exertion, angina, presyncope/syncope (due to LV outflow obstruction or arrhythmia), CHF, arrhythmias, SCD
- pulses: rapid upstroke, "spike and dome" pattern in carotid pulse (in HCM with outflow tract obstruction)
- precordial palpation: PMI localized, sustained, double impulse, 'triple ripple' (triple apical impulse in HOCM), LV lift
- precordial auscultation: normal or paradoxically split S2, S4, harsh systolic diamond-shaped murmur at LLSB or apex, enhanced by squat or Valsalva (murmur secondary to LVOT obstruction as compared to AS); often with pansystolic murmur due to mitral regurgitation

Investigations

- ECG/Holter monitor: LVH, high voltages across precordium, prominent Q waves (lead I, aVL, V5, V6), tall R wave in V1, P wave abnormalities
- transthoracic echocardiography and echo-Doppler study: asymmetric septal hypertrophy (less commonly apical), systolic anterior motion (SAM) of mitral valve and MR; LVOT gradient can be estimated by Doppler measurement
- genetic studies (\pm magnetic resonance imaging) can be helpful when echocardiography is inconclusive for diagnosis
- cardiac catheterization (only when patient being considered for invasive therapy)

Management

- avoid factors which increase obstruction (e.g. volume depletion)
 - avoidance of all competitive sports
- treatment of obstructive HCM
 - medical agents: β -blockers, disopyramide, verapamil (started only in monitored setting), phenylephrine (in setting of cardiogenic shock)
 - avoid nitrates, diuretics, and ACEI as they increase LVOT gradient and worsen symptoms
- patients with obstructive HCM and drug-refractory symptoms
 - surgical myectomy
 - ICD placement
 - septal ethanol ablation
 - dual chamber pacing (rarely done)
- treatment of ventricular arrhythmias: amiodarone or ICD
- first-degree relatives (children, siblings, parents) of patients with HCM should be screened (physical, ECG, 2D echo) every 12-18 mo during adolescence, then serially every 5 yr during adulthood

Prognosis

- potential complications: AFib, VT, CHF, sudden cardiac death (1% risk/yr; most common cause of SCD in young athletes)
 - major risk factors for sudden death (consider ICD placement)
 - history of survived cardiac arrest/sustained VT
 - family history of multiple premature sudden deaths
 - other factors associated with increased risk of sudden cardiac death
 - ♦ syncope (presumed to be arrhythmic in origin)
 - ♦ non-sustained VT on ambulatory monitoring
 - ♦ marked ventricular hypertrophy (maximum wall thickness ≥ 30 mm)
 - ♦ abnormal BP in response to exercise (in patients <40 yr old with HCM)

Restrictive Cardiomyopathy**Definition**

- impaired ventricular filling with preserved systolic function in a non-dilated, non-hypertrophied ventricle secondary to factors that decrease myocardial compliance (fibrosis and/or infiltration)

Etiology

- infiltrative: amyloidosis, sarcoidosis
- non-infiltrative: scleroderma, idiopathic myocardial fibrosis
- storage diseases: hemochromatosis, Fabry's disease, Gaucher's disease, glycogen storage diseases
- endomyocardial
 - endomyocardial fibrosis, Loeffler's endocarditis, or eosinophilic endomyocardial disease
 - radiation heart disease
 - carcinoid syndrome (may have associated tricuspid valve or pulmonary valve dysfunction)

Clinical Manifestations

- CHF (usually with preserved LV systolic function), arrhythmias
- elevated JVP with prominent x and y descents, Kussmaul's sign
- S3, S4, MR, TR
- thromboembolic events

Investigations

- ECG: low voltage, non-specific, diffuse ST-T wave changes \pm non-ischemic Q waves
- CXR: mild cardiac enlargement
- echo: LAE, RAE; specific Doppler findings with no significant respiratory variation
- cardiac catheterization: increased end-diastolic ventricular pressures
- endomyocardial biopsy: to determine etiology (especially for infiltrative RCM)

Management

- exclude constrictive pericarditis
- treat underlying disease: control HR, anticoagulate if AFib
- supportive care and treatment for CHF, arrhythmias
- heart transplant: might be considered for CHF refractory to medical therapy

Prognosis

- depends on etiology

RCM vs. Constrictive Pericarditis (CP)
Present similarly but CP is treatable with surgery

**Key Investigations**

- Echo: may show respiratory variation in blood flow in CP
- CT: may show very thickened pericardium and calcification in CP
- MRI: best modality to directly visualize pericardium and myocardium

Valvular Heart Disease

- see *Guidelines on the Management of Valvular Heart Disease. Eur Heart J 2012;33(19):2451-2496* for details

Infective Endocarditis

- see [Infectious Diseases, ID17](#)
- American Heart Association (AHA) 2007 guidelines recommend IE prophylaxis
 - only for patients with
 - ♦ prosthetic valve material
 - ♦ past history of IE
 - ♦ certain types of congenital heart disease
 - ♦ cardiac transplant recipients who develop valvulopathy
 - only for the following procedures
 - ♦ dental
 - ♦ respiratory tract
 - ♦ procedures on infected skin/skin structures/MSK structures
 - ♦ not GI/GU procedures specifically

Rheumatic Fever

- see [Pediatrics](#), P60

Prognosis

- acute complications: myocarditis (DCM/CHF), conduction abnormalities (sinus tachycardia, AFib), valvulitis (acute MR), acute pericarditis (not constrictive pericarditis)
- chronic complications: rheumatic valvular heart disease – fibrous thickening, adhesion, calcification of valve leaflets resulting in stenosis/regurgitation, increased risk of IE ± thromboembolism
- onset of symptoms usually after 10-20 yr latency from acute carditis of rheumatic fever
- mitral valve most commonly affected

Mitral Valve Repair vs. Replacement for Severe Ischemic Mitral Regurgitation

NEJM 2014;370:23-32

Purpose: Ischemic mitral regurgitation is associated with significant mortality risk. The purpose of this study was to compare the effectiveness and safety of repairing vs. replacing the mitral valve in patients with severe chronic ischemic mitral regurgitation.

Study Design: RCT with 251 patients with severe ischemic mitral regurgitation were randomly assigned to mitral valve repair or chordal-sparing replacement. The primary endpoint was the left ventricular end-systolic volume index (LVESVI) at 12 mo.

Results: There were no significant between-group differences in LVESVI, in the rate of major adverse cardiac or cerebrovascular events, in functional status, or in quality of life at 12 mo. The rate of moderate or severe mitral regurgitation recurrence at 12 mo was significantly higher in the repair group than in the replacement group (32.6% vs. 2.3%, respectively).

Conclusions: No significant difference in left ventricular reverse remodeling or survival at 12 mo between patients who underwent mitral valve repair or replacement. Replacement provided more durable correction of mitral regurgitation, but there were no significant differences in clinical outcomes.

Valve Repair and Valve Replacement

- indication for valve repair or replacement depends on the severity of the pathology; typically recommended when medical management has failed to adequately improve the symptoms or reduce the risk of morbidity and mortality
- pathologies that may require surgical intervention include congenital defects, infections, rheumatic heart disease as well as a variety of valve diseases associated with aging
- valve repair: balloon valvuloplasty, surgical valvuloplasty (commissurotomy, annuloplasty), chordae tendineae shortening, tissue patch
- valve replacement: typically for aortic or mitral valves only; repair is favored in younger individuals; percutaneous techniques being established

Choice of Valve Prosthesis

Table 15. Mechanical Valve vs. Bioprosthetic Valve

Mechanical Valve	Bioprosthetic Valve
Good durability	Limited long-term durability (mitral < aortic)
Less preferred in small aortic root sizes	Good flow in small aortic root sizes
Increased risk of thromboembolism (1-3%/yr); requires long-term anticoagulation with coumadin	Decreased risk of thromboembolism: long-term anticoagulation not needed for aortic valves
Target INR Aortic valves: 2.0-3.0 (mean 2.5) Mitral valves: 2.5-3.5 (mean 3.0)	Some recommendation for limited anticoagulation for mitral valves
Increased risk of hemorrhage: 1-2%/yr	Decreased risk of hemorrhage

A Bedside Clinical Prediction Rule for Detecting Moderate or Severe Aortic Stenosis

J Gen Intern Med 1998;13:699-704

Study Design: Blinded cross sectional study with 124 patients of an ambulatory cardiology clinic. Patients were examined for: 1) murmur over the right clavicle 2) murmur loudest at second right intercostal space 3) reduced intensity of S2 4) reduced volume of the carotid pulse 5) delayed carotid upstroke.

Methods: Patients were examined by blinded investigators and the clinical examination findings were compared to findings on subsequent echocardiography. Moderate to severe aortic stenosis was defined as a valve area <1.2 cm² or a peak intensity gradient of >25 mmHg.

Results: Absence of a murmur over the right clavicle ruled out aortic stenosis while presence of ≥3 of the 4 associated symptoms ruled in aortic stenosis (LR=40).

Conclusions: Bedside techniques can accurately rule in and rule out moderate to severe aortic stenosis.

Summary of Valvular Disease

Table 16. Valvular Heart Disease

Aortic Stenosis (AS)

Etiology

Congenital (bicuspid, unicuspid valve), calcification (wear and tear), rheumatic disease

Definition

Normal aortic valve area = 3–4 cm²

Mild AS 1.5 to 3 cm²

Moderate AS 1.0 to 1.5 cm²

Severe AS <1.0 cm²

Critical AS <0.5 cm²

Pathophysiology

Outflow obstruction → increased EDP → concentric LVH → LV failure → CHF, subendocardial ischemia

Symptoms

Exertional angina, syncope, dyspnea, PND, orthopnea, peripheral edema

Physical Exam

Narrow pulse pressure, brachial-radial delay, pulsus parvus et tardus, sustained PMI
Auscultation: crescendo-decrescendo SEM radiating to R clavicle and carotid, musical quality at apex (Gallavardin phenomenon), S₄, soft S₂ with paradoxical splitting, S₃ (late)

Investigations

ECG: LVH and strain, LBBB, LAE, AFib

CXR: post-stenotic aortic root dilatation, calcified valve, LVH, LAE, CHF

Echo: reduced valve area, pressure gradient, LVH, reduced LV function

Treatment

Asymptomatic: serial echos, avoid exertion

Symptomatic: avoid nitrates/arterial dilators and ACEI in severe AS

Surgery if: symptomatic or LV dysfunction

Surgical Options

Valve replacement: aortic rheumatic valve disease and trileaflet valve

– prior to pregnancy (if AS significant)

– balloon valvuloplasty (in very young)

Interventional Options

Percutaneous valve replacement (transfemoral or transapical approach)

is an option in selected patients who are not considered good candidates for surgery

© Anas Nader 2011

Aortic Regurgitation (AR)

Etiology

Supravalvular: aortic root disease (Marfan's, atherosclerosis and dissecting aneurysm, connective tissue disease)

Valvular: congenital (bicuspid aortic valve, large VSD), IE

Acute Onset: IE, aortic dissection, trauma, failed prosthetic valve

Pathophysiology

Volume overload → LV dilatation → increased SV, high sBP and low dBP → increased wall tension → pressure overload → LVH (low dBP → decreased coronary perfusion)

Symptoms

Usually only becomes symptomatic late in disease when LV failure develops

Dyspnea, orthopnea, PND, syncope, angina

Physical Exam

Waterhammer pulse, bisferiens pulse, femoral-brachial sBP >20 (Hill's test wide pulse pressure), hyperdynamic apex, displaced PMI, heaving apex

Auscultation: early decrescendo diastolic murmur at LLSB (cusp pathology) or RLBB (aortic root pathology), best heard sitting, leaning forward, on full expiration, soft S₁, absent S₂, S₃ (late)

Investigations

ECG: LVH, LAE

CXR: LVH, LAE, aortic root dilatation

Echo/TTE: quantify AR, leaflet or aortic root anomalies

Cath: if >40 yr and surgical candidate – to assess for ischemic heart disease

Exercise testing: hypotension with exercise

Treatment

Asymptomatic: serial echos, afterload reduction (e.g. ACEI, nifedipine, hydralazine)

Symptomatic: avoid exertion, treat CHF

Surgery if: NYHA class III-IV CHF; LV dilatation and/or LVEF <50% with/without symptoms

Surgical Options

Valve replacement: most patients

Valve repair: very limited role

Aortic root replacement (Bentall procedure):

– when ascending aortic aneurysm present, valved conduit used

© Anas Nader 2011

Mitral Stenosis (MS)

Etiology

Rheumatic disease most common cause, congenital (rare)

Definition

Severe MS is mitral valve area (MVA) <1.2 cm²

Pathophysiology

MS → fixed CO and LAE → increased LA pressure → pulmonary vascular resistance and CHF; worse with AFib (no atrial kick), tachycardia (decreased atrial emptying time) and pregnancy (increased preload)

Symptoms

SOB on exertion, orthopnea, fatigue, palpitations, peripheral edema, malar flush, pinched and blue facies (severe MS)

Physical Exam

AFib, no "a" wave on JVP, left parasternal lift, palpable diastolic thrill at apex

Auscultation: mid-diastolic rumble at apex, best heard with bell in left lateral decubitus position following exertion, loud S₁, OS following loud P₂ (heard best during expiration), long diastolic murmur and short A₂-OS interval correlate with worse MS

Investigations

ECG: NSR/AFib, LAE (P mitrale), RVH, RAD

CXR: LAE, CHF, mitral valve calcification

Echo/TTE: shows restricted opening of mitral valve

Cath: indicated in concurrent CAD if >40 yr (male) or >50 yr (female)

Treatment

Avoid exertion, fever (increased LA pressure), treat AFib and CHF, increase diastolic filling time (β-blockers, digitalis)

Surgery if: NYHA class III-IV CHF and failure of medical therapy

Invasive Options

Percutaneous balloon valvuloplasty: young rheumatic pts and good leaflet morphology (can be determined by echo), asymptomatic pts with moderate-severe MS, pulmonary HTN

Contraindication: left atrial thrombus, moderate MR

Open Mitral Commissurotomy: if mild calcification + leaflet/chordal thickening

– restenosis in 50% pts in 8 yr

Valve replacement: indicated in moderate-severe calcification and severely scarred leaflets

© Anas Nader 2011

Mitral Regurgitation (MR)

Etiology

Mitral valve prolapse, congenital cleft leaflets, LV dilatation/aneurysm (CHF, DCM, myocarditis), IE abscess, Marfan's syndrome, HOCM, acute MI, myxoma, mitral valve annulus calcification, chordae/papillary muscle trauma/ischemia/rupture (acute), rheumatic disease

Pathophysiology

Reduced CO → increased LV and LA pressure → LV and LA dilatation → CHF and pulmonary HTN

Symptoms

Dyspnea, PND, orthopnea, palpitations, peripheral edema

Physical Exam

Displaced hyperdynamic apex, left parasternal lift, apical thrill

Auscultation: holosystolic murmur at apex, radiating to axilla ± mid-diastolic rumble, loud S₂ (if pulmonary HTN), S₃

Investigations

ECG: LAE, left atrial delay (bifid P waves), ± LVH

CXR: LVH, LAE, pulmonary venous HTN

Echo: etiology and severity of MR, LV function, leaflets

Swan-Ganz Catheter: prominent LA "v" wave

Treatment

Asymptomatic: serial echos

Symptomatic: decrease preload (diuretics), decrease afterload (ACEI) for severe MR and poor surgical candidates; stabilize acute MR with vasodilators before surgery

Surgery if: acute MR with CHF, papillary muscle rupture, NYHA class III-IV CHF, AF, increasing LV size or worsening LV function, earlier surgery if valve repairable (>90% likelihood) and patient is low-risk for surgery

Surgical Options

Valve repair: >75% of pts with MR and myxomatous mitral valve prolapse – annuloplasty rings, leaflet repair, chordae transfers/shorten/replacement

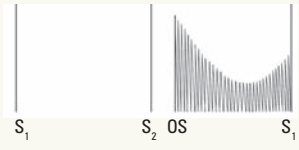

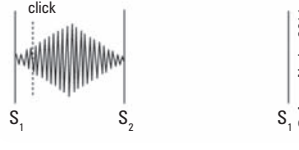

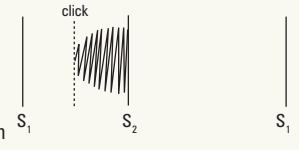

Valve replacement: failure of repair, heavily calcified annulus

Advantage of repair: low rate of endocarditis, no anticoagulation, less chance of re-operation

© Anas Nader 2011

<p>Mitral Valve Prolapse (MVP)</p> <p>Etiology Myxomatous degeneration of chordae, thick, bulky leaflets that crowd orifice, associated with Marfan’s syndrome, pectus excavatum, straight back syndrome, other MSK abnormalities; <3% of population</p> <p>Pathophysiology Mitral valve displaced into LA during systole; no causal mechanisms found for symptoms</p> <p>Symptoms Prolonged, stabbing chest pain, dyspnea, anxiety/panic, palpitations, fatigue, presyncope</p> <p>Physical Exam Auscultation: mid-systolic click (due to billowing of mitral leaflet into LA; tensing of redundant valve tissue); mid to late systolic murmur at apex, accentuated by Valsalva or squat-to-stand maneuvers</p> <p>Investigations ECG: non-specific ST-T wave changes, paroxysmal SVT, ventricular ectopy Echo: systolic displacement of thickened mitral valve leaflets into LA</p> <p>Treatment Asymptomatic: no treatment; reassurance Symptomatic: β-blockers and avoidance of stimulants (caffeine) for significant palpitations, anticoagulation if AFib</p> <p>Surgical Options Mitral valve surgery (repair favored over replacement) if symptomatic and significant MR</p>	

Figure 39. Hemodynamics of aortic stenosis

Stenosis across the aortic valve results in the generation of a significant pressure gradient between the left ventricle and the aorta and a crescendo-decrescendo murmur during systolic contraction. The stenosis decreases the intensity of aortic valve closure hence diminishing S2.

Figure 40. Hemodynamics of aortic regurgitation

Regurgitation across the aortic valve during diastole causes the aortic pressure to rapidly decrease and a decrescendo murmur can be heard at the onset of diastole (after S2 is audible). The presence of regurgitant blood from the aorta increases left-ventricular end-diastolic volume.

Figure 41. Hemodynamics of acute mitral regurgitation

During systolic contraction, blood regurgitates from the left ventricle into the left atrium across the incompetent mitral valve resulting in an audible holosystolic murmur between S1 and S2. The portion of left ventricular end diastolic volume that regurgitates into the left atrial myocardium increases left atrial pressures resulting in a tall V-wave (in the JVP).

Figure 42. Hemodynamics of mitral stenosis

First note that the left atrial pressure exceeds the left ventricular pressure during diastole due to mitral stenosis and the consequent generation of a pressure gradient across the left atrium and left ventricle. In diastole the stenotic mitral valve opens which corresponds to the opening snap (OS) and the passage of blood across the mitral stenosis results in an audible decrescendo murmur. Left atrial contraction prior to S1 increases the pressure gradient resulting in accentuation of the murmur before S1 is audible.

Pericardial Disease

Acute Pericarditis

Etiology of Pericarditis/Pericardial Effusion

- idiopathic is most common: presumed to be viral
- infectious
 - viral: Coxsackie virus A, B (most common), echovirus
 - bacterial: *S. pneumoniae*, *S. aureus*
 - TB
 - fungal: histoplasmosis, blastomycosis
- post-MI: acute (direct extension of myocardial inflammation, 1-7 d post-MI), Dressler's syndrome (autoimmune reaction, 2-8 wk post-MI)
- post-cardiac surgery (e.g. CABG), other trauma
- metabolic: uremia (common), hypothyroidism
- neoplasm: Hodgkin's, breast, lung, renal cell carcinoma, melanoma
- collagen vascular disease: SLE, polyarteritis, rheumatoid arthritis, scleroderma
- vascular: dissecting aneurysm
- other: drugs (e.g. hydralazine), radiation, infiltrative disease (sarcoid)

Signs and Symptoms

- diagnostic triad: chest pain, friction rub, and ECG changes
- pleuritic chest pain: alleviated by sitting up and leaning forward
- pericardial friction rub: may be uni-, bi-, or triphasic
- \pm fever, malaise

Investigations

- ECG: initially diffuse elevated ST segments \pm depressed PR segment, the elevation in the ST segment is concave upwards \rightarrow 2-5 d later ST isoelectric with T wave flattening and inversion
- CXR: normal heart size, pulmonary infiltrates
- echo: performed to assess for pericardial effusion

Treatment

- treat the underlying disease
- anti-inflammatory agents (high dose NSAIDs/ASA, colchicine; steroids use controversial), analgesics

Complications

- recurrent episodes of pericarditis, atrial arrhythmia, pericardial effusion, tamponade, constrictive pericarditis

Acute Pericarditis Triad

- Chest pain
- Friction rub
- ECG changes

Pericardial Effusion

Etiology

- transudative (serous)
- CHF, hypoalbuminemia/hypoproteinemia, hypothyroidism
- exudative (serosanguinous or bloody)
 - causes similar to the causes of acute pericarditis
 - may develop acute effusion secondary to hemopericardium (trauma, post-MI myocardial rupture, aortic dissection)
- physiologic consequences depend on type and volume of effusion, rate of effusion development, and underlying cardiac disease

Signs and Symptoms

- may be asymptomatic or similar to acute pericarditis
- dyspnea, cough
- extra-cardiac (esophageal/recurrent laryngeal nerve/tracheo-bronchial/phrenic nerve irritation)
- JVP increased with dominant "x" descent
- arterial pulse normal to decreased volume, decreased pulse pressure
- auscultation: distant heart sounds \pm rub
- Ewart's sign

Investigations

- ECG: low voltage, flat T waves, electrical alternans
- CXR: cardiomegaly, rounded cardiac contour
- echo (procedure of choice): fluid in pericardial sac
- pericardiocentesis: definitive method of determining transudate vs. exudate, identify infectious agents, neoplastic involvement

Treatment

- mild: frequent observation with serial echos, treat underlying cause, anti-inflammatory agents
- severe: treat as in tamponade

Ewart's Sign

Bronchial breathing and dullness to percussion at the lower angle of the left scapula in pericardial effusion due to effusion compressing left lower lobe of lung

Cardiac Tamponade

Etiology

- major complication of rapidly accumulating pericardial effusion
- cardiac tamponade is a clinical diagnosis
- any cause of pericarditis but especially trauma, malignancy, uremia, proximal aortic dissection with rupture

Pathophysiology

- high intra-pericardial pressure → decreased venous return → decreased diastolic ventricular filling → decreased CO → hypotension and venous congestion

Signs and Symptoms

- tachypnea, dyspnea, shock, muffled heart sounds
- pulsus paradoxus (inspiratory fall in systolic BP >10 mmHg during quiet breathing)
- JVP “x” descent only, blunted “y” descent
- hepatic congestion/peripheral edema

Investigations

- ECG: electrical alternans (pathognomonic variation in R wave amplitude), low voltage
- echo: pericardial effusion, compression of cardiac chambers (RA and RV) in diastole
- cardiac catheterization

Treatment

- pericardiocentesis – echo-guided
- pericardiectomy
- avoid diuretics and vasodilators (these decrease venous return to already under-filled RV → decrease LV preload → decrease CO)
- IV fluid may increase CO
- treat underlying cause

Classic Quartet of Tamponade

- Hypotension
- Increased JVP
- Tachycardia
- Pulsus paradoxus

Beck's Triad

- Hypotension
- Increased JVP
- Muffled heart sounds

DDx Pulsus Paradoxus

- Constrictive pericarditis (rarely)
- Severe obstructive pulmonary disease (e.g. asthma)
- Tension pneumothorax
- PE
- Cardiogenic shock
- Cardiac tamponade

Constrictive Pericarditis

Etiology

- chronic pericarditis resulting in fibrosed, thickened, adherent, and/or calcified pericardium
- any cause of acute pericarditis may result in chronic pericarditis
- major causes are idiopathic, post-infectious (viral, TB), radiation, post-cardiac surgery, uremia, MI, collagen vascular disease

Signs and Symptoms

- dyspnea, fatigue, palpitations
- abdominal pain
- may mimic CHF (especially right-sided HF)
 - ascites, hepatosplenomegaly, edema
- increased JVP, Kussmaul's sign (paradoxical increase in JVP with inspiration), Friedreich's sign (prominent “y” descent)
- BP usually normal (and usually no pulsus paradoxus)
- precordial examination: ± pericardial knock (early diastolic sound)
- see Table 17 for differentiation from cardiac tamponade

Investigations

- ECG: non-specific – low voltage, flat T wave, ± AFib
- CXR: pericardial calcification, effusions
- echo/CT/MRI: pericardial thickening
- cardiac catheterization: equalization of end-diastolic chamber pressures (diagnostic)

Treatment

- medical: diuretics, salt restriction
- surgical: pericardiectomy (only if refractory to medical therapy)
- prognosis best with idiopathic or infectious cause and worst in post-radiation; death may result from heart failure

Table 17. Differentiation of Constrictive Pericarditis vs. Cardiac Tamponade

Characteristic	Constrictive Pericarditis	Cardiac Tamponade
JVP	“y” > “x”	“x” > “y”
Kussmaul's sign	Present	Absent
Pulsus paradoxus	Uncommon	Always
Pericardial knock	Present	Absent
Hypotension	Variable	Severe

Vascular Disease

- see [Vascular Surgery](#), VS2

Common Medications

Table 18. Commonly Used Cardiac Therapeutics

Drug Class	Examples	Mechanism of Action	Indications	Side Effects	Contraindications
ANGIOTENSIN CONVERTING ENZYME INHIBITORS (ACEI)					
	enalapril (Vasotec®), perindopril (Aceon®), ramipril (Altace®), lisinopril (Zestril®)	Inhibit ACE-mediated conversion of angiotensin I to angiotensin II (AT II), causing peripheral vasodilation and decreased aldosterone synthesis	HTN, CAD, CHF, post-MI, DM	Dry cough, 10% hypotension, fatigue, hyperkalemia, renal insufficiency, angioedema	Bilateral renal artery stenosis, pregnancy, caution in decreased GFR
ANGIOTENSIN II RECEPTOR BLOCKERS (ARBs)					
	candesartan, irbesartan, valsartan	Block AT II receptors, causing similar effects to ACEI	Same as ACEI, although evidence is generally less for ARBs; often used when ACEI are not tolerated	Similar to ACEI, but do not cause dry cough	Same as ACEI
DIRECT RENIN INHIBITORS (DRIs)					
	aliskiren	Directly blocks renin thus inhibiting the conversion of angiotensinogen to angiotensin I; this also causes a decrease in AT II	HTN (exact role of this drug remains unclear)	Diarrhea, hyperkalemia (higher risk if used with an ACEI), rash, cough, angioedema, reflux, hypotension, rhabdomyolysis, seizure	Pregnancy, severe renal impairment
β-BLOCKERS					
β1 antagonists	atenolol, metoprolol, bisoprolol	Block β-adrenergic receptors, decreasing HR, BP, contractility, and myocardial oxygen demand, slow conduction through the AV node	HTN, CAD, acute MI, post-MI, CHF (start low and go slow), AFib, SVT	Hypotension, fatigue, light-headedness, depression, bradycardia, hyperkalemia, bronchospasm, impotence, depression of counterregulatory response to hypoglycemia, exacerbation of Raynaud's phenomenon, and claudication	Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, WPW Caution in asthma, claudication, Raynaud's phenomenon, and decompensated CHF
β1/β2 antagonists	propranolol				
α1/β1/β2 antagonists	labetalol, carvedilol				
β1 antagonists with intrinsic sympathomimetic activity	acebutalol				
CALCIUM CHANNEL BLOCKERS (CCBs)					
Benzothiazepines Phenylalkylamines (non-dihydropyridines)	diltiazem verapamil	Block smooth muscle and myocardial calcium channels causing effects similar to β-blockers Also vasodilate	HTN, CAD, SVT, diastolic dysfunction	Hypotension, bradycardia, edema Negative inotrope	Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, WPW, CHF
Dihydropyridines	amlodipine (Norvasc®), nifedipine (Adalat®), felodipine (Plendil®)	Block smooth muscle calcium channels causing peripheral vasodilation	HTN	Hypotension, edema, flushing, headache, light-headedness	Severe aortic stenosis and liver failure
DIURETICS					
Thiazides	hydrochlorothiazide, chlorthalidone, metolazone	Reduce Na ⁺ reabsorption in the distal convoluted tubule (DCT)	HTN (drugs of choice for uncomplicated HTN)	Hypotension, hypokalemia, polyuria	Sulfa allergy, pregnancy
Loop diuretics	furosemide (Lasix®)	Blocks Na ⁺ /K ⁺ -ATPase in the loop of Henle	CHF, pulmonary or peripheral edema	Hypovolemia, hypokalemic metabolic alkalosis	Hypovolemia, hypokalemia
Aldosterone receptor antagonists	spironolactone, eplerenone	Antagonize aldosterone receptors	HTN, CHF, hypokalemia	Edema, hyperkalemia, gynecomastia	Renal insufficiency, hyperkalemia, pregnancy
INOTROPES					
	digoxin (Lanoxin®)	Inhibit Na ⁺ /K ⁺ -ATPase, leading to increased intracellular Na ⁺ and Ca ²⁺ concentration and increased myocardial contractility Also slows conduction through the AV node	CHF, AFib	AV block, tachyarrhythmias, bradyarrhythmias, blurred or yellow vision (van Gogh syndrome), anorexia, N/V	2nd or 3rd degree AV block, hypokalemia, WPW

Table 18. Commonly Used Cardiac Therapeutics (continued)

Drug Class	Examples	Mechanism of Action	Indications	Side Effects	Contraindications
ANTICOAGULANTS					
Coumarins	warfarin (Coumadin®)	Antagonizes vitamin K, leading to decreased synthesis of clotting factors II, VII, IX, and X	AFib, LV dysfunction, prosthetic valves	Bleeding (by far the most important side effect), paradoxical thrombosis, skin necrosis	Recent surgery or bleeding, bleeding diathesis, pregnancy
Heparins	Unfractionated heparin LMWHs: dalteparin, enoxaparin, tinzaparin	Antithrombin III agonist, leading to decreased clotting factor activity	Acute MI; when immediate anticoagulant effect needed	Bleeding, osteoporosis, heparin-induced thrombocytopenia (less in LMWHs)	Recent surgery or bleeding, bleeding diathesis, thrombocytopenia, renal insufficiency (for LMWHs)
Direct thrombin inhibitors	dabigatran, melagatran	Competitive, direct thrombin inhibitor; thrombin enables fibrinogen conversion to fibrin during the coagulation cascade, thereby preventing thrombus development	AFib	Bleeding, GI upset	Severe renal impairment, recent surgery, active bleeding
Direct Factor Xa inhibitors	rivaroxaban	Direct, selective and reversible inhibition of factor Xa in both the intrinsic and extrinsic coagulation pathways	AFib	Bleeding, GI upset, elevated liver enzymes	Hepatic disease, active bleeding, bleeding diathesis, pregnancy, lactation
ANTIPLATELETS					
Salicylates	ASA (Aspirin®)	Irreversibly acetylates platelet COX-1, preventing thromboxane A2-mediated platelet aggregation	CAD, acute MI, post-MI, post-PCI, CABG	Bleeding, GI upset, GI ulceration, impaired renal perfusion	Active bleeding or PUD
Thienopyridines	clopidogrel (Plavix®), ticlopidine (Ticlid®)	Block platelet ADP receptors	Acute MI, post-MI, post-PCI, CABG	Bleeding, thrombotic thrombocytopenic purpura, neutropenia (ticlopidine)	Active bleeding or PUD
GPIIb/IIIa inhibitors	eptifibatide, tirofiban, abciximab	Block binding of fibrinogen to Gp IIb/IIIa	Acute MI, particularly if PCI is planned	Bleeding	Recent surgery or bleeding, bleeding diathesis
THROMBOLYTICS					
	alteplase, reteplase, tenecteplase, streptokinase	Convert circulating plasminogen to plasmin, which lyses cross-linked fibrin	Acute STEMI	Bleeding	See Table 8, C28
NITRATES					
	nitroglycerin	Relax vascular smooth muscle, producing venous and arteriolar dilation	CAD, MI, CHF (isosorbide dinitrate plus hydralazine)	Headache, dizziness, weakness, postural hypotension	Concurrent use of cGMP phosphodiesterase inhibitors, angle closure glaucoma, increased intracranial pressure
LIPID LOWERING AGENTS					
Statins	atorvastatin (Lipitor®), pravastatin (Pravachol®), rosuvastatin (Crestor®), simvastatin (Zocor®), lovastatin (Meracor®)	Inhibit HMG CoA reductase, which catalyzes the rate-limiting step in cholesterol synthesis	Dyslipidemia (1° prevention of CAD), CAD, post-MI	Myalgia, rhabdomyolysis, abdominal pain	Liver or muscle disease

Antiarrhythmics

Figure 43. Representative cardiac action potential

Table 19. Antiarrhythmic* Drugs (Vaughan-Williams Classification)

Class	Agent	Indications	Side Effects	Mechanism of Action
Ia	quinidine procainamide disopyramide	SVT, VT	Torsades de Pointes (all Ia), diarrhea Lupus-like syndrome Anticholinergic effects	Moderate Na ⁺ channel blockade Slows phase 0 upstroke Prolongs repolarization, slowing conduction
Ib	lidocaine mexiletine	VT	Confusion, stupor, seizures GI upset, tremor	Mild Na ⁺ channel blockade Shortens phase 3 repolarization
Ic	propafenone flecainide encainide	SVT, VT AFib	Exacerbation of VT (all Ic) Negative inotropy (all Ic) Bradycardia and heart block (all Ic)	Marked Na ⁺ channel blockade Markedly slows phase 0 upstroke
II	propranolol metoprolol, etc.	SVT, AFib	Bronchospasm, negative inotropy, bradycardia, AV block, impotence, fatigue	β-blocker Decreases phase 4 depolarization
III	amiodarone** sotalol	SVT, VT AFib SVT, VT, AFib	Photosensitivity, pulmonary toxicity, hepatotoxicity, thyroid disease, increased INR Torsades de Pointes, bradycardia, heart block, β-blocker side effects	Blocks K ⁺ channel Prolongs phase 3 repolarization, which prolongs refractory period
IV	verapamil diltiazem	SVT AFib	Bradycardia, AV block Hypotension	Calcium channel blocker Slows phase 4 spontaneous depolarization, slowing AV node conduction

*All antiarrhythmics have potential to be proarrhythmic

**Amiodarone has class I, II, III, and IV properties

Antiarrhythmic Drug Classification

Some Block Potassium Channels

- I – Sodium channel blocker
- II – β-Blocker
- III – Potassium channel blocker
- IV – CCB

Table 20. Actions of α and β Adrenergic Receptors

Target System	α RECEPTORS		β RECEPTORS	
	α1	α2	β1	β2
Cardiovascular	Constriction of vascular smooth muscle Constriction of skin, skeletal muscle, and splanchnic vessels Increased myocardial contractility Decreased heart rate	Same as α1 Peripherally act to modulate vessel tone Vasoconstrict and dilate; oppose α1 vasoconstrictor activity	Increased myocardial contractility Accelerate SA node Accelerate ectopic pacemakers	Decreased vascular smooth muscle tone
Respiratory				Bronchodilation
Dermal	Pilomotor smooth muscle contraction Apocrine constriction			
Ocular	Radial muscle contraction		Ciliary muscle relaxation	
Gastrointestinal	Inhibition of myenteric plexus Anal sphincter contraction			
Genitourinary	Pregnant uterine contraction Penile and seminal vesicle ejaculation Urinary bladder contraction	Smooth muscle wall relaxation	Stimulation of renal renin release	Bladder wall relaxation Uterine relaxation
Metabolic	Stimulate liver gluconeogenesis and glycogenolysis at the liver	Same as α1 Fat cell lipolysis	Fat cell lipolysis Glycogenolysis	Gluconeogenesis Fat cell lipolysis

Adapted from the Family Practice Notebook (www.fpnotebook.com/NEU194.htm)

Table 21. Commonly Used Drugs that Act on α and β Adrenergic Receptors

Mechanism of Action	α RECEPTORS			β RECEPTORS		
	α_1	α_1 and α_2	α_2	β_1	β_1 and β_2	β_2
Agonist	Phenylephrine Methoxamine	Epinephrine Norepinephrine	Clonidine Methyldopa	Norepinephrine Dobutamine	Isoproterenol Epinephrine	Albuterol Terbutaline
Antagonist	Prazosin Phenoxybenzamine	Phentolamine	Yohimbine Mirtazapine	Metoprolol Acebutolol Alprenolol Atenolol Esmolol	Propranolol Timolol Nadolol Pindolol Carvedilol	Butoxamine

Landmark Cardiac Trials

Trial	Reference	Results
ISCHEMIC HEART DISEASE		
ASCOT-LLA	<i>Lancet</i> 2003; 361:1149-58	In hypertensive patients with risk factors for CHD and average or below-average cholesterol, atorvastatin reduced nonfatal MI, fatal CHD, fatal/nonfatal stroke, coronary events but not all-cause mortality
CAPRIE	<i>Lancet</i> 1996; 348:1329-39	In atherosclerotic vascular disease clopidogrel reduced the primary combined endpoint of stroke, MI, or vascular death and improved PAD compared to ASA
CARE	<i>NEJM</i> 1996; 335:1001-9	Pravastatin reduced MI and stroke in patients with previous MI and average cholesterol
COURAGE	<i>NEJM</i> 2007; 356:1503-16	Compared with optimal medical therapy alone PCI + medical therapy did not reduce all-cause mortality and non fatal MI, and it did not reduce the incidence of major cardiovascular events
CURE	<i>NEJM</i> 2001; 345:494-502	Clopidogrel plus ASA reduced death from CV causes, non fatal MI, or stroke but increased bleeding complications
EUROPA	<i>Lancet</i> 2003; 362:782-88	With stable CAD and no CHF perindopril reduced cardiovascular death, MI, and total mortality
HOPE	<i>NEJM</i> 2000; 342:154-60	In high-risk patients without low LVEF or CHF ramipril reduced rates of death, MI, stroke, revascularization, new diagnosis of DM and complications due to DM; vitamin E had no effect on outcomes
HPS	<i>Lancet</i> 2002; 360:7-22	In high-risk patients with various cholesterol values simvastatin reduced all-cause mortality, coronary deaths, and major vascular events
JUPITER	<i>NEJM</i> 2008; 359:2195-2207	With low to normal LDL-C and elevated hsCRP treatment with rosuvastatin significantly reduced major cardiovascular events; NNT with rosuvastatin for 2 yr to prevent one primary endpoint = 95
SYNTAX	<i>NEJM</i> 2009; 360:961-972	CABG has lower rate of major cardiac or cerebrovascular events; the rate of stroke was increased with CABG, whereas the rate of repeat revascularization was increased with PCI
TNT	<i>NEJM</i> 2005; 352:1425-35	Lipid-lowering therapy with atorvastatin 80 mg/d in patients with stable CHD provides clinical benefit beyond atorvastatin 10 mg/d
WHI	<i>JAMA</i> 2002; 288:321-333	Estrogen plus progestin therapy is associated with increased risks of cardiovascular disease and breast cancer but decreased risks of hip fracture and colorectal cancer in postmenopausal women
MYOCARDIAL INFARCTION		
BHAT	<i>JAMA</i> 1982; 247:1707-14	In acute MI propranolol reduced all-cause mortality, cardiovascular death, and sudden death from atherosclerotic heart disease
COURAGE	<i>NEJM</i> 2007; 356:1503-16	Compared with optimal medical therapy alone PCI + medical therapy did not reduce all-cause mortality and non fatal MI, and it did not reduce the incidence of major cardiovascular events
ISIS-2	<i>Lancet</i> 1988; 2:349-60	Early therapy with streptokinase and ASA in patients with MI individually and in combination significantly reduced all-cause mortality and in combination demonstrated additive effect
ISIS-4	<i>Lancet</i> 1995; 345:669-85	In patients with suspected or definite acute MI early treatment with captopril reduced all-cause mortality at 35 d and during long-term follow up
OASIS-5	<i>NEJM</i> 2006; 354:1464-76	Compared to enoxaparin, fondaparinux reduced mortality rates, major bleeds at 9 and MI at 30 and 180 d
PROVE IT – TIMI 22	<i>NEJM</i> 2004; 350:1495-1504	In patients hospitalized for ACS high-dose atorvastatin reduced all-cause mortality, MI, unstable angina, revascularization, and stroke compared with pravastatin

Useful app "CHF Trials" available on iTunes®

Trial	Reference	Results
HEART FAILURE		
AIRE	<i>Lancet</i> 1993; 342:821-8	Ramipril commenced 3-10 d after MI and continued for a mean 15-month period significantly reduced all-cause mortality in patients with non-severe CHF
CHARM	<i>Lancet</i> 2003; 362:759-66	Candesartan reduced overall mortality, cardiovascular death, and CHF hospitalizations
CIBIS II	<i>Lancet</i> 1999; 353:9-13	Bisoprolol reduced all-cause mortality, cardiovascular death, all-cause hospitalization, and CHF hospitalization
COMET	<i>Lancet</i> 2003; 362:7-13	Carvedilol was associated with a reduction in all cause mortality compared with metoprolol
CONSENSUS	<i>NEJM</i> 1987; 316:1429-35	Enalapril reduced all-cause mortality, death due to progression of heart failure
COPERNICUS	<i>NEJM</i> 2001; 344:1651-8	Carvedilol in addition to standard treatment significantly reduced the risk of death or hospitalization in patients with severe CHF
I-PRESERVE	<i>NEJM</i> 2008; 359:2456-2467	In patients with CHF and normal LVEF treatment with ARB (irbesartan) did not improve mortality or cardiovascular morbidity compared to placebo
MERIT-HF	<i>Lancet</i> 1999; 353:2001-7	Metoprolol CR/XL daily in addition to optimum standard therapy improved survival in clinically stable patients equating to prevention of 1 death per 27 patients treated per year
RALES	<i>NEJM</i> 1999; 341:709-17	In severe CHF (class III/IV) and LVEF <35% spironolactone reduced all-cause mortality, sudden death, and death due to progression of heart failure
SAVE	<i>NEJM</i> 1992; 327:669-77	Patients with LV dysfunction post-MI long-term captopril over 3.5 yr reduced the risk of death due to cardiovascular causes, recurrent MI, development of severe CHF, and CHF hospitalization
SCD-HeFT	<i>NEJM</i> 2005; 352:225-237	In mild-to-moderate CHF shock-only ICD significantly reduces risk of death; amiodarone had no benefit compared with placebo in treating patients with mild-to-moderate CHF
SOLVD	<i>NEJM</i> 1991; 325:293-302	In stable chronic CHF with decreased LVEF (<0.35) long-term enalapril reduced death due to all causes and death or hospitalization due to CHF
TRACE	<i>NEJM</i> 1995; 333:1670-6	In patients with LV dysfunction post-MI long-term trandolapril reduced the risk of death or progression to severe CHF and reduced risk of sudden death
V-HeFT II	<i>NEJM</i> 1991; 325:303-10	In chronic CHF enalapril reduced mortality more than hydralazine-isosorbide for at least 2 yr; treatment with either enalapril or hydralazine-isosorbide increased LVEF
DIABETES		
CARDS	<i>Lancet</i> 2004; 264:685-96	Atorvastatin reduces the risk of cardiovascular events in patients with type 2 DM
ONTARGET	<i>NEJM</i> 2008; 358:1547-59	In patients with vascular disease or DM without CHF telmisartan is equally as effective as ramipril, with telmisartan causing a reduced risk of cough and angioedema, and an increased risk of hypotensive symptoms; combination therapy offers no advantage
ARRHYTHMIA		
AFFIRM	<i>NEJM</i> 2002; 347:1825-33	No significant difference in mortality rates between rate or rhythm control of AFib
AF-CHF	<i>NEJM</i> 2008; 358:2667-77	In patients with AFib and CHF there is no significant difference in mortality rates from cardiovascular causes between rate and rhythm control
ROCKET-AF	<i>NEJM</i> 2011; 365:883-891	In patients with AFib rivoxabarin is non-inferior to warfarin for stroke prevention, and major and non-major bleeding
HYPERTENSION		
HYVET	<i>NEJM</i> 2008; 358:1887-98	In hypertensive patients >80 yr treatment with indapamide, with or without perindopril, showed a trend towards reduced relative risk of fatal or non-fatal stroke
UKHDS (UKPDS)	<i>BMJ</i> 1998; 317:703-13	Hypertensive patients with DM and tight BP control at <150/85 mmHg by use of ACEI or β -blocker reduced risk of diabetic complications and death related to DM and reduced risk of end-organ damage
VALUE	<i>Lancet</i> 2004; 363:2022-2031	Valsartan group had higher incidence of MI than amlodipine group, whereas amlodipine had a higher incidence of new-onset DM

Acronyms

ACE	angiotensin converting enzyme	CSFa	certain safety factor	PD	pharmacodynamics
ACh	acetylcholine	CYP	cytochrome P450 protein	PDE	phosphodiesterase
ADR	adverse drug reaction	DIN	drug identification number	Pgp	p-glycoprotein
ARB	angiotensin receptor blocker	F	bioavailability	PK	pharmacokinetics
BBB	blood brain barrier	GFR	glomerular filtration rate	TBW	total body water
Cl	clearance	NDC	national drug code	TDM	therapeutic drug monitoring
Cr	creatinine	NE	norepinephrine	TI	therapeutic index
CSF	cerebrospinal fluid	P _{o/w}	partition coefficient of a drug	Vd	volume of distribution

General Principles

Drug Nomenclature

- **chemical name:** describes chemical structure; same in all countries (e.g. *N*-(4-hydroxyphenyl) acetamide is acetaminophen)
- **DIN or NDC:** DIN assigned by Health Canada; NDC assigned by FDA (US)
- **non-proprietary name:** approved name (post-phase III trial), official name (listed in pharmacopoeia), or generic name (off-patent) (e.g. acetaminophen)
- **proprietary (trade) name:** the brand name or registered trademark (e.g. Tylenol®)

Phases of Clinical Testing

- **phase I:** first administration to healthy human volunteers, following animal studies; to determine PK and PD
- **phase II:** first administration to patients, small sample sizes; to determine initial safety and effectiveness, dose range, PK, PD
- **phase III:** large sample sizes, often double-blind RCT; comparative (new drug vs. placebo or standard of care) to establish safety and efficacy
- **phase IV:** post-marketing surveillance, wide distribution; to determine rare ADRs, effects of long-term use, ideal dosing, effects in real world practice

Drug Administration

- choice of route of administration depends on: drug properties, local and systemic effects (limiting action or adverse events), desired onset and/or duration of action, patient characteristics

Table 1. Routes of Drug Administration

Route	Advantage	Disadvantage
Oral (PO)	Convenient, easy to administer Large surface area for absorption Inexpensive relative to parenteral administration	Drug metabolism by GI secretions Incomplete absorption Hepatic first-pass effect Potential GI irritation
Buccal/Sublingual (SL)	Rapid onset of action No hepatic first-pass effect	Must be lipid-soluble, non-irritating Short duration of action
Rectal (PR)	Almost no hepatic first-pass effect Use when NPO, vomiting, or unconscious	Inconvenient, irritation at site of application Erratic absorption
Intravenous (IV)	No hepatic first-pass effect Slow infusion or rapid onset of action Easy to titrate dose	Hard to remove once administered Risk of infection, bleeding, vascular injury, extravasation Expensive
Intramuscular (IM)	Depot storage if oil-based = slow release of drug Aqueous solution = rapid onset of action	Pain at site of injection
Subcutaneous (SC)	Non-irritating drugs, small volumes Constant, even absorption Alternative to IV	Pain at site of injection Smaller volumes than IM May have tissue damage from multiple injections
Intrathecal	Direct into CSF Bypass BBB and blood-CSF barrier	Risk of infection
Inhalation	Immediate (local) action in lungs Rapid delivery to blood (systemic action) No hepatic first-pass effect	Must be a gas, vapour, or aerosol
Topical	Easy to administer Localized (limited systemic absorption)	Effects are mainly limited to site of application
Transdermal	Drug absorption through intact skin No hepatic first-pass effect	Irritation at site of application Delayed onset of action Hydrophilic drugs are not easily absorbed
Others (intraperitoneal, intra-articular)	Local effect	Risk of infection

At the time of drug launch, only data from phases I-III are available; thus, true effectiveness (in contrast to efficacy) and safety may be unknown because real-world patients and usage patterns sometimes differ significantly from those in premarket phases

Common Latin Abbreviations

q	each, every
OD/bid/tid/qid	once/twice/three/four times a day
hs	at bedtime
ac/pc/cc	before/after/with meals
prn	as necessary
gtt	drops
ung	ointment
ud	as directed
od/os/ou	right/left/each eye
ad/as/au	right/left/each ear

Pharmacokinetics

- study of “what the body does to a drug”
- definition: relationship between drug administration, time-course/rate of absorption and distribution, concentration changes in the body compartments, and the drug's removal from the body

$P_{o/w}$

- Ratio of a drug's solubility in oil/lipid (e.g. cell membrane) as compared to water (e.g. extracellular fluid)
- A large $P_{o/w}$ (e.g. anesthetics) means that a drug is highly soluble in lipid and will cross membranes easily

Absorption

- definition: movement of the drug from the site of administration into plasma

Mechanisms of Drug Absorption

- most drugs are absorbed into the systemic circulation via passive diffusion
- other mechanisms: active transport, facilitated diffusion, pinocytosis/phagocytosis

Factors Affecting the Rate and Extent of Drug Absorption

- $P_{o/w}$ (i.e. its relative solubility in oil (lipid) vs. water)
- **local blood flow** at the site of administration (e.g. sublingual vessels facilitate rapid absorption of SL medications)
- **molecular size** (e.g. small molecular weight drugs absorb faster)
- **pH and drug ionization**
 - drugs are usually weak acids (e.g. ASA) or weak bases (e.g. ketoconazole) and thus have both ionized and non-ionized forms
 - body compartment pH and drug pK_a determine the ratio of ionized:non-ionized ratio (using the Henderson-Hasselbach equation)
 - non-ionized forms cross cell membranes much faster than ionized (charged) forms
- **total surface area for absorption**
 - small intestinal villi (large surface area) is the primary site of absorption for most oral drugs

Bioavailability

- definition: fraction of dose after administration that reaches systemic circulation in an unchanged state
- decreased by: drug absorption, gut metabolism, and hepatic first-pass effect
- IV dose has 100% bioavailability ($F = 1$)

First-Pass Effect

- definition: drug metabolism by the liver and sometimes the gut before it reaches systemic circulation, resulting in reduced F
- occurs with PO administration of a drug: GI tract (absorption) → portal vein to liver (first-pass metabolism) → systemic circulation
- occurs to much lesser extent with PR administration because drug absorbed in colon bypasses the portal system: colon (absorption) → internal pudendal veins → IVC → systemic circulation

Efflux Pump

- Pgp is a protein in the GI tract, renal epithelium, and elsewhere that acts as a multidrug efflux pump involved in the transport of drugs out of cells
- acts to oppose intestinal absorption and enhance renal elimination of certain drugs (e.g. digoxin, dabigatran, etexilate, etoposide, paclitaxel, tacrolimus, cyclosporine)
- some drugs (e.g. macrolide antibiotics) inhibit Pgp function, leading to increased levels of Pgp substrates; Pgp inducers (e.g. St. John's wort) do the opposite
- some tumors overexpress Pgp leading to multidrug resistance to chemotherapy agents

Distribution

- definition: movement of drugs between different body compartments and to the site of action
- major body fluid compartments: plasma, interstitial fluid, intracellular fluid, transcellular fluid (e.g. CSF, peritoneal, pleural)
- tissue compartments: fat, brain

Drug Ionization Reaction and the Henderson-Hasselbach Equation

using the body compartment pH and drug pK_a , can determine the ionized: non-ionized ratio

for a weak acid:
 $HA \rightleftharpoons A^- + H^+$; $pK_a = pH + \log [HA/A^-]$
 e.g. drug $pK_a = 4.4$ at a gastric pH of 1.4,
 non-ionized:ionized = $HA:A^- = 1:0.001$
 Thus, weak acids are mainly non-ionized and more readily absorbed in stomach

for a weak base:
 $BH^+ \rightleftharpoons B + H^+$; $pK_a = pH + \log [BH^+/B]$
 e.g. drug $pK_a = 8.0$ at an intestinal pH of 9.0
 ionized:non-ionized = $BH^+:B = 0.1:1$
 Thus, weak bases more readily absorbed (pH ~6.0-9.0)

Examples of Drugs with High First-Pass Effect (Hepatic Extraction)

- Levodopa
- Morphine
- Propranolol
- Lidocaine
- Organic nitrates

Examples of Drugs with Low First-Pass Effect

- Diazepam
- Digoxin
- Phenytoin
- Warfarin

Factors Affecting the Rate and Extent of Drug Distribution

- physiochemical properties of the drug (e.g. $P_{o/w}$)
- pH of fluid
- plasma protein binding
- binding within compartments (i.e. depots)
- regional blood flow

Volume of Distribution

- maximum actual V_d (anatomic fluid volume accessible to drug) = TBW (TBW ~40 L for average adult)
- V_d : the apparent volume of fluid into which a drug dissolves
 - a calculated value = amount of drug in body \div plasma drug concentration
 - a theoretical value that does not correspond to an anatomical space (i.e. can exceed TBW)
 - small V_d corresponds to a drug which concentrates in plasma and/or binds plasma proteins to a high degree
 - large V_d corresponds to a drug that distributes into tissues (fat, muscle, etc.); most is not in blood (measured) space, and it therefore “appears” to distribute in a large volume
 - V_d of plasma-protein bound drugs can be altered by liver and kidney disease
- example: amiodarone distributes into TBW (actual $V_d = 40$ L), but it also concentrates in fat tissues giving instead an apparent V_d of 400 L; therefore, to achieve a given plasma concentration of amiodarone, we dose as though the drug distributes into 400 L of body fluid

Plasma Protein Binding

- drug molecules in the blood exist in an equilibrium of two forms:
 1. bound to plasma protein: acidic drugs bind to albumin, basic drugs bind to α_1 -acid glycoprotein
 2. free or unbound: can leave the circulation to distribute into tissues and exert an effect, subject to metabolism and elimination
- bound fraction is determined by drug concentration, binding affinity, and plasma protein concentration (number of binding sites)
- reduced number of binding sites (e.g. hypoalbuminemia) or saturation of binding sites (e.g. competition/displacement) may result in an increased concentration of free drug, which is often metabolized with no harmful effects, although toxicity is possible

Depots

- a body compartment where drug molecules tend to be stored and released slowly over a long period of time
- fat is a depot for very lipid soluble drugs (e.g. diazepam)
- some oil-based medications are injected IM for slow release (e.g. depot medroxyprogesterone acetate q3mo; depot risperidone q2wk)

Barriers (Relative)

- body structures that limit or prevent diffusion of drug molecules, such as the placenta or BBB (a barrier composed of tight junctions between capillary endothelial cells and astrocytes)
- many of these barriers result, in part, from the activity of multidrug efflux pumps (e.g. Pgp), which serve as a natural defense mechanism against drugs and xenobiotics
- need to consider dosing route if drugs are meant to cross these barriers

Figure 1. Distribution of total body water (TBW)

Special consideration must be given in dosing patients in **hypoalbuminemic** states (e.g. liver failure or nephrotic syndrome) to prevent drug toxicity. Highly protein-bound drugs (e.g. warfarin, digoxin, diazepam, furosemide, amitriptyline) will exert a greater effect in these patients than in healthy individuals because of higher levels of free drug

Multiple drugs and endogenous substances can **compete** for the same protein binding sites. For example, ASA displaces highly protein-bound acidic drugs such as phenytoin, thus increasing risk of toxicity, and sulfonamide displaces bilirubin, which could potentially lead to jaundice and kernicterus in neonates

Main Factors Governing Penetration of BBB

- Small molecular size (< 500 Da)
- High lipid solubility
- Active transport mechanisms (e.g. Pgp multidrug efflux pump)

Many Drugs Cross BBB:

- General anesthetics
- Alcohol

Metabolism (Biotransformation)

- definition: chemical transformation of a drug *in vivo* to make it more hydrophilic to enhance renal elimination
- sites of biotransformation: liver (main), GI tract, lung, plasma, kidney
- as a result of the process of biotransformation
 - a pro-drug may be **activated** (e.g. tamoxifen to endoxifen; codeine to morphine)
 - a drug may be **changed** to another active metabolite (e.g. diazepam to oxazepam)
 - a drug may be **changed** to a toxic metabolite (e.g. meperidine to normeperidine)
 - a drug may be **inactivated** (most drugs)

Drug Metabolizing Pathways

• phase I (P450) reactions

- small molecular changes introduce or unmask polar chemical groups on a parent compound to increase its water solubility (e.g. oxidation-reduction, hydrolysis, hydroxylation); the change in $P_{o/w}$ is typically minimal compared to phase II, and often phase I places a polar 'handle' on a lipophilic drug to allow for phase II
- mediated by CYPs found in the endoplasmic reticulum
- product of the reaction can be excreted or undergo further phase II reactions

• phase II (conjugation) reactions

- conjugation with large polar endogenous substrates (e.g. glucuronidation, glutathione conjugation, sulfation)
- dramatically increases water solubility and renal elimination
- sometimes results in biologically active metabolites (e.g. glucuronides of morphine)
- can occur independently of phase I reactions

Factors Affecting Drug Biotransformation

• genetic polymorphism of metabolizing enzymes

- individual genotypes may determine rate of drug metabolism (e.g. poor, intermediate, extensive, or ultrarapid metabolizers)
- may lead to toxicity or ineffectiveness of a drug at a normal dose
 - tamoxifen and codeine are prodrugs activated by CYP2D6 (nonfunctional alleles reduce effectiveness, whereas overactive/duplicated alleles impart "ultrarapid metabolizer" phenotype)
 - warfarin is metabolized by CYP2C9 (nonfunctional alleles lead to greater effect and lower dose requirements)

• enzyme inhibition may sometimes be due to other drugs

- CYP inhibition leads to an increased concentration and bioavailability of the substrate drug (e.g. erythromycin [CYP3A4 inhibitor], can predispose patients to simvastatin toxicity [metabolized by CYP3A4])

• enzyme induction

- certain medications enhance gene transcription leading to an increase in the activity of a metabolizing enzyme
- a drug may induce its own metabolism (e.g. carbamazepine) or that of other drugs (e.g. phenobarbital can induce the metabolism of OCP and bilirubin) by inducing the CYP system

• liver dysfunction (e.g. hepatitis, alcoholic liver, biliary cirrhosis, or hepatocellular carcinoma) may decrease drug metabolism but this may not be clinically significant due to the liver's reserve capacity

• renal disease often results in decreased drug clearance

• extremes of age (neonates or elderly) have reduced biotransformation capacity, and doses should be adjusted accordingly

• nutrition: insufficient protein and fatty acid intake decreases CYP biotransformation, and vitamin/mineral deficiencies may also impact metabolizing enzymes

• alcohol: while acute alcohol ingestion inhibits CYP2E1, chronic consumption can induce CYP2E1 and increase the risk of hepatocellular damage from acetaminophen by increasing the generation of acetaminophen's toxic metabolite

• smoking can induce CYP1A2, thus increasing the metabolism of some drugs (e.g. theophylline)

Cytochrome P450 System

The CYPs are a superfamily of heme proteins that are grouped into families and subfamilies according to their amino acid sequence. These proteins are responsible for the metabolism of drugs, chemicals, and other substances

Nomenclature: CYP3A4

"CYP" = cytochrome P450 protein

1st number = family

letter = subfamily

2nd number = isoform

The CYP1, CYP2, and CYP3 families metabolize most drugs in humans. The most important isoforms are CYP3A4 and CYP2D6; therefore, anticipate drug interactions if prescribing drugs using these enzymes

Common Examples of CYP Inhibitors and Inducers

CYP Inhibitors "MINCE"

Metronidazole (CYP2C9)

Isoniazid (CYP2C9), Indinavir (CYP3A4)

Naringin or bergamottin (bioflavonoid in grapefruit) (CYP3A4)

Ciprofloxacin (CYP3A4, 1A2)

Erythromycin (macrolides) (CYP3A4)

CYP Inducers

Phenytoin (CYP3A4)

Dexamethasone (CYP3A4)

Phenobarbital (CYP3A4)

Rifampin (CYP2D6, 3A4)

Smoking (CYP1A2)

St. John's wort (CYP3A4, CYP2C19, pgp)

Note: The above list is not exhaustive

The **very** young and the **very** old are **very** sensitive to the actions of drugs

Avoid toxicity from drug or metabolite accumulation by adjusting a drug's dosage according to the elimination characteristics of the patient (e.g. in renal impairment)

Elimination

- definition: removal of drug from the body

Routes of Drug Elimination

• kidney (main organ of elimination): two mechanisms

1. glomerular filtration

- a passive process, so that only the free drug fraction can be filtered
- drug filtration rate depends on GFR, degree of protein binding of drug, and size of drug

2. tubular secretion

- an active process that is saturable, allowing both protein-bound and free drug fractions to be excreted
- distinct transport mechanisms for weak acids (e.g. penicillin, salicylic acid, probenecid, chlorothiazide) and weak bases (e.g. quinine, quaternary ammonium compounds such as choline)
- drugs may competitively block mutual secretion if both use the same secretion system (e.g. probenecid can be used to reduce the excretion of penicillin)

- **tubular reabsorption:** drugs can be passively reabsorbed back to the systemic circulation, countering elimination mechanisms
- **renal function** (decreases with age and is affected by many disease states) is assessed clinically using serum Cr levels
- **stool:** some drugs and metabolites are actively excreted in the bile (e.g. corticosteroids) or directly into the intestinal tract
 - enterohepatic reabsorption counteracts stool elimination, and thus can substantially prolong the drug's duration in the body
 - some glucuronic acid conjugates that are excreted in the bile will be hydrolyzed in the intestines by bacteria back to its original form that can be systemically reabsorbed
- **lungs:** elimination of anesthetic gases and vapours by exhalation
- **saliva:** saliva concentrations of some drugs parallel their plasma levels (e.g. rifampin)

Pharmacokinetic Calculation

- definition: the quantitative description of the rates of the various steps of drug disposition (i.e. how drugs move through the body)
- the pharmacokinetic principles of ADME (absorption, distribution, metabolism, and elimination) can be graphically represented on a concentration vs. time graph

Time-Course of Drug Action

- many kinetic parameters are measured using IV dosing, such that absorption is immediate and distribution for most drugs is rapid; thus elimination is the main process being measured
- the concentration axis is converted to a \log_{10} concentration to allow for easier mathematical calculations

Half-Life

- definition: time taken for the serum drug level to fall 50% during elimination
- drugs with first order kinetics require five half-lives to reach steady state with repeated dosing or for complete drug elimination once dosing is stopped

# of Half-Lives	1	2	3	3.3	4	5
% of Steady State Concentration	50%	75%	87.5%	90%	93.8%	96.9%

Steady State

- drug concentration stays constant when the same amount of drug entering the system is eliminated from the system
- appropriate timing is important for therapeutic monitoring since drug levels are reliable only when the drug has reached steady state
- special situations
 - use a loading dose for drugs with a long half-life and when there is clinical need to rapidly achieve therapeutic levels (e.g. amiodarone, digoxin, phenytoin)
 - use continuous infusion for drugs with a very short half-life and when there is need for a long-term effect and multiple or frequently repeated doses are too inconvenient (e.g. nitroprusside, insulin, unfractionated heparin)

Clearance

- a quantitative measurement of the body fluid volume from which a substance is removed per unit time
- $Cl = \text{rate of elimination of drug} \div \text{plasma drug concentration}$
- must consider Cl from a specific part of the body and total body Cl

Elimination Kinetics

- first-order kinetics (most common type)
 - constant fraction of drug eliminated per unit time
 - some drugs can follow first-order kinetics until elimination is saturated (usually at large doses) at which point the Cl decreases
 - becomes linear relationship when plotted on a $\log(\text{concentration})$ vs. time graph
- zero-order kinetics (less common, associated with toxicities, e.g. alcohol)
 - a constant rate of drug eliminated regardless of concentration; concept of half-life does not apply
 - the concentration axis is converted to a \log (concentration) to allow for easier mathematical calculations

The Cockcroft-Gault Equation can Estimate CrCl in Adults 20 yr of age and older

- For males

$$\text{CrCl (mL/min)} = \frac{[(140 - \text{age in yr}) \times \text{Weight (kg)}] \times 1.2}{\text{serum Cr } (\mu\text{mol/L})}$$
- For females, multiply above equation $\times 0.85$
- Only applies when renal function is at steady state

Principles of Pharmacokinetics

V_d = amount of drug in the body/plasma drug concentration

Cl = rate of elimination of drug/plasma drug concentration

Half-life ($t_{1/2}$) = $0.7 \times V_d / Cl$

For most drugs it takes 5 half-lives to reach steady state with repeated dosing or to eliminate a drug once dosing is stopped

Figure 2. Time course of drug action

Figure 3. Steady state of a drug

Figure 4. $\log(\text{concentration})$ vs. time graph (IV bolus dose) for first-order kinetics

Table 2. Loading vs. Maintenance Dosing

Loading Dose	Maintenance Dose
Use when you need an IMMEDIATE effect	After a loading dose OR beginning with maintenance doses
Often parenteral medication	Steady-state levels achieved after ~5 half-lives
Rationale: give large dose of medication to "fill up" the volume of distribution	Can be given as either a continuous infusion (relatively rare, short half-life drug) OR much more commonly as intermittent doses

Figure 5. First and zero order kinetics

In first order kinetics (solid line), a constant fraction of the drug is eliminated per unit time; in zero order kinetics (dashed line), a constant amount of the drug is eliminated per unit time

Loading dose: large initial dose to "fill up" the volume of distribution; used for IMMEDIATE effect

Maintenance dose: after loading dose OR begin with maintenance dose; reaches steady state after 5 half-lives

For unit conversion factors, please see Appendix: Common Unit Conversions

Efficacy vs. Potency

- Efficacy measures the maximal effect of a drug
- Potency measures the concentration of a drug needed to produce a certain effect

Pharmacodynamics

Dose-Response Relationship

Efficacy

- the ability of a drug to produce a response after binding to its cognate receptor
- measured by E_{\max} (the maximal response that a drug can elicit in a RCT or under optimal circumstances)

Potency

- measured by EC_{50} (the concentration of a drug needed to produce 50% of E_{\max})
- a drug that reaches its EC_{50} at the lower dose is more potent

Figure 6. log(dose)-response curve illustrating efficacy and potency

Effects of Drugs on Receptors

Agonists

- drugs that have both affinity and efficacy for their cognate receptors
 - affinity:** the ability of the agonist to bind to the receptor (e.g. the β_2 -agonist salbutamol has greater affinity for β_2 -receptors than β_1 -receptors)
 - efficacy:** the ability to recapitulate endogenous response via the receptor interaction (e.g. binding of salbutamol to β_2 -receptors results in smooth muscle relaxation)
- full agonists:** can elicit a maximal effect at a receptor
- partial agonists:** can only elicit a partial effect, no matter how high the concentration (i.e. reduced efficacy compared to full agonists) at the receptor

Antagonists

- drugs that block the action of an agonist or of an endogenous ligand
- chemical antagonism:** direct chemical interaction between agonist and antagonist prevents agonist-receptor binding (e.g. chelating agents for removal of heavy metals)
- functional antagonism:** two agonists that act independently at different receptors and have opposite physiological effects (e.g. acetylcholine at the muscarinic receptor compared to epinephrine at the adrenergic receptor)
- reversible competitive and irreversible antagonism**
 - drugs that have affinity but no efficacy for their cognate receptors, and therefore, exert no effect upon binding
 - reversible competitive antagonists reversibly bind to the same receptor as the agonist, thus displacing it (e.g. naloxone is an antagonist to morphine or heroin)

- irreversible antagonists irreversibly bind to the same receptor as the agonist, blocking it from binding (e.g. phenoxybenzamine forms a permanent covalent bond with adrenergic receptors preventing adrenaline and NE from binding)
- non-competitive antagonism**
 - antagonist binds to an alternate site separate but near the agonist site, producing allosteric effects that change the ability of the agonist to bind (e.g. organophosphates irreversibly bind acetylcholinesterase)

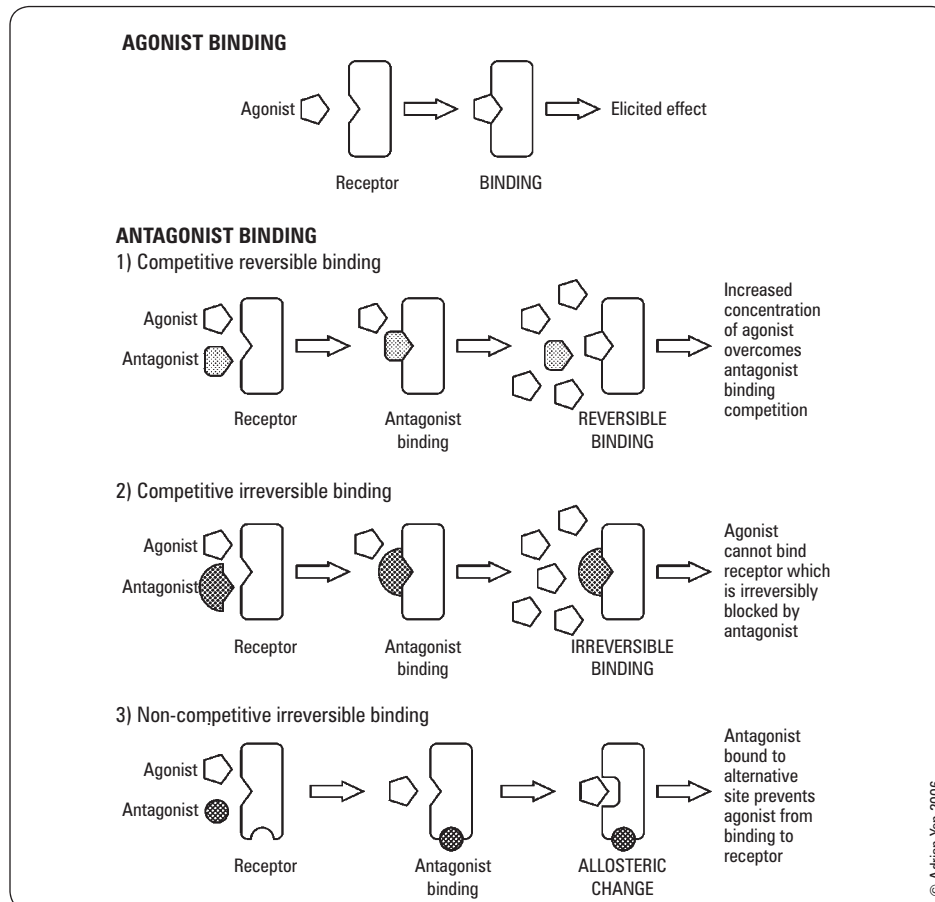

Figure 7. Mechanism of agonists and antagonists

Figure 8. The log(dose)-response curve for competitive reversible antagonism

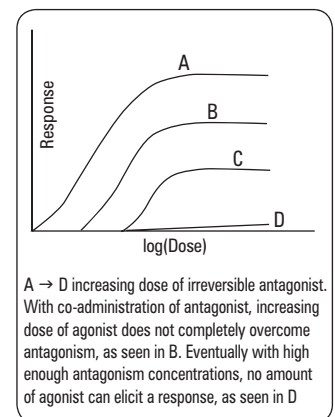

Figure 9. The log(dose)-response curve for irreversible antagonism

The two most clinically relevant properties of any drug are effectiveness and safety

Effectiveness and Safety

Effectiveness

- ED₅₀ (Effective Dose): the dose of a drug needed to cause a therapeutic effect in 50% of a test population of subjects

Safety

- LD₅₀ (Lethal Dose): the dose of a drug needed to cause death in 50% of a test population of subjects
- TD₅₀ (Toxic Dose): the dose needed to cause a harmful effect in 50% of a test population of subjects

Therapeutic Indices

Therapeutic Index: TD_{50}/ED_{50}

- reflects the “margin of safety” for a drug – the likelihood of a therapeutic dose to cause serious toxicity or death
- the larger the TI, the safer a drug (e.g. warfarin has a narrow TI and requires accurate therapeutic monitoring)
- factors that can change the TI
 - presence of interacting drugs
 - changes in drug absorption, distribution, metabolism, elimination

Certain Safety Factor: TD_1/ED_{99}

- CSFa >1 translates to a dose effective in at least 99% of the population and toxic in less than 1% of the population

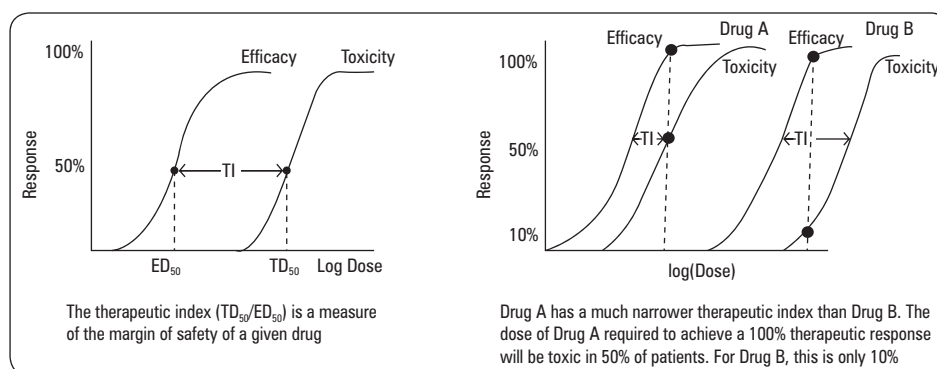

Figure 10. ED_{50} , TD_{50} , and the therapeutic index

Therapeutic Drug Monitoring

- definition: using serum drug concentration data to optimize drug therapy (e.g. dose adjustment, monitor compliance)
 - serum drug samples are usually taken when the drug has reached steady state (after approximately 5 half-lives)
- TDM is often used for drugs that have: narrow TIs, unpredictable dose-response relationships, significant consequences associated with therapeutic failure or toxicity, wide inter-patient pharmacokinetic variability

Adverse Drug Reactions

Table 3. Characteristics of Type A-E Adverse Drug Reactions

Classification	Definition	Characteristics
A (Augmented)	Dose related	<ul style="list-style-type: none"> Predictable extension of drug's pharmacologic effect (e.g. β-blockers causing bradycardia) >80% of all ADRs
B (Bizarre)	Non-dose related	<ul style="list-style-type: none"> Reactions unrelated to the known pharmacological actions of the drug Examples include drug hypersensitivity syndromes, immunologic reactions (penicillin hypersensitivity) and idiosyncratic reactions (malignant hyperthermia)
C (Chronic)	Dose and time related	<ul style="list-style-type: none"> Related to cumulative doses Effects are well-known and can be anticipated (e.g. femur fracture from bisphosphonates)
D (Delayed)	Time related	<ul style="list-style-type: none"> Occurs some time after use of drug (e.g. carcinogen) May also be dose related
E (End of Use)	Withdrawal	<ul style="list-style-type: none"> Occurs after cessation of drug use (e.g. opiate withdrawal)

Drugs with a narrow TI have a high likelihood of causing toxicity and need close therapeutic monitoring

Examples of drugs whose levels need to be monitored: warfarin (via INR levels), digoxin, lithium, antiepileptics (e.g. phenytoin, carbamazepine)

In the US, 700,000 emergency department visits and 120,000 hospitalizations are due to ADRs annually

Adverse Events Related to Emergency Department Care

PLoS One 2013;8(9):e74214

Systematic review was performed, and studies were considered for inclusion if they examined a broad demographic group reflecting a significant proportion of ED patients and described the proportion of adverse events. Ten articles, representing eight observational studies, were included. Methodological quality was low to moderate with weaknesses in study group comparability, follow-up, and outcome ascertainment and reporting. There was substantial variation in the proportion of patients with adverse events related to ED care, ranging from 0.16% (n=9,308) to 6.0% (n=399). Similarly, the reported preventability of adverse events ranged from 36% (n=250) to 71% (n=24).

Approach to Suspected Adverse Drug Reactions

- history and physical exam: signs and symptoms of the reaction (e.g. rash, fever, hepatitis, anaphylaxis), timing, risk factors, detailed medication history including all drugs and timing, dechallenge (response when drug is removed) and rechallenge (response when drug is given again)
- differentiate between drug therapy vs. disease pathophysiology
- treatment: stop the drug, supportive care, symptomatic relief
- resources: check recent literature, FDA; contact the pharmaceutical company; call Poison Control (1-800-222-1222) if overdose or poisoning suspected; check with Motherisk (www.motherisk.org) in cases involving pregnant or breastfeeding women
- report all suspected ADRs that are: 1) unexpected, 2) serious, or 3) reactions to recently marketed drugs (on the market <5 yr) regardless of nature or severity
 - FDA Adverse Event Reporting System available for reporting

Variability in Drug Response

- recommended patient dosing is based on clinical research and represents mean values for a select population, but each person may be unique in their dosing requirements
- possible causes of individual variability in drug response include problems with:
 - ♦ intake: patient adherence
 - ♦ pharmacokinetics
 - absorption: vomiting, diarrhea or steatorrhea; first pass effect increased due to enzyme induction or decreased due to liver disease
 - drug interactions (e.g. calcium carbonate complexes with iron, thyroxine, and fluoroquinolones)
 - distribution: very high or low percentage body fat; intact or disrupted BBB; patient is elderly or a neonate, or has liver dysfunction
 - biotransformation and elimination: certain genetic polymorphisms or enzyme deficiencies related to drug metabolism (e.g. acetylcholinesterase deficiency, CYP polymorphism); kidney or liver dysfunction
 - ♦ pharmacodynamics: genetic variability in drug response (e.g. immune-mediated reactions); diseases that affect drug pharmacodynamics; drug tolerance or cross-tolerance

Drug Interactions

- concomitant prescriptions: one drug alters the effect of another by changing its PK and/or PD
- PK interactions involve
 - absorption: alterations in gastrointestinal pH, gastric emptying, intestinal motility, gut mucosal function
 - biotransformation: alterations in drug metabolizing enzymes
 - excretion: alterations in renal elimination
- PD interactions are due to two drugs that exert similar effects (additive) or opposing effects (subtractive)
- drug interactions can also involve herbal medications (e.g. St. John's wort) and food (e.g. grapefruit)

Autonomic Pharmacology

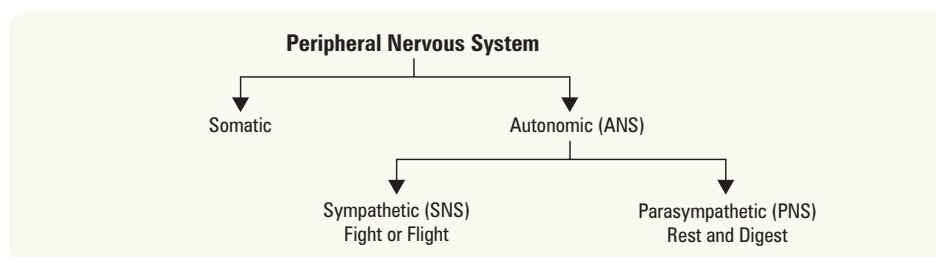

Figure 11. Subdivisions of the peripheral nervous system

Sample of Clinically Relevant Adverse Drug Reactions

Classification	Drug(s)	ADR
A	β-blockers	Bradycardia
A	ACEIs	Cough
A	NSAIDs	GI bleeding
A	Opiates	GI upset, constipation, urinary retention, respiratory depression
A	Acetaminophen	Hepatotoxicity
A	Vancomycin	Red Man syndrome
A	Aminoglycosides	Ototoxicity and nephrotoxicity
B	Sulfa Drugs	Stevens-Johnson syndrome Toxic epidermal necrolysis
B	Penicillins	Rash
B	Valproic acid, Chinese herbs	Hepatotoxicity

Sulfa-Containing Medications

- Sulfamethoxazole
- Sulfasalazine
- Dapsone

Examples of Clinically Relevant Drug Interactions

Interaction	Potential Effect
Warfarin plus ciprofloxacin, clarithromycin, erythromycin, metronidazole or trimethoprim-sulfamethoxazole	Increased effect of warfarin
Oral contraceptive pills plus rifampin, antibiotics	Decreased effectiveness of oral contraception
Sildenafil plus nitrates	Hypotension
SSRI plus St. John's wort, naratriptan, rizatriptan, sumatriptan, zolmitriptan	Serotonin syndrome
SSRI plus selegiline or non-selective MAO-I	Serotonin syndrome
Some HMG-CoA reductase inhibitors plus niacin, gemfibrozil, erythromycin or itraconazole	Possible rhabdomyolysis

- the autonomic nervous system is divided into sympathetic and parasympathetic divisions
- most organs are innervated by both sympathetic and parasympathetic nerves which have opposing effects (see [Neurology, N6](#))
- ACh and NE are the main neurotransmitters of the autonomic NS
- ACh binds to cholinergic receptors, which include nicotinic and muscarinic receptors
- NE binds to adrenergic receptors, which include β_1 , β_2 , α_1 , and α_2
- ACh action is terminated by metabolism in the synaptic cleft by acetylcholinesterase and in the plasma by pseudocholinesterase
 - acetylcholinesterase inhibitors (donepezil, galantamine, rivastigmine) are used to increase ACh levels in conditions such as myasthenia gravis and Alzheimer's disease
- NE action is terminated by reuptake by the presynaptic membrane, diffusion from the synaptic cleft, and degradation by monoamine oxidase (MAO) and catechol-O-methyl transferase (COMT)

Parasympathetic Nervous System

- blood vessels, sweat glands, spleen capsule, and adrenal medulla do NOT have parasympathetic innervation
- parasympathetic pre-ganglionic fibers originate in the lower brainstem from cranial nerves III, VII, IX, X, and in the sacral spinal cord at levels S2-S4 and connect with post-ganglionic fibers via nicotinic receptors in ganglionic cells located near or within the target organ
- post-ganglionic fibers connect with effector tissues via:
 - M_1 muscarinic receptors located in the CNS
 - M_2 muscarinic receptors located in smooth muscle, cardiac muscle, and glandular epithelium

Sympathetic Nervous System

- sympathetic pre-ganglionic fibers originate in the spinal cord at spinal levels T1-L3
- pre-ganglionic fibers connect with post-ganglionic fibers via nicotinic receptors located in one of two groups of ganglia
 1. paravertebral ganglia (i.e. the sympathetic trunk) that lie in a chain close to the vertebral column
 2. pre-vertebral ganglia (i.e. celiac and mesenteric ganglia) that lie within the abdomen
- post ganglionic fibers connect with effector tissues via
 - β_1 receptors in cardiac tissue
 - β_2 receptors in smooth muscle of bronchi and GI tract
 - α_1 receptors in vascular smooth muscle
 - α_2 receptors in vascular smooth muscle
 - M_3 muscarinic receptors located in sweat glands

Figure 12. Autonomic nervous system efferent tracts

Table 4. Direct Effects of Autonomic Innervation on the Cardiorespiratory System

Organ	Sympathetic NS		Parasympathetic NS	
	Receptor	Action	Receptor	Action
Heart				
1. Sinoatrial	β_1	Increased HR	M	Decreased conduction
2. Atrioventricular node	β_1	Increased conduction	M	Decreased conduction
3. Atria	β_1	Increased contractility	M	Decreased conduction
4. Ventricles	β_1	Increased contractility	M	Decreased HR
Blood Vessels				
1. Skin, splanchnic	α_1, α_2	Constriction	M	Dilatation
2. Skeletal muscle	α	Constriction	M	Dilatation
	β_2 (large muscles)	Dilatation	M	Dilatation
3. Coronary	α_1, α_2	Constriction	M	Dilatation
	β_2	Dilatation	M	Dilatation
Lungs				
1. Bronchiolar smooth muscle	β_2	Relaxation	M	Constriction
2. Bronchiolar glands	α_1, β_2	Increased secretion	M	Stimulation

Common Drug Endings

Table 5. Common Drug Endings

Ending	Category	Example
-afil	5-PDE inhibitor	sildenafil
-ane	Inhaled general anesthetic	halothane
-azepam	Benzodiazepine	lorazepam
-azole	Antifungal	ketoconazole
-caine	Local anesthetic	lidocaine
-olol	β -blocker	propranolol
-prazole	Proton pump inhibitor	omeprazole
-pril	ACE inhibitor	captopril
-sartan	ARB	candesartan
-statin	HMG-CoA inhibitor	atorvastatin
-terol	β_2 agonist	albuterol
-tidine	H ₂ antagonist	cimetidine
-tropin	Pituitary hormone	somatotropin
-vir	Antiviral	acyclovir
-zosin	α_1 antagonist	prazosin

Note: Some medications are exceptions to the rule, e.g. methimazole (antithyroid)

Introduction to Skin

Skin Anatomy

Figure 1. Histologic layers of the skin. Epidermal layer is detailed in A

Skin

- divided anatomically into epidermis, dermis, and subcutaneous tissue
- epidermis**
 - avascular: receives its nutrition from the dermal capillaries
 - derived from keratinocytes with the youngest presenting at the stratum basale
 - cells progress from stratum basale to stratum corneum in about 4 wk
 - stratum basale (germinativum): displays mitotic figures that give rise to keratinocytes
 - stratum spinosum (prickle cells): junctions in this layer (tonofilaments) give the epidermis its strength
 - stratum granulosum: flat cells containing basophilic granules which characterize skin
 - stratum lucidum: comprised of transparent layers of packed dead cells
 - stratum corneum: flat scales of the water-resistant protein keratin
- dermis**: comprised of connective tissue divided into two regions
 - papillary: contains numerous capillaries that supply nutrients to the dermis and epidermis
 - reticular: provides a strong structure for skin; consists of collagen bundles woven together along with elastic fibers, fibroblasts, and macrophages
- subcutaneous tissue** (subdermal)
 - consists primarily of adipose cells, larger caliber vessels, nerves and fascia

Cells in Epidermis

- keratinocytes**: located in all layers of the epidermis, except the stratum corneum; connected to each other by desmosomes
- melanocytes**: located in the stratum basale; keratinocyte to melanocyte ratio in the basal layer is 10:1; melanocyte number is equal among races
- Langerhans cells**: important for immune surveillance
- Merkel cells**: involved in touch sensation

Skin Appendages

- epidermal in origin, can extend into the dermis; includes hair, nails, and cutaneous glands

Cutaneous Glands

- sebaceous gland**: part of pilosebaceous unit, produces sebum which is secreted into the hair follicle via the sebaceous duct, where it covers the skin surface (protective function)
 - sebum has some antifungal properties
 - these glands cover entire skin surface except palms and soles
- apocrine sweat gland**: apocrine duct empties into hair follicle above sebaceous gland
 - found in axillae and perineum
 - likely a vestigial structure, functions in other species to produce scent (e.g. pheromones)
- eccrine sweat gland**: not part of pilosebaceous unit
 - found over entire skin surface except lips, nail beds and glans penis
 - important in temperature regulation via secretion of sweat to cool skin surface

BSA	body surface area
BUN	blood urea nitrogen
CBC	complete blood count
CMV	cytomegalovirus
CNS	central nervous system
Cr	creatinine
CXR	chest X-ray
DLE	discoid lupus erythematosus
DM	diabetes mellitus
DRESS	drug reaction with eosinophilia and systemic symptoms
DVT	deep vein thrombosis
EM	erythema multiforme
Fe	iron
FTA-ABS	fluorescent treponemal antibody-absorption group A β-hemolytic <i>Streptococcus</i>
GAS	group A β-hemolytic <i>Streptococcus</i>
GVHD	graft-vs.-host disease
HHV	human herpes virus
HPA	hypothalamic-pituitary-adrenal
HPV	human papillomavirus
HRT	hormone replacement therapy
HSV	herpes simplex virus
HZV	herpes zoster virus
IFN	interferon
IVIg	intravenous immunoglobulin
LFT	liver function test
MAOI	monoamine oxidase inhibitor
MM	malignant melanoma
MMR	measles/mumps/rubella
MRSA	methicillin-resistant <i>Staphylococcus aureus</i>
MTP	metatarsal phalangeal
NB-UVB	narrow band ultraviolet wavelength B
NCN	neocellular nevus
Nd: Yag	neodymium-doped yttrium aluminum garnet
NMN	nevomelanocytic nevus
NMSC	nonmelanoma skin cancers
NSAID	nonsteroidal anti-inflammatory drug
OCP	oral contraceptive pill
OTC	over-the-counter
PABA	para-aminobenzoic acid
PASI	Psoriasis Area and Severity Index
PPD	purified protein derivative
PURVA	psoralens and long wave ultraviolet radiation
RA	rheumatoid arthritis
SCC	squamous cell carcinoma
SHBG	sex hormone-binding globulin
SJS	Stevens-Johnson syndrome
SLE	systemic lupus erythematosus
SPF	sun protection factor
SSRI	selective serotonin reuptake inhibitor
SSSS	staphylococcal scalded skin syndrome
STD	sexually transmitted disease
TB	tuberculosis
TEN	toxic epidermal necrolysis
TMP/SMX	trimethoprim-sulfamethoxazole
TSH	thyroid stimulating hormone
UC	ulcerative colitis
URTI	upper respiratory tract infection
UV	ultraviolet
UVA	ultraviolet wavelength A
UVB	ultraviolet wavelength B
UVC	ultraviolet wavelength C
VDRL	venereal disease research laboratory
VZV	varicella zoster virus

Skin Function

- **protection**
 - due to continuous recycling and avascularity of epidermis
 - barrier to UV radiation, mechanical/chemical insults, pathogens and dehydration
- **thermal regulation**
 - insulation to maintain body temperature in cool environments via peripheral vasoconstriction, hair, and subcutaneous adipose tissue
 - dissipation of heat in warm environments via increased activity of sweat glands and increased blood flow within dermal vascular networks
- **sensation**
 - touch, pain, and temperature sensation
- **metabolic function**
 - vitamin D synthesis
 - energy storage (mainly in the form of triglycerides)

Definitions

Primary Lesions

Definition

- a lesion that the body makes that has not been altered by trauma or manipulation and has not regressed

Types of Primary Lesions

- **macule**: flat lesion, size less than 5 mm; differs from surrounding skin with respect to its color only
- **patch**: used by some dermatologists to mean a large macule, and others to mean a thin plaque
- **papule**: raised lesion less than 5 mm; its substance consists of inflammatory cells, neoplastic cells or accumulations of metabolic by-products e.g. lipids
- **plaque**: raised lesion; usually greater than 2 cm; its surface is greater than its height
- **nodule**: similar to a papule but measures 5 mm-5cm. Are often deep and palpable
- **tumor**: a large nodule: > 5 cm; tumor in this context does not imply malignancy
- **vesicle**: small raised lesion that is fluid-filled, <5 mm
- **bulla**: larger vesicle; >5 mm
- **pustule**: an elevated lesion containing purulent fluid (white, grey, yellow, green)

Specific Types of Primary Lesions

- **cyst**: an epithelial-lined collection containing semi-solid or fluid material
- **wheel**: a special form of papule or plaque that is blanchable and transient, formed by edema in the dermis (e.g. urticaria)
- **comedones**: collection of sebum and keratin
 - open comedo (blackhead)
 - closed comedo (whitehead; differentiated from pustule)
- **petechiae**: small pinpoint extravasation of blood into dermis resulting in hemorrhagic lesions; non-blanchable, <3 mm in size
- **purpura**: larger than petechia, 3 mm-1 cm in size
- **ecchymoses**: larger than purpura, >1 cm in size, i.e. a "bruise"
- **telangiectasia**: dilated superficial blood vessels; blanchable

Secondary Morphological Lesions

Definition

- develop during the evolutionary process of skin disease, or created by manipulation, or due to complication of primary lesion (e.g. rubbing, scratching, infection)
- **crust**: dried fluid (serum, blood, or purulent exudate) (e.g. impetigo)
- **scale**: excess keratin (e.g. seborrheic dermatitis)
- **lichenification**: thickening of the skin and accentuation of normal skin markings (e.g. chronic atopic dermatitis)
- **fissure**: a linear slit-like cleavage of the skin
- **excoriation**: a scratch mark
- **atrophy**: histological decrease in size and number of cells or tissues, resulting in thinning or depression of the skin

Describe a Lesion with SCALDA

Size and Surface area

Color (e.g. hyperpigmented, hypopigmented, erythematous)

Arrangement (e.g. solitary, linear, reticulated, grouped, herpetiform)

Lesion morphology

Distribution (e.g. dermatomal, intertriginous, symmetrical/asymmetrical, follicular)

Always check hair, nails, mucous membranes and intertriginous areas

Skin Phototypes (Fitzpatrick)

Phototype	Color of Skin	Skin's Response to Sun Exposure (without SPF protection)
I	White	Always burns, never tans
II	White	Always burns, little tan
III	White	Slight burn, slow tan
IV	Pale brown	Slight burn, faster tan
V	Brown	Rarely burns, dark tan
VI	Dark brown or black	Never burns, dark tan

Patch: used by some dermatologists to mean a large macule, and others to mean a thin plaque

Papule: raised lesion less than 5mm. Its substance consists of inflammatory cells, neoplastic cells or accumulations of metabolic by-products e.g. lipids

- **erosion**: a disruption of the skin involving the epidermis alone; heals without scarring
- **ulcer**: a disruption of the skin that extends into the dermis or deeper; heals with scarring
- **scar**: replacement fibrosis of dermis and subcutaneous tissue (hypertrophic or atrophic)

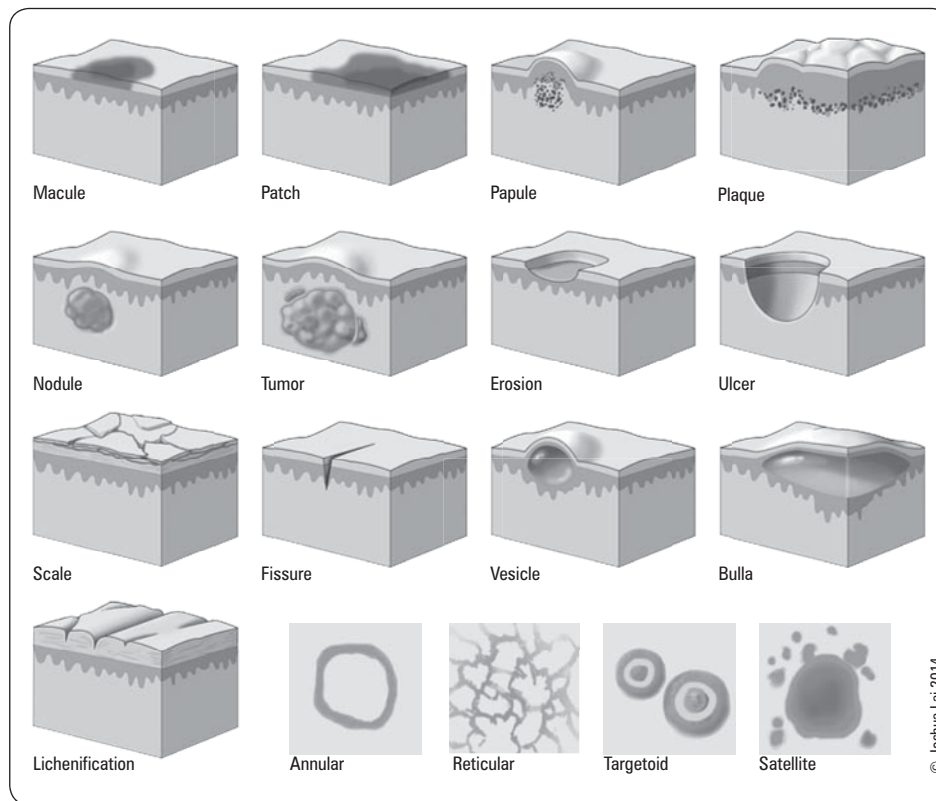

Figure 2. Examples of primary and secondary morphology and arrangement of lesions

Arrangement and Distribution

- **acral**: relating to the hands and feet (e.g. hand, foot and mouth disease)
- **annular**: ring-shaped (e.g. granuloma annulare)
- **follicular**: involving hair follicles (e.g. folliculitis)
- **guttate**: lesions following a “drop-like” pattern (e.g. guttate psoriasis)
- **Koebner phenomenon**: i.e. isomorphic response, appearance of lesions at an injury site (e.g. lichen planus, psoriasis, vitiligo); an isomorphic reaction that develops in areas of trauma after the traumatic event; usually linear
- **morbilliform**: a maculopapular rash resembling measles
- **reticular**: lesions following a net-like pattern (e.g. livedo reticularis)
- **satellite**: lesions scattered outside of primary lesion (e.g. candida diaper dermatitis)
- **serpiginous**: lesions following a snake-like pattern (e.g. cutaneous larva migrans)
- **target/targetoid**: concentric ring lesions, like a dartboard (e.g. erythema multiforme). “Target” refers to lesions with 3 different zones of color and “targetoid” refers to lesions with 2 zones of color
- **other descriptive terms**: discrete, clustered, linear, confluent, , indurated

Differential Diagnoses of Common Presentations

Table 1. Differential Diagnosis of Common Presenting Problems

Lesion	Infectious	Inflammatory	Drug/Toxin	Miscellaneous
Brown Macule		Post-inflammatory hyper-pigmentation	UV radiation, actinic/solar lentigo, freckle (ephelide)	Congenital: café-au-lait spots, congenital nevus, epidermal/junctional nevus Neoplasia: lentigo maligna, MM, pigmented BCC Other: melasma/chloasma ("mask of pregnancy")
Discrete Red Papule	Folliculitis Furuncle Scabies	Acne vulgaris Lichen planus Rosacea Psoriasis Urticaria	Bites/stings	Vascular: hemangioma, pyogenic granuloma Other: dermatofibroma, milium rubra
Red Scales	Pityriasis rosea Secondary syphilis Tinea	Dermatitis (atopic, contact, nummular, seborrheic) Discoid lupus Lichen planus Psoriasis Pityriasis rosea	Lichen planus or psoriasis from a drug e.g. many antihypertensives may cause lichen planus; Beta-blockers may exacerbate psoriasis	Neoplastic: mycosis fungoides
Vesicle	Cat scratch disease Impetigo Viral: HSV, HZV, VZV, Molluscum, Coxsackie Scabies	Acute contact dermatitis Dyshidrotic eczema		Other: dermatitis herpetiformis, porphyria cutanea tarda
Bulla	Bullous impetigo	Acute dermatitis EM, SJS, TEN, SLE	Fixed drug eruption	Autoimmune: bullous pemphigoid, pemphigus vulgaris Other: dermatitis herpetiformis, porphyria cutanea tarda
Pustule	Candida Dermatophyte Impetigo Septic vasculitis Varicella	Acne vulgaris Rosacea Dyshidrotic dermatitis Pustular folliculitis Pustular psoriasis	Acute generalized exanthematous pustulosis (usually secondary to drug reaction)	Other: hidradenitis suppurativa
Oral Ulcer	Aspergillosis CMV Coxsackie Cryptococcosis HSV/HZV HIV, TB, Syphilis	Allergic stomatitis EM/SJS/TEN Lichen planus Seronegative arthropathies, SLE Recurrent aphthous stomatitis Behçet's disease	Chemotherapy Radiation therapy	Autoimmune: pemphigus vulgaris Congenital: XXY Hematologic: sickle cell disease Neoplasia: BCC, SCC
Skin Ulcer	Plaque Syphilis TB Tularemia	RA, SLE, vasculitis UC (pyoderma gangrenosum)		Autoimmune: necrobiosis lipoidica diabetorum (e.g. DM) Congenital: XXY Hematologic: sickle cell disease Neoplasia: SCC Vascular: arterial, neurotropic, pressure, venous, aphthous, leukoplakia, traumatic

Common Skin Lesions

Cysts

Table 2. Cysts

	Clinical Presentation	Pathophysiology	Epidemiology	Clinical Course	Management
Epidermal Cyst	Round, yellow/flesh-colored, slow growing, mobile, firm, fluctuant, nodule or tumor	Epithelial cells displaced into dermis, epidermal lining becomes filled with keratin and lipid-rich debris May be post-traumatic, rarely syndromic	Most common cutaneous cyst in youth – mid age	Central punctum may rupture (foul, cheesy odor, creamy color) and produce inflammatory reaction Increase in size and number over time, especially in pregnancy. May become inflamed or infected	Excise completely before it becomes infected
Pilar Cyst (Trichilemmal)	Single or multiple, hard, variable sized nodules under the scalp, lacks central punctum	Thick-walled cyst lined with stratified squamous epithelium and filled with dense keratin Idiopathic Post-trauma, often familial	2nd most common cutaneous cyst F > M	Rupture causes pain and inflammation	Excision
Dermoid Cyst	Most commonly found at lateral third of eyebrow or midline under nose	Rare, congenital hamartomas, which arise from inclusion of epidermis along embryonal cleft closure lines, creating a thick-walled cyst filled with dense keratin	Rare	If nasal midline, risk of extension into CNS	Excision
Digital Mucous Cyst	Usually solitary, translucent; a clear gelatinous viscous fluid may be extruded	Cystic lesion that originates from joint or tendon sheath, called a digital mucous cyst when found on fingertip Associated with osteoarthritis	Older age	Stable	Incision and expression of contents Laser ablation and electrodesiccation
Milium	1-2 mm superficial, white to yellow subepidermal papules occurring on eyelids, cheeks, and forehead	Small epidermal inclusion cyst, primarily arising from pluripotential cells in epidermal or adnexal epithelium	Any age 40-50% of infants	In newborns, spontaneously resolves in first 4 wk of life	Incision and expression of contents Laser ablation and electrodesiccation Multiple facial milia respond to topical retinoid therapy

Fibrous Lesions

DERMATOFIBROMA

Clinical Presentation

- button-like, firm dermal papule or nodule, skin-colored to red-brown coloring
- majority are asymptomatic but may be pruritic and/or tender
- site: legs > arms > trunk
- dimple sign: lateral compression causes dimpling of the lesion

Pathophysiology

- benign tumor due to fibroblast proliferation in the dermis

Etiology

- unknown; may be associated with history of minor trauma (e.g. shaving or insect bites)
- eruptive dermatofibromata can be associated with SLE

Epidemiology

- adults, F>M

Differential Diagnosis

- dermatofibrosarcoma protruberans, MM, Kaposi's sarcoma, blue nevus

Investigations

- biopsy if diagnosis is uncertain

Management

- no treatment required
- excision or cryosurgery if bothersome

SKIN TAGS

Clinical Presentation

- small (1-10 mm), soft, skin-colored or darker pedunculated papule, often polypoid
- sites: eyelids, neck, axillae, inframammary, and groin

Pathophysiology

- benign outgrowth of skin

Epidemiology

- middle-aged and elderly, F>M, obese, can increase in size and number during pregnancy

Differential Diagnosis

- pedunculated seborrheic keratosis, compound or dermal melanocytic nevus, neurofibroma, fibroepithelioma of Pinkus (rare variant of BCC)

Management

- excision, electrodesiccation, cryosurgery

Skin Tags are also known as...

- Acrochordons
- Fibroepithelial polyps
- Soft fibromas
- Pedunculated lipofibromas
- Cutaneous papillomas

Keloids

Clinical Presentation

- firm, shiny, skin-colored or red-bluish papules/nodules that most often arise from cutaneous injury (e.g. piercing, surgical scar, acne), but may appear spontaneously
- extends beyond the margins of the original injury, and may continue to expand in size for years with claw-like extensions
- can be pruritic and painful
- sites: earlobes, shoulders, sternum, scapular area

Pathophysiology

- excessive deposition of randomly organized collagen fibers following trauma to skin
- differentiated from a hypertrophic scar which is confined to the borders of the original injury

Epidemiology

- most common in black patients, followed by those of Asian descent (predilection for darker skin)
- M=F, all age groups

Keloids vs. Hypertrophic Scars

- **Keloids:** extend beyond margins of original injury with claw-like extensions
- **Hypertrophic Scars:** confined to original margins of injury

Management

- intralesional corticosteroid injections
- cryotherapy
- silicone compression

Hyperkeratotic and Hyperplastic Lesions

**SEBORRHEIC KERATOSIS****Clinical Presentation**

- well-demarcated waxy papule/plaque with classic “stuck on” appearance
- large variety in color, size and shape
- over time lesions appear more warty, greasy and pigmented
- sites: face, trunk, upper extremities (may occur at any site except palms or soles)

Pathophysiology

- very common benign epithelial tumor

Epidemiology

- unusual <30 yr old
- autosomal dominant inheritance

Differential Diagnosis

- MM (lentigo maligna, nodular melanoma), melanocytic nevi, pigmented BCC, solar lentigo, spreading pigmented AK

Investigations

- biopsy only if diagnosis uncertain

Management

- none required, for cosmetics only
- cryotherapy, curettage

ACTINIC KERATOSIS (SOLAR KERATOSIS)

- see *Pre-Malignant Skin Conditions*, D31

**KERATOACANTHOMA**

- see *Malignant Skin Tumors*, D32

CORNS**Clinical Presentation**

- firm papule with a central, translucent, cone-shaped, hard keratin core
- painful with direct pressure
- sites: most commonly on dorsolateral fifth toe and dorsal aspects of other toes

Pathophysiology

- localized hyperkeratosis induced by pressure on hands and feet

Epidemiology

- F>M, can be caused by chronic microtrauma

Differential Diagnosis

- tinea pedis, plantar warts

Management

- relieve pressure with padding or alternate footwear, orthotics
- paring, curettage

**Corns vs. Warts vs. Calluses**

- **Corns** have a whitish yellow central translucent keratinous core; painful with direct pressure
- **Warts** bleed with paring and have a black speckled central appearance due to thrombosed capillaries; plantar warts destroy dermatoglyphics (epidermal ridges)
- **Calluses** have layers of yellowish keratin revealed with paring; there are no thrombosed capillaries or interruption of epidermal ridges

Pigmented Lesions and Pigmentary Disorders

Table 3. Comparison of Pigmented Lesions

	Clinical Presentation	Pathophysiology	Epidemiology	Differential Diagnosis	Clinical Course and Management
Ephelides (Freckles)	Small (<5 mm) well-demarcated light brown macules Sites: sun-exposed skin	Increased melanin within basal layer keratinocytes secondary to sun exposure	Skin phototypes I-II	Junctional nevi Juvenile lentigines	No treatment required Multiply and darken with sun exposure, fade in winter Sunscreen may prevent the appearance of new freckles
Solar Lentigo (Liver Spot)	Well-demarcated brown/black irregular macules Sites: sun-exposed skin	Small increase in number of melanocytes in the basal layer and elongation of the rete ridges due to chronic sun exposure	Most common in Caucasians >40 yr Skin phototypes I-III	Lentigo maligna, seborrheic keratosis, pigmented solar keratosis	Laser therapy, shave excisions, cryotherapy
Dermal Melanocytosis (historically known as Mongolian Spot)	Congenital gray-blue solitary or grouped macules commonly on lumbosacral area	Ectopic melanocytes in dermis	99% occurs in Asian and Aboriginal infants	Ecchymosis	Usually fades in early childhood but may persist into adulthood
Becker's Nevus	Hairy, light brown macule/patch with a papular verrucous surface Sites: trunk and shoulders, onset in teen years	Pigmented hamartoma with increased melanin in basal cells	M>F Often becomes noticeable at puberty	Hairy congenital melanocytic nevus	Hair growth follows onset of pigmentation Cosmetic management (usually too large to remove)

NEVOMELANOCYTIC NEVI

- common mole
- be suspicious of new or changing pigmented lesions (signs of melanoma)
- average number of moles per person: 18-40 yr
- 3 stages of evolution
 - junctional NMN: macular; arise at dermal-epidermal junction
 - compound NMN: papular; nevus cells move into the papillary dermis
 - dermal NMN: skin colored papules (no longer hyperpigmented); nevus cells completely migrate into dermis

Table 4. Nevomelanocytic Nevus Classification

Type	Age of Onset	Clinical Presentation	Histology	Management
Congenital	Birth and early infancy	Sharply demarcated pigmented brown plaque with regular/irregular contours ± coarse hairs Consider meningeal involvement if very large or bathing suit distribution	Nevomelanocytes in epidermis (clusters) and dermis (strands)	Surgical excision if suspicious, due to increased risk of melanoma
Acquired	Early childhood to age 40 Involute by age 60	Benign neoplasm of pigment-forming nevus cell Well circumscribed, round, uniformly pigmented macules/papules <1.5 cm Classified according to site of nevus cells		Excisional biopsy can be considered if on scalp, soles, mucous membranes, anogenital area, or if varied colors, irregular borders, pruritic, bleeding, exposed to trauma
Junctional	Childhood Majority progress to compound nevus	Flat, irregularly bordered, uniformly tan-dark brown, sharply demarcated smooth macule	Melanocytes at dermal-epidermal junction above basement membrane	Same as above
Compound	Any age	Domed, regularly bordered, smooth, round, tan-dark brown papule Sites: face, trunk, extremities, scalp	Melanocytes at dermal-epidermal junction; migration into dermis	Same as above
Dermal	Adults	Soft, dome-shaped, skin-colored to tan/brown papules or nodules, often with telangiectasia Sites: face, neck	Melanocytes exclusively in dermis	Same as above
Atypical	Childhood	Variiegated macule/papule/plaque May be large, may have regular borders or be asymmetric. May have a "fried-egg" appearance (central papule with surrounding macule) People with many atypical nevi and/or a family history of melanoma are at higher risk of developing a melanoma themselves	Hyperplasia and proliferation of melanocytes extending beyond dermal compartment of the nevus Often with region of adjacent nests	For patients with many atypical nevi, follow with full body photographs for changes Excisional biopsy if lesion changing or highly atypical

* Note: Junctional, compound and dermal nevi may be congenital or acquired. They may be typical or atypical

DDx of Hyperpigmented Macules

- Purpura (e.g. solar, ASA, anti-coagulants, steroids, hemosiderin stain)
- Post-inflammatory
- Melasma
- Melanoma
- Fixed drug eruption

ABCDE of Melanoma

- Asymmetry
- Borders (irregular)
- Colour (variegated)
- Diameter (>6 mm)
- Evolution (changes are seen)

Other Nevi

- **Halo Nevus:** often a typical appearing nevus surround by a ring of depigmentation; not rare in children; uncommonly associated with vitiligo; no treatment required unless irregular color or borders
- **Blue Nevus:** round to oval macule/papule with homogenous blue to blue-black color; often appears in childhood and late adolescence; no treatment required unless atypical features are noted

MELASMA

Clinical Presentation

- even tan macules on sun-exposed areas of face (forehead, upper lip, cheeks, chin)
- usually symmetrical

Pathophysiology

- increase in number and activity of melanocytes
- associated with estrogen and progesterone
- classification determined by depth of hyperpigmentation in the skin (epidermal, dermal, mixed type)
- epidermal pigmentation is most common and can be diagnosed with Wood's light

Epidemiology

- F>>M
- common in pregnancy (chloasma = "mask of pregnancy") and women taking OCP and HRT
- risk factors include sun exposure and dark skin tone
- can occur with mild endocrine disturbances, antiepileptic medications and other photosensitizing drugs

Management

- bleaching cream (hydroquinone), retinoic acid, topical steroids or combination creams
- destructive modalities (chemical peels, laser treatment)
- camouflage make-up
- avoiding sun and using sunscreen are key to preventing melasma
- often fades over several months after stopping hormone treatment or delivering baby

Vitiligo

Clinical Presentation

- primary pigmentary disorder characterized by depigmentation
- acquired destruction of melanocytes characterized by sharply margined white patches
- associated with streaks of depigmented hair, chorioretinitis
- sites: extensor surfaces and periorificial areas (mouth, eyes, anus, genitalia)
- Koebner phenomenon, may be precipitated by trauma

Pathophysiology

- acquired autoimmune destruction of melanocytes

Epidemiology

- 1% incidence, polygenic
- 30% with positive family history

Investigations

- rule out associated autoimmune diseases: thyroid disease, pernicious anemia, Addison's disease, Type I DM
- Wood's lamp to detect lesions: illuminates UV light onto skin to detect amelanosis (porcelain white discoloration)

Management

- sun avoidance and protection
- topical calcineurin inhibitor (e.g. tacrolimus, pimecrolimus) or topical corticosteroids
- PUVA or Narrow band UVB
- make-up
- "bleaching" normal pigmented areas (i.e. monobenzyl ether of hydroquinone 20%) if widespread loss of pigmentation

Interventions for Vitiligo

Cochrane DB Syst Rev 2010;1:CD003263

Study: Systematic review of randomized controlled trials.

Patients: 3,139 participants with vitiligo.

Intervention: Topical treatments, light therapies, oral treatments, surgical methods, and psychological therapies.

Outcome: > 75% repigmentation, adverse effects.

Results: Moderate evidence exists for the use of topical corticosteroids to induce repigmentation but, adverse effects are observed with long-term use. Topical use of non-steroidal immunomodulators (e.g. tacrolimus), especially in combination with light therapies, has also been shown to induce repigmentation, but long-term use may theoretically increase the risk for skin cancer. In general, combination therapy including some form of light therapy had the most significant improvement. Sustained repigmentation (>2 yr) has not been reported and thus results should be treated with caution.

Vascular Lesions

Table 5. Infantile Hemangiomas Compared to Vascular Malformations

	Infantile Hemangiomas	Vascular Malformations
Definition	Endothelial hyperplasia	Congenital malformation with normal endothelial turnover
Presence at Birth	Usually postnatal	100% at birth (not always obvious)
M:F	1:3-5	1:1
Natural History	Phases: • Proliferating • Involuting • Involved	Proportionate growth (can expand)

HEMANGIOMAS

Clinical Presentation

- red or blue subcutaneous mass that is soft/compressible, blanches with pressure; feels like a “bag of worms” when palpated

Pathophysiology

- benign vascular tumor
- includes: infantile hemangioma, capillary/infantile hemangioma, spider hemangioma

A spider angioma will blanch when a microscope slide is applied to the centre of the lesion

Pyogenic granuloma is a misnomer: it is neither pyogenic nor granulomatous

Table 6. Vascular Tumors

	Clinical Presentation	Pathophysiology	Epidemiology	Clinical Course	Management
Infantile Hemangioma	Hot, firm red to blue plaques or tumors	Benign vascular proliferation of endothelial lining	Appears shortly after birth; rarely may be congenital	Appears shortly after birth, increases in size over months, then regresses 50% of lesions resolve spontaneously by 5 yr	10% require treatment due to functional impairment (visual compromise, airway obstruction, high output cardiac failure) or cosmesis Consider treatment if not gone by school age; propranolol; systemic corticosteroids; laser treatment; surgery
Spider Angioma (Campbell Telangiectasia)	Central red arteriole with slender branches, faintly pulsatile, blanchable	Associated with hyperestrogenic state (e.g. in hepatocellular disease, pregnancy, OCP)		Increase in number over time	Electrodesiccation or laser surgery Systemic corticosteroids and IFN- α may be indicated for rapidly growing lesions
Cherry Angioma (Campbell De Morgan Spot)	Bright red to deep maroon, dome-shaped vascular papules, 1-5 mm Site: trunk Less friable compared to pyogenic granulomas	Benign vascular neoplasm	>30 yr old	Lesions do not fade in time Lesions bleed infrequently	Usually no treatment needed Laser or electrocautery for small lesions Excision of large lesions if necessary
Pyogenic Granuloma	Bright red, dome-shaped sessile or pedunculated friable nodule Sites: fingers, lips, mouth, trunk, toes DDx: glomus tumor, nodular MM, SCC, nodular BCC	Rapidly developing hemangioma Proliferation of capillaries with erosion of epidermis and neutrophilia	<30 yr old		Surgical excision with histologic examination Electrocautery; laser; cryotherapy

VASCULAR MALFORMATIONS

1. Nevus Flammeus (Port-Wine Stain)

Clinical Presentation

- red to blue macule present at birth that follows a dermatomal distribution, rarely crosses midline
- most common site: nape of neck

Pathophysiology

- congenital vascular malformation of dermal capillaries; rarely associated with Sturge-Weber syndrome (V1, V2 distribution)

Management

- laser or make-up

2. Nevus Simplex (Salmon Patch)

Clinical Presentation

- pink-red irregular patches
- midline macule on glabella known as “Angel Kiss”; on nuchal region known as “Stork Bites”
- present in 1/3 of newborns
- majority regress spontaneously

Pathophysiology

- congenital dilation of dermal capillaries

Management

- no treatment required

A combination of topical retinoids and topical erythromycin or clindamycin is more effective than either agent used alone

Intralesional Injections

Intralesional corticosteroid injections are effective in the treatment of individual acne nodules

Acne Myths Debunked

- Eating greasy food and chocolate does not cause or worsen acne
- Blackheads (comedones) are black because of oxidized fatty acids, not dirt
- Acne is not caused by poor hygiene; on the contrary, excessive washing of face can be an aggravator

Acne Exacerbating Factors

- Systemic medications: lithium, phenytoin, steroids, halogens, androgens, iodides, bromides, danazol, epidermal growth factor receptor inhibitors e.g. cetuximab
- Topical agents: steroids, tars, ointments, oily cosmetics
- Mechanical pressure or occlusion, such as leaning face on hands
- Emotional stress

Accutane and Pregnancy

- Use of isotretinoin during pregnancy is associated with spontaneous abortion and major birth defects such as facial dysmorphism and cognitive impairment
- Pregnancy should be ruled out before starting isotretinoin
- Ideally, patients should use 2 forms of contraception while on isotretinoin
- Patients and their health care providers need to register with iPledge (www.ipledge.com) before isotretinoin can be prescribed and comply with mandated procedure for use of this medication

Treatment of Acne Scars

- Tretinoin creams
- Microdermabrasion for superficial scars
- Injectable fillers (collagen, hyaluronic acid)
- Fraxel laser

Antibiotics are used in inflammatory skin conditions since they also have anti-inflammatory properties (e.g. macrolides in acne). Topical antibiotics may also be used to treat secondary bacterial superinfections (e.g. impetigo)

Acneiform Eruptions

Acne Vulgaris/Common Acne

Clinical Presentation

- a common inflammatory pilosebaceous disease categorized with respect to severity
 - Type I: comedonal, sparse, no scarring
 - Type II: comedonal, papular, moderate ± little scarring
 - Type III: comedonal, papular, and pustular, with scarring
 - Type IV: nodulocystic acne, risk of severe scarring
- sites of predilection: face, neck, upper chest, and back

Pathophysiology

- hyperkeratinization, at the follicular ostia (opening), blocks the secretion of sebum (microcomedones)
- androgens stimulate sebaceous glands to produce sebum
- anaerobic diphtheroid *Propionibacterium acnes* bacteria contains lipase, which converts sebum to free fatty acids and produces pro-inflammatory mediators

Epidemiology

- age of onset in puberty (10-17 yr in females, 14-19 yr in males)
- in prepubertal children consider underlying hormonal abnormality (e.g. late onset congenital adrenal hyperplasia)
- more severe in males than in females
- incidence decreases in adulthood
- genetic predisposition: majority of individuals with cystic acne have parent(s) with history of severe acne

Differential Diagnosis

- folliculitis, keratosis pilaris (upper arms, face, thighs), perioral dermatitis, rosacea

Table 7. Management of Acne

Drug Name	Mechanism of Action	Notes
MILD ACNE: Topical Therapies Over-the-Counter		
Benzoyl peroxide (BPO)	Bactericidal agent (targets <i>P. acnes</i>) and comedolytic	Helps prevent <i>P. acnes</i> resistance, is a bactericidal agent (targets <i>P. acnes</i>) and is comedolytic
Salicylic acid	Comedolytic	Used when patients cannot tolerate a topical retinoid due to skin irritation
MILD ACNE: Prescription Topical Therapies		
Clindamycin phosphate	Lincosamide antibiotic; inhibits protein synthesis	High rate of resistance when used as monotherapy
Erythromycin	Macrolide antibiotic; inhibits protein synthesis	High rate of resistance when used as monotherapy
BenzaClin® gel	1% clindamycin and 5% benzoyl peroxide	See above
Erythromycin + benzoyl peroxide (Benzamycin®)	3% erythromycin and 5% benzoyl peroxide	See above
Adapalene (e.g. Differin®)	Comedolytic	Less irritating than tretinoin. Not photolabile
Tretinoin (e.g. Retin-A®)	Comedolytic	Photolabile and irritation
Adapalene + benzoyl peroxide (e.g. Epiduo®)	0.1% adapalene and 2.5% benzoyl peroxide	See above

Table 7. Management of Acne (continued)

Drug Name	Mechanism of Action	Notes
MODERATE ACNE: After topical treatments have failed, add oral antibiotics, such as doxycycline (100 mg po bid), minocycline (50 to 100 mg po bid), tetracycline (250 mg PO bid to 500 mg bid), or erythromycin (500 mg PO bid). Antibiotics require 3-6 mo of use before assessing efficacy. Consider hormonal therapy, including antiandrogens		
Tetracycline	Inhibits protein synthesis	Use caution with regard to drug interactions: do not use with isotretinoin. Sun sensitivity
Oral contraceptive pills (Ortho Tri-cyclen®, Estrostep® and Yaz® are FDA-approved for acne treatment)	Norgestimate, norethindrone, drospirone: possesses anti-androgenic, progestogenic and antigonadotrophic activity	After 35 yr of age, estrogen/progesterone should only be considered in exceptional circumstances, carefully weighing the risk/benefit ratio with physician guidance
Spironolactone (off-label use for acne)	Ethinyl estradiol: increases level of SHBG, reducing circulating plasma levels of androgens	May cause hyperkalemia at higher doses
SEVERE ACNE: Consider systemic retinoids after above treatments have failed or if significant scarring present		
Isotretinoin (Accutane®, Clarus®)	Retinoid that inhibits sebaceous gland function and regulates keratinization	See Table 25, D44 for full side effect profile Most adverse effects are temporary and will resolve when the drug is discontinued Baseline lipid profile (risk of hypertriglyceridemia), LFTs and β -hCG before treatment May transiently exacerbate acne before patient sees improvement Drug may be discontinued at 16-20 wk when nodule count has dropped by >70% A second course may be initiated after 2 mo pm Refractory cases may require multiple courses of isotretinoin

Figure 3. Rosacea distribution

Rosacea can be differentiated from acne by the absence of comedones, a predilection for the central face and symptoms of flushing

Guidelines for the Diagnosis of Rosacea

J Drugs Dermatol 2012;11(6):725-730

Presence of one or more of the following primary features:

- Flushing (transient erythema)
- Nontransient erythema
- Papules and pustules
- Telangiectasia

May include one or more of the following secondary features:

- Burning or stinging
- Dry appearance
- Edema
- Phymatous changes
- Ocular manifestations
- Peripheral location

Subtypes and Variants of Rosacea and Their Characteristics

N.B. the subtypes can all coexist and can be seen on a spectrum of severity

SUBTYPE

- **Erythematotelangiectatic**
 - Flushing, persistent central facial erythema \pm telangiectasia
- **Papulopustular**
 - Persistent central facial erythema
 - Transient central facial papules or pustules or both
- **Phymatous**
 - Thickening skin, irregular surface nodularities and enlargement
 - Nose most commonly, rarely occurs elsewhere (chin, forehead, cheeks or ears)
- **Ocular**
 - Foreign body sensation in the eye, burning or stinging, dryness, itching, ocular photosensitivity, blurred vision, telangiectasia of the sclera or other parts of the eye, or periorbital edema

VARIANT

- **Granulomatous**
 - Noninflammatory, hard, brown, yellow, or red cutaneous papules or nodules of uniform size

Perioral Dermatitis

Clinical Presentation

- discrete erythematous micropapules that often become confluent, forming inflammatory plaques on perioral, perinasal and periorbital skin
- commonly symmetrical, rim of sparing around vermillion border of lips

Epidemiology

- 15-40 yr old, occasionally in younger children
- predominantly females

Differential Diagnosis

- contact dermatitis, rosacea, acne vulgaris

Management

- avoid all topical steroids
- topical: metronidazole 0.75% gel or 0.75-1% cream to affected area bid
- systemic: tetracycline family antibiotic (utilized for its anti-inflammatory properties)

Rosacea

Clinical Presentation

- dome-shaped papules \pm pustules
- flushing, non-transient erythema and telangiectasia
- distribution: typically on central face including forehead, nose, cheeks and chin; rarely on scalp, neck and upper body
- characterized by remissions and exacerbations
- exacerbating factors: heat, cold, wind, sun, stress, drinking hot liquids, alcohol, caffeine, spices
- all forms of rosacea can progress from mild to moderate to severe
- rarely in longstanding rosacea, signs of thickening, induration and lymphedema in the skin can develop
- phyma: a distinct swelling caused by lymphedema and hypertrophy of subcutaneous tissue, particularly affecting the nose (rhinophyma)
- ocular manifestations: blepharoconjunctivitis, keratitis, iritis

Pathophysiology

- unknown

Epidemiology

- although found in all skin types, highest prevalence in fair-skinned people
- 30-50 yr old; F>M

Differential Diagnosis

- acne vulgaris, seborrheic dermatitis, perioral dermatitis, contact dermatitis

Management

- trigger avoidance is key to long-term management
- avoid topical corticosteroids
- telangiectasia: treated by physical ablation; electrical hyfrecators, vascular lasers, and intense pulsed light therapies
- phymas: treated by physical ablation or removal; paring, electrosurgery, cryotherapy, laser therapy (CO₂, argon, Nd:YAG)

Table 8. Specific Rosacea Treatments

1st Line	2nd Line	3rd Line
Oral tetracyclines family	Topical clindamycin	Oral retinoids
Topical metronidazole	Topical erythromycin 2% solution	Topical sulfur
Oral erythromycin (250-500 mg PO bid)	Topical benzoyl peroxide	
Topical azelaic acid	Ampicillin	

Important Controversies Associated with Isotretinoin Therapy for Acne

Am J Clin Dermatol 2013;14:71-76

Study: Review on isotretinoin and (1) depression and suicide, (2) inflammatory bowel disease (IBD), (3) pregnancy prevention programs.

Conclusions

1. The evidence on whether isotretinoin causes depression and suicide is inconsistent; however, numerous controlled studies have shown an improvement in anxiety and depression scores in those taking isotretinoin. In practice, for patients with a history of depression, their psychiatrist should be consulted prior to use.
2. There is no association between IBD and isotretinoin use. Only one study showed a significantly increased risk of UC. When considering using isotretinoin in a patient with IBD or with a strong family history, consider involving a gastroenterologist.

Dermatitis (Eczema)

Definition

- inflammation of the skin

Clinical Presentation

- symptoms include pruritus and pain
- acute dermatitis: papules, vesicles
- subacute dermatitis: scaling, crusting
- chronic dermatitis: lichenification, xerosis, fissuring

Asteatotic Dermatitis

Clinical Presentation

- diffuse, mild pruritic dermatitis secondary to dry skin
- very common in elderly, especially in the winter (i.e. “winter itch”) but starts in the fall
- shins predominate, looks like a “dried river bed”

Management

- skin rehydration with moisturizing routine ± mild corticosteroid creams

Atopic Dermatitis

Clinical Presentation

- subacute and chronic eczematous reaction associated with prolonged severe pruritus
- distribution depends on age
- inflammation, lichenification, excoriations are secondary to relentless scratching
- atopic palms: hyperlinearity of the palms (associated with ichthyosis vulgaris)
- associated with: keratosis pilaris (hyperkeratosis of hair follicles, “chicken skin”), xerosis, occupational hand dryness

Epidemiology

- frequently affects infants, children, and young adults
- almost 15% of children in developed countries under the age of 5 are affected
- associated with personal or family history of atopy (asthma, hay fever, anaphylaxis, eosinophilia)
- polygenic inheritance: one parent >60% chance for child; two parents >80% chance for child
- the earlier the onset, the more severe and persistent the disease
- long-term condition with 1/3 of patients continuing to show signs of AD into adulthood

Pathophysiology

- a T-cell driven process with epidermal barrier dysfunction

Figure 4. Atopic dermatitis distribution

The typical distribution of atopic dermatitis in infants <6 mo (top), children >18 mo (middle) and adults (bottom)

Triggers for Atopic Dermatitis

- Irritants (detergents, solvents, clothing, water hardness)
- Contact allergens
- Environmental aeroallergens (e.g. dust mites)
- Inappropriate bathing habits (e.g. long hot showers)
- Sweating
- Microbes (e.g. *S. aureus*)
- Stress

Investigations

- clinical diagnosis
- consider: skin biopsy, immunoglobulin serum levels (often elevated serum IgE level), patch testing, and skin prick tests

Management

- goal: reduce signs and symptoms, prevent or reduce recurrences/flares
- better outcome (e.g. less flare-ups, modified course of disease) if diagnosis made early and treatment plan individualized
- avoid triggers of AD
- **enhance barrier function of the skin**
 - regular application of moisturizers
 - emollients hydrate the skin and reduce pruritus
 - twice daily application is recommended even in absence of symptoms, especially after bathing or swimming
 - bathing followed by the application of moisturizers and occlusives (e.g. petroleum jelly) promotes hydration
- **anti-inflammatory therapies**
 - topical corticosteroids**
 - effective, rapid symptomatic relief of acute flares
 - best applied immediately after bathing
 - control inflammation with a potent topical steroid; a milder one following resolution of acute flare
 - systemic immunosuppression may be needed in severe cases
 - flares may respond to systemic anti-staphylococcal therapy
 - side effects: skin atrophy, purpura, striae, steroid acne, perioral dermatitis, and glaucoma when used around the eyes
 - topical immunomodulators**
 - long-term management
 - calcineurin inhibitors include pimecrolimus (Elidel®), tacrolimus (Protopic®)
 - side effects: skin burning, transient irritation
 - advantages of immunomodulators over long-term corticosteroid use: rapid, sustained effect in controlling pruritus; no skin atrophy; safe for the face and neck

Complications

- infections
 - treatment of infections
 - ♦ topical mupirocin
 - ♦ oral antibiotics (e.g. cloxacillin, cephalexin) for widespread *S. aureus* infections

The Diagnostic Value of Atopy Patch Testing and Prick Testing in Atopic Dermatitis: Facts and Controversies

Clin Dermatol 2010;28:38-44

Study: Systematic review.

Conclusions

Use of the atopy patch test (APT) is controversial:

- There is no gold standard for aeroallergen provocation, so APT is used without comparison to another method.
- APT findings are not consistent among children with atopic dermatitis.

APT may be valuable:

- May provide diagnostic information and may aid clinical decision making regarding the use of IgE-mediated sensitizations.

Future research is needed:

- Need standardized provocation and avoidance testing to determine the clinical relevance of obtaining a positive APT result.

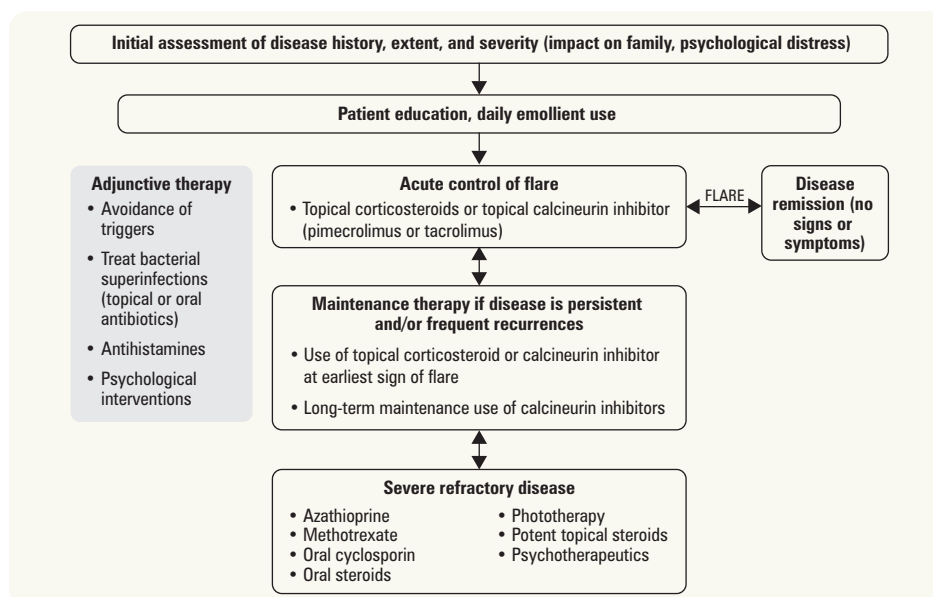

Figure 5. Atopic dermatitis treatment algorithm

Adapted from: Ellis C, et al. ICCAD II Faculty. International Consensus Conference on Atopic Dermatitis II (ICCAD II): clinical update and current treatment strategies. *Br J Dermatol* 2003;148(Suppl 63):3-10

Contact Dermatitis

Clinical Presentation

- cutaneous inflammation caused by an external agent(s)

Table 9. Contact Dermatitis

	Irritant Contact Dermatitis	Allergic Contact Dermatitis
Mechanism of Reaction	Toxic injury to skin; non-immune mechanism	Cell-mediated delayed (Type IV) hypersensitivity reaction (see Rheumatology, RH2)
Type of Reaction	Erythema, dryness, fine scale, burning Acute: quick reaction, sharp margins (e.g. from acid/alkali exposure) Cumulative insult: slow to appear, poorly defined margins (e.g. from soap), more common	Erythema with a papulovesicular eruption, swelling, pruritus
Frequency	Majority; will occur in anyone given sufficient concentration of irritants	Minority; patient acquires susceptibility to allergen that persists indefinitely
Distribution	Palmar surface of hand usually involved	Dorsum of hand usually involved; often discrete area of skin involvement
Examples	Soaps, weak alkali, detergents, organic solvents, alcohol, oils	(See sidebar) Many allergens are irritants, so may coincide with irritant dermatitis
Management	Avoidance of irritants Wet compresses with Burow's solution Barrier moisturizers Topical/oral steroids	Patch testing to determine specific allergen Avoid allergen and its cross-reactants Wet compresses soaked in Burow's solution (drying agent) Steroid cream (e.g. hydrocortisone 1%, betamethasone valerate 0.05% or 0.1% cream; bid) Systemic steroids prn (prednisone 1 mg/kg, taper over 2 wk)

Top Ten Allergens as Identified by The North American Contact Dermatitis Group

Test Substance	Allergic Reactions (%)	Common Uses
Nickel sulfate	14.2	Found in some jewelry, belt buckles
Neomycin sulfate	13.1	Most commonly used topical antibiotic
Balsam of Peru	11.8	Fragrance material
Fragrance mix	11.7	A mix of eight different fragrance components which was developed to allow for allergen testing in cosmetics
Thimerosal	10.9	A common preservative that is used in vaccines, contact lens solution, cosmetics
Sodium gold	9.5	Used in jewellery, dentistry, thiosulfate electronics
Formaldehyde	9.3	A colorless gas found in many workplaces, cosmetics, medications, textiles, resins, plastic bottles
Quaternium-15	9.0	A component in many shampoos, moisturizers, conditioners and soaps
Cobalt chloride	9.0	A hard metal found in cosmetics, jewellery, buttons, tools
Bacitracin	8.7	A topical antibiotic – one of the main ingredients in Polysporin®

Dyshidrotic Dermatitis

Clinical Presentation

- “tapioca pudding” papulovesicular dermatitis of hands and feet that coalesce into plaques, followed by painful fissuring
- acute stage often very pruritic
- secondary infection common
- lesions heal with desquamation and may lead to chronic lichenification
- sites: palms and soles ± dorsal surfaces of hands and feet

Pathophysiology

- NOT caused by hyperhidrosis (excessive sweating)
- emotional stress may precipitate the dermatitis

Management

- topical: high potency corticosteroid with plastic cling wrap occlusion to increase penetration
- intralesional triamcinolone injection
- systemic
 - prednisone in severe cases
 - antibiotics for secondary *S. aureus* infection

Nummular Dermatitis

Clinical Presentation

- annular, coin-shaped, pruritic, dry, scaly, erythematous plaques, can become lichenified
- often associated with atopic and dyshidrotic dermatitis
- secondary infection common

Pathophysiology

- little is known, but it is often accompanied by xerosis, which results from a dysfunction of the epidermal lipid barrier; this in turn can allow permeation of environmental agents, which can induce an allergic or irritant response

Management

- moisturization
- mid to high potency corticosteroid ointment bid

Seborrheic Dermatitis

Clinical Presentation

- greasy, erythematous, yellow, scaling, minimally elevated papules and plaques in areas rich in sebaceous glands, can look moist and superficially eroded in flexural regions
- infants: "cradle cap"
- children: may be generalized with flexural and scalp involvement
- adults: diffuse involvement of scalp margin with yellow to white flakes, pruritus, and underlying erythema
- sites: scalp, eyebrows, eyelashes, beard, glabella, post-auricular, over sternum, trunk, body folds, genitalia

Pathophysiology

- possible etiologic association with *Malassezia* spp. (yeast)

Epidemiology

- common in infants and adolescents
- increased incidence and severity in immunocompromised patients
- in adults, can cause dandruff (pityriasis sicca)

Management

- face: ketoconazole (Nizoral®) cream daily or bid + mild steroid cream daily or bid
- scalp: salicylic acid in olive oil or Derma-Smoother FS® oil (peanut oil, mineral oil, fluocinolone acetone 0.01%) to remove dense scales, 2% ketoconazole shampoo (Nizoral®), ciclopirox (Loprox®) shampoo, selenium sulfide (e.g. Selsun®) or zinc pyrithione (e.g. Head and Shoulders®) shampoo, steroid lotion (e.g. betamethasone valerate 0.1% lotion bid)

Stasis Dermatitis

Clinical Presentation

- chronic erythema, xerosis, scaling, pruritus, and brownish pigmentation in late stages
- site: lower legs

Pathophysiology

- chronic venous insufficiency leads to venous stasis
- surrounding soft tissue inflammation and fibrosis results

Investigations

- Doppler and color-coded Duplex sonography if suspicious for DVT
- culture for MRSA if there is crusting

Management

- compression stockings
- rest and elevate legs (above the level of the heart)
- moisturizer to treat xerosis
- mid-high potency topical corticosteroids to control inflammation

Complications

- ulceration (common at medial malleolus), secondary bacterial infections

Lichen Simplex Chronicus

Clinical Presentation

- well-defined plaque(s) of lichenified skin with decreased skin markings ± excoriations
- common sites: neck, scalp, lower extremities, urogenital area
- often seen in patients with atopy

Pathophysiology

- skin hyperexcitable to itch, continued rubbing/scratching of skin results
- eventually lichenification occurs

Investigations

- if patient has generalized pruritus, rule out systemic cause: CBC with differential count, transaminases, renal and thyroid function tests
- CXR if lymphoma suspected

Management

- treat pruritus to break the itch-scratch cycle: antipruritics (e.g. antihistamines, topical or intralesional glucocorticoids, Unna boot)

Papulosquamous Diseases

Lichen Planus

Clinical Presentation

- acute or chronic inflammation of mucous membranes or skin, especially on flexural surfaces
- small, polygonal, pruritic, flat-topped, shiny, violet papules; resolves into hyperpigmented macules
- common sites: wrists, ankles, mucous membranes in 60% (mouth, vulva, glans), nails, scalp
- distribution: symmetrical and bilateral
- Wickham's striae: reticulate white-gray lines over surface; pathognomonic but may not be present
- mucous membrane lesions: lacy, whitish reticular network, milky-white plaques/papules; increased risk of SCC in erosions and ulcers
- nails: longitudinal ridging; dystrophic; pterygium formation
- scalp: scarring alopecia with perifollicular hyperkeratosis
- spontaneously resolves but may last for weeks, months or years (mouth and skin lesions)
- rarely associated with hepatitis C
- Koebner phenomenon

Pathophysiology

- autoimmune, antigen unknown
- lymphocyte activation leads to keratinocyte apoptosis

Investigations

- biopsy
- hepatitis C serology if patient has risk factors

Management

- topical or intralesional corticosteroids
- short courses of oral prednisone (rarely)
- phototherapy for generalized or resistant cases
- oral retinoids for erosive lichen planus in mouth
- oral metronidazole or systemic immunosuppressants (e.g. azathioprine, methotrexate, cyclosporine)

The 6 Ps of Lichen Planus

Purple
Pruritic
Polygonal
Peripheral
Papules
Penis (i.e. mucosa)

Pityriasis Rosea

Clinical Presentation

- acute, self-limiting eruption characterized by red, oval plaques/patches with central scale that does not extend to edge of lesion
- long axis of lesions follows skin tension lines (i.e. Langer's Lines) parallel to ribs producing "Christmas tree" pattern on back
- varied degree of pruritus
- most start with a "herald" patch which precedes other lesions by 1-2 wk
- common sites: trunk, proximal aspects of arms and legs

Etiology

- suspected HHV-7 or HHV-6 reactivation

Investigations

- none required

Management

- none required; clears spontaneously in 6-12 wk
- symptomatic: topical glucocorticoids if pruritic

PSORIASIS: Presentation and Pathophysiology

Pink papules/Plaques/Pinpoint bleeding (Auspitz sign)/Physical injury (Koebner phenomenon)
Silver scale/Sharp margins
Onycholysis/Oil spots
Rete ridges with Regular elongation on pathology
Itching (sometimes)
Arthritis/Abscess (Munro) on pathology/
Autoimmune
Stratum corneum with nuclei
Immunologic
Stratum granulosum absent on pathology

Psoriasis

Classification

1. plaque psoriasis
2. guttate psoriasis
3. erythrodermic psoriasis
4. pustular psoriasis
5. inverse psoriasis

Pathophysiology

- not fully understood, genetic and immunologic factors
- shortened keratinocyte cell cycle leads to Th1- and Th17-mediated inflammatory response

PSORIASIS: Triggers

- Physical trauma (Koebner phenomenon)
- Infections (acute streptococcal infection precipitates guttate psoriasis)
- Stress (can be a major factor in flares)
- Drugs (rebound from stopping systemic glucocorticoids, lithium, antimalarial drugs, interferon)
- Smoking and heavy alcohol consumption

Differential Diagnosis

- AD, mycosis fungoides (cutaneous T-cell lymphoma), seborrheic dermatitis, tinea, nummular dermatitis, lichen planus

Investigations

- biopsy (if atypical presentation, rarely needed)

1. PLAQUE PSORIASIS

Clinical Presentation

- chronic and recurrent disease characterized by well-circumscribed erythematous papules/plaques with silvery-white scales
- often worse in winter (lack of sun and humidity)
- Auspitz sign: bleeds from minute points when scale is removed
- common sites: scalp, extensor surfaces of elbows and knees, trunk (especially buttocks), nails, pressure areas

Management

Table 10. Topical Treatment of Psoriasis

Treatment	Mechanism	Comments
Lubricants	Reduce fissure formation	Petrolatum is effective
Salicylic acid 1-12%	Remove scales	
Tar (LCD: liquor carbonis detergens) 20% coal tar solution	Inhibits DNA synthesis, increases cell turnover	Poor long-term compliance
Calcipotriene/calcipotriol (Dovonex [®] , Silkis [®])	Binds to skin 1,25-dihydroxyvitamin D3 to inhibit keratinocyte proliferation	Can be used on face and skin folds
Betamethasone + calcipotriene (Dovobet [®])	See above	Not to be used on face and folds
Topical Corticosteroids	Reduce scaling and thickness	Use appropriate potency steroid in different areas for degree of psoriasis
Tazarotene (Tazorac [®]) (gel/cream)	Retinoid derivative, decreased scaling	Use on nails

Table 11. Systemic Treatment of Psoriasis

Treatment	Adverse Effects
Methotrexate	Bone marrow toxicity, hepatic cirrhosis, teratogenicity
PUVA	Pruritus, burning, cataracts, skin cancer
Acitretin	Alopecia, cheilitis, teratogenicity, epistaxis, xerosis, hypertriglyceridemia
Cyclosporine	Renal toxicity, HTN, immunosuppression
UVB and "Narrow band" UVB (311-312 nm)	Well tolerated

Table 12. Biologics Approved in US

Treatment	Route	Dosing Schedule	Effectiveness	Action
Etanercept (Enbrel [®])*	SC	Twice weekly initially	+++	Anti-TNF
Adalimumab (Humira [®])*	SC	Once every 2 wk	++++	Anti-TNF
Infliximab (Remicade [®])*	IV	~Every 2 mo	+++++	Anti-TNF
Ustekinumab (Stelara [®])	SC	Every 12 wk during maintenance	+++	Anti-IL 12/23

*Can also be used to treat psoriatic arthritis

- biologics under study for treatment of psoriasis: secukinumab, brodalumab, ixekizumab, tildrakizumab, guselkumab

2. GUTTATE PSORIASIS ("DROP-LIKE")

Clinical Presentation

- discrete, scattered salmon-pink small scaling papules
- sites: diffuse, usually on trunk and legs, sparing palms and soles
- often antecedent streptococcal pharyngitis

Topical Treatments for Chronic Plaque Psoriasis

Cochrane DB Syst Rev 2009;2:CD005028

Study: Systematic review of randomized trials comparing treatments against placebo or against vitamin D.

Patients: 21,448 patients with chronic plaque psoriasis.

Intervention: Corticosteroids, dithranol, tarazotene, salicylic acid, retinoids, methotrexate, macrolactams, vitamin D, and vitamin D + corticosteroids.

Outcome: Investigator assessment of overall global improvement. Total severity scores. Psoriasis area and severity index. Patient assessment of overall global improvement.

Results: Corticosteroids, vitamin D, dithranol, and tazarotene performed better than placebo alone. A combination of corticosteroids and vitamin D were better than either vitamin D or corticosteroids alone.

Calcipotriol is a Vitamin D Derivative

Dovobet[®] = calcipotriene combined with betamethasone dipropionate and is considered to be one of the most potent topical psoriatic therapies.

Mechanism of Biologics

"-mab" = monoclonal antibody

"-cept" = receptor

Management

- UVB phototherapy, sunlight, lubricants
- penicillin V or erythromycin if Group A β -hemolytic Streptococcus on throat culture

3. ERYTHRODERMIC PSORIASIS**Clinical Presentation**

generalized erythema with fine desquamative scale on surface

- associated signs and symptoms: arthralgia, severe pruritus, dehydration, electrolyte imbalance
- may have history of mild plaque psoriasis
- aggravating factors: lithium, β -blockers, NSAIDs, antimalarials, phototoxic reaction, infection

Management

- hospitalization, bed rest, IV fluids, monitor fluids and electrolytes
- treat underlying aggravating condition, sun avoidance
- methotrexate, cyclosporine, UV, oral retinoids, biologics

4. PUSTULAR PSORIASIS**Clinical Presentation**

- sudden onset of erythematous macules and papules which evolve rapidly into pustules, very painful
- can be generalized or localized to palms/soles
- patient usually has history of psoriasis; may occur with sudden withdrawal from steroid therapy

Management

- methotrexate, cyclosporine, oral retinoids, biologics
- hospitalization if generalized

5. INVERSE PSORIASIS**Clinical Presentation**

- erythematous well-demarcated plaques on flexural surfaces such as axillae, inframammary folds, gluteal fold, inguinal folds
- lesions may be macerated

Management

- low potency topical corticosteroids
- topical vitamin D derivatives such as calcipotriene or calcitriol
- topical calcineurin inhibitors such as tacrolimus or pimecrolimus

6. PSORIATIC ARTHRITIS

- 5-30% of patients with psoriasis can also be suffering from psoriatic arthritis
- psoriatic patients with nail or scalp involvement are at a higher risk for developing psoriatic arthritis
- see [Rheumatology](#), RH23

Vesicobullous Diseases

Bullous Pemphigoid

**Clinical Presentation**

- chronic autoimmune bullous eruption characterized by pruritic, tense, subepidermal bullae on an erythematous or normal skin base
- sometimes presents as urticarial plaques without bullae
- common sites: flexor aspect of forearms, axillae, medial thighs, groin, abdomen, mouth in 33%

Pathophysiology

- IgG produced against dermal-epidermal basement membrane proteins (hemidesmosomes) leads to subepidermal bullae

Epidemiology

- mean age of onset: 60-80 yr old
- possible rare association with internal malignancy

Pemphigus Vulgaris vs. Bullous Pemphigoid

Vulgaris = Superficial, intraepidermal, flaccid lesions
 Pemphigoid = Deeper, tense lesions at the dermal-epidermal junction

Investigations

- immunofluorescence shows linear deposition of IgG and C3 along the basement membrane
- anti-basement membrane antibody (IgG) (pemphigoid antibody detectable in serum)

Prognosis

- heals without scarring, usually chronic
- rarely fatal

Management

- prednisone 0.5-1 mg/kg/d until clear, then taper \pm steroid-sparing agents (e.g. azathioprine, methotrexate)
- topical potent steroids (clobetasol) may be as effective as systemic steroids in limited disease
- tetracycline \pm nicotinamide is effective for some cases
- immunosuppressants such as azathioprine, mycophenolate mofetil, cyclosporine
- IVIg and plasmapheresis for refractory cases

Pemphigus Vulgaris

**Clinical Presentation**

- autoimmune blistering disease characterized by flaccid, non-pruritic intraepidermal bullae/vesicles on an erythematous or normal skin base
- may present with erosions and secondary bacterial infection
- sites: mouth (90%), scalp, face, chest, axillae, groin, umbilicus
- Nikolsky's sign: rubbing pressure on skin to cause bulla formation
- Asboe-Hansen sign: pressure applied to bulla causes it to extend laterally

Pathophysiology

- IgG against epidermal desmoglein-1 and -3 leads to intraepidermal bullae

Epidemiology

- 40-60 yr old, higher prevalence in Jewish, Mediterranean, Asian populations
- paraneoplastic pemphigus may be associated with thymoma, myasthenia gravis, malignancy, and use of D-penicillamine

Investigations

- immunofluorescence: shows IgG and C3 deposition intraepidermally
- circulating serum anti-desmoglein IgG antibodies

Prognosis

- begins with mouth lesions, followed by skin lesions
- lesions heal with hyperpigmentation but do not scar
- may be fatal unless treated with immunosuppressive agents

Management

- prednisone 1-2 mg/kg until no new blisters, then 1-1.5 mg/kg until clear, then taper \pm steroid-sparing agents (e.g. azathioprine, methotrexate, gold, cyclophosphamide, cyclosporine, IVIg, mycophenolate mofetil, rituximab)

**Pemphigus Foliaceus**

An autoimmune intraepidermal blistering disease that is more superficial than pemphigus vulgaris due to antibodies against desmoglein-1, a transmembrane adhesion molecule. Appears as crusted patches, erosions and/or flaccid bullae that usually start on the trunk. Localized disease can be managed with topical steroids. Active widespread disease is treated like pemphigus vulgaris

Dermatitis Herpetiformis

Clinical Presentation

- grouped papules/vesicles/urticarial wheals on an erythematous base, associated with intense pruritus, burning, stinging, excoriations
- lesions grouped, bilaterally symmetrical
- common sites: extensor surfaces of elbows/knees, sacrum, buttocks, scalp

Pathophysiology

- transglutaminase IgA deposits in the skin alone or in immune complexes leading to eosinophil and neutrophil infiltration
- 90% have HLA B8, DR3, DQWZ
- 90-100% associated with an often subclinical gluten-sensitive enteropathy (i.e. celiac disease)
- 30% have thyroid disease; increased risk of intestinal lymphoma in untreated comorbid celiac disease; iron/folate deficiency is common

Investigations

- biopsy
- immunofluorescence shows IgA deposits in perilesional skin

Epidemiology

- 20-60 yr old, M:F = 2:1

Management

- dapsone for pruritus (sulfapyridine if contraindicated or poorly tolerated)
- gluten-free diet for life

Porphyria Cutanea Tarda

Clinical Presentation

- tense vesicles/bullae in photoexposed areas subjected to trauma
- facial hypertrichosis, vesicles, and bullae in photodistribution (dorsum of hands and feet), milia, scarring
- common sites: light-exposed areas subjected to trauma, dorsum of hands and feet, nose, and upper trunk

Pathophysiology

- autosomal dominant or sporadic skin disorder associated with the presence of excess heme precursors
- associated with hemochromatosis, alcohol abuse, DM, drugs (estrogen therapy, NSAIDs), HIV, hepatitis C, increased iron indices

Epidemiology

- 30-40 yr old, M>F

Investigations

- urine + 5% HCl shows orange-red fluorescence under Wood's lamp (UV rays)
- 24 h urine for uroporphyrins (elevated)
- stool contains elevated coproporphyrins
- immunofluorescence shows IgE at dermal-epidermal junctions

Management

- discontinue aggravating substances (alcohol, estrogen therapy)
- phlebotomy to decrease body iron load
- low dose hydroxychloroquine

Drug Eruptions

Drug Hypersensitivity Syndrome

- fever followed by symmetrical bright red exanthematous eruption that may lead to internal organ involvement (e.g. hepatitis, arthralgia, nephritis, pneumonitis, lymphadenopathy, hematologic abnormalities, thyroid abnormalities)
- classically occurs approximately 7-10 d after first exposure to the drug
- may be elevated incidence of similar reactions in siblings
- most common causes: sulfonamides, allopurinol, and anticonvulsants (e.g. phenytoin, phenobarbital, carbamazepine, lamotrigine)
- 10% mortality if severe, undiagnosed, and untreated
- management: discontinue offending drug ± prednisone 0.5 mg-1 mg/kg/d, consider cyclosporine or other steroid-sparing agent in severe cases

**Drug Hypersensitivity Syndrome Triad**

- Fever
- Exanthematous eruption
- Internal organ involvement

Erythema Multiforme, Stevens-Johnson Syndrome, Toxic Epidermal Necrolysis

- disorders with varying presence of characteristic skin lesions, blistering and mucous membrane involvement

Table 13. Comparison of Erythema Multiforme, Stevens-Johnson Syndrome, Toxic Epidermal Necrolysis

	Lesion	Sites	Other Complications	Constitutional Symptoms	Etiology	Differential Diagnosis	Course and Prognosis	Management
Erythema Multiforme	Macules/papules with central vesicles Classic bull's-eye pattern of concentric light and dark rings (typical target lesions) Bilateral and symmetric All lesions appear within 72 h May show dermal edema Lesion "fixed" for at least 7 d	Dorsa of hands and forearms Mucous membrane involvement (lips, tongue, buccal mucosa) is possible Extremities with face > trunk Involvement of palms and soles	Burning and stinging Recurrences Secondary bacterial infection	Weakness, malaise	Infection: HSV, or <i>Mycoplasma pneumoniae</i>	Urticaria, granuloma annulare, mycosis fungoides, vasculitis	Lesions last 2 wk and heal without complications	Symptomatic treatment (oral antihistamines, oral antacids) Corticosteroids in severely ill (controversial) Prophylactic oral acyclovir for 6-12 mo for HSV-associated EM with frequent recurrences
Stevens-Johnson Syndrome	Cutaneous blistering with mucous membrane involvement (especially lips) "Atypical lesions": red circular patch with dark purple center (i.e. targetoid) "Sicker" (high fever) Sheet-like epidermal detachment in <10% of BSA (Nikolsky sign)	Prominent face and trunk involvement Palms and soles may be involved later on <10% body surface area involved by detached and detachable skin	Infection, scarring, contractures, eruptive NMN, corneal scarring, blindness, phimosis, and vaginal synechiae	Prodrome 1-14 d prior to eruption with fever and flu-like illness	Frequently drug-related (NSAIDs, anticonvulsants, sulfonamides, penicillins) Occurs up to 1-3 wk after drug exposure with more rapid onset upon rechallenge	Scarlet fever, phototoxic, eruption, GVHD, SSSS, exfoliative dermatitis, Kawasaki disease, paraneoplastic pemphigus	4-6 wk course 5% mortality	Prolonged hospitalization, admit to burn unit if significant denudation Withdraw suspect drug Intravenous fluids Infection prophylaxis Consider IVIg vs. cyclosporine (corticosteroids controversial)
Toxic Epidermal Necrolysis	Mucous membrane involvement, and severe blistering "Atypical lesions": 50% have no target lesions Diffuse erythema then necrosis and sheet-like epidermal detachment in >30% of BSA	Nails may also shed	Same as SJS PLUS electrolyte imbalance, dehydration, tubular necrosis and acute kidney injury, epithelial erosions of trachea, death	High fever >101°F	Same as SJS	Same as SJS	30% mortality due to fluid loss, regrowth of epidermis by 3 wk, secondary infection	Same as SJS Admit to burn unit Consider IVIg vs. cyclosporine

* SJS/TEN overlap is defined as the presence of 10-30% detached and detachable skin

Exanthematous Eruptions (Maculopapular Eruptions/Morbilliform)

- symmetrical, widespread, erythematous patches or plaques ± scales
- the "classic" and most common adverse drug reaction
- often starts on trunk
- may progress to generalized exfoliative dermatitis especially if the drug is continued
- most common causes: penicillin, sulfonamides, phenytoin
- management: discontinue offending drug ± oral antihistamines or topical/oral corticosteroids

Fixed Drug Eruptions

- sharply demarcated erythematous oval patches on the skin or mucous membranes
 - common sites: face, mucosa, genitalia, acral
 - recurs in same location upon subsequent exposure to the drug (fixed location)
- most common causes: antimicrobials (tetracycline, sulfonamides), anti-inflammatories, psychoactive agents (barbiturates), phenolphthalein
- management: discontinue offending drug ± prednisone 1mg/kg/d x 2 wk for generalized lesions ± potent topical corticosteroids for non-eroded lesions or antimicrobial ointment for eroded lesions

Photosensitivity Eruptions

- phototoxic reaction: "an exaggerated sunburn" confined to sun-exposed areas
- photoallergic reaction: an eczematous eruption that may spread to areas not exposed to light
- most common causes: chlorpromazine, doxycycline, thiazide diuretics, procainamide
- management: sun protection ± topical/oral corticosteroids

Intravenous Immunoglobulin Use in Patients with Toxic Epidermal Necrolysis and Stevens-Johnson Syndrome

Am J Clin Dermatol 2006;7:359-368

Study: Systematic review of 17 articles

(retrospective cohort studies were most common, no RCTs).

Patients: Individuals with a diagnosis of SJS/TEN treated with IVIg.

Intervention: Various doses and regimens of IVIg.

Outcomes: Time to disease cessation, time to healing.
Results: Eleven of 14 TEN studies reported positive results, while three studies did not observe a statistically significant improvement. Two of three SJS studies reported positive results, with one study observing no significant difference in mortality, or speed of healing.

Conclusion: IVIg appears to have a positive impact on TEN/SJS but results cannot be statistically analyzed as a whole due to variability and inconsistency in data presented from each study. However, it is considered the gold standard treatment.

Serum Sickness-Like Reaction

- a symmetric drug eruption resulting in fever, arthralgia, lymphadenopathy, and skin rash (urticaria)
- usually appears 5-10 d after drug exposure
- most common causes: cefaclor in kids; bupropion (Zyban®, Wellbutrin®) in adults
- management: discontinue offending drug ± topical/oral corticosteroids

Heritable Disorders

Ichthyosis Vulgaris

Clinical Presentation

- generalized hyperkeratosis leading to dry skin
- “fish-scale” appearance especially on extremities with sparing of flexural creases, palms and soles

Pathophysiology

- genetic deficiency in filaggrin protein leads to abnormal retention of keratinocytes (hyperkeratosis)
- scaling without inflammation

Epidemiology

- 1:300 incidence
- autosomal dominant inheritance
- associated with AD and keratosis pilaris

Investigations

- electron microscopy: keratohyalin granules

Management

- immersion in bath and oils followed by an emollient cream, humectant cream, or creams/oil containing urea or α - or β -hydroxy acids
- intermittent systemic retinoids for severe cases

Neurofibromatosis (Type I; von Recklinghausen's Disease)

Clinical Presentation

- diagnostic criteria includes 2 or more of the following
 1. more than 5 café-au-lait patches >1.5 cm in an adult or more than 5 café-au-lait macules >0.5 cm in a child under age 5 yr
 2. axillary or inguinal freckling
 3. iris hamartomas (Lisch nodules)
 4. optic gliomas
 5. neurofibromas
 6. distinctive bony lesion (sphenoid wing dysplasia or thinning of long bone cortex)
 7. first degree relative with neurofibromatosis type 1
- associated with pheochromocytoma, astrocytoma, bilateral acoustic neuromas, bone cysts, scoliosis, precocious puberty, developmental delay, and renal artery stenosis
- skin lesions less prominent in neurofibromatosis Type II (see [Pediatrics, P88](#))

Pathophysiology

- autosomal dominant disorder with excessive and abnormal proliferation of neural crest elements (Schwann cells, melanocytes), high incidence of spontaneous mutation
- linked to absence/truncation of neurofibromin (a tumour suppressor gene)

Epidemiology

- incidence 1:3,000

Investigations

- Wood's lamp examination to detect café-au-lait macules in patients with pale skin

Management

- refer to orthopedics, ophthalmology, plastics, and psychology for relevant management
- follow-up annually for brain tumors such as astrocytoma
- excise suspicious or painful lesions
- see [Pediatrics, P88](#)

Infections

Bacterial Infections

EPIDERMIS

IMPETIGO

Clinical Presentation

- acute purulent infection which appears micro-pustular; progresses to golden yellow “honey-crusted” lesions surrounded by erythema
- can present with bullae
- common sites: face, arms, legs, and buttocks

Etiology

- GAS, *S.aureus*, or both

Epidemiology

- preschool and young adults living in crowded conditions, poor hygiene, neglected minor trauma

Differential Diagnosis

- infected eczema, HSV, VZV

Investigations

- Gram stain and culture of lesion fluid or biopsy

Management

- remove crusts, use saline compresses and topical antiseptic soaks bid
- topical antibacterials such as 2% mupirocin or fusidic acid (Canada only) tid; continue for 7-10 d after resolution
- systemic antibiotics such as cloxacillin or cephalexin for 7-10 d

DERMIS

Table 14. Comparison of Erysipelas and Cellulitis

	Clinical Presentation	Etiology	Complications	Differential Diagnosis	Investigations	Management
Erysipelas	Involves upper dermis Confluent, erythematous, sharp raised edge, warm plaque, well demarcated Very painful (“St. Anthony’s fire”) Sites: face and legs Systemic symptoms: fever, chills, headache, weakness (if present, sign of more serious infection)	GAS	Scarlet fever, streptococcal gangrene, fat necrosis, coagulopathy Spreads via lymphatics	DVT (less red, less hot, smoother), superficial phlebitis, contact dermatitis, photosensitivity reaction, stasis dermatitis, panniculitis, vasculitis	Clinical diagnosis: rarely do skin/blood culture If suspect necrotizing fasciitis: do immediate biopsy and frozen section, histopathology	1st line: penicillin, cloxacillin or cefazolin 2nd line: clindamycin or cephalexin If allergic to penicillin, use erythromycin
Cellulitis	Involves lower dermis/subcutaneous fat Unilateral erythematous flat lesion, often with vesicles poorly demarcated, not uniformly raised Tender and warm to touch Sites: commonly on legs Systemic symptoms (uncommon): fever, leukocytosis, lymphadenopathy	GAS, <i>S. aureus</i> (large sized wounds), <i>H. influenzae</i> (periocular), <i>Pasteurella multocida</i> (dog/cat bite)	Uncommon	Same as erysipelas	Same as erysipelas	1st line: cloxacillin or cefazolin/cephalexin 2nd line: erythromycin or clindamycin Children: cefuroxime If DM (foot infections): TMP/SMX and metronidazole

COMMON HAIR FOLLICLE INFECTIONS

Table 15. Comparison of Superficial Folliculitis, Furuncles, and Carbuncles

	Clinical Presentation	Etiology	Management
Superficial Folliculitis	Superficial infection of the hair follicle (vs. pseudofolliculitis: inflammation of follicle due to friction, irritation, or occlusion or ingrowing hair) Acute lesion consists of a dome-shaped pustule at the mouth of hair follicle Pustule ruptures to form a small crust Sites: primarily scalp, shoulders, anterior chest, upper back, other hair-bearing areas	Normal non-pathogenic bacteria (<i>Staphylococcus</i> – most common; <i>Pseudomonas</i> – hot tub) <i>Pityrosporum</i>	Antiseptic (Hibiclens®) Topical antibacterial (fusidic acid, mupirocin, or erythromycin) Oral cloxacillin for 7-10 d
Furuncles (Boils)	Red, hot, tender, inflammatory nodules with central yellowish point, which forms over summit and ruptures Involves subcutaneous tissue that arises from a hair follicle Sites: hair-bearing skin (thigh, neck, face, axillae, perineum, buttocks)	<i>S. aureus</i>	Incise and drain large furuncles to relieve pressure and pain If afebrile: hot wet packs, topical antibiotic If febrile/cellulitis: culture blood and aspirate pustules (Gram stain and C&S) Cloxacillin for 1-2 wk (especially for lesions near external auditory canal/nose, with surrounding cellulitis, and not responsive to topical therapy)
Carbuncles	Deep-seated abscess formed by multiple coalescing furuncles Usually in areas of thicker skin Occasionally ulcerates Lesions drain through multiple openings to the surface Systemic symptoms may be associated	<i>S. aureus</i>	Same as for furuncles

Dermatophytoses

Clinical Presentation

- infection of skin, hair and nails caused by dermatophytes (fungi that live within the epidermal keratin or hair follicle and do not penetrate into deeper structures)

Pathophysiology

- digestion of keratin by dermatophytes results in scaly skin, broken hairs, crumbling nails/onycholysis

Etiology

- Trichophyton*, *Microsporum*, *Epidermophyton* species (*Pityrosporum* is a superficial yeast and not a dermatophyte)

Investigations

- skin scrapings, hair, and/or nail clippings analyzed with potassium hydroxide (KOH) prep to look for hyphae and mycelia Nails can also be sent to pathology for PAS staining

Management

- topicals as first line agents for tinea corporis/cruris and tinea pedis (interdigital type): clotrimazole, or terbinafine or ciclopirox olamine cream applied bid
- oral therapy is often indicated for onychomycosis or tinea capitis although ciclopirox nail lacquer bid x 6 mo is an option in those unable to take oral:
 - e.g. terbinafine (Lamisil® – liver toxicity, CYP2D6 inhibitor) or itraconazole (Sporanox® – CYP3A4 inhibitor, liver toxicity, CHF)

Table 16. Different Manifestations of Dermatophyte Infection

	Clinical Presentation	Differential Diagnosis	Investigations	Management
Tinea Capitis	Round, scaly patches of alopecia, possibly with broken off hairs; pruritic Sites: scalp, eyelashes, and eyebrows; involving hair shafts and follicles Kerion (boggy, elevated, purulent inflamed nodule/plaque) may form secondary to infection by bacteria and result in scarring May have occipital lymphadenopathy Affects children (mainly African American), immunocompromised adults Very contagious and may be transmitted from barber, hats, theatre seats, pets commonly amongst multiple family members	Alopecia areata, psoriasis, seborrheic dermatitis, trichotillomania, dissecting cellulitis of the scalp, acne keloidalis nuchae	Wood's light examination of hair: green fluorescence only for <i>Microsporum</i> infection Culture of scales/hair shaft Microscopic examination of KOH preparation of scales or hair shafts	Griseofulvin most common in US Terbinafine (Lamisil®) x 4 wk NB: oral agents are required to penetrate the hair root where dermatophyte resides Adjunctive antifungal shampoos or lotions may be helpful, and may prevent spread (e.g. selenium sulfide, ketoconazole, ciclopirox)
Tinea Corporis (Ringworm)	Pruritic, scaly, round/oval plaque with active erythematous margin and central clearing. Scale often more prominent at outer rim Site: trunk, limbs, face	Nummular dermatitis, granuloma annulare, pityriasis rosea, psoriasis, seborrheic dermatitis, SCLÉ	Microscopic examinations of KOH prep of scales shows hyphae Culture of scales	Topicals: 1% clotrimazole, 2% ketoconazole 2% miconazole, terbinafine or ciclopirox olamine cream bid for 2-4 wk Oral terbinafine, or itraconazole, or fluconazole, or ketoconazole if extensive

Table 16. Different Manifestations of Dermatophyte Infection (continued)

	Clinical Presentation	Differential Diagnosis	Investigations	Management
Tinea Cruris (“Jock Itch”)	Scaly patch/plaque with a well-defined, curved border and central clearing Pruritic, erythematous, dry/macerated Site: medial thigh	Candidiasis (involvement of scrotum and satellite lesions), contact dermatitis, erythrasma, inverse psoriasis, seborrheic dermatitis	Same as for tinea corporis	Same as for tinea corporis
Tinea Pedis (Athlete’s Foot)	Pruritic scaling and/or maceration of the web spaces and powdery scaling of soles Acute infection: interdigital (esp. 4th web space) red/white scales, vesicles, bullae, often with maceration Secondary bacterial infection may occur Chronic: non-pruritic, pink, scaling keratosis on soles and sides of feet May present as flare-up of chronic tinea pedis Predisposing factors: heat, humidity, occlusive footwear	Atopic dermatitis, contact dermatitis, dyshidrotic dermatitis, erythrasma, , palmoplantar psoriasis If only between 4th and 5th toes soft corn	Same as for tinea corporis	Same as for tinea corporis
Tinea Mannum	Primary fungal infection of the hand is rare; usually associated with tinea pedis Acute: blisters at edge of red areas on hands Chronic: single dry scaly patch	AD, contact dermatitis, granuloma annulare, psoriasis	Same as for tinea corporis	Same as for tinea corporis
Tinea Unguium (Onychomycosis)	Crumbling, distally dystrophic nails; yellowish, opaque with subungual hyperkeratotic debris Toenail infections usually precede fingernail infections <i>T. rubrum</i> (90% of all toenail infections)	Psoriasis, lichen planus, contact dermatitis, traumatic onychodystrophies, bacterial infections, chronic candidal infection	Microscopic examinations of KOH prep of scales from subungual scraping shows hyphae Culture of subungual scraping or nail clippings on Sabouraud’s agar PAS stain of nail clipping by pathology	Terbinafine (Lamisil®) (6 wk for fingernails, 12 wk for toenails) Itraconazole (Sporanox®) 7 d on, 3 wk off (2 pulses for fingernails, 3 pulses for toenails) Topical: ciclopirox (Penlac®); nail laquer (often ineffective)

Parasitic Infections

SCABIES

Clinical Presentation

- characterized by superficial burrows, intense pruritus (especially nocturnal), and secondary infection
- primary lesion: superficial linear burrows; inflammatory papules and nodules. Most common sites: finger webs, periumbilical and groin
- secondary lesion: small crusted papules, eczematous plaques, excoriations
- common sites: axillae, groin, buttocks, hands/feet (especially web spaces), sparing of head and neck (except in infants)

Pathophysiology

- scabies mite remains alive 2-3 d on clothing/sheets, however eggs can take 7 days to hatch
- incubation of 1 mo, then pruritus begins
- re-infection followed by hypersensitivity in 24 h

Etiology

- *Sarcoptes scabiei* (a mite)
- risk factors: sexual promiscuity, crowding, poverty, nosocomial, immunocompromised

Differential Diagnosis

- asteatotic eczema, dermatitis herpetiformis, lichen simplex chronicus (neurodermatitis)

Investigations

- microscopic examination of root and content of burrow and mineral oil mount for mite, eggs, feces
- skin biopsy may sometimes show scabies mite

Management

- bathe, then apply permethrin 5% cream (i.e. Nix®) from neck down to soles of feet (must be left on for 8-14 h and requires second treatment as it is not ovicidal)
- in pregnancy permethrin is not used due to neurotoxicity. Instead topical sulfur is considered safe
- change underwear and linens; wash twice with detergent in hot water cycle then machine dry
- treat family and close contacts
- pruritus may persist for 2 months after effective treatment due to prolonged hypersensitivity reaction
- mid potency topical steroids and antihistamines for symptom management

LICE (PEDICULOSIS)

Clinical Presentation

- intensely pruritic red excoriations, morbilliform rash, caused by louse (a parasite)
- scalp lice: nits (i.e. louse eggs) on hairs; red, excoriated skin with secondary bacterial infection, lymphadenopathy
- pubic lice: nits on hairs; excoriations
- body lice: nits and lice in seams of clothing; excoriations and secondary infection mainly on shoulders, belt-line and buttocks

Etiology

- *Phthirus pubis* (pubic), *Pediculus humanus capitis* (scalp), *Pediculus humanus humanus* (body): attaches to body hair and feeds
- can transmit infectious agents such as *Bartonella quintana* and *Rickettsia prowazekii*

Differential Diagnosis

- on scalp: bacterial infection of scalp, seborrheic dermatitis, on body: scabies

Diagnosis

- lice visible on inspection of affected area or clothing seams

Management

- permethrin 1% (Nix® cream rinse) (ovicidal) or permethrin 1% (RC & Cor®, Kwellada-P® shampoo)
- comb hair with fine-toothed comb using dilute vinegar solution to remove nits
- repeat in 7 d after first treatment
- shave hair if feasible, change clothing and linens; wash with detergent in hot water cycle then machine dry
- treat sexual contacts in case of pubic lice

BED BUGS (HEMIPTERA)

Clinical Presentation

- burning wheals, turning to firm papules, often in groups of three – “breakfast, lunch and dinner” – in areas with easy access (face, neck, arms, legs, hands)

Etiology

- caused by *Cimex lectularius*, a small insect that feeds mainly at night (hide in crevices in walls and furniture during the day)

Differential Diagnosis

- dermatitis herpetiformis, drug eruptions, ecthyma, other insect bites, scabies

Investigations

- none required, but lesional biopsy can confirm insect bite reaction

Management

- professional fumigation
- topical steroids and oral H1-antagonists for symptomatic relief
- definitive treatment is removal of clutter in home and application of insecticides to walls and furniture

Viral Infections

HERPES SIMPLEX

Clinical Presentation

- herpetiform (i.e. grouped) vesicles on an erythematous base on skin or mucous membranes
- transmitted via contact with erupted vesicles or via asymptomatic viral shedding
- **primary**
 - children and young adults
 - usually asymptomatic; may have high fever, regional lymphadenopathy, malaise
 - followed by antibody formation and latency of virus in dorsal nerve root ganglion
- **secondary**
 - recurrent form seen in adults; much more common than primary
 - prodrome: tingling, pruritus, pain
 - triggers for recurrence: fever, excess sun exposure, physical trauma, menstruation, emotional stress, URTI
- **potential complications**
 - dendritic corneal ulcer
 - Erythema Multiforme
 - herpes simplex encephalitis (infants at risk)

- HSV infection on atopic dermatitis causing Kaposi's varicelliform eruption (eczema herpeticum)
- two biologically and immunologically different subtypes: HSV-1 and HSV-2

Investigations

- Tzanck smear with Giemsa stain shows multinucleated giant epithelial cells most common investigation although diagnosis is usually clinical
- viral culture, electron microscopy, and direct fluorescence antibody test of specimen taken from the base of a relatively new lesion
- serologic testing for antibody for current or past infection if necessary rarely performed as expensive, and high prevalence of positives

HSV-1

- typically "cold sores" (grouped vesicles at the mucocutaneous junction which quickly burst)
- recurrent on face, lips and hard palate, but NOT on soft, non-keratinized mucous membranes (unlike aphthous ulcers)

Management

- treat during prodrome to prevent vesicle formation
- topical antiviral (Zovirax®) cream, apply 5-6x/d x 4-7 d for facial/genital lesions
- oral antivirals (e.g. acyclovir, famciclovir, valacyclovir) are far more effective and have an easier dosing schedule, can be used at first sign of prodrome or if frequent outbreaks as prophylactic suppression

HSV-2

- sexually transmitted; incubation 2-20 d
- gingivostomatitis: entire buccal mucosa involved with erythema and edema of gingiva
- vulvovaginitis: edematous, erythematous, extremely tender, profuse vaginal discharge
- urethritis: watery discharge in males
- recurrent on vulva, vagina, penis for 5-7 d
- ddx of genital ulcers: *Candida* balanitis, chancroid, syphilitic chancres

Management

- rupture vesicle with sterile needle if you wish to culture it
- wet dressing with aluminum subacetate solution, Burow's compression, or betadine solution
- 1st episode: acyclovir 200 mg PO 5 times a day x 10 d
 - maintenance: acyclovir 400 mg PO bid
- famciclovir and valacyclovir may be substituted and have better enteric absorption and less frequent dosing
- in case of herpes genitalis, look for and treat any other sexually-transmitted infections
- for active lesions in pregnancy, see [Obstetrics, OB20](#)

HERPES ZOSTER (SHINGLES)

Clinical Presentation

- unilateral dermatomal eruption occurring 3-5 d after pain and paresthesia of that dermatome; may be disseminated in immunosuppressed (eg HIV, organ transplant)
- vesicles, bullae, and pustules on an erythematous, edematous base
- lesions may become eroded/ulcerated and last days to weeks
- pain is can be pre-herpetic, synchronous with rash, or post-herpetic
- severe post-herpetic neuralgia often occurs in elderly and may be permanent
- Hutchinson's sign: involvement of tip of nose suggests eye involvement
- distribution: thoracic (50%), trigeminal (10-20%), cervical (10-20%); disseminated in HIV

Etiology

- caused by reactivation of VZV
- risk factors: immunosuppression, old age, occasionally associated with hematologic malignancy, stress

Differential Diagnosis

- before thoracic skin lesions occur, must consider other causes of chest pain
- contact dermatitis, localized bacterial infection, zosteriform HSV (more pathogenic for the eyes than VZV)

Investigations

- none required, but can do Tzanck test, direct fluorescence antibody test, or viral culture to rule out HSV

Management

- compress with normal saline, Burow's, or betadine solution
- analgesics (NSAIDs, amitriptyline)
- famciclovir or valacyclovir or acyclovir for 7 d; must initiate within 72 h to be of benefit; IV acyclovir for ophthalmic or disseminated involvement
- gabapentin 300-600 mg PO tid for post-herpetic neuralgia

Both HSV-1 and HSV-2 can occur on face or genitalia

Herpes zoster typically involves a single dermatome; lesions rarely cross the midline

MOLLUSCUM CONTAGIOSUM

Clinical Presentation

- discrete dome-shaped and umbilicated pearly, white papules caused by DNA Pox virus (*Molluscum contagiosum* virus); giant verrucous forms in advanced HIV
- common sites: eyelids, beard (likely spread by shaving), neck, axillae, trunk, perineum, buttocks

Etiology

- virus is spread via direct contact, auto-inoculation, sexual contact
- common in children and sexually active young adults (giant molluscum and severe cases can be seen in the setting of HIV)

Investigations

- none required, however can biopsy to confirm diagnosis

Management

- topical cantharidin (a vesicant)
- cryotherapy
- curettage
- topical retinoids
- Aldara® (imiquimod): immune modulator that produces a cytokine inflammation

WARTS (VERRUCA VULGARIS) (HUMAN PAPILLOMAVIRUS INFECTIONS)

Table 17. Different Manifestations of HPV Infection

	Definition and Clinical Features	Differential Diagnosis	Distribution	HPV Type
Verruca Vulgaris (Common Warts)	Hyperkeratotic, elevated discrete epithelial growths with papillated surface caused by HPV Paring or dermoscopic exam of surface reveals punctate, red-brown specks (thrombosed capillaries)	Molluscum contagiosum, seborrheic keratosis, SCC	Located at trauma sites: fingers, hands, knees of children and teens	At least 80 types are known
Verruca Plantaris (Plantar Warts) and Verruca Palmaris (Palmar Warts)	Hyperkeratotic, shiny, sharply margined growths Paring of surface reveals red-brown specks (capillaries), interruption of epidermal ridges	May need to scrape ("pare") lesions to differentiate wart from callus and corn (see sidebar, D7)	Located at pressure sites: metatarsal heads, heels, toes	Commonly HPV 1, 2, 4, 10
Verruca Planae (Flat Warts)	Multiple discrete, skin colored, flat topped papules grouped or in linear configuration Common in children	Syringoma, seborrheic keratosis, molluscum contagiosum, lichen planus	Sites: face, dorsa of hands, shins, knees	Commonly HPV 3, 10
Condyloma Acuminata (Genital Warts)	Skin-colored pinhead papules to soft cauliflower like masses in clusters Often occurs in young adults, infants, children Can be asymptomatic, lasting months to years Highly contagious, transmitted sexually and non-sexually (e.g. Koebner phenomenon via scratching, shaving), and can spread without clinically apparent lesions Investigations: acetowhiteness (subclinical lesions seen with 5% acetic acid x 5 min and hand lens) Complications: fairy-ring warts (satellite warts at periphery of treated area of original warts)	Condyloma lata (secondary syphilitic lesion, dark field strongly +ve), Molluscum contagiosum, SCC	Sites: genitalia and perianal areas	Commonly HPV 6 and 11 HPV 16, 18, 31, 33 cause cervical dysplasia, SCC and invasive cancer

- other viruses associated with skin changes, such as measles, roseola, fifth disease, etc.
- see [Pediatrics, P57](#)

Yeast Infections

CANDIDIASIS

Etiology

- many species of *Candida* (70-80% of infections are from *Candida albicans*)
- opportunistic infection in those with predisposing factors (e.g. trauma, malnutrition, immunodeficiency)

Candidal Paronychia

- painful red swellings of periungual skin
- management: topical agents not as effective; oral antifungals recommended

Candidal Intertrigo

- macerated/eroded erythematous patches that may be covered with papules and pustules, located in intertriginous areas often under breast, groin, or interdigitally
- peripheral "satellite" pustules

Treatment for Warts

- First line Therapies:** salicylic acid preparations (patches, solutions, creams, ointments), cryotherapy, topical cantharone
- Second Line Therapies:** topical imiquimod, topical 5-fluorouracil, topical tretinoin, podophyllotoxin
- Third Line Therapies:** curettage, cautery, surgery for non plantar warts, CO₂ laser, oral cimetidine (particularly children), intralesional bleomycin (plantar warts), trichloroacetic acid, diphencyprone

- predisposing factors: obesity, DM, systemic antibiotics, immunosuppression, malignancy
- starts as non-infectious maceration from heat, moisture and friction
- management: keep area dry, terbinafine, ciclopirox olamine, ketoconazole/clotrimazole cream bid until rash clears

PITYRIASIS (TINEA) VERSICOLOR

Clinical Presentation

- asymptomatic superficial fungal infection with finely scaling macules of various colors. In caucasian skin often red-brown to light brown, in darker skin tones often light brown to pale (thus versicolor)
- In Caucasians affected skin darker than surrounding skin in winter, lighter in summer (does not tan)
- common sites: upper chest and back

Pathophysiology

- microbe produces carboxylic acid → inflammatory reaction inhibiting melanin synthesis yielding variable pigmentation
- affinity for sebaceous glands; require fatty acids to survive

Etiology

- *Pityrosporum ovale* (*Malassezia furfur*)
- also associated with folliculitis and seborrheic dermatitis
- predisposing factors: summer, tropical climates, excessive sweating, Cushing's syndrome, prolonged corticosteroid use

Investigations

- clinical diagnosis but can perform microscopic examination, KOH prep of scales for hyphae and spores

Management

- ketoconazole shampoo or cream daily
- topical terbinafine or ciclopirox olamine bid
- systemic fluconazole or itraconazole for 7 d if extensive

Oral Terbinafine (Lamisil®) is not effective because it is not secreted by sweat glands

Natural History of Untreated Syphilis

- Inoculation
- Primary syphilis (10-90 d after infection)
- Secondary syphilis (simultaneous to primary syphilis or up to 6 mo after healing of primary lesion)
- Latent syphilis
- Tertiary syphilis (2-20 yr)

Latent Syphilis

70% of untreated patients will remain in this stage for the rest of their lives and are immune to new primary infection

Sexually Transmitted Diseases

SYPHILIS

Clinical Presentation

- characterized initially by a painless ulcer (chancere)
- following inoculation, systemic infection with secondary and tertiary stages

Etiology

- *Treponema pallidum*
- transmitted sexually, congenitally, or rarely by transfusion

Table 18. Stages of Syphilis

	Clinical Presentation	Investigations	Management
Primary Syphilis	Single red, indurated, painless chancre, that develops into painless ulcer with raised border and scanty serous exudate Chancre develops at site of inoculation after 3 wk of incubation and heals in 4-6 wk; chancre may also develop on lips or anus Regional non-tender lymphadenopathy appears <1 wk after onset of chancre DDx: chancroid (painful), HSV (multiple lesions)	CANNOT be based on clinical presentation alone VDRL negative – repeat weekly for 1 mo Fluorescent treponemal antibody-syphilis (FTA-ABS) test has greater sensitivity and may detect disease earlier in course Dark field examination – spirochete in chancre fluid or lymph node aspirate	Penicillin G, 2.4 million units IM, single dose Notify public health authorities
Secondary Syphilis	Presents 2-6 mo after primary infection (patient may not recall presence of primary chancre) Associated with generalized lymphadenopathy, splenomegaly, headache, chills, fever, arthralgias, myalgias, malaise, photophobia Lesions heal in 1-5 wk and may recur for 1 yr 3 types of lesions 1. Macules and papules: flat top, scaling, non-pruritic, sharply defined, circular/annular rash (DDx: pityriasis rosea, guttate psoriasis, tinea corporis, drug eruptions, lichen planus) 2. Condyloma lata: wart-like moist papules around genital/perianal region 3. Mucous patches: macerated patches mainly found in oral mucosa	VDRL positive FTA-ABS +ve; –ve after 1 yr following appearance of chancre Dark field +ve in all secondary	As for primary syphilis
Tertiary Syphilis	Extremely rare 3-7 yr after secondary Main skin lesion: 'Gumma' – a granulomatous non-tender nodule	As in primary syphilis, VDRL can be falsely negative	Treatment: penicillin G, 2.4 million units IM weekly x 3 wk Notify public health authorities

GONOCOCCEMIA**Clinical Presentation**

- disseminated gonococcal infection
- hemorrhagic, tender, pustules on a purpuric/petechial background
- common sites: distal aspects of extremities
- associated with fever, arthritis, urethritis, proctitis, pharyngitis, and tenosynovitis
- neonatal conjunctivitis if infected via birth canal

Etiology

- *Neisseria gonorrhoeae*

Investigations

- requires high index of clinical suspicion plays because tests are often negative
- bacterial culture of blood, joint fluid, and skin lesions
- joint fluid cell count and Gram stain

Management

- notify Public Health authorities
- screen for other STDs
- cefixime 400 mg PO (drug of choice) or ceftriaxone 125 mg IM

HSV

- see *Viral Infections*, D27

HPV

- see *Viral Infections*, D29

Pre-Malignant Skin Conditions

Actinic Keratosis (Solar Keratosis)

Clinical Presentation

- ill-defined, scaly erythematous papules or plaques on a background of sun-damaged skin (solar heliosis)
- sandpaper-like, gritty sensation felt on palpation, often easier to appreciate on palpation rather than inspection
- sites: areas of sun exposure (face, ears, scalp if bald, neck, sun-exposed limbs)

Pathophysiology

- UV radiation damage to keratinocytes from repeated sun exposure (especially UVB)
- risk of transformation of AK to SCC (~1/1,000), but higher likelihood if AK is persistent

Epidemiology

- common with increasing age, outdoor occupation, M>F
- skin phototypes I-III, rare in darker skin as melanin is protective

Differential Diagnosis

- SCC *in situ*, superficial BCC, seborrheic keratosis, cutaneous lupus erythematosus

Investigations

- biopsy lesions that are refractory to treatment

Management

- destructive: cryotherapy, electrodesiccation and curettage
- pharmacotherapy: 5-fluorouracil cream for 2-3 wk, imiquimod cream for 8-10 wk, photodynamic therapy
- excision

**Types of AK**

- Erythematous: typical AK lesion
- Hypertrophic: thicker, rough papule/plaque
- Cutaneous horn: firm hyperkeratotic outgrowth
- Actinic cheilitis: confluent AKs on the lip
- Pigmented: flat, tan-brown, scaly plaque
- Spreading pigmented
- Proliferative
- Conjunctival: pinguecula, pterygium

Leukoplakia

Clinical Presentation

- a morphologic term describing homogenous or speckled white plaques with sharply demarcated borders
- sites: oropharynx, most often floor of the mouth, soft palate, and ventral/lateral surfaces of the tongue

Pathophysiology

- precancerous or premalignant condition
- oral form is strongly associated with tobacco use and alcohol consumption, although also occurs in congenital disease eg dyskeratosis congenita

Epidemiology

- 1-5% prevalence in adult population after 30 yr of age; peak at age 50
- M>F, fair-skinned
- most common oral mucosal premalignant lesion

Differential Diagnosis

- lichen planus, oral hairy leukoplakia, mild oral candidiasis

Investigations

- biopsy is mandatory because it is premalignant

Management

- low risk sites on buccal/labial mucosal or hard palate: eliminate carcinogenic habits, follow-up
- moderate/dysplastic lesions: excision, cryotherapy

Malignant Skin Tumors

Non-Melanoma Skin Cancers

BASAL CELL CARCINOMA

Subtypes

- noduloulcerative (typical)
 - skin-colored papule/nodule with rolled, translucent (“pearly”) telangiectatic border and depressed/eroded/ulcerated center
- pigmented variant
 - flecks of pigment in translucent lesion with surface telangiectasia
 - may mimic malignant melanoma or seborrheic keratosis clinically
- superficial variant
 - flat, tan to red-brown plaque, often with scaly, pearly border and fine telangiectasia at margin
 - least aggressive subtype
- sclerosing (morpheaform) variant
 - flesh/yellowish-colored, shiny papule/plaque with indistinct borders, indurated

Pathophysiology

- malignant proliferation of basal keratinocytes of the epidermis
 - low grade cutaneous malignancy, locally aggressive (primarily tangential growth), rarely metastatic
 - usually due to UVB light exposure, therefore >80% on face
 - may also occur in previous scars, radiation, trauma, arsenic exposure, or genetic predisposition (Gorlin syndrome)

Epidemiology

- most common malignancy in humans
- 75% of all malignant skin tumors >40 yr, increased prevalence in the elderly
- M>F, skin phototypes I and II, chronic cumulative sun exposure

Differential Diagnosis

- benign: sebaceous hyperplasia, intradermal melanocytic nevus, dermatofibroma
- malignant: nodular MM, SCC

Management

- imiquimod 5% cream (Aldara®), 5-Fluorouracil (efudex) or cryotherapy is indicated for superficial BCCs on the trunk smaller than 2 cm

Workup/Investigations of BCC and Other NMSCs

- **History:** duration, growth rate, family/personal hx of skin cancer, prior therapy to the particular lesion
- **Physical:** location, size, whether circumscribed, tethering to deep structures, full skin exam, lymph node exam
- **Biopsy:** if shallow lesion, can do shave biopsy; otherwise punch or excisional biopsy may be more appropriate

Surgical Margins

- **Smaller Lesions:** electrodesiccation and curettage with 2-3 mm margin of normal skin
- **Deep Infiltrative Lesions:** surgical excision with 3-5 mm margins beyond visible and palpable tumor border, which may require skin graft or flap; or Mohs surgery, which conserves tissue and does not require margin control

- excision or electrodesiccation and curettage for most types of BCCs < 2 cm and not on face, not including morpheaform
- Mohs surgery: microscopically controlled, minimally invasive, stepwise excision for lesions on the face or in areas that are difficult to reconstruct or recurrent lesions
- radiotherapy used in advanced cases of BCC where surgical intervention is not an option
- life-long follow-up
- 95% cure rate if lesion <2 cm in diameter or if treated early
- vismodegib for metastatic disease

SQUAMOUS CELL CARCINOMA

Clinical Presentation

- indurated erythematous nodule/plaque with surface scale/crust \pm ulceration
- more rapid enlargement than BCC
- sites: face, ears, scalp, forearms, dorsum of hands

Pathophysiology

- malignant neoplasm of keratinocytes (primarily vertical growth)
- predisposing factors include: UV radiation, PUVA, ionizing radiation therapy/exposure, chemical carcinogens (such as arsenic, tar and nitrogen mustards), HPV 16, 18, immunosuppression
- may occur in previous scar (SCC more commonly than BCC)

Epidemiology

- second most common type of cutaneous neoplasm
- primarily on sun-exposed skin in the elderly, M>F, skin phototypes I and II, chronic sun exposure
- in organ transplant recipients SCC is most common cutaneous malignancy, with increased mortality as compared to non-immunocompromised population

Differential Diagnosis

- benign: nummular eczema, psoriasis, irritated seborrheic keratosis, wart
- malignant: keratoacanthoma, Bowen's disease, BCC

Management

- surgical excision with primary closure, skin flaps or grafting
- Mohs surgery
- lifelong follow-up (more aggressive treatment than BCC)

Prognosis

- good prognostic factors: early treatment, negative margins, and small size of lesion
- SCCs that arise from AK metastasize less frequently (~1%) than other SCCs arising de novo in old burns (2-5% of cases)
- overall control is 75% over 5 yr, 5-10% metastasize

OTHER FORMS OF SQUAMOUS CELL CARCINOMA (SCC)

BOWEN'S DISEASE (SQUAMOUS CELL CARCINOMA *IN SITU*)

Clinical Presentation

- sharply demarcated erythematous plaque with scale and/or crusting
- often 1-3 cm in diameter and found on the skin and mucous membranes
- evolves to SCC in 10-20% of cutaneous lesions and >20% of mucosal lesions

Management

- same as for BCC
- biopsy required for diagnosis
- topical 5-fluorouracil (Efudex®) or imiquimod (Aldara®) used if extensive and as a tool to identify margins of poorly defined tumors
- cryosurgery
- shave excision with electrodesiccation and curettage

KERATOACANTHOMA

Clinical Presentation

- rapidly growing, firm, dome-shaped, erythematous or skin-colored nodule with central keratin-filled crater, resembling an erupting volcano
- may spontaneously regress within a year, leaving a scar
- sites: sun-exposed skin

Pathophysiology

- epithelial neoplasm with atypical keratinocytes in epidermis
- low grade variant of SCC

Etiology

- HPV, UV radiation, chemical carcinogens (tar, mineral oil)

Epidemiology

- >50 yr, rare <20 yr

Differential Diagnosis

- treat as SCC until proven otherwise
- hypertrophic solar keratosis, verruca vulgaris

Management

- surgical excision or saucerization (shave biopsy) followed by electrodesiccation of the base, treated similarly to SCC

Malignant Melanoma

**Clinical Presentation**

- malignant characteristics of a mole: “ABCDE” mnemonic
- sites: skin, mucous membranes, eyes, CNS

Clinical Subtypes of Malignant Melanoma

- **lentigo maligna**
 - malignant melanoma *in situ* (normal and malignant melanocytes confined to the epidermis)
 - 2-6 cm, tan/brown/black uniformly flat macule or patch with irregular borders
 - lesion grows radially and produces complex colors
 - often seen in the elderly
 - 10% evolve to lentigo maligna melanoma
- **lentigo maligna melanoma** (15% of all melanomas)
 - malignant melanocytes invading into the dermis
 - associated with pre-existing solar lentigo, not pre-existing nevi
 - flat, brown, stain-like, gradually enlarging with loss of skin surface markings
 - with time, color changes from uniform brown to dark brown with black and blue
 - found on all skin surfaces, especially those often exposed to sun, such as the face and hands
- **superficial spreading melanoma** (60-70% of all melanomas)
 - atypical melanocytes initially spread laterally in epidermis then invade the dermis
 - irregular, indurated, enlarging plaques with red/white/blue discoloration, focal papules or nodules
 - ulcerate and bleed with growth
- **nodular melanoma** (30% of all melanomas)
 - atypical melanocytes that initially grow vertically with little lateral spread
 - uniformly ulcerated, blue-black, and sharply delineated plaque or nodule
 - rapidly fatal
 - may be pink or have no color at all, this is called an amelanotic melanoma
 - “EFG” Elevated, Firm, Growing
- **acrolentiginous melanoma** (5% of all melanomas)
 - ill-defined dark brown, blue-black macule
 - palmar, plantar, subungual skin
 - melanomas on mucous membranes have poor prognosis

Pathophysiology

- malignant neoplasm of pigment forming cells (melanocytes and nevus cells)

Epidemiology

- incidence 1/75 (Canada) 1/50 (US)
- risk factors: numerous moles, fair skin, red hair, positive personal/family history, large congenital nevi, familial dysplastic nevus syndrome, multiple dysplastic nevi
- most common sites: back (M), calves (F)
- worse prognosis if: male, on scalp, hands, feet, late lesion, no pre-existing nevus present

Differential Diagnosis

- benign: nevi, solar lentigo, seborrheic keratosis
- malignant: pigmented BCC

**Does this Patient have a Mole or Melanoma?****ABCDE checklist****Asymmetry****Border** (irregular and/or indistinct)**Color** (varied)**Diameter** (increasing or >6 mm)**Enlargement, elevation, evolution** (i.e. change in color, size, or shape)

Sensitivity 92% (CI 82-96%)

Specificity 100% (CI 54-100%)

JAMA 1998;279:696-701

**Risk Factors for Melanoma****no SPF is a SIN****Sun exposure****Pigment traits** (blue eyes, fair/red hair, pale complexion)**Freckling****Skin reaction to sunlight** (increased incidence of sunburn)**Immunosuppressive states** (e.g. renal transplantation)**Nevi** (dysplastic nevi; increased number of benign melanocytic nevi)

Management

- excisional biopsy preferable, otherwise incisional biopsy as staged by depth so shave will not be adequate
- remove full depth of dermis and extend beyond edges of lesion only after histologic diagnosis, except for small lesions (removed entirely at biopsy and additional incisional biopsy if positive)
- beware of lesions that regress – tumour is usually deeper than anticipated
- high dose IFN for stage II (regional), chemotherapy (cis-platinum, BCG) and high dose IFN for stage III (distant) disease
- newer chemotherapeutic, gene therapies and vaccines starting to be used in metastatic melanoma
- radiotherapy may be used as adjunctive treatment

Node Dissection for Lesions

>1 mm thick OR <1 mm and ulcerated
OR >1 mitoses/mm² (Stage IB or higher melanoma patients should be offered a sentinel lymph node biopsy)

- Assess sentinel node at time of wide excision

Table 19. American Joint Committee on Cancer Staging System Based on Breslow's Thickness of Invasion

Tumor Depth	Stage	Approximate 5 Year Survival
T1 <1.0 mm	Stage I T1a – T2a	5 yr survival 90%
T2 1.01-2.0 mm	Stage II T2b – T4b	5 yr survival 70%
T3 2.01-4.0 mm	Stage III any nodes	5 yr survival 45%
T4 >4.0 mm	Stage IV any mets	5 yr survival 10%

a = no ulceration; b = ulceration

Other Cutaneous Cancers

CUTANEOUS T-CELL LYMPHOMA

Clinical Presentation

- **Mycosis fungoides** (limited superficial type)
 - characterized by erythematous patches/plaques/nodules/tumors, which may be pruritic and poikilodermic (atrophy, telangiectasia, hyperpigmentation)
 - common sites include: trunk, buttocks, proximal limbs
 - mildly symptomatic, usually excellent prognosis for early disease
- **Sézary syndrome** (widespread systemic type)
 - rare variant characterized by erythroderma, lymphadenopathy, WBC >20 x 10⁹/L with Sézary cells
 - associated with intense pruritus, alopecia, palmoplantar hyperkeratosis, and systemic symptoms (fatigue, fever)
 - often fatal

Pathophysiology

- clonal proliferation of skin-homing CD4 T-cells

Epidemiology

- >50 yr old, M:F 2:1

Differential Diagnosis

- tinea corporis, nummular dermatitis, psoriasis, DLE, Bowen's disease

Investigations

- skin biopsy (histology, "lymphocyte antigen cell" markers, TcR gene arrangement), epidermotropism, atypical lymphocytes and loss of CD5 and CD7 markers
- blood smear looking for Sézary cells or flow cytometry (e.g. CD4:CD8 >10 is Sézary)
- imaging (for systemic involvement)

Management

- **Mycosis fungoides**
 - treatment is dependent on stage of disease
 - for patch stage: topical steroids and/or PUVA, narrow band (311-313 nm), UVB (NBUVB)
 - plaque stage: steroids, topical nitrogen mustard, bexarotene, IFN, chemotherapeutic agent)
- **Sézary syndrome**
 - oral retinoids and IFN
 - extra-corporeal photophoresis
 - may need radiotherapy for total skin electron beam radiation
 - may maintain on UV therapy
 - other chemotherapy agents

Alopecia (Hair Loss)

Hair Loss

TOP HAT

Telogen effluvium, tinea capitis

Out of Fe, Zn

Physical: trichotillomania, "corn-row" braiding

Hormonal: hypothyroidism, androgenic

Autoimmune: SLE, alopecia areata

Toxins: heavy metals, anticoagulants, chemotherapy, vitamin A, SSRIs

Non-Scarring Alopecia: intact hair follicles on exam → biopsy not required (but may be helpful)

Scarring Alopecia: absent hair follicles on exam → biopsy required

DDx of Non-Scarring (Non-Cicatricial) Alopecia

• Autoimmune

- Alopecia areata

• Endocrine

- Hypothyroidism
- Androgens

• Micronutrient deficiencies

- Iron
- Zinc

• Toxins

- Heavy metals
- Anticoagulants
- Chemotherapy
- Vitamin A

• Trauma to the hair follicle

- Trichotillomania
- 'Corn-row' braiding

• Other

- Syphilis
- Severe illness
- Childbirth

Precipitants of Telogen Effluvium

"SEND" hair follicles out of anagen and into telogen

Stress and Scalp disease (surgery)

Endocrine (hypothyroidism, post-partum)

Nutritional (iron and protein deficiency)

Drugs (citraetin, heparin, lithium, IFN, β -blockers, valproic acid, SSRIs)

Hair Growth

- hair grows in a cyclic pattern that is defined in 3 stages
 1. growth stage = anagen phase
 2. transitional stage = catagen stage
 3. resting stage = telogen phase
- total duration of the growth stage reflects the type and location of hair: eyebrow, eyelash, and axillary hairs have a short growth stage in relation to the resting stage
- growth of the hair follicles is also based on the hormonal response to testosterone and DHT; this response is genetically controlled

Non-Scarring (Non-Cicatricial) Alopecia

ANDROGENETIC ALOPECIA

Clinical Presentation

- male- or female-pattern alopecia
- males: fronto-temporal areas progressing to vertex, entire scalp may be bald
- females: widening of central part, "Christmas tree" pattern

Pathophysiology

- action of testosterone on hair follicles

Epidemiology

- males: early 20s-30s
- females: 40s-50s

Management

- minoxidil (Rogaine®) solution or foam to reduce rate of loss/partial restoration
- spironolactone in women (anti-androgenic effects), cyproterone acetate (Diane-35®)
- finasteride (Propecia®) (5- α -reductase inhibitor) 1 mg/d in men
- hair transplant

PHYSICAL

- trichotillomania: impulse-control disorder characterized by compulsive hair pulling with irregular patches of hair loss, and with remaining hairs broken at varying lengths
- traumatic (e.g. tight "corn-row" braiding of hair, wearing tight pony tails, tight tying of turbans)

TELOGEN EFFLUVIUM

Clinical Presentation

- uniform decrease in hair density secondary to hairs leaving the growth (anagen) stage and entering the resting (telogen) stage of the cycle

Pathophysiology

- variety of precipitating factors (see sidebar)
- hair loss typically occurs 2-4 mo after exposure to precipitant
- regrowth occurs within a few months but may not be complete

ANAGEN EFFLUVIUM

Clinical Presentation

- hair loss due to insult to hair follicle impairing its mitotic activity (growth stage)

Pathophysiology

- precipitated by chemotherapeutic agents (most common), other meds (bismuth, levodopa, colchicine, cyclosporine), exposure to chemicals (thallium, boron, arsenic)
- dose-dependent effect
- hair loss 7-14 d after single pulse of chemotherapy; most clinically apparent after 1-2 mo
- reversible effect; follicles resume normal mitotic activity few weeks after agent stopped

ALOPECIA AREATA

Clinical Presentation

- autoimmune disorder characterized by patches of complete hair loss often localized to scalp but can affect eyebrows, beard, eyelashes, etc.
- may be associated with dystrophic nail changes – fine stippling, pitting
- “exclamation mark” pattern (hairs fractured and have tapered shafts, i.e. looks like “!”)
- may be associated with pernicious anemia, vitiligo, thyroid disease, Addison’s disease
- spontaneous regrowth may occur within months of first attack (worse prognosis if young at age of onset and extensive loss)
- frequent recurrence often precipitated by emotional distress

Management

- generally unsatisfactory
- intralesional triamcinolone acetonide (corticosteroids) can be used for isolated patches
- UV or PUVA therapy
- immunomodulatory (diphencyprone)

Alopecia Areata Subtypes

Alopecia totalis: loss of all scalp hair and eyebrows

Alopecia universalis: loss of all body hair

DDx of Scarring (Cicatricial) Alopecia

Developmental/Hereditary Disorders

- Aplasia cutis congenita
- Epidermal nevi
- Romberg’s syndrome
- Generalized follicular hamartoma

Primary Causes

- Group 1: Lymphocytic
 - DLE
 - Lichen planopilaris
 - Central centrifugal cicatricial alopecia
 - Classic pseudopelade
- Group 2: Neutrophilic
 - Folliculitis decalvans
 - Dissecting scalp cellulitis
- Group 3: Mixed
 - Acne keloidalis nuchae

Secondary Causes

- Infectious agents
 - Bacterial (e.g. post-cellulitis)
 - Fungal (e.g. tinea capitis)
- Neoplasms (e.g. BCC, SCC, lymphomas, and metastatic tumors)
- Physical agents
 - Mechanical trauma
 - Burns
 - Radiotherapy
 - Caustic chemicals

Scarring (Cicatricial) Alopecia

Clinical Presentation

- irreversible loss of hair follicles with fibrosis

Etiology

- physical: radiation, burns
- infections: fungal, bacterial, TB, leprosy, viral (HZV)
- inflammatory
 - lichen planus (lichen planopilaris)
 - DLE (note that SLE can cause an alopecia unrelated to DLE lesions which are non-scarring)
 - morphea: “coup de sabre” with involvement of center of scalp
 - central centrifugal cicatricial alopecia: seen in up to 40% of black women, starting at central scalp; one of most commonly diagnosed scarring alopecias, may be associated with hair care practices in this population

Investigations

- biopsy from active border

Management

- infections: treat underlying infection
- inflammatory: topical/intralesional steroids, anti-inflammatory antibiotics, antimalarials, immunosuppressants, oral steroids, retinoids, thalidomide

Nails and Disorders of the Nail Apparatus

Table 20. Nail Changes in Systemic and Dermatological Conditions

Nail Abnormality	Definition/Etiology	Associated Disease
NAIL PLATE CHANGES		
Clubbing	Proximal nail plate has greater than 180 degree angle to nail fold, watch-glass nails, bulbous digits	Cyanotic heart disease, bacterial endocarditis, pulmonary disorders, GI disorders, etc.
Koilonychia	Spoon shaped nails	Iron deficiency, malnutrition, DM
Onycholysis	Separation of nail plate from nail bed	Psoriasis, dermatophytes, thyroid disease
Onychogryphosis	Hypertrophy of the nail plate and subungal hyperkeratosis	Poor circulation, chronic inflammation, tinea
Onychohemia	Subungal hematoma	Trauma to nail bed
Onychomycosis	Fungal infection of nail (e.g. dermatophyte, yeast, mold)	HIV, DM, peripheral arterial disease
Onychocryptosis (ingrown toenail)	Often hallux with congenital malalignment, painful inflammation, granulation tissue	Tight fitting shoes, excessive nail clipping
SURFACE CHANGES		
V-shaped nicking	Distal margin has v-shaped loss of the nail plate	Darier’s disease (follicular dyskeratosis)
Pterygium invs. unguium	Distal nail plate does not separate from underlying nail bed	Scleroderma
Pitting	Punctate depressions that migrate distally with growth	Psoriasis (random pattern), alopecia areata (geometric, gridshaped arrangement), eczema
Transverse ridging	Transverse depressions often more in central portion of nail plate	Serious acute illness slows nail growth (when present in all nails = Beau’s lines), eczema, chronic paronychia, trauma
Transverse white lines	Bands of white discoloration	Poisons, hypoalbuminemia (Muherke’s lines)

Table 20. Nail Changes in Systemic and Dermatological Conditions (continued)

Nail Abnormality	Definition/Etiology	Associated Disease
Color CHANGES		
Yellow		Tinea, jaundice, tetracycline, pityriasis rubra pilaris, yellow nail syndrome, psoriasis, tobacco use
Green		Pseudomonas
Black		Melanoma, hematoma
Brown		Nicotine use, psoriasis, poisons, longitudinal melanonychia (ethnic)
Splinter hemorrhages	Extravasation of blood from longitudinal vessels of nail bed, blood attaches to overlying nail plate and moves distally as it grows	Trauma, bacterial endocarditis, blood dyscrasias, psoriasis
Oil spots	Brown-yellow discoloration	Psoriasis
NAIL FOLD CHANGES		
Herpetic whitlow	HSV infection of distal phalanx	HSV infection
Paronychia	Local inflammation of the nail fold around the nail bed	Acute: painful infection Chronic: constant wetting (e.g. dishwashing, thumbsucking)
Nail fold telangiectasias	Cuticular hemorrhages, roughness, capillary changes	Scleroderma, SLE, dermatomyositis
Pterygium of nail fold	Skin overgrows nail plate	lichen planus

Skin Manifestations of Systemic Disease

**Table 21. Skin Manifestations of Internal Conditions**

Disease	Related Dermatoses
AUTOIMMUNE DISORDERS	
Behçet's disease	Painful aphthous ulcers in oral cavity ± genital mucous membranes, erythema nodosum, acneiform papules, pathergy
Buerger's disease	Superficial migratory thrombophlebitis, pallor, cyanosis, gangrene, ulcerations, digital resorptions
Dermatomyositis	Periorbital and extensor violaceous erythema, heliotrope with edema, Gottron's papules (violaceous flat-topped papules with atrophy), periungual erythema, telangiectasia, calcinosis cutis, shawl signs (erythema and poikiloderma V-sign of chest and upper back) holster sign (hips poikiloderma), photosensitivity, scalp burning
Polyarteritis nodosa	Subcutaneous nodules, stellate purpura, erythema, gangrene, splinter hemorrhages, livedo reticularis, ulceration
Rheumatic fever	Petechiae, urticaria, erythema nodosum, rheumatic nodules, evanescent rash
Scleroderma	Raynaud's, nonpitting edema, waxy/shiny/tense atrophic skin (morphea), fingertip pitting and ulcers, cutaneous calcification, periungual telangiectasia, acrosclerosis, salt-and-pepper leukoderma
Systemic lupus erythematosus	Malar erythema, discoid rash (erythematous papules or plaques with keratotic scale, follicular plugging, atrophic scarring on face, hands, and arms), hemorrhagic bullae, palpable purpura, urticarial purpura, patchy/diffuse alopecia, mucosal ulcers, photosensitivity, 'lupus hairs' (fragile hairs anterior hairline), panniculitis
Crohn's disease/UC	Pyoderma gangrenosum, erythema nodosum, Sweet's syndrome
ENDOCRINE DISORDERS	
Addison's disease	Generalized hyperpigmentation or limited to skin folds, buccal mucosa and scars
Cushing's syndrome	Moon facies, purple striae, acne, hyperpigmentation, hirsutism, atrophic skin with telangiectasia
DM	Infections (e.g. boils, carbuncles, <i>Candidiasis</i> , <i>S. aureus</i> , dermatophytoses, tinea pedis and cruris, infectious eczematoid dermatitis), pruritus, eruptive xanthomas, necrobiosis lipoidica diabetorum, granuloma annulare, diabetic foot, diabetic bullae, acanthosis nigricans, calciphylaxis
Hyperthyroidism	Moist, warm skin, seborrhea, acne, nail atrophy, hyperpigmentation, toxic alopecia, pretibial myxedema, acropachy, onycholysis
Hypothyroidism	Cool, dry, scaly, thickened, hyperpigmented skin; toxic alopecia with dry, coarse hair, brittle nails, myxedema, loss of lateral 1/3 eyebrows
HIV-RELATED	
Infections	Viral (e.g. HSV, HZV, HPV, CMV, molluscum contagiosum, oral hairy leukoplakia), bacterial (impetigo, acneiform folliculitis, dental caries, cellulitis, bacillary epithelioid angiomatosis, syphilis), fungal (candidiasis, histoplasmosis, cryptococcus, blastomycosis)
Inflammatory dermatoses	Seborrhea, psoriasis, , vasculitis, eosinophilic folliculitis
Malignancies	Kaposi's sarcoma, lymphoma, BCC, SCC, MM

Raynaud's Phenomenon DDx

COLD HAND

Cryoglobulins/Cryofibrinogens
Obstruction/Occupational
Lupus erythematosus, other connective tissue disease
DM/Drugs
Hematologic problems (polycythemia, leukemia, etc)
Arterial problems (atherosclerosis)
Neurologic problems (vascular tone)
Disease of unknown origin (idiopathic)

Acanthosis Nigricans

An asymptomatic dark thickened velvety hyperpigmentation of flexural skin most commonly around the neck. Associated with DM, obesity, and other endocrine disorders and malignancy. It is a cutaneous marker of tissue insulin resistance

Table 21. Skin Manifestations of Internal Conditions (continued)

Disease	Related Dermatoses
MALIGNANCY	
Adenocarcinoma	
Gastrointestinal	Peutz-Jeghers: pigmented macules on lips/oral mucosa
Cervix/anus/rectum	Paget's disease: eroding scaling plaques of perineum
Carcinoma	
Breast	Paget's disease: eczematous and crusting lesions of breast
GI	Palmoplantar keratoderma: thickened skin of palms/soles
Thyroid	Sipple's syndrome: multiple mucosal neuromas
Breast/lung/ovary	Dermatomyositis: heliotrope erythema of eyelids and violaceous plaques over knuckles
Lymphoma/Leukemia	
Hodgkin's	Ataxia Telangiectasia: telangiectasia on pinna, bulbar conjunctiva
Acute leukemia	Ichthyosis: generalized scaling especially on extremities, Sweet's syndrome
	Bloom's syndrome: butterfly erythema on face, associated with short stature
Multiple myeloma	Amyloidosis: large, smooth tongue with waxy papules on eyelids, nasolabial folds and lips, as well as facial petechiae
OTHERS	
Liver disease	Pruritus, hyperpigmentation, spider nevi, palmar erythema, white nails (Terry's nails), porphyria cutanea tarda, xanthomas, hair loss, jaundice
Renal disease	Pruritus, pigmentation, half and half nails, perforating dermatosis, calciphylaxis
Pruritic urticaria papules and plaques of pregnancy	Erythematous papules or urticarial plaques in distribution of striae distensae: buttocks, thighs, upper inner arms and lower backs although always spares umbilicus
Cryoglobulinemia	Palpable purpura in cold-exposed areas, Raynaud's, cold urticaria, acral hemorrhagic necrosis, bleeding disorders, associated with hepatitis C infection

Pediatric Exanthems

- see [Pediatrics](#), P57

Miscellaneous Lesions

Angioedema and Urticaria

Angioedema

- deeper swelling of the skin involving subcutaneous tissues; often involves the eyes, lips, and tongue
- may or may not accompany urticaria
- hereditary or acquired forms
- hereditary angioedema (does not occur with urticaria)
 - onset in childhood; 80% have positive family history
 - recurrent attacks; 25% die from laryngeal edema
 - triggers: minor trauma, emotional upset, temperature changes
- types of acquired angioedema
 - acute allergic angioedema (allergens include food, drugs, contrast media, insect venom, latex)
 - non-allergic drug reaction (drugs include ACE inhibitors)
 - acquired C1 inhibitor deficiency
- treatment
 - prophylaxis with danazol or stanozolol for hereditary angioedema
 - epinephrine pen to temporize until patient reaches hospital in acute attack

Urticaria

- also known as "hives"
- transient, red, pruritic well-demarcated wheals
- each individual lesion lasts less than 24 h
- second most common type of drug reaction
- results from release of histamine from mast cells in dermis
- can also result after physical contact with allergen
- treatment with oral antihistamines in high dosages, oral steroids, immunosuppressives (mycophenolate mofetil, imuran) or newly approved omalizumab

Wheal

- Typically erythematous flat-topped, palpable lesions varying in size with circumscribed dermal edema
- Individual lesion lasts <24 h
- Associated with mast cell release of histamine
- May be pruritic

Table 22. Classification of Urticaria

Type	Etiology
Acute Urticaria >2/3 of cases Attacks last <6 wk Individual lesions last <24 h	Drugs: especially ASA, NSAIDs Foods: nuts, shellfish, eggs, fruit Idiopathic (> 2/3 of patients) Infection Insect stings (bees, wasps, hornets) Percutaneous absorption: cosmetics, work exposures Stress Systemic diseases: SLE, endocrinopathy, neoplasm
Chronic Urticaria <1/3 of cases Attacks last >6 wk Individual lesion lasts <24 h	IgE-dependent: trigger associated Idiopathic (90% of chronic urticaria patients) Aeroallergens Drugs (antibiotics, hormones, local anesthetics) Foods and additives Insect stings Parasitic infections Physical contact (animal saliva, plant resins, latex, metals, lotions, soap) Direct mast cell release Opiates, muscle relaxants, radio-contrast agents Complement-mediated Serum sickness, transfusion reactions Infections, viral/bacterial (>80% of urticaria in pediatric patients) Urticarial vasculitis Arachidonic acid metabolism ASA, NSAIDs Physical Dermatographism (friction, rubbing skin), cold (ice cube, cold water), cholinergic (hot shower, exercise), solar, pressure (shoulder strap, buttocks), aquagenic (exposure to water), adrenergic (stress), heat Other Mastocytosis, urticaria pigmentosa In non-pruritic chronic urticaria, consideration should be given to Syndromes such as Schnitzler's, Muckle-Wells and Familial Cold Urticaria
Urticarial Vasculitis Individual lesions last >24 h Often painful, less likely pruritic, heals with bruise type lesions Requires biopsy	Idiopathic Infections Hepatitis Autoimmune diseases SLE Drug hypersensitivity Cimetidine and diltiazem

**DDx for Urticaria****DAM HIVES**

Drugs and foods

Allergic

Malignancy

Hereditary

Infection

Vasculitis

Emotions

Stings

**Approach to Urticaria**

- Thorough Hx and P/E
- **Acute:** no immediate investigations needed; consider referral for allergy testing
- **Chronic:** further investigations required: CBC and differential, urinalysis, ESR, TSH, LFTs to help identify underlying cause
- **Vasculitic:** biopsy of lesion and referral to dermatology

**Mastocytosis (Urticaria Pigmentosa)**

Rare disease due to excessive infiltration of the skin by mast cells. It manifests as many reddish-brown elevated plaques and macules. Friction to a lesion produces a wheal surrounded by intense erythema (Darier's sign), due to mast cell degranulation; this occurs within minutes

Erythema Nodosum

Clinical Presentation

- acute or chronic inflammation of subcutaneous fat (panniculitis)
- round, red, tender, poorly demarcated nodules
- sites: asymmetrically arranged on extensor lower legs, (typically shins) much less commonly knees, arms
- associated with arthralgia, fever, malaise

Etiology

- 40% are idiopathic
- drugs: sulfonamides, OCPs (also pregnancy), analgesics, trans retinoic acid
- infections: GAS, TB, histoplasmosis, *Yersinia*
- inflammation: sarcoidosis, Crohn's > UC
- malignancy: acute leukemia, Hodgkin's lymphoma

Epidemiology

- 15-30 yr old, F:M = 3:1
- lesions last for days and spontaneously resolve in 6 wk, although some patients will have chronic recurrence secondary to underlying conditions

Investigations

- chest X-ray (to rule out chest infection and sarcoidosis)
- throat culture, ASO titre, PPD skin test

Management

- symptomatic: bed rest, compressive bandages, wet dressings
- NSAIDs, intralesional steroids
- treat underlying cause
- super saturated potassium iodide with thyroid monitoring, dapsone and colchicine

**DDx of Erythema Nodosum****NODOSUM**

No cause (idiopathic) in 40%

Drugs (sulfonamides, OCP, etc.)

Other infections (GAS+)

Sarcoidosis

UC and Crohn's

Malignancy (leukemia, Hodgkin's

lymphoma)

Many Infections

Pruritus

Clinical Presentation

- a sensation provoking a desire to scratch, with or without skin lesions
- lesions may arise from the underlying disease, or from excoriation causing crusts, lichenified plaques, or wheals

Etiology

- dermatologic – generalized
 - asteatotic dermatitis (“winter itch” due to dry skin)
 - pruritus of senescent skin (may not have dry skin, any time of year)
 - infestations: scabies, lice
 - drug eruptions: ASA, antidepressants, opiates
 - psychogenic states
- dermatologic – local
 - atopic and contact dermatitis, lichen planus, urticaria, insect bites, dermatitis herpetiformis
 - infection: varicella, candidiasis
 - lichen simplex chronicus
 - prurigo nodularis
- systemic disease – usually generalized
 - hepatic: obstructive biliary disease, cholestatic liver disease of pregnancy
 - renal: chronic renal failure, uremia secondary to hemodialysis
 - hematologic: Hodgkin's lymphoma, multiple myeloma, leukemia, polycythemia vera, hemochromatosis, Fe deficiency anemia, cutaneous T-cell lymphoma
 - neoplastic: lung, breast, gastric (internal solid tumors), non-Hodgkin's lymphoma
 - endocrine: carcinoid, DM, hypothyroid/thyrototoxicosis
 - infectious: HIV, trichinosis, echinococcosis, hepatitis C
 - psychiatric: depression, psychosis
 - neurologic: post-herpetic neuralgia, multiple sclerosis

DDx of Pruritus

SCRATCHED

Scabies
Cholestasis

Renal
Autoimmune
Tumors

Crazies (psychiatric)

Hematology (polycythemia, lymphoma)

Endocrine (thyroid, parathyroid, ↓ Fe)

Drugs, Dry skin

Investigations

- detailed history
- complete physical, including rectal and pelvic examination
- blood work: CBC, ESR, Cr/BUN, LFT, TSH, fasting blood sugar, stool culture and serology for parasites, if on palms with no rash check bile acids, especially in pregnancy

Management

- treat underlying cause
- cool water compresses to relieve pruritus
- bath oil and emollient ointment (especially if xerosis is present)
- topical corticosteroid and antipruritics (e.g. menthol, camphor, phenol, mirtazapine, capsaicin)
- systemic antihistamines: H1 blockers are most effective, most useful for urticaria
- phototherapy with UVB or PUVA
- doxepin, amitriptyline
- gabapentin, pregabalin
- naloxone
- immunosuppressive agents if severe: steroids and steroid sparing

Wounds and Ulcers

- see [Plastic Surgery](#), PS8, PS15

- Consider biopsy of any nonhealing wound to rule out cancer

Common Medications

Sunscreens and Preventative Therapy

Sunburn

- erythema 2-6 h post UV exposure often associated with edema, pain and blistering with subsequent desquamation of the dermis, and hyperpigmentation
- chronic UVA, UVB exposure leads to photoaging, immunosuppression, photocarcinogenesis
- prevention: avoid peak UVR (10 am to 4 pm), wear appropriate clothing, wide-brimmed hat, sunglasses, and broad-spectrum sunscreen
- clothing with UV protection expressed as UV protection factor (UPF) is analogous to SPF of sunscreen

SPF = burn time with cream/burn time without cream

Sunscreens

- under ideal conditions an SPF of 10 means that a person who normally burns in 20 min will burn in 200 min following the application of the sunscreen but by definition SPF relates ONLY to UVB absorption

- topical chemical: absorbs UV light
 - requires application at least 15-60 min prior to exposure, should be reapplied every 2 h (more often if sweating, swimming)
 - UVB absorbers: PABA, salicylates, cinnamates, benzylidene camphor derivatives
 - UVA absorbers: benzophenones, anthranilates, dibenzoylmethanes, benzylidene camphor derivatives
- topical physical: reflects and scatters UV light
 - titanium dioxide, zinc oxide, kaolin, talc, ferric chloride, and melanin
 - ♦ all are effective against the UVA and UVB spectrum
 - less risk of sensitization than chemical sunscreens and waterproof, but may cause folliculitis or miliaria
- some sunscreen ingredients may cause contact or photocontact allergic reactions, but are uncommon

Management

- sunburn: if significant blistering present, consider treatment in hospital; otherwise, symptomatic treatment (cool wet compresses, oral anti-inflammatory, topical corticosteroids)
- antioxidants, both oral and topical are being studied for their abilities to protect the skin; topical agents are limited by their ability to penetrate the skin

UV Radiation

UVA (320-400 nm): Aging

- Penetrates skin more effectively than UVB or UVC
- Responsible for tanning, burning, wrinkling, photoallergy and premature skin aging
- Penetrates clouds, glass and is reflected off water, snow and cement

UVB (290-320 nm): Burning

- Absorbed by the outer dermis
- Is mainly responsible for burning and premature skin aging
- Primarily responsible for BCC, SCC
- Does not penetrate glass and is substantially absorbed by ozone

UVC (200-290 nm)

- Is filtered by ozone layer

Body Site

Relative Percutaneous Absorption

Forearm	1.0
Plantar foot	0.14
Palm	0.83
Back	1.7
Scalp	3.7
Forehead	6.0
Cheeks	13.0
Scrotum	42.0

Calculation of strength of steroid compared to hydrocortisone on forearm: relative strength of steroid x relative percutaneous absorption

Surface Area

30 g covers full adult body once. Children have a greater surface area/volume ratio and there are consequently greater side effects

Side Effects of Topical Steroids

- Local: atrophy, perioral dermatitis, steroid acne, rosacea, contact dermatitis, tachyphylaxis (tolerance)
- Systemic: suppression of HPA axis

Vehicles

- Ointment (water in oil): hydrate, greasy
- Cream (oil in water): hydrate, variable
- Lotion (powder in water): drying, cosmesis
- Solutions (water, alcohol, propylene glycol)
- Gel (solution that melts on contact with skin, alcohol): drying

Topical Steroids

Table 23. Potency Ranking of Topical Steroids

Relative Potency	Relative Strength	Generic Names	Trade Names	Usage
Weak	x1	hydrocortisone – 2.5% (1% available over-the-counter)	Emo Cort®	Intertriginous areas, children, face, thin skin
Moderate	x3	hydrocortisone 17-valerate – 0.2% desonide mometasone furoate	Westcort® Tridesilon® Elocom®	Arm, leg, trunk
Potent	x6	betamethasone – 0.1% 17-valerate – 0.1% amcinonide	Betnovate® Celestoderm – V® Cyclocort®	Body
Very Potent	x9	betamethasone dipropionate – 0.05% fluocinonide – 0.05% halcinonide	Diprosone® Lidex, Topsyn gel® Lyderm® Halog®	Palms and soles
Extremely Potent	x12	clobetasol propionate – 0.05% (most potent) betamethasone dipropionate ointment halobetasol propionate – 0.05%	Dermovate® Diprolene® Ultravate®	Palms and soles or for very limited time spans to trunk

Dermatologic Therapies

Table 24. Common Topical Therapies

Drug Name	Dosing Schedule	Indications	Comments
Calcipotriol (Dovonex®)	0.005% cream, ointment, scalp solution, apply bid For maintenance therapy apply OD	Psoriasis	Burning, itching, skin irritation, worsening of psoriasis Avoid face, mucous membranes, eyes; wash hands after application Maximum weekly dosage of cream by age: 2-5 yr – 25 g/wk 6-10 yr – 50 g/wk 11-14 yr – 75 g/wk >14 yr – 100 g/wk Inactivated by light (do not apply before phototherapy)
Calcitriol (vectical)	Ointment	Psoriasis	
Imiquimod (Aldara®)	5% cream applied 3x/wk Apply at bedtime, leave on 6-10 h, then wash off with mild soap and water Max duration 16 wk	Genital warts Cutaneous warts AK Superficial BCC	Avoid natural/artificial sun exposure Local skin and application site reactions Erythema, ulceration, edema, flu-like symptoms Works best for warts on mucosal surfaces May induce inflammation and erosion

Table 24. Common Topical Therapies (continued)

Drug Name	Dosing Schedule	Indications	Comments
Permethrin (Kwellada® P Lotion and Nix® Dermal Cream)	5% cream, applied once overnight to all skin areas from neck down, repeated one week later	Scabies (Kwellada-P Lotion, Nix® Dermal Cream) Pediculosis (Kwellada-P Crème Rinse®, Nix Crème Rinse®)	Do not use in children <2 yr old Hypersensitivity to drug, or known sensitivity to chrysanthemums Local reactions only (resolve rapidly); including burning, pruritus Low toxicity, excellent results Consider second application after 7 d
Pimecrolimus (Elidel®)	1.0% cream bid Use for as long as lesions persist and discontinue upon resolution of symptoms	AD (mild to moderate)	Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive
Tacrolimus Topical (Protopic®)	0.03% (children) or 0.1% (adults) ointment bid Continue for duration of disease PLUS 1 wk after clearing	AD (mild to moderate)	Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive

Table 25. Common Oral Therapies

Drug Name	Dosing Schedule	Indications	Comments
Acitretin (Soriatane®)	25-50 mg PO OD; maximum 75 mg/d	Severe psoriasis Other disorders of hyperkeratinization (ichthyosis, Darier's disease)	<u>Monitoring strategies</u> Monitor lipids, LFTs at baseline and q1-2wk until stable <u>Contraindications</u> Not given to women of childbearing age <u>Drug interactions</u> Other systemic retinoids, methotrexate, tetracyclines, certain contraceptives May be combined with PUVA phototherapy (known as re-PUVA)
Antivirals	famcyclovir (Famvir®) 250 mg PO tid x 7-10 d (for 1st episode of genital herpes) 125 mg PO bid x 5 d (for recurrent genital herpes)	Chickenpox Herpes zoster Genital herpes Acute and prophylactic to reduce transmission in infected patients Herpes labialis	<u>Side effects</u> Headache, nausea, diarrhea, abdominal pain Reduce dose if impaired renal function
	valacyclovir (Valtrex®) 1000 mg PO bid x 7-10 d (for 1st episode of genital herpes) 500 mg PO bid x 5 d (for recurrent genital herpes)		<u>Side effects</u> Dizziness, depression, abdominal pain Reduce dose if impaired renal function <u>Drug interactions</u> cimetidine
Cyclosporin (Neoral®)	2.5-4 mg/kg/d PO divided bid Max 4 mg/kg/d After 4 wk may increase by 0.5 mg/kg/d q2wks Concomitant dose of magnesium may protect the kidneys	Psoriasis May also be effective in: Lichen planus EM Recalcitrant urticaria Recalcitrant AD	<u>Monitoring strategies</u> Blood pressure, renal function <u>Contraindications</u> Abnormal renal function, uncontrolled HTN, malignancy (except NMSC), uncontrolled infection, immunodeficiency (excluding autoimmune disease), hypersensitivity to drug Long-term effects preclude use of cyclosporin for >2 yr; discontinue earlier if possible May consider rotating therapy with other drugs to minimize adverse effects of each drug
Dapsone	50-100-150 mg PO OD tapering to 25-50 mg PO OD to as low as 50 mg 2x/wk	Dermatitis herpetiformis, neutrophilic dermatoses	<u>Monitoring strategies</u> Obtain G6PD levels before initiating; in the initial two wk obtain methemoglobin levels and follow the blood counts carefully for the first few months <u>Side effects</u> Neuropathy Hemolysis (Vitamin C and E supplementation can help prevent this) <u>Drug interactions</u> Substrate of CYP2C8/9 (minor), 2C19 (minor), 2E1 (minor), 3A4 (major) Often a dramatic response within hours

Table 25. Common Oral Therapies (continued)

Drug Name	Dosing Schedule	Indications	Comments
Isotretinoin (Accutane®)	0.5-1 mg/kg/d given OD, to achieve a total dose of 120 mg/kg (20-24 wk)	Severe nodular and/or inflammatory acne Acne conglobata Recalcitrant acne Widespread comedonal acne	<u>Monitoring strategies</u> Baseline lipid profile and LFTs before treatment, β -hCG <u>Contraindications</u> Teratogenic – in sexually active females, 2 forms of reliable contraception necessary Generally regarded as unsafe in lactation <u>Side effects</u> Night blindness, decreased tolerance to contact lenses, dry mucous membranes May transiently exacerbate acne, dry skin Depression, myalgia <u>Drug interactions</u> Do not use at the same time as tetracycline or minocycline – both may cause pseudotumor cerebri Discontinue vitamin A supplements Drug may be discontinued at 16-20 wk when nodule count has dropped by >70%; a second course may be initiated after 2 mo pm Refractory cases may require >3 courses
Itraconazole (Sporanox®)	100-400 mg PO OD, depending on infection treated Tinea corporis/cruris: 200 mg PO OD x 7 d Tinea pedis: 200 mg PO bid x 7 d Tinea versicolor: 200 mg PO OD x 7 d Toenails with or without fingernail involvement: 200 mg PO bid x 7 d once per mo, repeated 3x Fingernail involvement only: 200 mg bid PO x 7 d once per mo, repeated 2x	Onychomycosis Tinea corporis, cruris, pedis, versicolor, capitis	<u>Contraindications</u> CHF <u>Side effects</u> Serious hepatotoxicity <u>Drug Interactions</u> Inhibits CYP3A4. Increases concentration of some drugs metabolized by this enzyme (i.e. statins, diabetic drugs) Give capsules with food, capsules must be swallowed whole
Ivermectin (Mectizan®, Stromectol®)	200-250 μ g/kg PO qweekly x 2 Take once as directed; repeat one wk later	Onchocerciasis Also effective for: scabies	No significant serious side effects Efficacious
Methotrexate (Trexall®)	10-25 mg qwk, PO, IM, or IV Max: 30 mg/wk To minimize side effects, administer with folic acid supplementation: 1-5 mg OD	Psoriasis AD Lymphomatoid papulosis May also be effective in: cutaneous sarcoidosis	<u>Monitoring strategies</u> Baseline renal, liver, and hematological studies <u>Contraindications</u> Pregnancy, lactation, alcohol abuse, liver dysfunction, immunodeficiency syndrome, blood dyscrasias, hypersensitivity to drug Restricted to severe, recalcitrant or disabling psoriasis not adequately responsive to other forms of therapy May be combined with cyclosporine to allow lower doses of both drugs
Minocycline (Minocin®)	50-100 mg PO bid Taper to 50 mg PO OD as acne lessens	Acne vulgaris Rosacea	<u>Contraindications</u> Caution if impaired renal or liver function <u>Drug interactions</u> Do not use with isotretinoin (Accutane®) <u>Side effects</u> Extensive; affects multiple organ systems including CNS, teeth, eyes, bones, renal, and skin (photosensitivity and blue pigmentation) Drug-induced lupus (check p-ANCA) Alternative to tetracycline
OCPs	TriCyclen Diane 35 Alesse All combined OCPs are helpful in acne but those listed above have undergone RCTs	Hormonal acne (chin, jawline) Acne associated with polycystic ovarian syndrome or other endocrine abnormalities	<u>Contraindications</u> Smoking, HTN, migraines with aura, pregnancy Routine gynecological health maintenance should be up to date
Spirolactone	50-100 mg PO OD alone or with OCPs	Hormonal acne (chin, jawline) Acne with endocrine abnormality	<u>Contraindications</u> Pregnancy <u>Side effects</u> Menstrual irregularities at higher doses if not on OCPs Breast tenderness, mild diuresis common Risk of hyperkalemia – counsel patients to reduce intake of potassium rich foods such as bananas
Terbinafine (Lamisil®)	250 mg PO OD x 2 wk Fingernails x 6 wk Toenails x 12 wk Confirm diagnosis prior to treatment	Onychomycosis Tinea corporis, cruris, pedis, capitis	<u>Contraindications</u> Pregnancy, chronic or active liver disease <u>Drug interactions</u> Potent inhibitor of CYP2D6; use with caution when also taking β -blockers, certain anti-arrhythmic agents, MAOI type B, and/or antipsychotics Drug concentrates rapidly in skin, hair, and nails at levels associated with fungicidal activity
Tetracycline	250-500 mg PO bid to tid Taken 1 h before or 2 h after a meal	Acne vulgaris Rosacea Bullous pemphigoid	<u>Contraindications</u> Severe renal or hepatic dysfunction

Initial Patient Assessment/Management

1. Rapid Primary Survey

- Airway maintenance with cervical spine (C-spine) control
- Breathing and ventilation
- Circulation (pulses, hemorrhage control)
- Disability (neurological status)
- Exposure (complete) and Environment (temperature control)
- continually reassessed during secondary survey
- **IMPORTANT:** always watch for signs of shock while doing primary survey

A. AIRWAY

- first priority is to secure airway
- assume a cervical injury in every trauma patient and immobilize with collar
- assess ability to breathe and speak
- can change rapidly, therefore reassess frequently

Airway Management

- permit adequate oxygenation and ventilation

1. Basic Airway Management

- protect the C-spine
- head-tilt (if C-spine injury not suspected) or jaw thrust to open the airway
- sweep and suction to clear mouth of foreign material

2. Temporizing Measures

- nasopharyngeal airway (if gag reflex present, i.e. conscious)
- oropharyngeal airway (if gag reflex absent, i.e. unconscious)
- "rescue" airway devices (e.g. laryngeal mask airway, Combitube®)
- transtracheal jet ventilation through cricothyroid membrane (last resort)

3. Definitive Airway Management

- ETT intubation with in-line stabilization of C-spine
 - orotracheal ± RSI preferred
 - nasotracheal may be better tolerated in conscious patient
 - ♦ relatively contraindicated with basal skull fracture
 - does not provide 100% protection against aspiration
- surgical airway (if unable to intubate using oral/nasal route and unable to ventilate)
 - cricothyroidotomy

Contraindications to Intubation

- supraglottic/glottic pathology that would preclude successful intubation

Approach to the Critically Ill Patient

1. Rapid Primary Survey (RPS)
2. Resuscitation (often concurrent with RPS)
3. Detailed Secondary Survey
4. Definitive Care

Noisy breathing is obstructed breathing until proven otherwise

Signs of Airway Obstruction

- Agitation, confusion, "universal choking sign"
- Respiratory distress
- Failure to speak, dysphonia
- Cyanosis

Medications that can be Delivered via ETT

NAVEL
 Naloxone (Narcan®)
 Atropine
 Ventolin® (salbutamol)
 Epinephrine
 Lidocaine

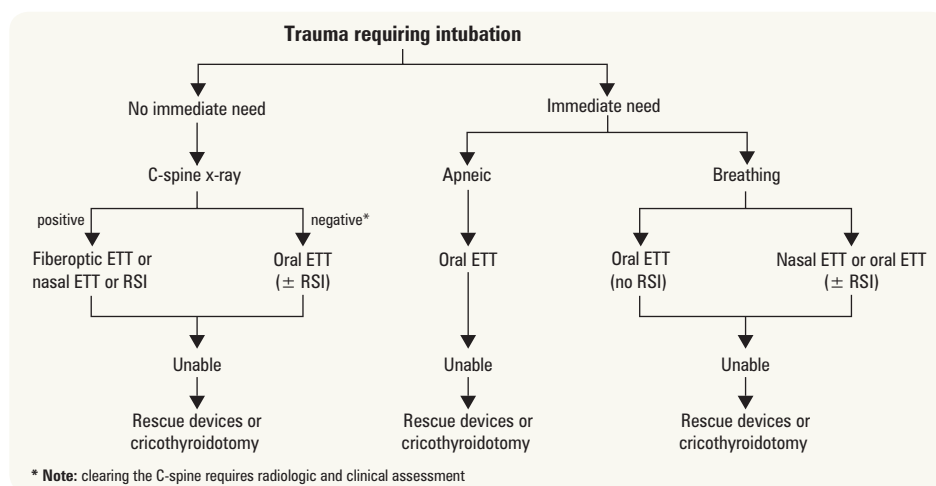

Figure 1. Approach to endotracheal intubation in an injured patient

B. BREATHING

• Look

- mental status (anxiety, agitation, decreased LOC), color, chest movement (bilateral vs. asymmetrical), respiratory rate/effort, nasal flaring

• Listen

- auscultate for signs of obstruction (e.g. stridor), breath sounds, symmetry of air entry, air escaping

• Feel

- tracheal shift, chest wall for crepitus, flail segments, sucking chest wounds, subcutaneous emphysema

Breathing Assessment

- objective measures of respiratory function: rate, oximetry, ABG, A-a gradient

Management of Breathing

- nasal prongs → simple face mask → non-rebreather mask → CPAP/BiPAP (in order of increasing F_iO_2)
- Venturi mask: used to precisely control O_2 delivery
- Bag-Valve mask and CPAP to supplement inadequate ventilation

C. CIRCULATION

Definition of Shock

- inadequate organ and tissue perfusion with oxygenated blood (brain, kidney, extremities)

Table 1. Major Types of Shock

Hypovolemic	Cardiogenic	Distributive (vasodilation)	Obstructive
Hemorrhage (external and internal)	Myocardial ischemia	Septic	Cardiac tamponade
Severe burns	Dysrhythmias	Anaphylactic	Tension pneumothorax
High output fistulas	CHF	Neurogenic (spinal cord injury)	PE
Dehydration (diarrhea, DKA)	Cardiomyopathies		Aortic stenosis
	Cardiac valve problems		Constrictive pericarditis

Clinical Evaluation

- early: tachypnea, tachycardia, narrow pulse pressure, reduced capillary refill, cool extremities, and reduced central venous pressure
- late: hypotension and altered mental status, reduced urine output

Table 2. Estimation of Degree of Hemorrhagic Shock

Class	I	II	III	IV
Blood loss	<750 cc	750-1,500 cc	1,500-2,000 cc	>2,000 cc
% of blood volume	<15%	15-30%	30-40%	>40%
Pulse	<100	>100	>120	>140
BP	Normal	Normal	Decreased	Decreased
Respiratory rate	20	30	35	>45
Capillary refill	Normal	Decreased	Decreased	Decreased
Urinary output	30 cc/h	20 cc/h	10 cc/h	None
Fluid replacement	Crystalloid	Crystalloid	Crystalloid + blood	Crystalloid + blood

Indications for Intubation

- Unable to protect airway (e.g. GCS <8; airway trauma)
- Inadequate oxygenation with spontaneous respiration (O_2 saturation <90% with 100% O_2 , or rising pCO_2)
- Profound shock
- Anticipatory: in trauma, overdose, CHF, asthma, COPD, and smoke inhalation injury
- Anticipated transfer of critically ill patients

Rescue Techniques in Intubation

- Bougie (used like a guidewire)
- Glidescope®
- Lighted stylet (use light through skin to determine if ETT in correct place)
- Fiberoptic intubation – indirect visualization using fiberoptic cable

Shock in a trauma patient is hemorrhagic until proven otherwise

Causes of Shock

SHOCKED

Septic, spinal/neurogenic, Hemorrhagic
 Obstructive (e.g. tension pneumothorax, cardiac tamponade, PE)
 Cardiogenic (e.g. blunt myocardial injury, dysrhythmia, MI)
 anaphylactic
 Endocrine (e.g. Addison's, myxedema, coma)
 Drugs

Estimated Systolic Blood Pressure Based on Position of Most Distal Palpable Pulse

	sBP (mmHg)
Radial	>80
Femoral	>70
Carotid	>60

Management of Hemorrhagic Shock

- ABCs
- diagnose and manage underlying cause
- if bleeding externally, apply direct pressure and elevate extremities if possible
 - do not remove impaled objects as they tamponade hemorrhage
 - tourniquet as a last resort
- resuscitation
 - infuse 1-2 L of crystalloid with large bore IVs (warmed if possible)
 - if inadequate response, consider active internal bleeding (e.g. chest, abdomen, pelvis, femurs), will likely require surgical intervention
 - if severely hypotensive on arrival or if shock persists, consider pRBC transfusion
 - transfuse crossmatched (ideally) or type-specific blood if available
 - if unavailable, transfuse O-negative in children/women of childbearing age or O-positive in all others
 - with significant blood loss, early transfusion of platelets and FFP may improve outcomes

D. DISABILITY

- assess LOC using GCS
- pupils
 - assess equality, size, symmetry, reactivity to light
 - ♦ inequality/sluggish suggests local eye problem or lateralizing CNS lesion
 - ♦ relative afferent pupillary defect (swinging light test) – optic nerve damage
 - extraocular movements and nystagmus
 - fundoscopy (papilledema, hemorrhages)
 - reactive pupils + decreased LOC → metabolic or structural cause
 - non-reactive pupils + decreased LOC → structural cause (especially if asymmetric)

Glasgow Coma Scale

- for use in trauma patients with decreased LOC; good indicator of severity of injury and neurosurgical prognosis
- most useful if repeated; change in GCS with time is more relevant than the absolute number
- less meaningful for metabolic coma
- patient with deteriorating GCS needs immediate attention
- prognosis based on best post-resuscitation GCS
- reported as a 3 part score: Eyes + Verbal + Motor = Total
- if patient intubated, GCS score reported out of 10 + T (T = tubed, i.e. no verbal component)

Table 3. Glasgow Coma Scale

Eyes Open		Best Verbal Response		Best Motor Response	
Spontaneously	4	Answers questions appropriately	5	Obeys commands	6
To voice	3	Confused, disoriented	4	Localizes to pain	5
To pain	2	Inappropriate words	3	Withdraws from pain	4
No response	1	Incomprehensible sounds	2	Decorticate (flexion)	3
		No verbal response	1	Decerebrate (extension)	2
				No response	1

13-15 = mild injury, 9-12 = moderate injury, ≤8 = severe injury
See Table 32 for modified GCS for infants and children

E. EXPOSURE/ENVIRONMENT

- undress patient completely and assess entire body for injury; log roll to examine back
- DRE
- keep patient warm with a blanket ± radiant heaters; avoid hypothermia
- warm IV fluids/blood
- keep providers safe (contamination, combative patient)

2. Resuscitation

- done concurrently with primary survey
- attend to ABCs
- manage life-threatening problems as they are identified
- vital signs q5-15 min
- ECG, BP, and O₂ monitors
- Foley catheter and NG tube if indicated
- tests and investigations: CBC, electrolytes, BUN, Cr, glucose, amylase, INR/PTT, β-hCG, toxicology screen, cross and type

Fluid Resuscitation

- Give bolus until HR decreases, urine output increases, and patient stabilizes
- Maintenance: 4:2:1 rule
- 0-10 kg: 4 cc/kg/h
- 10-20 kg: 2 cc/kg/h
- Remaining weight: 1 cc/kg/h
- Replace ongoing losses and deficits (assume 10% of body weight)

3:1 Rule

Since only 30% of infused isotonic crystalloids remains in intravascular space, you must give 3x estimated blood loss

Initial Management of Any Patient in Shock

- ABCs
- IV fluids
- Oxygen
- Monitor (HR, BP, urine, mentation, O₂ saturation)
- Control hemorrhage

Unilateral, Dilated, Non-Reactive Pupil, Think:

- Focal mass lesion
- Epidural hematoma
- Subdural hematoma

Contraindications to Foley Insertion

- Blood at urethral meatus
- Scrotal hematoma
- High-riding prostate on DRE

NG Tube Contraindications

- Significant mid-face trauma
- Basal skull fracture

Table 4. 2010 AHA CPR Guidelines

Step/Action	Adult: >8 yr	Child: 1-8 yr	Infant: <1 yr
Airway	Head tilt-chin lift		
Breaths	2 breaths at 1 second/breath – stop once see chest rise		
Foreign-Body Airway Obstruction	Abdominal thrust		Back slaps and chest thrusts
Compressions			
Compression landmarks	In the center of the chest, between nipples		Just below nipple line
Compression method: push hard and fast, and allow for complete recoil	2 hands: heel of 1 hand with second hand on top	2 hands: heel of 1 hand with second on top, or 1 hand: heel of 1 hand only	2 fingers, or thumbs
Compression depth	At least 2 inches	About 1/3 to 1/2 the depth of the chest	
Compression rate	100/min		
Compression-ventilation ratio	30 compressions to 2 ventilations		
Compression-only CPR	Hands-only CPR is preferred if the bystander is not trained or does not feel confident in their ability to provide conventional CPR or if the bystander is trained but chooses to use compressions only		
Defibrillation	Immediate defibrillation for all rescuers responding to a sudden witnessed collapse Compressions (5 cycles/2 min) before AED is considered if unwitnessed arrest Manual defibrillators are preferred for children and infants but can use adult dose AED if a manual defibrillator is not available		

3. Secondary Survey

- done after rapid primary survey problems have been addressed
- identifies major injuries or areas of concern
- full physical exam and x-rays (C-spine, chest, pelvis – required in blunt trauma, consider T-spine and L-spine)

HISTORY

- “SAMPLE”: Signs and symptoms, Allergies, Medications, Past medical history, Last meal, Events related to injury

Figure 2. Four areas of a FAST

PHYSICAL EXAM

Head and Neck

- palpation of facial bones, scalp

Chest

- inspect for midline trachea, flail segment: ≥ 2 rib fractures in ≥ 2 places; if present look for associated hemothorax, pneumothorax, and contusions
- auscultate lung fields
- palpate for subcutaneous emphysema
- CXR

Abdomen

- assess for peritonitis, abdominal distention, and evidence of intra-abdominal bleeding
- FAST or CT (if stable)
- rectal exam for GI bleed, high riding prostate and anal tone (best to do during the log roll)
- bimanual exam in females as appropriate

Musculoskeletal

- examine all extremities for swelling, deformity, contusion, tenderness, ROM
- check for pulses and sensation in all injured limbs
- log roll and palpate thoracic and lumbar spines
- palpate iliac crests and pubic symphysis, pelvic stability (lateral, AP, vertical)
- pelvic x-ray

Neurological

- GCS
- full cranial nerve exam
- alterations of rate and rhythm of breathing are signs of structural or metabolic abnormalities
 - progressive deterioration of breathing pattern implies a failing CNS
- assess spinal cord integrity
 - conscious patient: assess distal sensation and motor
 - unconscious patient: response to painful or noxious stimulus applied to extremities

Non-contrast head CT is the best imaging modality for intracranial injury

Signs of Increased ICP

- Deteriorating LOC (hallmark)
- Deteriorating respiratory pattern
- Cushing reflex (high BP, low heart rate, irregular respirations)
- Lateralizing CNS signs (e.g. cranial nerve palsies, hemiparesis)
- Seizures
- Papilledema (occurs late)
- N/V and headache

Ethical Considerations

Consent to Treatment: Adults

- see [Ethical, Legal, and Organizational Medicine, ELOAM5](#)
- Emergency Rule: consent is not needed when a patient is at imminent risk from a serious injury AND obtaining consent is either: a) not possible, OR b) would increase risk to the patient
 - assumes that most people would want to be saved in an emergency
- any capable and informed patient can refuse treatment or part of treatment, even if it is life-saving
- exceptions to the Emergency Rule: treatment cannot be initiated if:
 - a competent patient has previously refused the same or similar treatment and there is no evidence to suggest the patient's wishes have changed
 - an advanced directive is available (e.g. do not resuscitate order)
 - NOTE: refusal of help in a suicide situation is NOT an exception; care must be given
- if in doubt, initiate treatment
 - care can be withdrawn if necessary at a later time or if wishes are clarified by family

Consent to Treatment: Children

- treat immediately if patient is at imminent risk
- parents/guardians have the right to make treatment decisions
- if parents refuse treatment that is life-saving or will potentially alter the child's quality of life, CAS must be contacted – consent of CAS is needed to treat

Other Issues of Consent

- need consent for HIV testing, as well as for administration of blood products
- however, if delay in substitute consent for blood transfusions puts patient at risk, transfusions can be given

Duty to Report

- law may vary depending on state
- examples: gunshot wounds, potential drunk drivers, suspected child abuse, various communicable diseases, medical unsuitability to drive, risk of substantial harm to others

Jehovah's Witnesses

- Capable adults have the right to refuse medical treatment
- May refuse whole blood, pRBCs, platelets, and plasma even if life-saving
- Should be questioned directly about the use of albumin, immunoglobulins, hemophilic preparations
- Do not allow autologous transfusion unless there is uninterrupted extra corporeal circulation
- Usually ask for the highest possible quality of care without the use of the above interventions (e.g. crystalloids for volume expansion, attempts at bloodless surgery)
- Patient will generally sign hospital forms releasing medical staff from liability
- Most legal cases involve children of Jehovah's Witnesses; if life-saving treatment is refused, contact CAS

Traumatology

- epidemiology
 - leading cause of death in patients <45 yr
 - 4th highest cause of death in North America
 - causes more deaths in children/adolescents than all diseases combined
- trimodal distribution of death
 - minutes: lethal injuries, death usually at the scene
 - early: death within 4-6 h – “golden hour” (decreased mortality with trauma care)
 - days-weeks: death from multiple organ dysfunction, sepsis, etc.
- injuries fall into two categories
 - blunt (most common): MVC, pedestrian-automobile impact, motorcycle collision, fall, assault, sports
 - penetrating (increasing in incidence): gunshot wound, stabbing, impalement

Considerations for Traumatic Injury

- important to know the mechanism of injury in order to anticipate traumatic injuries
- always look for an underlying cause (alcohol, medications, illicit substances, seizure, suicide attempt, medical problem)
- always inquire about head injury, loss of consciousness, amnesia, vomiting, headache, and seizure activity

Table 5. Mechanisms and Considerations of Traumatic Injuries

Mechanism of Injury	Special Considerations	Associated Injuries
Motor Vehicle Collision	Vehicle(s) involved: weight, size, speed, damage Location of patient in vehicle Use and type of seatbelt Ejection of patient from vehicle Entrapment of patient under vehicle Airbag deployment Helmet use in motorcycle collision	Head-on collision: head/facial, thoracic (aortic), lower extremity Lateral/T-bone collision: head, cervical spine, thoracic, abdominal, pelvic, and lower extremity Rear-end collision: hyper-extension of cervical spine (whiplash injury) Rollover
Pedestrian-Automobile Impact	High morbidity and mortality Vehicle speed is an important factor Site of impact on car	Children at increased risk of being run over (multisystem injuries) Adults tend to be struck in lower legs (lower extremity injuries), impacted against car (truncal injuries), and thrown to ground (HI)
Falls	1 storey = 12 ft = 3.6 m Distance of fall: 50% mortality at 4 storeys and 95% mortality at 7 storeys Landing position (vertical vs. horizontal)	Vertical: lower extremity, pelvic, and spine fractures; HI Horizontal: facial, upper extremity, and rib fractures; abdominal, thoracic, and HI

High Risk Injuries

- MVC at high speed, resulting in ejection from vehicle
- Motorcycle collisions
- Vehicle vs. pedestrian crashes
- Fall from height >12 ft (3.6 m)

Vehicle vs. Pedestrian Crash

In adults look for triad of injuries (Waddle's triad):

- Tibia-fibula or femur fracture
- Truncal injury
- Craniofacial injury

Cardiac Box: sternal notch, nipples, and xiphoid process; injuries inside this area should increase suspicion of cardiac injury

Always completely expose and count the number of wounds

Head Trauma

- see [Neurosurgery, NS29](#)
- 60% of MVC-related deaths are due to head injury

Specific Injuries

- fractures
 - Dx: non-contrast head CT and physical exam
- A. skull fractures
 - vault fractures
 - ♦ linear, non-depressed
 - most common
 - typically occur over temporal bone, in area of middle meningeal artery (commonest cause of epidural hematoma)
 - ♦ depressed
 - open (associated overlying scalp laceration and torn dura, skull fracture disrupting paranasal sinuses or middle ear) vs. closed
 - basal skull
 - ♦ typically occur through floor of anterior cranial fossa (longitudinal more common than transverse)
 - ♦ clinical diagnosis superior as poorly visualized on CT
- B. facial fractures (see [Plastic Surgery, PL28](#))
 - neuronal injury

Signs of Basal Skull Fracture

- Battle's sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF rhinorrhea/otorrhea

- beware of open fracture or sinus fractures (risk of infection)
- severe facial fractures may pose risk to airway from profuse bleeding
- **scalp laceration**
 - can be a source of significant bleeding
 - achieve hemostasis, inspect and palpate for skull bone defects ± CT head (rule-out skull fracture)
- **neuronal injury**
 - A. diffuse
 - mild TBI = concussion
 - ♦ transient alteration in mental status that may involve loss of consciousness
 - hallmarks of concussion: confusion and amnesia, which may occur immediately after the trauma or min later
 - loss of consciousness (if present) must be less than 30 min, initial GCS must be between 13-15, and post-traumatic amnesia must be less than 24 h
 - diffuse axonal injury
 - ♦ mild: coma 6-24 h, possibly lasting deficit
 - ♦ moderate: coma >24 h, little or no signs of brainstem dysfunction
 - ♦ severe: coma >24 h, frequent signs of brainstem dysfunction
 - B. focal injuries
 - contusions
 - intracranial hemorrhage (epidural, subdural, intracerebral)

ASSESSMENT OF BRAIN INJURY

History

- pre-hospital status
- mechanism of injury

Physical Exam

- assume C-spine injury until ruled out
- vital signs
 - shock (not likely due to isolated brain injury, except in infants)
 - Cushing's response to increasing ICP (bradycardia, HTN, irregular respirations)
- severity of injury determined by
 1. LOC
 - ♦ GCS ≤8 intubate, any change in score of 3 or more = serious injury
 - ♦ mild TBI = 13-15, moderate = 9-12, severe = 3-8
 2. pupils: size, anisocoria >1 mm (in patient with altered LOC), response to light
 3. lateralizing signs (motor/sensory)
 - ♦ may become more subtle with increasing severity of injury
- reassess frequently

Investigations

- labs: CBC, electrolytes, PT/PTT or INR/PTT, glucose, toxicology screen
- CT scan (non-contrast) to exclude intracranial mass lesions
- C-spine imaging, often with CT head and neck to exclude intracranial mass lesions

Management

- goal in ED: reduce secondary injury by avoiding hypoxia, ischemia, decreased CPP, seizure
- general
 - ABCs
 - ensure oxygen delivery to brain through intubation and prevent hypercarbia
 - maintain BP (sBP >90)
 - treat other injuries
- early neurosurgical consultation for acute and subsequent patient management
 - medical management
 - ♦ seizure treatment/prophylaxis
 - benzodiazepines, phenytoin, phenobarbital
 - steroids are of no proven value
 - ♦ treat suspected raised ICP → consider if head injury with signs of increased ICP
 - raise head of stretcher 20° if patient hemodynamically stable
 - intubate and hyperventilate (100% O₂) to a pCO₂ of 30-35 mmHg
 - mannitol 1 g/kg infused as rapidly as possible (contraindicated in shock and renal failure/anuria)
 - consider paralyzing medications if agitated/high airway pressures
 - maintenance of CPP is critical (CPP = MAP - ICP)

Disposition

- neurosurgical ICU admission for severe HI
- in hemodynamically unstable patient with other injuries, prioritize most life-threatening injuries and maintain cerebral perfusion
- for minor head injury not requiring admission, provide 24 h HI protocol to competent caregiver, follow-up with neurology as even seemingly minor HI may cause lasting deficits

Warning Signs of Severe Head Injury

- GCS <8
- Deteriorating GCS
- Unequal pupils
- Lateralizing signs

N.B. Altered LOC is a hallmark of brain injury

Canadian CT Head Rule

Lancet 2001;357:1391-1396

CT Head is only required for patients with minor head injuries with any one of the following:

High Risk (for neurological intervention)

- GCS score <15 at 2 h after injury.
- Suspected open or depressed skull fracture.
- Any sign of basal skull fracture (hemotympanum, "raccoon" eyes, CSF otorrhea/rhinorrhea, Battle's sign).
- Vomiting ≥2 episodes.
- Age ≥65 yr.

Medium Risk (for brain injury on CT)

- Amnesia before impact >30 min (i.e. cannot recall events just before impact).
- Dangerous mechanism (pedestrian struck by motor vehicle, occupant ejected from motor vehicle, fall from height >3 feet or five stairs).

Minor head injury is defined as witnessed loss of consciousness, definite amnesia, or witnessed disorientation in a patient with a GCS score of 13-15.
NB: Canadian CT Head Rule does not apply for non-trauma cases, for GCS <13, age <16, for patients on Coumadin® and/or having a bleeding disorder, or having an obvious open skull fracture.

Mild Traumatic Brain Injury

Epidemiology

- TBI results in 1.7 million deaths, hospitalizations, and ED visits each yr (US)
- 75% are estimated to be mild TBI; remainder are moderate or severe (see [Neurosurgery, NS31](#))
- highest rates in children 0-4 yr, adolescents 15-19 yr, and elderly >65 yr

Clinical Features

- somatic: headache, sleep disturbance, N/V, blurred vision
- cognitive dysfunction: attentional impairment, reduced processing speed, drowsiness, amnesia
- emotion and behavior: impulsivity, irritability, depression
- severe concussion: may precipitate seizure, bradycardia, hypotension, sluggish pupils

Etiology

- falls, MVC, and traffic accidents, struck by an object, assault, sports

Investigations

- neurological exam
- concussion recognition tool (see [thinkfirst.ca](#))
- imaging – CT as per Canadian CT Head Rules, or MRI if worsening symptoms despite normal CT

Treatment

- close observation and follow-up; for patients at risk of intracranial complications, give appropriate discharge instructions to patient and family, watch for changes to clinical features above, and if change, return to ED
- hospitalization with normal CT (GCS <15, seizures, bleeding diathesis), or with abnormal CT
- early rehabilitation to maximize outcomes
- pharmacological management of pain, depression, headache
- follow Return to Play guidelines

Prognosis

- most recover with minimal treatment
 - athletes with previous concussion are at increased risk of cumulative brain injury
- repeat TBI can lead to life-threatening cerebral edema or permanent impairment

Extent of retrograde amnesia correlates with severity of injury

Every Patient with One or More of the Following Signs or Symptoms should be Placed in a C-Spine Collar

- Midline tenderness
- Neurological symptoms or signs
- Significant distracting injuries
- Head injury
- Intoxication
- Dangerous mechanism
- History of altered LOC

Of the investigations, the lateral C-spine x-ray is the single most important film; 95% of radiologically visible abnormalities are found on this film

Cauda Equina Syndrome can occur with any spinal cord injury below T10 vertebrae; look for incontinence, anterior thigh pain, quadriceps weakness, abnormal sacral sensation, decreased rectal tone, and variable reflexes

The Canadian C-Spine Rule vs. the NEXUS Low-Risk Criteria in Patients with Trauma
NEJM 2003;349:2510-2518

Purpose: To compare the clinical performance of the Canadian C-Spine Rule (CCR) and the National Emergency X-Radiography Utilization Study (NEXUS) Low-Risk Criteria (NLC).

Study: Trauma patients (n=8,283) in stable condition were prospectively evaluated by both the CCR and NLC by 394 physicians before radiography. 2% of these patients had a C-spine injury.

Results: Compared to the NLC, the CCR was more sensitive (99.4 vs. 90.7%) and more specific (45.1 vs. 36.8%) after exclusion of indeterminate cases. The number of missed patients would be 1 for the CCR and 16 for the NLC. The ROM was not evaluated in some CCR cases likely because physicians were not comfortable with the procedure and this may slightly lower the sensitivity or specificity of the CCR in practice.

Summary: The CCR is superior to the NLC in alert and stable patients with trauma. The use of the CCR can result in lower radiography rates.

Spine and Spinal Cord Trauma

- assume cord injury with significant falls (>12 ft), deceleration injuries, blunt trauma to head, neck, or back
- spinal immobilization (cervical collar, spine board during patient transport only) must be maintained until spinal injury has been ruled out (Figure 3)
- vertebral injuries may be present without spinal cord injury; normal neurologic exam does not exclude spinal injury
- cord may be injured despite normal C-spine x-ray (SCIWORA = spinal cord injury without radiologic abnormality)
- injuries can include: complete/incomplete transection, cord edema, spinal shock

History

- mechanism of injury, previous deficits, SAMPLE
- neck pain, paralysis/weakness, paresthesia

Physical Exam

- ABCs
- abdominal: ecchymosis, tenderness
- neurological: complete exam, including mental status
- spine: maintain neutral position, palpate C-spine; log roll, then palpate T-spine and L-spine; assess rectal tone
 - when palpating, assess for tenderness, muscle spasm, bony deformities, step-off, and spinous process malalignment
- extremities: check cap refill, suspect thoracolumbar injury with calcaneal fractures

Investigations

- labs: CBC, electrolytes, Cr, glucose, coagulation profile, cross and type, toxicology screen
- imaging
 - full C-spine x-ray series for trauma (AP, lateral, odontoid)
- thoracolumbar x-rays
 - AP and lateral views
 - indications
 - ♦ patients with C-spine injury
 - ♦ unconscious patients (with appropriate mechanism of injury)
 - ♦ patients with neurological symptoms or findings

- ♦ patients with deformities that are palpable when patient is log rolled
- ♦ patients with back pain
- ♦ patients with bilateral calcaneal fractures (due to fall from height)
 - concurrent burst fractures of the lumbar or thoracic spine in 10% (T11-L2)
- consider CT (for subtle bony injuries), MRI (for soft tissue injuries) if appropriate

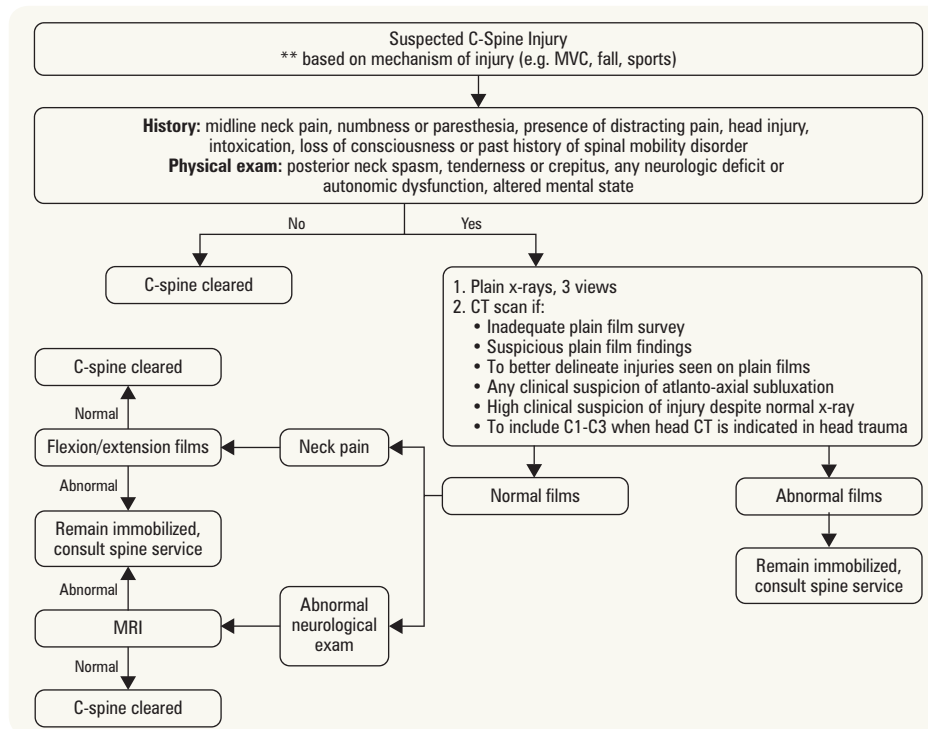

Figure 3. Approach to clearing the C-spine

Can Clear C-Spine if:

- oriented to person, place, time, and event
- no evidence of intoxication
- no posterior midline cervical tenderness
- no focal neurological deficits
- no painful distracting injuries (e.g. long bone fracture)

Management of Cord Injury

- immobilize
- evaluate ABCs
- treat shock (maintain sBP >100 mmHg)
- insert NG and Foley catheter
- high dose steroids: methylprednisolone 30 mg/kg bolus, then 5.4 mg/kg/h drip, start within 6-8 h of injury (controversial and recently has less support)
- complete imaging of spine and consult spine service if available
- continually reassess high cord injuries as edema can travel up cord
- if cervical cord lesion, watch for respiratory insufficiency
 - low cervical transection (C5-T1) produces abdominal breathing (phrenic innervation of diaphragm still intact)
 - high cervical cord injury (above C4) may require intubation and ventilation
- beware of hypotension (neurogenic shock)
- treatment: warm blanket, Trendelenburg position (occasionally), volume infusion, consider vasopressors

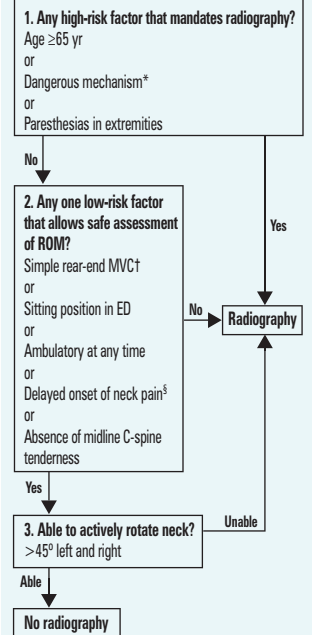

Approach to C-Spine X-Rays

- 3-view C-spine series is the screening modality of choice
 1. lateral C1-T1 ± swimmer's view
 - ♦ lateral view is best, identifies 90-95% of injuries
 2. odontoid view (open mouth or oblique submental view)
 - ♦ examine the dens for fractures
 - if unable to rule out fracture, repeat view or consider CT or plain film tomography
 - ♦ examine lateral aspects of C1 and spacing relative to C2

**The Canadian C-Spine Rule**

JAMA 2001;286:1841-1848

For Alert (GCS Score = 15) and Stable Trauma Patients where C-Spine Injury is a Concern

*Dangerous Mechanism:

- Fall from ≥1 meter/5 stairs
- Axial load to head (e.g. diving)
- MVC high speed (>100 km/h), rollover, ejection
- Motorized recreational vehicles
- Bicycle collision

†Simple rear-end MVC excludes:

- Pushed into oncoming traffic
- Hit by bus/large truck
- Rollover
- Hit by high-speed vehicle

‡Delayed: not immediate onset of neck pain

Figure 4. Lines of contour on a lateral C-spine x-ray

Prevertebral soft tissue swelling is only 49% sensitive for injury

3. AP view

- ♦ alignment of spinous processes in the midline
- ♦ spacing of spinous processes should be equal
- ♦ check vertebral bodies and facet dislocations

Table 6. Interpretation of Lateral View: The ABCS

A Adequacy and Alignment	<ul style="list-style-type: none"> • Must see C1 to C7-T1 junction; if not, downward traction of shoulders, swimmer's view, bilateral supine obliques, or CT scan needed • Lines of contour – in children <8 yr of age, can see physiologic subluxation of C2 on C3, and C3 on C4, but the spino-laminar line is maintained • Fanning of spinous processes suggests posterior ligamentous disruption • Widening of facet joints • Check atlanto-occipital joint • Line extending inferiorly from clivus should transect odontoid • Atlanto-axial articulation, widening of predental space (normal: <3 mm in adults, <5 mm in children) indicates injury of C1 or C2
B Bones	<ul style="list-style-type: none"> • Height, width, and shape of each vertebral body • Pedicles, facets, and laminae should appear as one – doubling suggests rotation
C Cartilage	<ul style="list-style-type: none"> • Intervertebral disc spaces – wedging anteriorly or posteriorly suggests vertebral compression
S Soft Tissues	<ul style="list-style-type: none"> • Widening of retropharyngeal (normal: <7 mm at C1-4, may be wide in children <2 yr on expiration) or retrotracheal spaces (normal: <22 mm at C6-T1, <14 mm in children <5 yr)

Sequelae of C-Spine Fractures

- see [Neurosurgery, NS32](#)
- acute phase of SCI
 - spinal shock: absence of all voluntary and reflex activity below level of injury
 - ♦ decreased reflexes, no sensation, flaccid paralysis below level of injury, lasting days to months
 - neurogenic shock: loss of vasomotor tone, SNS tone
 - ♦ watch for: hypotension (lacking SNS), bradycardia (unopposed PNS), poikilothermia (lacking SNS so no shunting of blood from extremities to core)
 - ♦ occurs within 30 min of SCI at level T6 or above, lasting up to 6 wk
 - ♦ provide airway support, fluids, atropine (for bradycardia), vasopressors for BP support
- chronic phase of SCI
 - autonomic dysreflexia: in patients with an SCI at level T6 or above
 - ♦ signs and symptoms: pounding headache, nasal congestion, feeling of apprehension or anxiety, visual changes, dangerously increased sBP and dBP
 - ♦ common triggers
 - GU causes: bladder distention, urinary tract infection, and kidney stones
 - GI causes: fecal impaction or bowel distention
 - ♦ treatment: monitoring and controlling BP, prior to addressing causative issue

**Figure 5. C-spine x-ray; odontoid view****Supine Oblique Views**

- Rarely used
- Better visualization of posterior element fractures (lamina, pedicle, facet joint)
- Good to assess patency of neural foramina
- Can be used to visualize the C7-T1 junction

20% of C-spine fractures are accompanied by other spinal fractures, so ensure thoracic and lumbar spine x-rays are normal before proceeding to OR

Trauma to the chest accounts for 50% of trauma deaths

80% of all chest injuries can be managed non-surgically with simple measures such as intubation, chest tubes, and pain control

Chest Trauma

- two types: those found and managed in 1° survey and those found and managed in 2° survey

Table 7. Life-Threatening Chest Injuries Found in 1° Survey

	Physical Exam	Investigations	Management
Airway Obstruction	<ul style="list-style-type: none"> • Anxiety, stridor, hoarseness, altered mental status • Apnea, cyanosis 	<ul style="list-style-type: none"> • Do not wait for ABG to intubate 	<ul style="list-style-type: none"> • Definitive airway management • Intubate early • Remove foreign body if visible with laryngoscope prior to intubation
Tension Pneumothorax	<ul style="list-style-type: none"> • Respiratory distress, tachycardia, distended neck veins, cyanosis, asymmetry of chest wall motion • Tracheal deviation away from pneumothorax • Percussion hyperresonance • Unilateral absence of breath sounds 	<ul style="list-style-type: none"> • Non-radiographic diagnosis 	<ul style="list-style-type: none"> • Needle thoracostomy – large bore needle, 2nd ICS mid clavicular line, followed by chest tube in 5th ICS, anterior axillary line

Table 7. Life-Threatening Chest Injuries Found in 1° Survey (continued)

	Physical Exam	Investigations	Management
Open Pneumothorax • Air entering chest from wound rather than trachea	• Gunshot or other wound (hole >2/3 tracheal diameter) ± exit wound • Unequal breath sounds	• ABG: decreased pO ₂	• Air-tight dressing sealed on 3 sides • Chest tube • Surgery
Massive Hemothorax • >1,500 cc blood loss in chest cavity	• Pallor, flat neck veins, shock • Unilateral dullness • Absent breath sounds, hypotension	• Usually only able to do supine CXR – entire lung appears radioopaque as blood spreads out over posterior thoracic cavity	• Restore blood volume • Chest tube • Thoracotomy if: • >1,500 cc total blood loss • ≥200 cc/h continued drainage
Flail Chest • Free-floating segment of chest wall due to >2 rib fractures, each at 2 sites • Underlying lung contusion (cause of morbidity and mortality)	• Paradoxical movement of flail segment • Palpable crepitus of ribs • Decreased air entry on affected side	• ABG: decreased pO ₂ , increased pCO ₂ • CXR: rib fractures, lung contusion	• O ₂ + fluid therapy + pain control • Judicious fluid therapy in absence of systemic hypotension • Positive pressure ventilation • ± intubation and ventilation
Cardiac Tamponade • Clinical diagnosis • Pericardial fluid accumulation impairing ventricular function	• Penetrating wound (usually) • Beck's triad: hypotension, distended neck veins, muffled heart sounds • Tachycardia, tachypnea • Pulsus paradoxus • Kussmaul's sign (increased JVP with inspiration)	• Echocardiogram • FAST	• IV fluids • Pericardiocentesis • Open thoracotomy

Table 8. Potentially Life-Threatening Chest Injuries Found in 2° Survey

	Physical Exam	Investigations	Management
Pulmonary Contusion	• Blunt trauma to chest • Interstitial edema impairs compliance and gas exchange	• CXR: areas of opacification of lung within 6 h of trauma	• Maintain adequate ventilation • Monitor with ABG, pulse oximeter, and ECG • Chest physiotherapy • Positive pressure ventilation if severe
Ruptured Diaphragm	• Blunt trauma to chest or abdomen (e.g. high lap belt in MVC)	• CXR: abnormality of diaphragm/lower lung fields/NG tube placement • CT scan and endoscopy: sometimes helpful for diagnosis	• Laparotomy for diaphragm repair and associated intra-abdominal injuries
Esophageal Injury	• Usually penetrating trauma (pain out of proportion to degree of injury)	• CXR: mediastinal air (not always) • Esophagram (Gastrografin®) • Flexible esophagoscopy	• Early repair (within 24 h) improves outcome but all require repair
Aortic Tear • 90% tear at subclavian (near ligamentum arteriosum), most die at scene • Salvageable if diagnosis made rapidly	• Sudden high speed deceleration (e.g. MVC, fall, airplane crash), complaints of chest pain, dyspnea, hoarseness (frequently absent) • Decreased femoral pulses, differential arm BP (arch tear)	• CXR, CT scan, transesophageal echo, aortography (gold standard) • See sidebar for CXR features	• Thoracotomy (may treat other severe injuries first)
Blunt Myocardial Injury (rare)	• Blunt trauma to chest (usually in setting of multi-system trauma and therefore difficult to diagnose) • Physical exam: overlying injury, e.g. fractures, chest wall contusion	• ECG: dysrhythmias, ST changes • Patients with a normal ECG and normal hemodynamics never get dysrhythmias	• O ₂ • Antidysrhythmic agents • Analgesia

Other Potentially Life-Threatening Injuries Related to the Chest**Penetrating Neck Trauma**

- includes all penetrating trauma to the three zones of the neck
- management: injuries deep to platysma require further evaluation by angiography, contrast CT, or surgery
- do not explore penetrating neck wounds except in the OR

Airway Injuries

- always maintain a high index of suspicion

**3-way Seal for Open Pneumothorax (i.e. sucking chest wound)**

Allows air to escape during the expiratory phase (so that you do not get a tension pneumothorax) but seals itself to allow adequate breaths during the inspiratory phase

Pulsus Paradoxus: a drop in BP of >10 mmHg with inspiration; recall that BP normally drops with inspiration, but what's "paradoxical" about this is that it drops more than it should

Ruptured diaphragm is more often diagnosed on the left side, as liver conceals right side defect

**Aortic Tear: ABC WHITE**

x-ray features of Aortic tear
depressed left mainstem Bronchus
pleural Cap
Wide mediastinum (most consistent)
Hemothorax
Indistinct aortic knuckle
Tracheal deviation to right side
Esophagus (NG tube) deviated to right
(Note: present in 85% of cases, but cannot rule out)

**If Penetrating Neck Trauma Present, DON'T:**

- Clamp structures (can damage nerves)
- Probe
- Insert NG tube (leads to bleeding)
- Remove weapon/impaed object

**Figure 6. Zones of the neck in trauma**

- larynx
 - history: strangulation, direct blow, blunt trauma, any penetrating injury involving platysma
 - triad: hoarseness, subcutaneous emphysema, palpable fracture, crepitus
 - other symptoms: hemoptysis, dyspnea, dysphonia
 - investigations: CXR, CT scan, arteriography (if penetrating)
 - management
 - ♦ airway: manage early because of edema
 - ♦ C-spine may also be injured, consider mechanism of injury
 - ♦ surgical: tracheotomy vs. repair
- trachea/bronchus
 - frequently missed
 - history: deceleration, penetration, increased intra-thoracic pressure, complaints of dyspnea, hemoptysis
 - examination: subcutaneous air, Hamman's sign (crunching sound synchronous with heart beat)
 - CXR: mediastinal air, persistent pneumothorax or persistent air leak after chest tube inserted for pneumothorax
 - management: surgical repair if >1/3 circumference

Abdominal Trauma

- two mechanisms
 - blunt: usually causes solid organ injury (spleen = most common, liver = 2nd)
 - penetrating: usually causes hollow organ injury or liver injury (most common)

BLUNT TRAUMA

- results in two types of hemorrhage: intra-abdominal and retroperitoneal
- adopt high clinical suspicion of bleeding in multi-system trauma

History

- mechanism of injury, SAMPLE history

Physical Exam

- often unreliable in multi-system trauma, wide spectrum of presentations
 - slow blood loss not immediately apparent
 - other injuries may mask symptoms
 - serial examinations are required
- abdomen
 - inspect: contusions, abrasions, seatbelt sign, distention
 - auscultate: bruits, bowel sounds
 - palpate: tenderness, rebound tenderness, rigidity, guarding
 - DRE: rectal tone, blood, bone fragments, prostate location
 - placement of NG, Foley catheter should be considered part of the abdominal exam
- other systems to assess: cardiovascular, respiratory (possibility of diaphragm rupture), genitourinary, pelvis, back/neurological

Investigations

- labs: CBC, electrolytes, coagulation, cross and type, glucose, Cr, CK, lipase, amylase, liver enzymes, ABG, blood EtOH, β -hCG, U/A, toxicology screen

Table 9. Imaging in Abdominal Trauma

Imaging	Strengths	Limitations
X-Ray	Chest (looking for free air under diaphragm, diaphragmatic hernia, air-fluid levels), pelvis, cervical, thoracic, lumbar spines	Soft tissue not well visualized
CT Scan	Most specific test	Radiation exposure 20x more than x-ray Cannot use if hemodynamic instability
Diagnostic Peritoneal Lavage (rarely used)	Most sensitive test Tests for intra-peritoneal bleed	Cannot test for retroperitoneal bleed or diaphragmatic rupture Cannot distinguish lethal from trivial bleed Results can take up to 1 h
U/S: FAST	Identifies presence/absence of free fluid in peritoneal cavity RAPID exam: less than 5 min Can also examine pericardium and pleural cavities	NOT used to identify specific organ injuries If patient has ascites, FAST will be falsely positive

Seatbelt Injuries may Cause:

- Retroperitoneal duodenal trauma
- Intraperitoneal bowel transection
- Mesenteric injury
- L-spine injury

Indications for Foley and NG Tube in Abdominal Trauma

Foley catheter: unconscious or patient with multiple injuries who cannot void spontaneously

NG tube: used to decompress the stomach and proximal small bowel

Criteria for Positive Lavage

- >10 cc gross blood
- Bile, bacteria, foreign material
- RBC count >100,000 x 10⁶/L
- WBC >500 x 10⁶/L
- Amylase >175 IU

- imaging must be done if
 - equivocal abdominal examination, altered sensorium, or distracting injuries (e.g. head trauma, spinal cord injury resulting in abdominal anesthesia)
 - unexplained shock/hypotension
 - multiple trauma patients who must undergo general anesthesia for orthopedic, neurosurgical, or other injuries
 - fractures of lower ribs, pelvis, spine
 - positive FAST

Management

- general: ABCs, fluid resuscitation, and stabilization
- surgical: watchful waiting vs. laparotomy
- solid organ injuries: decision based on hemodynamic stability, not the specific injuries
- hemodynamically unstable or persistently high transfusion requirements: laparotomy
- hollow organ injuries: laparotomy
- even if low suspicion of injury: admit and observe for 24 h

PENETRATING TRAUMA

- high risk of gastrointestinal perforation and sepsis
- history: size of blade, caliber/distance from gun, route of entry
- local wound exploration under direct vision may determine lack of peritoneal penetration (not reliable in inexperienced hands) with the following exceptions:
 - thoracoabdominal region (may cause pneumothorax)
 - back or flanks (muscles too thick)

Management

- general: ABCs, fluid resuscitation, and stabilization
- gunshot wounds → always require laparotomy

Laparotomy is mandatory if penetrating trauma and:

- Shock
- Peritonitis
- Evisceration
- Free air in abdomen
- Blood in NG tube, Foley catheter, or on rectal exam

"Rule of Thirds" for Stab Wounds:

- 1/3 do not penetrate peritoneal cavity
- 1/3 penetrate but are harmless
- 1/3 cause injury requiring surgery

Genitourinary Tract Injuries

- see [Urology, U31](#)

Etiology

- blunt trauma: often associated with pelvic fractures
 - upper tract
 - ♦ renal
 - contusions (minor injury – parenchymal ecchymoses with intact renal capsule)
 - parenchymal tears/laceration: non-communicating (hematoma) vs. communicating (urine extravasation, hematuria)
 - ♦ ureter: rare, at uretero-pelvic junction
 - lower tract
 - ♦ bladder
 - extraperitoneal rupture of bladder from pelvic fracture fragments
 - intraperitoneal rupture of bladder from trauma and full bladder
 - ♦ urethra
 - posterior urethral injuries: MVCs, falls, pelvic fractures
 - anterior urethral injuries: blunt trauma to perineum, straddle injuries/direct strikes
 - external genitalia
- penetrating trauma
 - damage to: kidney, bladder, ureter (rare), external genitalia
- acceleration/deceleration injury
 - renal pedicle injury: high mortality rate (laceration and thrombosis of renal artery, renal vein, and their branches)
- iatrogenic
 - ureter and urethra (from instrumentation)

History

- mechanism of injury
- hematuria (microscopic or gross), blood on underwear
- dysuria, urinary retention
- history of hypotension

Gross hematuria suggests bladder injury

Physical Exam

- abdominal pain, flank pain, CVA tenderness, upper quadrant mass, perineal lacerations
- DRE: sphincter tone, position of prostate, presence of blood
- scrotum: ecchymoses, lacerations, testicular disruption, hematomas
- bimanual exam, speculum exam
- extraperitoneal bladder rupture: pelvic instability, suprapubic tenderness from mass of urine or extravasated blood
- intraperitoneal bladder rupture: acute abdomen
- urethral injury: perineal ecchymosis, scrotal hematoma, blood at penile meatus, high riding prostate, pelvic fractures

Investigations

- urethra: retrograde urethrography
- bladder: U/A, CT scan, urethrogram ± retrograde cystoscopy, ± cystogram (distended bladder + post-void)
- ureter: retrograde ureterogram
- renal: CT scan (best, if hemodynamically stable), intravenous pyelogram

Management

- urology consult
- renal
 - minor injuries: conservative management
 - ♦ bedrest, hydration, analgesia, antibiotics
 - major injuries: admit
 - ♦ conservative management with frequent reassessments, serial U/A ± re-imaging
 - ♦ surgical repair (exploration, nephrectomy): hemodynamically unstable or continuing to bleed >48 h, major urine extravasation, renal pedicle injury, all penetrating wounds and major lacerations, infections, renal artery thrombosis
- ureter
 - ureteroureterostomy
- bladder
 - extraperitoneal
 - ♦ minor rupture: Foley drainage x 10-14 d
 - ♦ major rupture: surgical repair
 - intraperitoneal
 - ♦ drain abdomen and surgical repair
- urethra
 - anterior: conservative, if cannot void → Foley or suprapubic cystostomy and antibiotics
 - posterior: suprapubic cystostomy (avoid catheterization) ± surgical repair

In the case of gross hematuria, the GU system is investigated from distal to proximal (i.e. urethrogram, cystogram, etc.)

Orthopedic Injuries

- see [Orthopedics](#) (Shoulder OR11, Knee OR30, Wrist OR20, Ankle OR36)

Goals of ED Treatment

- diagnose potentially life/limb threatening injuries
- reduce and immobilize fractures (cast/splint) as appropriate
- provide adequate pain relief
- arrange proper follow-up if necessary

History

- use SAMPLE
- mechanism of injury may be very important

Physical Exam

- look (inspection): “SEADS” Swelling, Erythema, Atrophy, Deformity, Skin changes (e.g. bruises)
- feel (palpation): all joints/bones for local tenderness, swelling, warmth, crepitus, joint effusions, subtle deformity
- move: joints affected plus those above and below injury – active ROM preferred to passive
- neurovascular status: distal to injury (before and after reduction)

Description of Fractures

SOLARTAT

Site
Open vs. closed
Length
Articular
Rotation
Translation
Alignment/Angulation
Type e.g. Salter-Harris, etc.

LIFE- AND LIMB-THREATENING INJURIES

Table 10. Life- and Limb-Threatening Orthopedic Injuries

Life-Threatening Injuries (usually blood loss)	Limb-Threatening Injuries (usually interruption of blood supply)
Major pelvic fractures	Fracture/dislocation of ankle (talar AVN)
Traumatic amputations	Crush injuries
Massive long bone injuries (beware of fat emboli)	Compartment syndrome
Vascular injury proximal to knee/elbow	Open fractures
	Dislocations of knee/hip
	Fractures above knee/elbow

Open Fractures

- communication between fracture site and external surface of skin – increased risk of osteomyelitis
- remove gross debris, irrigate, cover with sterile dressing – formal irrigation and debridement often done in the OR
- control bleeding with pressure (no clamping)
- splint
- antibiotics (1st generation cephalosporin and aminoglycoside) and tetanus prophylaxis
- must secure definitive surgical care within 6-8 h

Vascular Injuries

- realign limb/apply longitudinal traction and reassess pulses (e.g. Doppler probe)
- surgical consult
- direct pressure if external bleeding

Compartment Syndrome

- increased interstitial pressure in an anatomical “compartment” (forearm, calf) with little room for expansion, resulting in decreased perfusion and potential muscle/nerve necrosis
- clinical diagnosis: maintain a high index of suspicion
 - pain out of proportion to the injury
 - pain worse with passive stretch
 - look for “the 6 Ps”
- requires prompt decompression: remove constrictive casts, dressings; fasciotomy may be needed emergently

UPPER EXTREMITY INJURIES

- anterior shoulder dislocation
 - axillary nerve (lateral aspect of shoulder) and musculocutaneous nerve (extensor aspect of forearm) at risk
 - seen on lateral view: humeral head anterior to glenoid
 - ♦ reduce (traction, scapular manipulation), immobilize in internal rotation, repeat x-ray, out-patient follow-up with orthopedics
 - ♦ with forceful injury, look for fracture
- Colles' fracture
 - distal radius fracture with dorsal displacement from “Fall on Outstretched Hand” (FOOSH)
 - AP film: shortening, radial deviation, radial displacement
 - lateral film: dorsal displacement, volar angulation
 - reduce, immobilize with splint, out-patient follow-up with orthopedics or immediate orthopedics referral if complicated fracture
 - if involvement of articular surface, emergent orthopedic referral
- scaphoid fracture
 - tenderness in anatomical snuff box, pain on scaphoid tubercle, pain on axial loading of thumb
 - negative x-ray: thumb spica splint, repeat x-ray in 1 wk ± bone scan
 - positive x-ray: thumb spica splint x 6-8 wk, repeat x-ray in 2 wk
 - risk of AVN of scaphoid if not immobilized
 - outpatient orthopedic follow-up

LOWER EXTREMITY INJURIES

- ankle and foot fractures
 - see Ottawa Ankle and Foot Rules
- knee injuries
 - see Ottawa Knee Rules

When Dealing with an Open Fracture, Remember “STAND”

Splint
Tetanus prophylaxis
Antibiotics
Neurovascular status (before and after)
Dressings (to cover wound)

Vascular injury/compartment syndrome is suggested by “**The 6 Ps**”:

Pulse discrepancies
Pallor
Paresthesia/hypoesthesia
Paralysis
Pain (especially when refractory to usual analgesics)
Polar (cold)

Figure 7. Colles' fracture

Figure 8. Carpal bones

Figure 9. Ottawa ankle and foot rules

Adapted from: Stiell IG, et al. *JAMA* 1994;271:827-832

- avulsion of the base of 5th metatarsal
 - occurs with inversion injury
 - supportive tensor or below knee walking cast for 3 wk
- calcaneal fracture
 - associated with fall from height
 - associated injuries may involve ankles, knees, hips, pelvis, lumbar spin

A knee x-ray examination is required only for acute injury patients with one or more of:

- Age 55 yr or older
- Tenderness at head of fibula
- Isolated tenderness of patella
- Inability to flex to 90°
- Inability to bear weight both immediately and in the ED (four steps)

Figure 10. Ottawa knee rules

Adapted from: Stiell IG, et al. *JAMA* 1997;278:2075-2079

Wound Management

Goals of ED Treatment

- identify injuries and stop any active bleeding – direct pressure
- manage pain
- wound examination and exploration (history and physical)
- cleansing ± antibiotic and tetanus prophylaxis
- closure and dressing

Tetanus Prophylaxis

- both tetanus toxoid (Td) and immunoglobulin (TIG) are safe in pregnancy

Table 11. Guidelines for Tetanus Prophylaxis for Wounds

Immunization History	Non-Tetanus Prone Wounds		Tetanus Prone Wounds ¹	
	Td ²	TIG ³	Td	TIG
Uncertain or <3 doses	Yes	No	Yes	Yes
3 or more, none for >10 yr	Yes	No	Yes	No
3 or more, 5 to 10 yr ago	No	No	Yes	No
3 or more, <4 yr ago	No	No	No	No

¹ wounds >6 h old, >1 cm deep, puncture wounds, avulsions, wounds resulting from missiles, crush wounds, burns, frostbite, wounds contaminated with dirt, feces, soil, or saliva

² 0.5 mL IM tetanus and diphtheria toxoids (Td), adsorbed

³ tetanus immune globulin (TIG), 250 units deep IM

Accuracy of Ottawa Ankle Rules to Exclude Fractures of the Ankle and Mid-Foot: Systematic Review

BMJ 2003;326:417

This systematic review and meta-analysis of 27 studies including 15,581 patients evaluated the sensitivity and specificity of the Ottawa Ankle Rules for excluding fractures of the ankle and mid-foot.

Results: The pooled likelihood ratio of a negative result (obtaining a false negative) among those with a fracture was determined to be 0.08 for both the ankle and mid-foot.

Conclusions: The Ottawa Ankle Rules provide an accurate instrument for excluding fractures of the ankle and mid-foot with a sensitivity of almost 100% and a specificity of 26%. The use of this instrument can reduce the number of unnecessary radiographs.

Acute Treatment of Contusions

RICE

Rest
Ice
Compression
Elevation

Suture Use and Duration

Suture to	Close with Nylon or Other Nonabsorbable Suture	Approx. Duration (Days)
Face	6-0	5
Not Joint	4-0	7
Joint	3-0	10
Scalp	4-0	7
Mucous Membrane	absorbable (vicryl)	N/A

N.B. Patients on steroid therapy may need sutures for longer periods of time

Bruises

- non-palpable = ecchymosis
- palpable collection (not swelling) = hematoma following blunt trauma
- assess for coagulopathy (e.g. liver disease), anticoagulant use

Abrasions

- partial to full thickness break in skin
- management
 - clean thoroughly with brush to prevent foreign body impregnation ± local anesthetic
 - antiseptic ointment (Polysporin® or Vaseline®) for 7 d for facial and complex abrasions
 - tetanus prophylaxis

Lacerations

- see [Plastic Surgery, PL8](#)
- consider every structure deep to a laceration injured until proven otherwise
- in hand injury patients, include the following in history: handedness, occupation, mechanism of injury, previous history of injury
- physical exam
 - think about underlying anatomy
 - examine tendon function actively against resistance and neurovascular status distally
 - clean and explore under local anesthetic; look for partial tendon injuries
 - x-ray or U/S wounds if a foreign body is suspected (e.g. shattered glass) and not found when exploring wound (remember: not all foreign bodies are radioopaque), or if suspect intra-articular involvement
- management
 - disinfect skin/use sterile techniques
 - irrigate copiously with NS
 - analgesia ± anesthesia
 - maximum dose of lidocaine:
 - ♦ 7 mg/kg with epinephrine
 - ♦ 5 mg/kg without epinephrine
- in children, topical anesthetics such as LET (lidocaine, epinephrine and tetracaine), and in selected cases a short-acting benzodiazepine (midazolam or other agents) for sedation and amnesia are useful
- secure hemostasis
- evacuate hematomas, debride non-viable tissue, remove hair and foreign bodies
- ± prophylactic antibiotics (consider for animal/human bites, intraoral lesion, or puncture wounds to the foot)
- suture unless: delayed presentation (>6-8 h), puncture wound, mammalian bite, crush injury, or retained foreign body
 - take into account patient and wound factors when considering suturing
- advise patient when to have sutures removed
- cellulitis and necrotising fasciitis, see [Plastic Surgery, PL14](#)

Alternatives to Sutures

- Tissue glue
- Steristrips®
- Staples

Where **NOT** to use local anesthetic with epinephrine:

Ears, Nose, Fingers, Toes, and Penis

High Risk Factors for Infection

Wound Factors

- Puncture wounds
- Crush injuries
- Wounds > 12 h old
- Hand or foot wounds
- Immunocompromised

Patient Factors

- Age > 50 yr
- Prosthetic joints or valves (risk of endocarditis)

Early wound irrigation and debridement are the most important factors in decreasing infection risk

Approach to Common ED Presentations

Abdominal Pain

Rule Out Life-Threatening Causes

- CVS: MI, aortic dissection (tearing pain), ruptured AAA
- GI: perforated viscus, hepatic/splenic injury, ischemic bowel (diffuse pain), strangulated hernia
- gynecologic: ectopic pregnancy

Additional Differential Diagnosis

- GI: appendicitis, diverticulitis, bowel obstruction, hepatitis, cholecystitis, pancreatitis
- urinary: pyelonephritis, ureteral calculi, cystitis
- genital
 - female: tubo-ovarian abscess, ovarian torsion, ovarian cyst, salpingitis, PID, endometriosis
 - male: testicular torsion, epididymitis, prostatitis
- other: DKA, herpes zoster virus, intra-abdominal abscess, pneumonia, lead poisoning, porphyria, sickle cell crisis, acute angle closure glaucoma, Addison's crisis, psychiatric

History

- pain: OPQRST
- broad differential, including GU, gynecological, GI, respiratory, and CV systems
- recent/remote abdominal trauma/surgeries
- most recent colonoscopy

Be vigilant in those at extremes of ages (very young, elderly) as they often present atypically

Old age, pregnancy (T3), and chronic corticosteroid use can blunt peritoneal findings, so have an increased suspicion of intra-abdominal process in these individuals

If elevated AST and ALT:
think hepatocellular injury
AST > ALT: alcohol-related
ALT > AST: viral, drug, toxin

If elevated ALP and GGT:
think biliary tree stones

Physical Exam

- vitals, abdominal (including DRE, CVA tenderness), pelvic/genital, respiratory, and CVS as indicated by history

Investigations

- do not delay consultation if patient unstable
- CBC, electrolytes, glucose, BUN/Cr, U/A \pm LFTs, lipase, β -hCG, ECG, troponins
- AXR: look for calcifications, free air, gas pattern, air fluid levels
- CXR upright: look for pneumoperitoneum (free air under diaphragm)
- U/S: biliary tract, ectopic pregnancy, AAA, free fluid
- CT: trauma, AAA, pancreatitis, nephro/urolithiasis, appendicitis, and diverticulitis

Management

- NPO, IV, NG tube, analgesics, consider antibiotics and anti-emetics
- growing evidence that small amounts of opioid analgesics improve diagnostic accuracy of physical exam of surgical abdomen
- consult as necessary: general surgery, vascular surgery, gynecology, etc.

Disposition

- admission: surgical abdomen, workup of significant abnormal findings, need for IV antibiotics or pain control
- discharge: patients with a negative lab and imaging workup who improve clinically during their stay; instruct the patient to return if severe pain, fever, or persistent vomiting develop

Unstable patients should not be sent for imaging

Acute Pelvic Pain

Etiology

- gynecological
 - 2nd most common gynecological complaint (after vaginal bleeding)
 - ovaries: ruptured ovarian cysts (most common cause of pelvic pain), ovarian abscess, ovarian torsion (rare, 50% will have ovarian mass)
 - fallopian tubes: salpingitis, tubal abscess, hydrosalpinx
 - uterus: leiomyomas (uterine fibroids) – especially with torsion of a pedunculated fibroid or in pregnant patient (degeneration), PID, endometriosis
 - other: ectopic pregnancy (ruptured/expanding/leaking), spontaneous abortion (threatened or incomplete), endometriosis and dysmenorrhea, sexual, or physical abuse
- non-gynecological
 - GI: appendicitis, constipation, bowel obstruction, gastroenteritis, diverticulitis, IBD, IBS
 - GU: cystitis, pyelonephritis, ureteric stone
 - other: porphyria, abdominal angina, aneurysm, hernia, zoster, psychological abuse/domestic violence

All women of childbearing age are assumed to be pregnant; every pregnancy is potentially ectopic. A β -hCG must be obtained.

**Gynecological Causes of Pelvic Pain:**

- Ovarian cyst
- Dysmenorrhea
- Mittelschmerz
- Endometriosis
- Ovarian torsion
- Uterine fibroids/neoplasm
- Adnexal neoplasm
- PID + cervicitis

History and Physical Exam

- pain: OPQRST
- associated symptoms: vaginal bleeding, bowel or bladder symptoms, radiation
- vitals
- gynecological exam: assess for cervical motion tenderness/“chandelier sign” (suggests PID)
- abdominal exam

Investigations

- blood work
 - β -hCG for all women of childbearing age
 - CBC and differential, electrolytes, glucose, BUN/Cr, G&S, PTT/INR
- imaging
 - pelvic and abdominal U/S: evaluate adnexa, look for free fluid or masses in the pelvis, evaluate thickness of endometrium, confirm intrauterine pregnancy if β -hCG positive
 - doppler flow studies for ovarian torsion

U/S is the preferred imaging modality in the assessment of acute pelvic pain

Management

- general: analgesia, determine if admission and consults are needed
- specific
 - ovarian cysts
 - ♦ unruptured or ruptured and hemodynamically stable: analgesia and follow-up
 - ♦ ruptured with significant hemoperitoneum: may require surgery
 - ovarian torsion: surgical detorsion or removal of ovary
 - uncomplicated leiomyomas, endometriosis, and secondary dysmenorrhea can usually be treated on an outpatient basis, discharge with gynecology follow-up
 - PID: requires broad spectrum antibiotics

Disposition

- referral: gynecological or obstetrical causes requiring surgical intervention, requiring admission, or oncological in nature
- admission: patients requiring surgery, IV antibiotics/pain management
- discharge: negative workup and resolving symptoms; give clear instructions for appropriate follow-up

Altered Level of Consciousness

Definitions

- altered mental status: collective, non-specific term referring to change in cognitive function, behavior, or attentiveness, including:
 - delirium (see [Psychiatry, PS16](#))
 - dementia (see [Psychiatry, PS17](#))
 - lethargy: state of decreased awareness and alertness (patient may appear wakeful)
 - stupor: unresponsiveness but arousable
 - coma: a sleep-like state, not arousable to consciousness
 - use the GCS to evaluate LOC (see [Initial Patient Assessment/Management, ER2](#))

Possible Causes of Coma

AEIOU TIPS

Acidosis/Alcohol
Epilepsy
Infection
Oxygen (hypoxia)/Opiates
Uremia
Temperature/Trauma (especially head)
Insulin (too little or too much)
Psychogenic/Poisoning
Stroke

In general, GCS <8, intubate, but ability to protect airway is primary consideration

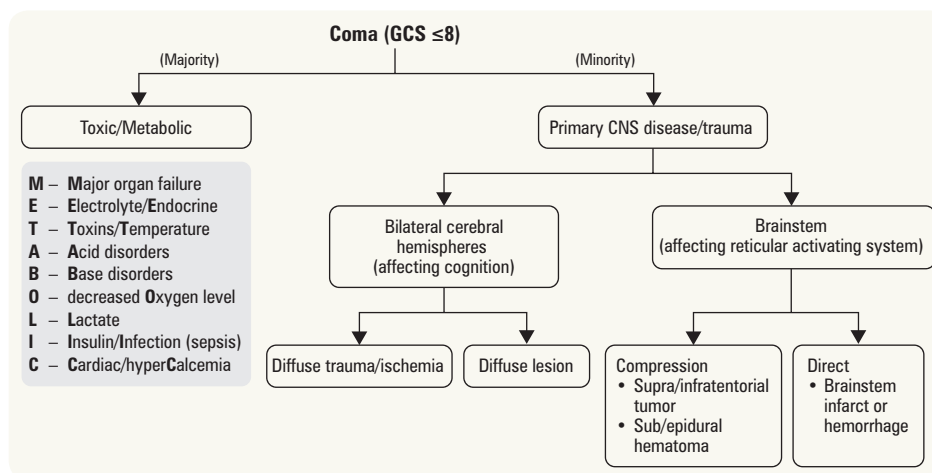

Figure 11. Etiology of coma

MANAGEMENT OF ALTERED LOC

History

- obtain collateral from family, friends, police, paramedics, old chart, etc.
- onset and progression
 - abrupt onset suggests CNS hemorrhage/ischemia or cardiac cause
 - progression over hours to days suggests progressive CNS lesion or toxic/metabolic cause
- preceding events
 - it is essential to determine patient's baseline LOC
 - antecedent trauma, seizure activity, fever
- past medical history (e.g. similar episode, depression, overdose)

Physical Exam

- ABCs, vitals including temperature, cardiac, chest, respiratory, abdominal exam
- complete neuro exam, in particular examination of the eyes (pupil size and reactivity), look for MedicAlert® bracelet

Investigations

- blood work
 - rapid blood sugar, CBC, electrolytes, Cr, BUN, LFTs, glucose, serum osmolality, VBG, PT/PTT/INR, troponins
 - serum EtOH, acetaminophen, and salicylate levels
- imaging
 - CXR, CT head
- other tests
 - ECG, U/A, UTox

Diagnosis

- administer appropriate universal antidotes
 - thiamine 100 mg IV if history of EtOH or patient looks malnourished
 - one ampule D50W IV if low blood sugar on finger-prick
 - naloxone 0.4-2 mg IV or IM if opiate overdose suspected
- distinguish between structural and toxic-metabolic coma
 - structural coma
 - ♦ pupils, extraocular movements, and motor findings, if present, are usually asymmetric
 - ♦ look for focal or lateralizing abnormalities
 - toxic-metabolic coma
 - ♦ dysfunction at lower levels of the brainstem (e.g. caloric unresponsiveness)
 - ♦ respiratory depression in association with an intact upper brainstem (e.g. equal and reactive pupils; see exceptions in Table 12)
 - ♦ extraocular movements and motor findings are symmetric or absent
- essential to re-examine frequently because status can change rapidly
- diagnosis may become apparent only with the passage of time
 - delayed deficit after head trauma suggestive of epidural hematoma (characteristic “lucid interval”)

Table 12. Toxic-Metabolic Causes of Fixed Pupils

Dilated	Dilated to Normal	Constricted
Anoxia	Hypothermia	Cholinergic agents (e.g. organophosphates)
Anticholinergic agents (e.g. atropine, TCAs)	Barbiturates	Opiates (e.g. heroin), except meperidine
Methanol (rare)	Antipsychotics	
Cocaine		
Opioid withdrawal		
Amphetamines		
Hallucinogens		

Disposition

- admission: if ongoing decreased LOC, admit to service based on tentative diagnosis, or transfer patient if appropriate level of care not available
- discharge: readily reversible alteration of LOC; ensure adequate follow-up care available

Chest Pain

Rule Out Life-Threatening Causes

- CVS: ACS, pericarditis, cardiac tamponade, aortic dissection
- respiratory: PE, pneumothorax (tension or spontaneous)
- GI: esophageal rupture, pneumomediastinum

Additional Differential Diagnosis

- cardiac: stable angina
- respiratory: pneumonia
- GI: peptic ulcer disease, pancreatitis, cholecystitis, esophagitis, reflux, esophageal spasm
- MSK: rib fractures, costochondritis, zoster, etc.
- psychogenic/anxiety (diagnosis of exclusion)

Initial Resuscitation and Management

- O₂, IV, cardiac monitoring, CXR (portable if unstable), ECG

History

- must evaluate cardiac risk factors (see [TIMI Score](#), [Cardiology and Cardiac Surgery](#), C27)
- classic presentations (but presentation seldom classic)
 - aortic dissection: syncope with sudden severe tearing pain, often radiating to back ± focal pain/neurologic loss in extremities secondary to major vessel ischemia
 - PE: pleuritic chest pain (75%), dyspnea, anxiety, tachycardia, PERC Score
 - pericarditis: anterior precordial pain, pleuritic, relieved by sitting up and leaning forward
 - ACS: retrosternal squeezing/pressure pain, radiation to arm/neck, dyspnea, N/V, syncope
 - esophageal: frequent heartburn, acid reflux, dysphagia, relief with antacids
- ACS more likely to be atypical in females, diabetics, and >80 yr

Physical Exam

- vitals (BP in both arms, but unreliable indicator of dissection)
- palpate chest wall for tender points; present in 25% of acute MI, but may suggest MSK cause if symptoms fully reproduced and all serious etiologies have been ruled out
- cardiac, respiratory, and peripheral vascular exams

Life-Threatening Causes of Chest Pain

PET MAP

Pulmonary embolism
Esophageal rupture
Tamponade
MI/angina
Aortic dissection
Pneumothorax

Imaging is necessary for all suspected aortic dissections, regardless of blood pressure

Signs and Symptoms of MI

PULSE

Persistent chest pain
Upset stomach
Lightheadedness
Shortness of breath
Excessive sweating

Investigations

- blood work
 - CBC, electrolytes, BUN/Cr
 - CK-MB: if normal, does not rule out MI
 - troponin I: more sensitive (but positive later than CK-MB; can have false positives in renal failure; must follow for 8 h post onset of symptoms)
 - D-dimer: if negative, can rule out PE in low probability patients
- ECG
 - always compare with previous
 - PE and acute MI may have normal ECG in up to 50% of cases
 - consider 15-lead ECG if hypotensive or if ECG shows inferior MI or AV node involvement
- CXR
 - always compare with previous
 - PE (see *Deep Vein Thrombosis*, ER33)
 - ♦ 50% completely normal
 - ♦ atelectasis, elevated hemidiaphragm, pleural effusion
 - aortic dissection
 - ♦ change from previous CXR is the most accurate finding
 - ♦ widened mediastinum (most consistent finding)
 - ♦ CXR is normal in 20% of thoracic dissections
 - pneumothorax
 - ♦ may need inspiration and expiration views
 - ♦ if large, may see tracheal shift (away from tension pneumothorax, towards a non-tension pneumothorax)
- V/Q scan or CT, venous leg Doppler, required to rule out PE in patients with intermediate or high probability (see sidebar for Wells' Criteria for PE, ER33)

Disposition

- admission and monitoring: patients at risk of developing dysrhythmias
- consult: cardiology for patients with ACS; cardiothoracic surgery for patients with valvular lesions, esophageal rupture, or aortic dissection
- discharge: patients with a low probability of life-threatening illness due to resolving symptoms and negative workup; instruct the patient to return if they develop SOB or increased chest pain

Table 13. Common Life-Threatening ECG Changes

Pathology	ECG Findings
Dysrhythmia	
a) Torsades de pointes	Ventricular complexes in upward-pointing and downward-pointing continuum (250-350 bpm)
b) Ventricular tachycardia	6 or more consecutive premature ventricular beats (150-250 bpm)
c) Ventricular flutter	Smooth sine wave pattern of similar amplitude (250-350 bpm)
d) Ventricular fibrillation	Erratic ECG tracing, no identifiable waves
Conduction	
a) 2nd degree heart block (Mobitz Type II)	PR interval stable, some QRSs dropped
b) 3rd degree heart block	Total AV dissociation, but stable P-P and R-R intervals
c) Left bundle branch block	Prolonged QRS complex (>0.12 s) RSR' in V5 or V6 Monophasic I and V6 May see ST elevation Difficult to interpret, new LBBB is considered STEMI equivalent
Ischemia	
a) STEMI	ST elevation in leads associated with injured area of heart and reciprocal lead changes (depression)
Metabolic	
a) Hyperkalemia	Tall T waves P wave flattening QRS complex widening and flattening
b) Hypokalemia	U waves appear Flattened T waves
Digitalis Toxicity	Gradual downward curve of ST At risk for AV blocks and ventricular irritability
Syndromes	
a) Brugada	RBBB with ST elevation in V1, V2, and V3 Susceptible to deadly dysrhythmias, including ventricular fibrillation
b) Wellens	Marked T wave inversion in V2 and V3 Left anterior descending coronary stenosis
c) Long QT syndrome	QT interval longer than ½ of cardiac cycle Predisposed to ventricular dysrhythmias

Signs of PE on CXR

Westermark's sign: abrupt tapering of a vessel on chest film

Hampton's hump: a wedge-shaped infiltrate that abuts the pleura

It is important to look for reciprocal changes in STEMI in order to differentiate from pericarditis (diffuse elevations)

Addition of Clopidogrel to Aspirin® and Fibrinolytic Therapy for Myocardial Infarction with ST-Segment Elevation

NEJM 2005;352:1179-1191

Purpose: To assess the benefit of adding clopidogrel to Aspirin® and fibrinolytic therapy in ST-elevation MI.

Study Characteristics: Double-blind, RCT, following intention-to-treat analysis, with 3,491 patients and clinical follow-up at 30 d.

Participants: Individuals presenting within 12 h of onset of ST-elevation MI (mean age 57, 80.3% male, 50.3% smokers, 9.1% previous MI). Those presenting after 12 h, age >75, or with previous CABG, were excluded.

Intervention: Clopidogrel (300 mg loading dose followed by 75 mg OD until day of angiogram) or placebo, in addition to Aspirin®, a fibrinolytic agent, and heparin when appropriate.

Primary Outcome: Composite of occluded infarct-related artery on angiography (thrombosis in MI flow grade 0 or 1), or death or recurrent MI prior to angiography.

Results: Rates of primary end point were 21.7% in the placebo group and 15.0% in the clopidogrel group (95% CI 24-47%). Among the individual components of the primary end point, clopidogrel had a significant effect on the rate of an occluded infarct-related artery and the rate of recurrent MI, but no effect on the rate of death from any cause. At 30 d clinical follow-up, there was no difference in rate of death from cardiovascular causes, a significant reduction in the odds of recurrent MI, and a non-significant reduction in recurrent ischemia with need for urgent revascularization. The rates of major bleeding and intracranial hemorrhage were similar between the two groups.

Conclusion: Addition of clopidogrel improves the patency rate of infarct-related arteries and reduces ischemic complications, both of which are associated with improved long-term survival after MI. The trial was not powered to detect a survival benefit, and none was seen.

ACUTE MYOCARDIAL INFARCTION

- see [Cardiology and Cardiac Surgery, C27](#)

Management

- immediate stabilization
 - oxygen 4 L/min
 - IV access
 - cardiac monitors
 - STAT ECG
 - cardiac enzymes (CK, troponins)
- ASA 162-325 mg chewed
- nitroglycerin 0.3 mg SL q5min x 3 (IV for CHF, HTN, unresolved pain)
 - do not use if patient is hypotensive or in the setting of an inferior MI
- morphine 2-5 mg IV q5-30min if unresponsive to nitroglycerin
- low molecular weight heparin 1 mg/kg SC bid (30 mg IV STAT post TNK/tenecteplase infusion)
- thrombolytics (within 30 min) or primary percutaneous coronary intervention (within 90 min)
 - agents include rt-PA, streptokinase, and TNK
 - evaluate indications and contraindications prior to use
- other: antidysrhythmics, cardioversion, defibrillation, transthoracic pacing, angioplasty
- cardiology consult

**Immediate Treatment of Acute MI****BEMOAN**

β-blocker
Enoxaparin
Morphine
Oxygen
ASA
Nitroglycerin

Epistaxis

- see [Otolaryngology, OT27](#)
- 90% of nosebleeds stem from the anterior nasal septum (at Kiesselbach's plexus located in Little's area)
- can be life-threatening

Etiology

- most commonly caused by trauma (digital, blunt, foreign bodies)
- other causes: barometric changes, nasal dryness, chemicals (cocaine, Otrivin*), or systemic disease (coagulopathies, HTN, etc.)

Investigations

- blood work: CBC, PT/PTT (as indicated)
- imaging: x-ray, CT as needed

Treatment

- aim is to localize bleeding and achieve hemostasis
- first-aid: ABCs, clear clots by blowing nose or suctioning, lean forward, pinch cartilaginous portion of nose for 20 min twice
- assess blood loss: vitals, IV NS, cross match 2 units pRBC if significant
- if first aid measures fail twice, proceed to packing
- apply an anterior pack
 - clear nose of any clots
 - apply topical anesthesia/vasoconstrictors (lidocaine with epinephrine, cocaine, or soaked pledgets)
 - insert either a traditional Vaseline® gauze pack or a commercial nasal tampon or balloon
 - if bleeding stops, arrange follow-up in 48-72 h for reassessment and pack removal
 - prophylactic anti-staphylococcal antibiotics should be prescribed to prevent sinusitis or toxic shock syndrome
 - if bleeding is controlled with anterior pressure, cautery with silver nitrate can be performed if the site of bleeding is identified (one side of septum only because if both are cauterized this can lead to septal perforation)
- if suspect posterior bleed or anterior packing does not provide hemostasis, consult ENT for posterior packing and further evaluation
- posterior packing (ENT consult)
 - posterior packing requires monitoring because can cause significant vagal response and posterior bleeding source can lead to significant blood loss

Disposition

- discharge: discharged upon stabilization and appropriate follow-up; educate patients about prevention (e.g. humidifiers, saline spray, topical ointments, avoiding irritants, managing HTN)
- admission: severe cases of refractory bleeding

Thrombocytopenic patients – use resorbable packs to avoid risk of re-bleeding caused by pulling out the removable pack

**Complications of Nasal Packing**

- Hypoxemia
- Toxic-shock syndrome
- Aspiration
- Pharyngeal fibrosis/stenosis
- Alar/septal necrosis

Headache

- see [Neurology, N43](#)

Etiology

• the common

- common migraine (no aura)/classic migraine (with aura)
 - ♦ gradual onset, unilateral/bilateral, throbbing
 - ♦ N/V, photo/phonophobia
 - ♦ treatment: analgesics, antiepileptic drugs, vasoactive medications
- tension/muscular headache
 - ♦ never during sleep, gradual over 24 h
 - ♦ posterior/occipital
 - ♦ increased with stressors
 - ♦ treatment: modify stressor(s), local measures, NSAIDs, tricyclic antidepressants

• the deadly

- SAH (see [Neurosurgery, NS18](#))
 - ♦ sudden onset, increased with exertion
 - ♦ reaches maximum intensity within minutes, N/V, meningeal signs
 - ♦ diagnosis: CT, LP (5-10% of patients with SAH have negative initial CT)
 - sensitivity of CT decreases with time and is much less sensitive by 48-72 h
 - if CT done within 6 h of headache onset, no need for LP
 - ♦ management: urgent neurosurgery consult
- increased ICP
 - ♦ worse in morning, when supine or bending down, with cough or Valsalva
 - ♦ physical exam: neurological deficits, cranial nerve palsies, papilledema
 - ♦ diagnosis: CT scan
 - ♦ management: consult neurosurgery
- meningitis (see [Infectious Diseases, ID19](#))
 - ♦ flu-like presentation initially (fever, N/V, malaise), meningeal signs, purpuric rash
 - ♦ altered LOC and confusion
 - ♦ perform CT to rule out increased ICP then do LP for diagnosis
 - ♦ treatment: early empiric antibiotics (depending on age group), steroid therapy
- temporal arteritis (causes significant morbidity, blindness) (see [Ophthalmology, OP38](#))
 - ♦ unilateral scalp tenderness, jaw claudication, visual disturbances
 - ♦ labs: elevated ESR, CRP
 - ♦ temporal artery biopsy is gold standard for diagnosis
 - ♦ associated with polymyalgia rheumatica
 - ♦ treatment: high-dose steroids immediately if suspected

Disposition

- admission: if underlying diagnosis is critical or emergent, if there are abnormal neurological findings, if patient is elderly or immunocompromised (atypical presentation), or if pain is refractory to oral medications
- discharge: assess for risk of narcotic misuse, most patients can be discharged with appropriate analgesia and follow-up with their family physician; instruct patients to return for fever, vomiting, neurologic changes, or increasing pain

Joint Pain

- see [Rheumatology, RH3](#)

Rule Out Life-Threatening Causes

- septic joint (see [Orthopedics, OR10](#))

Differential Diagnosis

- articular pain
 - monoarticular
 - ♦ infectious: bacterial, viral, fungal
 - ♦ hemarthrosis: trauma/fracture, anticoagulants, bleeding diatheses
 - ♦ crystal induced: gout, calcium pyrophosphate deposition, hydroxyapatite
 - ♦ inflammatory: seropositive, seronegative
 - ♦ neoplasm
 - ♦ degenerative: osteoarthritis
 - polyarticular
 - ♦ infectious: Lyme disease, bacterial endocarditis, septicemia, gonococcus, viral
 - ♦ post-infectious: rheumatic fever, reactive arthritis, enteric infections
 - ♦ inflammatory: seropositive, seronegative
 - ♦ degenerative: osteoarthritis

Dexamethasone for Reduction of Migraine Recurrence
Emerg Med J 2013;30:165-166
 Shows that a single dose of IV dexamethasone may decrease recurrence of migraine within 24 h (NNT 10).

Note: up to 5% of patients with SAH have a normal CT scan; if suspect SAH with a negative CT, perform a LP

DDx Subarachnoid Hemorrhage

BATS

Berry aneurysm
 Arteriovenous malformation/Adult polycystic kidney disease
 Trauma
 Stroke

Meningitis

- Do not delay IV antibiotics for LP
- Deliver 1st dose of dexamethasone with or before 1st dose of antibiotic therapy

Ottawa SAH Rules

- For alert patients older than 15 yr with new severe non-traumatic headache reaching maximum intensity within 1 h
- Not for patients with new neurologic deficits, previous aneurysms, SAH, brain tumors, or history of recurrent headaches (≥3 episodes over the course of ≥6 mo)
- Investigate if ≥1 high-risk variables present:
 - Age ≥40 yr
 - Neck pain or stiffness
 - Witnessed loss of consciousness
 - Onset during exertion
 - Thunderclap headache (instantly peaking pain)
 - Limited neck flexion on examination

- non-articular
 - localized: tendonitis, bursitis, capsulitis, muscle sprain
 - generalized: fibromyalgia, polymyalgia rheumatica
- other
 - neurologic: spinal stenosis/spondylolisthesis, degenerative disc disease, cauda equina syndrome, neoplasm, thoracic outlet syndrome, Charcot joint
 - vascular: intermittent claudication

History and Physical Exam

- associated symptoms: fever, constitutional symptoms, skin lesions, conjunctivitis, urethritis
- patterns of joint involvement: polyarticular vs. monoarticular, symmetric vs. asymmetric
- inflammatory symptoms: prolonged morning stiffness, stiffness and pain ease through the day, midday fatigue, soft tissue swelling
- non-inflammatory symptoms: stiffness short lived after inactivity, short duration stiffness in the morning, pain increases with activity
- assess ROM, presence of joint effusion, warmth
- assess for localized joint pain, erythema, warmth, swelling with pain on active ROM, inability to bear weight, fever; may indicate presence of septic joint

Investigations

- blood work
 - CBC, ESR, CRP, WBC, INR/PTT, blood cultures, urate
- imaging
 - joint x-ray ± contralateral joint for comparison
- other investigations
 - joint aspirate → send for: WBC, protein, glucose, Gram stain, crystals

Management

- septic joint: IV antibiotics ± joint decompression and drainage
 - antibiotics can be started empirically if septic arthritis cannot be ruled out
- crystalline synovitis: NSAIDs at high dose, colchicine within first 24 h, corticosteroids
 - do not use allopurinol, as it may worsen acute attack
- acute polyarthritis: NSAIDs, analgesics (acetaminophen ± opioids), local or systemic corticosteroids
- osteoarthritis: NSAIDs, acetaminophen
- soft tissue pain: allow healing with enforced rest ± immobilization
 - non-pharmacologic treatment: local heat or cold, electrical stimulation, massage
 - pharmacologic: oral analgesics, NSAIDs, muscle relaxants, corticosteroid injections, topical agents

Hospitalization is required for joint pain in the presence of:

- Significant, concomitant internal organ involvement
- Signs of bacteremia, including vesiculopustular skin lesions, Roth spots, shaking chills, or splinter hemorrhages
- Systemic vasculitis
- Severe pain
- Severe constitutional symptoms
- Purulent synovial fluid in one or more joints
- Immunosuppression

Otalgia

Differential Diagnosis (see [Otolaryngology](#), OT6)

- local
 - infections: acute otitis externa, acute otitis media, otitis media with effusion, mastoiditis, myringitis, malignant otitis in diabetics, herpes simplex/zoster, auricular cellulitis, external canal abscess, dental disease
 - others: trauma, temporomandibular joint dysfunction, neoplasm, foreign body, cerumen impactions, trigeminal neuralgia, granulomatosis with polyangiitis

History

- OPQRST
- associated symptoms: aural fullness (feeling of pressure), otorrhea, hearing loss, tinnitus, vertigo, pruritis, fever
- risk factors: Q-tip use, hearing aids, headphones

Physical Exam

- observe for otorrhea, palpation of outer ear/mastoid, otoscope to see bulging erythematous tympanic membrane, perforation

Investigations

- consider audiogram if hearing loss
- C&S of ear canal discharge, if present
- CT head if suspicion of mastoiditis, malignant otitis media

Management

- debridement of cerumen or exudates
- antibiotics/antifungals/antivirals for respective infections

Seizures

- see [Neurology, N16](#)

Definition

- paroxysmal alteration of behavior and/or EEG changes resulting from abnormal, excessive activity of neurons
- status epilepticus: continuous or intermittent seizure activity for greater than 5 min without regaining consciousness

Categories

- generalized seizure (consciousness always lost): tonic/clonic, absence, myoclonic, atonic
- partial seizure (focal): simple partial, complex partial
- causes: primary seizure disorder, structural (trauma, intracranial hemorrhage, infection, increased ICP), metabolic disturbance (hypo/hyperglycemia, hypo/hyponatremia, hypocalcemia, hypomagnesemia, toxins/drugs)
- differential diagnosis: syncope, pseudoseizures, migraines, movement disorders, narcolepsy/cataplexy, myoclonus

History

- from patient and bystander: flaccid and unconscious, often with deep rapid breathing
- preceding aura, rapid onset, loss of bladder/bowel control, tongue-biting (sides of the tongue)
- timing: length of seizure

Physical Exam

- injuries to head and spine and bony prominences (e.g. elbows), tongue laceration, aspiration, urinary incontinence

Investigations

- known seizure disorder: antiepileptic drug levels
- Accu-Chek®
- first time seizure: CBC, serum glucose, electrolytes, BUN/Cr, Ca^{2+} , Mg^{2+} ; consider prolactin, β -hCG, toxicology screen
- initial imaging: CT; x-ray if suspected extremity injuries; definitive imaging: MRI, EEG

Minimum Workup in an Adult with 1st Time Seizure

CBC and differential
Electrolytes including Ca^{2+} , Mg^{2+} , PO_4^{3-}
Head CT

Table 14. Management of Status Epilepticus

Time (min)	Steps
0-5	Give oxygen; ensure adequate ventilation Monitor: vital signs, ECG, oximetry Establish IV access; obtain blood samples for glucose level, CBC, electrolytes, toxins, and antiepileptic drug levels
6-9	Give 50 mL 50% glucose (preceded by thiamine 100 mg IM in adults)
10-20	IV lorazepam 0.1 mg/kg at 2 mg/min or IV diazepam 0.2 mg/kg at 5 mg/min Diazepam can be repeated if seizures do not stop after 5 min; if diazepam is used to stop the status, then phenytoin should be administered promptly to prevent the recurrence of status
21-60	If status persists, administer 15-20 mg/kg of phenytoin intravenously no faster than 50 mg/min in adults and 1 mg/kg/min in children
>60	If status does not stop after 20 mg/kg of phenytoin, give additional doses of 5 mg/kg to a maximal dose of 30 mg/kg If status persists, then give 20 mg/kg of phenobarbital IV at 100 mg/min; when phenobarbital is given after a benzodiazepine, ventilatory assistance is usually required If status persists, then give general anesthesia (e.g. pentobarbital); vasopressors or fluid volume are usually necessary, EEG should be monitored; neuromuscular blockade may be needed

Adapted from: *Cecil Essentials of Medicine*, 7th edition, Table 125-7. Used with permission

Disposition

- the decision to admit or discharge should be based on the underlying disease process identified
 - if a patient has returned to baseline function and is neurologically intact, then consider discharge with outpatient follow-up
- first-time seizure patients being discharged should be referred to a neurologist for follow-up
- admitted patients should generally have a neurology consult
- patient should not drive until medically cleared (local regulations vary)
 - complete notification form to appropriate authority regarding ability to drive
- warn regarding other safety concerns (e.g. no swimming, bathing children alone, etc.)

If administering phenytoin, patient must be on a cardiac monitor as dysrhythmias and/or hypotension may occur

Shortness of Breath

- see [Respirology, R3](#) and [Cardiology and Cardiac Surgery, C5](#)

Etiology

- categorized into one of two groups: respiratory or cardiovascular
- respiratory system dyspnea: disorders of the central controller (brain), the ventilatory pump (ventilatory muscles, peripheral nerves), and the gas exchanger (alveoli and pulmonary capillaries)
- cardiovascular system dyspnea: cardiac diseases (acute ischemia, heart failure, systolic dysfunction, valvular disorders, pericardial diseases, arrhythmias), anemia, and deconditioning

History and Physical Exam

- acute SOB is often due to a relatively limited number of conditions; associated symptoms and signs are key to the appropriate diagnosis
 - substernal chest pain with cardiac ischemia
 - fever, cough, and sputum with respiratory infections
 - urticaria with anaphylaxis
 - wheezing with acute bronchospasm
 - chest tightness may be indicative of bronchospasm
 - a sensation of rapid, shallow breathing may correspond to interstitial disease
 - a sense of heavy breathing is typical of deconditioning
 - ask about environmental or occupational exposures
- dyspnea may be the sole complaint and the physical exam may reveal few abnormalities (e.g. PE, pneumothorax)
- vitals including pulse oximetry
 - wheeze (airway) vs. crackles (parenchymal), JVP, and murmurs

Investigations

- blood work
 - CBC and differential (hematocrit to exclude anemia), electrolytes, consider VBG
 - serial cardiac enzymes and ECG if considering cardiac source
- imaging
 - CXR (hyperinflation and bullous disease suggestive of obstructive lung disease, or changes in interstitial markings consistent with inflammation, infection, or interstitial fluid)
 - CT chest usually is not indicated in the initial evaluation of patients with dyspnea, but can be valuable in patients with interstitial lung disease, occult emphysema, or chronic thromboembolic disease (i.e. PE)

Management of Life-Threatening Dyspnea NYD

- see [Primary and Secondary Surveys, ER2, ER5](#)
- treat underlying cause

Disposition

- the history and physical exam lead to accurate diagnoses in patients with dyspnea in approximately two-thirds of cases; the decision to admit or discharge should be based on the underlying disease process identified
 - consider intubation in CO₂ retainers (e.g. COPD)
- if the decision to discharge is chosen, provide appropriate discharge instructions to return in case of returning/worsening SOB

Causes of Acute Dyspnea

Cardiovascular: acute MI, CHF, cardiac tamponade, dysrhythmias

Respiratory: bronchospasm, PE, pneumothorax, infection (bronchitis, pneumonia), upper airway obstruction (aspiration, anaphylaxis)

Syncope

Definition

- sudden, transient loss of consciousness and postural tone with spontaneous recovery
- usually caused by generalized cerebral or reticular activating system hypoperfusion

Etiology

- cardiogenic: dysrhythmia, outflow obstruction (e.g. PE, tamponade, tension pneumothorax, pulmonary HTN), MI, valvular disease
- non-cardiogenic: peripheral vascular (hypovolemia), vasovagal, cerebrovascular disorders, CNS, metabolic disturbances (e.g. EtOH intoxication)

History

- gather details from witnesses, and clarify patient's experience (e.g. dizziness, ataxia, or true syncope)
 - two key historical features: prodrome and situation

5 Types of Syncope

- Vasomotor
- Cardiac
- CNS
- Metabolic
- Psychogenic

- distinguish between syncope and seizure (see [Neurology, N16](#))
 - some patients may have myoclonic jerks with syncope – NOT a seizure
 - signs and symptoms during presyncope, syncope, and postsyncope
 - past medical history, drugs
 - think anatomically in differential; pump (heart), blood, vessels, brain
- syncope is cardiogenic until proven otherwise if:
 - there is sudden loss of consciousness with no warning or prodrome
 - syncope is accompanied by chest pain

Physical Exam

- postural BP and HR
- cardiovascular, respiratory, and neurological exam
- physical findings in the elderly patient who falls (**I HATE FALLING**):
 - Inflammation of joints (or joint deformity)
 - Hypotension (orthostatic BP changes)
 - Auditory and visual abnormalities
 - Tremor (Parkinson's disease or other causes of tremor)
 - Equilibrium (balance) problem
 - Foot problems
 - Arrhythmia (dysrhythmia), heart block, or valvular disease
 - Leg-length discrepancy
 - Lack of conditioning (generalized weakness)
 - Illness
 - Nutrition (poor; weight loss)
 - Gait disturbance

Investigations

- ECG (tachycardia, bradycardia, blocks, Wolff-Parkinson White, long QT interval), bedside glucose
- blood work: CBC, electrolytes, BUN/Cr, ABGs, troponin, Ca^{2+} , Mg^{2+} , β -hCG
- consider toxicology screen

Management

- ABCs, IV, O_2 , monitor
- examine for signs of trauma caused by syncopal episode
- cardiogenic syncope: admit to medicine/cardiology
- low risk syncope: discharge with follow-up as indicated by cause (non-cardiogenic syncope may still be admitted)

Disposition

- decision to admit is based on etiology
- most patients will be discharged
- on discharge, instruct patient to follow up with family physician
 - educate regarding avoiding orthostatic or situational syncope
 - evaluate the patient for fitness to drive or work
 - patients with recurrent syncope should avoid high-risk activities (e.g. driving)

Causes of Syncope by System

HEAD, HEART, VeSSELS

Hypoxia/Hypoglycemia

Epilepsy

Anxiety

Dysfunctional brainstem

Heart attack

Embolism (PE)

Aortic obstruction

Rhythm disturbance

Tachycardia

Vasovagal

Situational

Subclavian steal

ENT (glossopharyngeal neuralgia)

Low systemic vascular resistance

Sensitive carotid sinus

San Francisco Syncope Rule: High risk of adverse outcomes in syncope patients if:

CHES

CHF: Hx of CHF

Hct: Low

ECG: Abnormal

SOB: Hx of dyspnea

SBP: sBP <90 at triage

Sexual Assault

Epidemiology

- 1 in 4 women and 1 in 10 men will be sexually assaulted in their lifetime
- it is estimated that only 7% of rapes are reported

General Approach

- ABCs, treat acute, serious injuries
- ensure patient is not left alone and provide ongoing emotional support
- set aside adequate time for exam (usually 1.5 h)
- obtain consent for medical exam and treatment, collection of evidence, disclosure to police (notify police as soon as consent obtained)
- Sexual Assault Kit (document injuries, collect evidence) if <72 h since assault
- label samples immediately and pass directly to police
- offer community crisis resources (e.g. shelter, hotline)
- do not report unless victim requests (legally required if <16 yr old)

History

- ensure privacy for the patient – others should be asked to leave
- questions to ask: who, when, where did penetration occur, what happened, any weapons or physical assault?

Legally required to report sexual assault if victim is <16 yr of age to CAS

- post-assault activities (urination, defecation, change of clothes, shower, douche, etc.)
- gynecologic history
 - gravidity, parity, last menstrual period
 - contraception use
 - last voluntary intercourse (sperm motile 6-12 h in vagina, 5 d in cervix)
- medical history: acute injury/illness, chronic diseases, psychiatric history, medications, allergies, etc.

Physical Exam

- evidence collection is always secondary to treatment of serious injuries
- never re-traumatize a patient with the examination
- general examination
 - mental status
 - sexual maturity
 - patient should remove clothes and place in paper bag
 - document abrasions, bruises, lacerations, torn frenulum/broken teeth (indicates oral penetration)
- pelvic exam and specimen collection
 - ideally before urination or defecation
 - examine for seminal stains, hymen, signs of trauma
 - collect moistened swabs of dried seminal stains
 - pubic hair combings and cuttings
 - speculum exam
 - ♦ lubricate with water only
 - ♦ vaginal lacerations, foreign bodies
 - ♦ Pap smear
 - ♦ oral/cervical/rectal culture for gonorrhea and chlamydia
 - ♦ posterior fornix secretions if present or aspiration of saline irrigation
 - ♦ immediate wet smear for motile sperm
 - ♦ air-dried slides for immotile sperm, acid phosphatase, ABO group
- others
 - fingernail scrapings
 - saliva sample from victim

Investigations

- VDRL: repeat in 3 mo if negative
- serum β -hCG
- blood for ABO group, Rh type, baseline serology (e.g. hepatitis, HIV)

Management

- involve local/regional sexual assault team
- medical
 - suture lacerations
 - tetanus prophylaxis
 - gynecology consult for foreign body, complex lacerations
 - assumed positive for gonorrhea and chlamydia
 - ♦ management: azithromycin 1 g PO x 1 dose (alt: doxycycline 100 mg PO bid x 7 d) and cefixime 800 mg PO x 1 dose (alt: ceftriaxone 1 g IM x 1 dose)
 - may start prophylaxis for hepatitis B and HIV
 - pre and post counseling for HIV testing
 - pregnancy prophylaxis offered
 - ♦ levonorgestrel 0.75 mg PO STAT, repeat within 12 h (Plan B®)
- psychological
 - high incidence of psychological sequelae
 - have victim change and shower after exam completed

Disposition

- discharge if injuries/social situation permit
- follow-up with physician in rape crisis center within 24 h
- best if patient does not leave ED alone

DOMESTIC VIOLENCE

- women are usually the victims, but male victimization also occurs
- identify the problem (need high index of suspicion)
 - suggestive injuries (bruises, sprains, abrasions, occasionally fractures, burns, or other injuries; often inconsistent with history provided)
 - somatic symptoms (chronic and vague complaints)
 - psychosocial symptoms
 - clinician impression (your 'gut feeling', e.g. overbearing partner that won't leave patient's side)
- if disclosed, be supportive and assess danger
- patient must consent to follow-up investigation/reporting (unless for children)

Risk of Sexually Transmitted Disease After Sexual Assault

- Gonorrhea: 6-18%
- Chlamydia: 4-17%
- Syphilis: 0.5-3%
- HIV: <1%

How do you get a patient who is accompanied by her partner alone without arousing suspicion; order an x-ray

Management

- treat injuries
- ask about sexual assault and children at home (encourage notification of police)
- document findings
- safety plan
- follow-up: family doctor/social worker

Medical Emergencies

Anaphylaxis and Allergic Reactions

Etiology

- anaphylaxis is an exaggerated immune mediated hypersensitivity reaction that leads to systemic histamine release, increased vascular permeability, and vasodilation; regardless of the etiology, the presentation and management of anaphylactic reactions are the same
 - allergic (re-exposure to allergen)
 - non-allergic (e.g. exercise induced)

Presentation

- classic presentation of anaphylaxis includes
 1. rapid onset and progression of symptoms
 2. life-threatening compromise of one or more of airway (breathing/swallowing difficulty, stridor, voice change), breathing (SOB, hypoxemia, wheezing, respiratory arrest), and circulation (tachycardia, hypotension, confusion, decreased urine output, chest pain)
 3. involvement of skin (erythema, urticaria, warmth) and/or mucosa (angioedema, obstruction, GI symptoms) not always present
- the presentation of anaphylaxis is diverse and there is no one specific symptom or sign for it
 - combinations of symptoms and signs will make anaphylaxis more likely
- life-threatening differentials for anaphylaxis include asthma and septic shock

Management

1. immediate initial management (call for help and perform concurrently)
 - give 0.5 mL of 1:1,000 epinephrine IM to lateral thigh (0.01 mL/kg up to 0.4 mL for children)
 - remove causative agent if possible
 - if severely compromised ABC or LOC, consult ICU immediately
 - otherwise, provide 100% O₂ through mask, give bolus 1,000 mL (20 mL/kg for children) crystalloid IV, then reassess; if IV access difficult, give fluid through intraosseous route
 - have continuous pulse oximetry and telemetry monitoring
 - frequently monitor BP
2. secondary treatment
 - diphenhydramine (Benadryl®) 50 mg IM or IV q4-6h
 - methylprednisolone 50-100 mg IV (dose depending on severity)
 - salbutamol (Ventolin®) via nebulizer if bronchospasm

Disposition

- monitor for 4-6 h in ED (minimum) and arrange follow-up with family physician in 24-48 h
- can have second phase (biphasic) reaction up to 48 h later, patient may need to be supervised (oral steroids on discharge may prevent this)
- educate patient on avoidance of allergens
- 3-day course of:
 - H1 antagonist (cetirizine 10 mg PO OD or Benadryl® 50 mg PO q4-6h)
 - H2 antagonist (ranitidine 150 mg PO OD)
 - corticosteroid (prednisone 50 mg PO OD) generally given for 5 d

Asthma

- see [Respirology, R7](#)
- chronic inflammatory airway disease with episodes of bronchospasm and inflammation resulting in reversible airflow obstruction

Investigations

- O₂ saturation
- peak flow meter
- ± ABG if in severe respiratory distress
- CXR if diagnosis in doubt or concerns of pneumonia, pneumothorax, etc.

**Most Common Triggers for Anaphylaxis**

- Foods (nuts, shellfish, etc.)
- Stings
- Drugs (penicillin, NSAIDs, ACEI)
- Radiographic contrast media
- Blood products
- Latex

Anaphylaxis should be suspected if airway, breathing, or especially circulation compromise is present after exposure to a known allergen

Beware of the silent chest in asthma exacerbations; this is a medical emergency and may require emergency intubation

Table 15. Asthma Assessment and Management

Classifications	History and Physical Exam	Management
Respiratory Arrest Imminent	<ul style="list-style-type: none"> Exhausted, confused, diaphoretic, cyanotic Silent chest, ineffective respiratory effort Decreased HR, RR > 30, pCO₂ > 45 mmHg O₂ sat < 90% despite supplemental O₂ 	<ul style="list-style-type: none"> 100% O₂, cardiac monitor, IV access Intubate (consider induction with ketamine) β-agonist: nebulizer 5 mg continually Anticholinergics: nebulizer 0.5 mg x 3 IV steroids: methylprednisolone 125 mg
Severe Asthma	<ul style="list-style-type: none"> Agitated, diaphoretic, labored respirations Speaking in words No relief from β-agonist O₂ sat < 90%, FEV₁ < 50% 	<ul style="list-style-type: none"> Anticipate need for intubation Similar to above management Magnesium sulphate 2 g IV O₂ to achieve O₂ sat > 92%
Moderate Asthma	<ul style="list-style-type: none"> SOB at rest, cough, congestion, chest tightness Speaking in phrases Inadequate relief from β-agonist FEV₁ 50-80% 	<ul style="list-style-type: none"> O₂ to achieve O₂ sat > 92% β-agonist: MDI or nebulizer q5min Steroids: prednisone 40-60 mg PO Anticholinergics (Atrovent) MDI or nebulizer x3
Mild Asthma	<ul style="list-style-type: none"> Exertional SOB/cough with some nocturnal symptoms Difficulty finishing sentences FEV₁ > 80% 	<ul style="list-style-type: none"> β-agonist Monitor FEV₁ Consider steroids (MDI or PO)

**5 Essential Elements on History**

- Cause of exacerbation
- Previous ER/ICU visits
- Previous intubations
- Timing of recent steroid use
- Frequency of asthma medication use

Disposition

- β-agonist MDI regular use (2-4 puffs q2-4h) until symptoms controlled, then prn
- prednisone 30-60 mg/d for 7-14 d with no taper
- counsel on medication adherence
- inhaled corticosteroids if not already prescribed
- follow-up with primary care physician

Cardiac Dysrhythmias

- see [Cardiology and Cardiac Surgery, C15](#)

**Bradydysrhythmias and AV Conduction Blocks**

- AV conduction blocks
 - 1st degree: prolonged PR interval (>200 msec), no treatment required
 - 2nd degree
 - ♦ Mobitz I: gradual prolongation of PR interval then dropped QRS complex, usually benign
 - ♦ Mobitz II: PR interval constant with dropped QRS complex, can progress to 3rd degree AV block
 - 3rd degree: P wave unrelated to QRS complex, PP and RR intervals constant
 - ♦ atropine and transcutaneous pacemaker (atropine with caution)
 - ♦ if transcutaneous pacemaker fails consider dopamine, epinephrine IV
 - long-term treatment for Mobitz II and 3rd degree block – internal pacemaker
- sinus bradycardia (rate < 60 bpm)
 - can be normal (especially in athletes)
 - causes: vagal stimulation, vomiting, myocardial infarction/ischemia, increased ICP, sick sinus node, hypothyroidism, drugs (e.g. β-blockers, CCBs)
 - treat if symptomatic (hypotension, chest pain)
 - ♦ acute: atropine ± transcutaneous pacing
 - ♦ sick sinus: transcutaneous pacing
 - ♦ drug induced: discontinue/reduce offending drug

Supraventricular Tachydysrhythmias (narrow QRS)

- sinus tachycardia (rate > 100 bpm)
 - causes: increased sympathetic tone, drugs, fever, hypotension, anemia, thyrotoxicosis, MI, PE, emotional, pain, etc.
 - search for and treat underlying cause, consider β-blocker if symptomatic
- regular rhythm
 - vagal maneuvers (carotid massage, Valsalva), adenosine 6 mg IV push, if no conversion give 12 mg, can repeat 12 mg dose once
 - rhythm converts: probable re-entry tachycardia (AVNRT more common than AVRT)
 - ♦ monitor for recurrence
 - ♦ treat recurrence with adenosine or longer acting medications
 - rhythm does not convert: atrial flutter, ectopic atrial tachycardia, junctional tachycardia
 - ♦ rate control (diltiazem, β-blockers) and consult cardiology
- irregular rhythm
 - probable atrial fibrillation, atrial flutter, or multifocal atrial tachycardia
 - rate control (diltiazem, β-blockers)

If the patient with tachydysrhythmia is unstable, perform immediate synchronized cardioversion

Atrial Fibrillation

- most common sustained dysrhythmia; no organized P waves (atrial rate >300/min), irregularly irregular heart rate, narrow QRS (typically)
- etiology: HTN, CAD, thyrotoxicosis, EtOH (holiday heart), valvular disease, pericarditis, cardiomyopathy, sick sinus syndrome
- treatment principles: stroke prevention, treat symptoms, identify/treat underlying cause
- decreases cardiac output by 20-30% (due to loss of organized atrial contractions)
- acute management
 - if unstable: immediate synchronized cardioversion
 - if onset of AFib is >48 h: rate control, anticoagulate 3 wk prior to and 4 wk after cardioversion or do transesophageal echocardiogram to rule out clot
 - if onset <48 h: may cardiovert
 - ♦ electrical cardioversion: synchronized direct current (DC) cardioversion
 - ♦ chemical cardioversion: procainamide, flecainide, propafenone
- long-term management: rate or rhythm control, consider anticoagulation (CHADS2 score, see [Cardiology and Cardiac Surgery, C19](#))

If patient has Wolff-Parkinson-White and is in AFib use amiodarone or procainamide. Avoid AV nodal blocking agents (adenosine, digoxin, diltiazem, verapamil, β -blockers), as this can increase conduction through bypass tract, leading to cardiac arrest

Ventricular Tachydysrhythmias (wide QRS)

- VTach (rate usually 140-200 bpm)
 - definition: 3 or more consecutive ventricular beats at >100 bpm
 - etiology: CAD with MI is most common cause
 - treatment: sustained VTach (>30 s) is an emergency
 - ♦ hemodynamic compromise: synchronized DC cardioversion
 - ♦ no hemodynamic compromise: synchronized DC cardioversion, lidocaine, amiodarone, procainamide
- ventricular fibrillation: call a code blue, follow ACLS for pulseless arrest
- torsades de pointes
 - looks like VTach but QRS 'rotates around baseline' with changing axis and amplitude (twisted ribbon)
 - etiology: prolonged QT due to drugs (e.g. quinidine, TCAs, erythromycin, quinolones), electrolyte imbalance (hypokalemia, hypomagnesemia), congenital
 - treatment:
 - ♦ IV Mg^{2+} , temporary overdrive pacing, isoproterenol
 - ♦ correct cause of prolonged QT

Need to Rule Out with COPD Exacerbation

- Pneumothorax
- CHF exacerbation
- Acute MI
- Pneumonia and other infectious causes
- PE

Causes of CHF Exacerbation

FAILURE

Forgot medication
Arrhythmia (Dysrhythmia)/Anemia
Ischemia/Infarction/Infection
Lifestyle (e.g. too much salt)
Upregulation of cardiac output (pregnancy, hyperthyroidism)
Renal failure
Embolism (pulmonary)

Hospital Management Required if:

- Acute MI
- Pulmonary edema or severe respiratory distress
- Severe complicating medical illness (e.g. pneumonia)
- Anasarca
- Symptomatic hypotension or syncope
- Refractory to outpatient therapy
- Thromboembolic complications requiring interventions
- Clinically significant dysrhythmias
- Inadequate social support for safe outpatient management
- Persistent hypoxia requiring supplemental oxygen

CHF on CXR

- Pulmonary vascular redistribution
- Perihilar infiltrates
- Interstitial edema, Kerley B lines
- Alveolar edema, bilateral infiltrates
- May see cardiomegaly, pleural effusions

Acute Treatment of CHF

LMNOP

Lasix (furosemide)
Morphine
Nitroglycerine
Oxygen
Position (sit upright), Pressure (BiPAP)

Chronic Obstructive Pulmonary Disease

- see [Respirology, R9](#)
- progressive development of irreversible airway obstruction, typically caused by smoking
- acute exacerbation: episode of increased dyspnea, coughing, increase in sputum volume or purulence

History and Physical Exam

- worsening dyspnea or tachypnea
- acute change in frequency, quantity, and color of sputum production
- triggers: pneumonia, urinary tract infection, PE, CHF, MI, drugs

Investigations

- CBC, electrolytes, ABG, CXR, ECG, PFTs

Management

- keep O_2 sat 88-92% (be aware when giving O_2 to chronic hypercapnic/ CO_2 retainers but do not withhold O_2 if hypoxic)
- apply BiPAP if severe distress, arterial pH <7.35, or hypercapnic
- ipratropium is anticholinergic agent of choice, add salbutamol
- steroids: ipratropium 40 mg PO for 5 d
- antibiotics: TMP-SMX, cephalosporins, respiratory quinolones (if acute change in frequency, quantity, and color of sputum production)
- if life-threatening, ICU admission for ventilation (chance of ventilation dependency)
- lower threshold to admit if comorbid illness

Disposition

- can use up to 4-6 puffs qid of ipratropium and salbutamol for exacerbations
- continue antibiotics if started and give tapering steroids

Congestive Heart Failure

- see [Cardiology and Cardiac Surgery, C33](#)

Etiology

- decreased myocardial contractility: ischemia, infarction, cardiomyopathy, myocarditis
- pressure overload states: HTN, valve abnormalities, congenital heart disease
- restricted cardiac output: myocardial infiltrative disease, cardiac tamponade
- volume overload

Presentation

- left-sided heart failure
 - dyspnea, decreased exercise tolerance, paroxysmal nocturnal dyspnea, orthopnea, nocturia, fatigue, possibly altered mental status, syncope, angina, systemic hypotension
 - hypoxia, decreased air entry to lungs, rales, S3 or S4, pulmonary edema on CXR, pleural effusion (usually right sided)
- right-sided heart failure
 - dependent bilateral pitting edema, JVP elevation, hepatic enlargement, ascites
- patients often present with a combination of right-sided and left-sided symptoms

Investigations

- labs: CBC, electrolytes, AST, ALT, bilirubin, Cr, BUN, cardiac enzymes, brain natriuretic peptide
- CXR (see [sidebar, ER32](#))
- ECG: look for MI, ischemia (ST elevation/depression, T-wave inversion)
 - in CHF: LVH, atrial enlargement, conduction abnormalities
- ABG: if severe or refractory to treatment
 - hypoxemia, hypercapnia and acidosis are signs of severe CHF
- echocardiogram: not usually used in emergency evaluation, previous results may aid in diagnosis
- may be precipitated by dysrhythmia (e.g. sudden onset AFib) – correct if new
- rule out serious differentials such as PE, pneumothorax, pneumonia/empyema, COPD exacerbation

Management (acute)

- ABC, may require intubation if severe hypoxia
- sit upright, cardiac monitoring and continuous pulse oximetry
- saline lock IV, Foley catheter (to follow effectiveness of diuresis)
- 100% O₂ by mask
 - if poor response, may require BiPAP or intubation
- drugs
 - nitroglycerin 0.3 mg SL q5min prn ± topical nitroglycerine patch (0.2-0.8 mg/h)
 - ♦ if not responding or ischemia: 10-200 µg/min IV, titrate
 - diuretic if volume overloaded (e.g. furosemide 40-80 mg IV), use caution if cause is valvulopathy
 - morphine 1-2 mg IV prn
 - ♦ if hypotensive: dobutamine (2.5 µg/kg/min IV) or dopamine (5-10 µg/kg/min IV), titrate up to sBP 90-100 mmHg
 - ASA 160 mg chew and swallow
- treat precipitating factor
- cardiology or medicine consult

Risk Factors for VTE

THROMBOSIS
 Trauma, travel
 Hypercoagulable, HRT
 Recreational drugs (IVDU)
 Old (age >60)
 Malignancy
 Birth control pill
 Obesity, obstetrics
 Surgery, smoking
 Immobilization
 Sickness (CHF, MI, nephrotic syndrome, vasculitis)

PERC Score

- Age >50 yr
- HR >100 bpm
- O₂ sat on RA <94%
- Prior history DVT/PE
- Recent trauma or surgery
- Hemoptysis
- Exogenous estrogen
- Clinical signs suggesting DVT

Score 1 for each question; a score 0/8 means patient has <1.6% chance having a PE and avoids further investigation. It is important to note that this clinical score cannot be applied to pregnant women

Wells' Criteria for PE

Previous Hx of DVT/emboli	+1.5
HR >100	+1.5
Recent immobility or surgery	+1.5
Clinical signs of DVT	+3
Alternate Dx less likely than PE	+3
Hemoptysis	+1
Cancer	+1

0-2: Low probability
 2-6: Intermediate probability
 >6: High probability

Deep Vein Thrombosis and Pulmonary Embolism

- see [Respirology, R18](#)

Risk Factors

- Virchow's triad
 - alterations in blood flow (venous stasis)
 - injury to endothelium
 - hypercoagulable state (including pregnancy, use of OCP, malignancy)
- clinical risk factors

Presentation

- DVT: calf pain, leg swelling/erythema/edema, palpable cord on exam; can be asymptomatic
- PE: dyspnea, pleuritic chest pain, hemoptysis, tachypnea, cyanosis, hypoxia, fever
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT/PE; investigation often needed
- calculate the PERC (PE rule out criteria) score to assess the need for PE workup before assessing the likelihood of a PE (Wells' Criteria)

Investigations

- ECG and CXR are useful to look for other causes (e.g. ACS, pneumonia)
- D-dimer is only useful if it is negative in low risk patients (highly sensitive)
- U/S has high sensitivity and specificity for proximal clot but only 73% sensitivity for DVT below the knee (may need to repeat in 1 wk)
- CT angiography has high sensitivity and specificity for PE, may also suggest other etiology
- V/Q scan useful when CT angiography not available, or patient unable to tolerate IV contrast (e.g. renal failure, allergy)

Management of DVT/PE

- LMWH unless patient also has renal failure
 - dalteparin 200 IU/kg SC q24h or enoxaparin 1.5 mg/kg SC q24h
- warfarin started at same time as LMWH (5 mg PO OD initially)
- LMWH discontinued when INR has been therapeutic (2-3) for 2 consecutive days
 - early ambulation with analgesia is safe if appropriately anticoagulated
- rivaroxaban can be used in both acute management of symptomatic DVT or PE and extended treatment
 - 15 mg PO bid for first 21 days; 20 mg PO daily for remaining treatment (taken with food at approximately the same time each day)
- IVC filter or surgical thrombectomy considered if anticoagulation is contraindicated
- consider thrombolysis if extensive DVT or PE causing hemodynamic compromise
- often can be treated as outpatient, may require analgesia for chest pain (narcotic or NSAID)
- admit if hemodynamically unstable, require supplemental O₂, major comorbidities, lack of sufficient social supports, unable to ambulate, need invasive therapy
 - consider referral to medicine for coagulopathy and malignancy workup
- long-term anticoagulation
 - if reversible risk factor: 3-6 mo of warfarin
 - idiopathic VTE: may need longer term warfarin (5 yr or more)

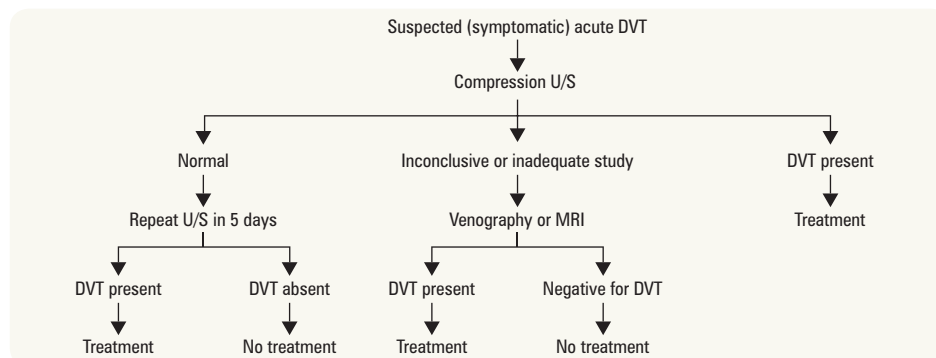

Figure 12. Approach to suspected DVT

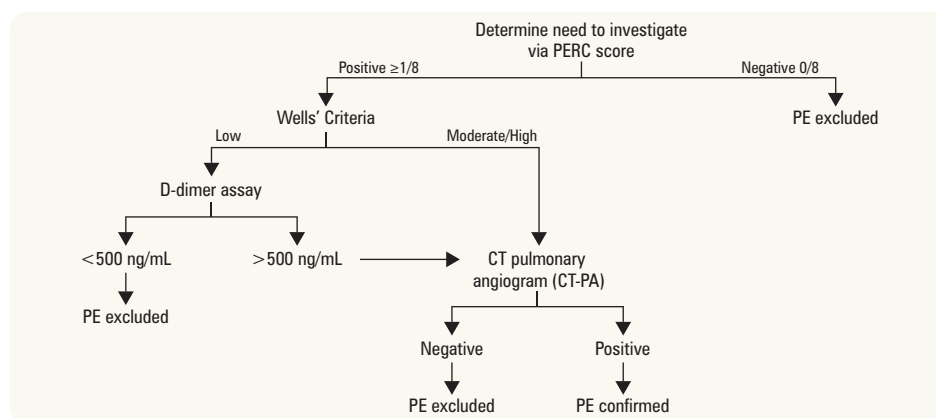

Figure 13. Approach to suspected PE

Oral Rivaroxaban for the Treatment of Symptomatic Pulmonary Embolism

NEJM 2012;366:1287-97

Background: A fixed-dose regimen of rivaroxaban, an oral factor Xa inhibitor, has been shown to be as effective as standard anticoagulant therapy for the treatment of DVT, without the need for laboratory monitoring.

Methods: A randomized, open-label, event-driven, non-inferiority trial involving 4,832 patients who had acute symptomatic PE with or without DVT, was undertaken to compare rivaroxaban (15 mg twice daily for 3 wk, followed by 20 mg once daily) with standard therapy with enoxaparin followed by an adjusted-dose vitamin K antagonist for 3, 6, or 12 mo. The primary efficacy outcome was symptomatic recurrent VTE.

Results: Rivaroxaban was non-inferior to standard therapy (non-inferiority margin, 2.0; $p=0.003$) for the primary efficacy outcome, with 50 events in the rivaroxaban group (2.1%) vs. 44 events in the standard-therapy group (1.8%) (hazard ratio, 1.12; 95% CI 0.75 to 1.68). The principal safety outcome occurred in 10.3% of patients in the rivaroxaban group and 11.4% of those in the standard-therapy group (hazard ratio, 0.90; 95% CI 0.76-1.07; $p=0.23$). Major bleeding was observed in 26 patients (1.1%) in the rivaroxaban group and 52 patients (2.2%) in the standard-therapy group (hazard ratio, 0.49; 95% CI 0.31-0.79; $p=0.003$). Rates of other adverse events were similar in the two groups.

Conclusions: A fixed-dose regimen of rivaroxaban alone was non-inferior to standard therapy for the initial and long-term treatment of PE and had a potentially improved benefit-risk profile.

Oral Rivaroxaban for the Treatment of Symptomatic Venous Thromboembolism

NEJM 2010;363:2499-510

Background: Rivaroxaban, an oral factor Xa inhibitor, may provide a simple, fixed-dose regimen for treating acute DVT and for continued treatment, without the need for laboratory monitoring.

Methods: An open-label, randomized, event-driven, non-inferiority study was conducted that compared oral rivaroxaban alone (15 mg twice daily for 3 wk, followed by 20 mg once daily) with subcutaneous enoxaparin followed by a vitamin K antagonist (either warfarin or acenocoumarol) for 3, 6, or 12 mo in patients with acute, symptomatic DVT. In parallel, a double-blind, randomized, event-driven superiority study was conducted to compare rivaroxaban alone (20 mg once daily) with placebo for an additional 6 to 12 mo in patients who had completed 6 to 12 mo of treatment for VTE. The primary efficacy outcome for both studies was recurrent VTE. The principal safety outcome was major bleeding or clinically relevant non-major bleeding in the initial-treatment study and major bleeding in the continued-treatment study.

Results: The study of rivaroxaban for acute DVT included 3,449 patients: 1,731 given rivaroxaban and 1,718 given enoxaparin plus a vitamin K antagonist. Rivaroxaban had non-inferior efficacy with respect to the primary outcome (36 events [2.1%], vs. 51 events with enoxaparin-vitamin K antagonist [3.0%]; hazard ratio, 0.68; 95% CI 0.44-1.04; $p<0.001$). The principal safety outcome occurred in 8.1% of the patients in each group. In the continued-treatment study, which included 602 patients in the rivaroxaban group and 594 in the placebo group, rivaroxaban had superior efficacy (8 events [1.3%], vs. 42 with placebo [7.1%]; hazard ratio, 0.18; 95% CI 0.09-0.39; $p<0.001$). Four patients in the rivaroxaban group had nonfatal major bleeding (0.7%), vs. none in the placebo group ($p=0.11$).

Conclusions: Rivaroxaban offers a simple, single-drug approach to the short-term and continued treatment of VTE that may improve the benefit-to-risk profile of anticoagulation.

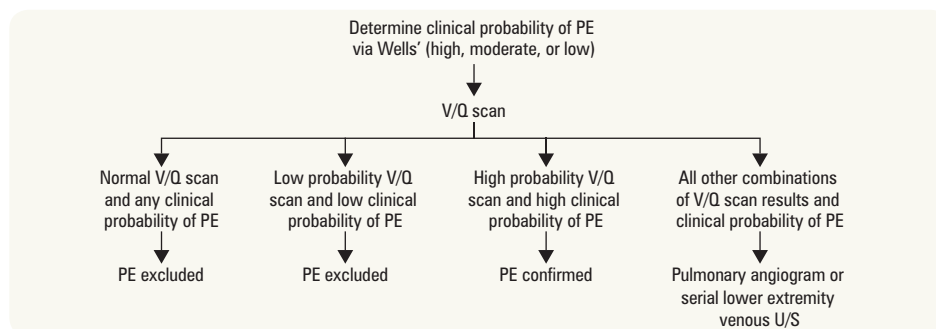

Figure 14. V/Q-based algorithm for suspected PE

**Pre-Test Probability for DVT (Wells' Score)**

Active cancer	+1
Paralysis or immobilization	+1
Recently bedridden >3 d or surgery within 4 wk	+1
Localized tenderness in deep vein system	+1
Entire leg swollen	+1
Calf swelling >3 cm asymptomatic side	+1
Pitting edema on affected side	+1
Superficial (non-varicose) veins	+1
Alternative dx more likely than DVT	-2

0-1: DVT unlikely

≥2: DVT likely

Adapted from: Wells PS, Anderson DR, Bormanis J, et al. Value of assessment of pretest probability of deep vein thrombosis in clinical management *Lancet* 2002;350:1795-1798

D-dimer is only useful if it is negative; negative predictive value >99%

50% of patients with symptomatic proximal DVT will develop PE, often within days to weeks of the event

Clinical Criteria to Prevent Unnecessary Diagnostic Testing in Emergency Department Patients with Suspected Pulmonary Embolism
J Thromb Haemost 2004;2:1247-1255

Purpose: To develop PE rule-out criteria (PERC) that can be used at the bedside, and prevents overtesting for PE, which includes the D-dimer test that frequently results in false positives.

Study: 21 variables were collected prospectively from 3,148 ER patients evaluated for possible PE to develop rule-out criteria. The application of the developed rules was investigated in 1,427 low-risk patients and 382 very low-risk patients.

Results: Eight variables were included in a block rule (age <50 yr, pulse <100 bpm, SaO₂ >94%, no unilateral leg swelling, no hemoptysis, no recent trauma or surgery, no prior PE or DVT, no hormone use), and a negative score was used to rule-out PE. In low-risk and very low-risk patients, the rule had a sensitivity of 96 and 100%, respectively and a specificity of 27 and 15%, respectively.

Summary: D-dimer testing for PE may not be favourable if all eight factors in the PERC are negative.

**Precipitating Factors in DKA**

The 5 Is
 Infection
 Ischemia
 Infarction
 Intoxication
 Insulin missed

Diabetic Emergencies

- see [Endocrinology](#), E11

Diabetic Ketoacidosis

- severe insulin deficiency resulting in hyperglycemia (200-1,000 mg/dL), dehydration, and electrolyte abnormalities
- history and physical exam – often young, type 1 DM, may be first presentation of undiagnosed DM (may occur in small percentage of type 2 DM patients)
 - early symptoms: polyuria, polydipsia, malaise, nocturia, weight loss
 - late signs and symptoms
 - ♦ anorexia, N/V, dyspnea (often due to acidosis), fatigue
 - ♦ abdominal pain
 - ♦ drowsiness, stupor, coma
 - ♦ Kussmaul's respiration
 - ♦ fruity acetone breath
- investigations
 - CBC, glucose, electrolytes, BUN/Cr, Ca²⁺, Mg²⁺, PO₄³⁻, urine glucose and ketones
 - ABG
 - ECG (MI possible precipitant; electrolyte disturbances may predispose to dysrhythmia)
- management
 - rehydration
 - ♦ bolus of NS, then high rate NS infusion (beware of overhydration and cerebral edema, especially in pediatric patients)
 - ♦ beware of a pseudohyponatremia due to hyperglycemia (add 3 Na⁺ per 18 glucose over 100 mg/dL)
 - potassium
 - ♦ essential to avoid hypokalemia: replace KCl (20 mEq/L if adequate renal function and initial K⁺ <5.5 mEq/L)
 - ♦ use cardiac monitoring if potassium levels normal or low
 - insulin
 - ♦ critical, as this is the only way to turn off gluconeogenesis/ketosis
 - ♦ do not give insulin if K⁺ <3.3 mEq/L
 - ♦ initial bolus of 5-10 U short-acting/regular insulin (or 0.2 U/kg) IV in adults (controversial – may just start with infusion)
 - ♦ followed by continuous infusion at 5-10 U (or 0.1 U/kg) per h
 - ♦ add D5W to IV fluids when blood glucose <270 mg/dL to prevent hypoglycemia
 - bicarbonate is not given unless patient is at risk of death or shock (typically pH <7.0)

Hyperosmolar Hyperglycemic State

- state of extreme hyperglycemia (800-2,400 mg/dL) due to relative insulin deficiency, increased counter-regulatory hormones, gluconeogenesis, and dehydration (due to osmotic diuresis) in type 2 DM, high mortality (5-20%)
- history and physical exam
 - mental disturbances, coma, delirium, seizures
 - polyuria
 - N/V
- investigations
 - CBC, electrolytes, Cr, BUN, glucose, Mg²⁺, PO₄³⁻, urine glucose and ketones
 - ABG
 - ECG
- management
 - rehydration with IV NS (total water deficit estimated at average 100 cc/kg body weight)
 - O₂ and cardiac monitoring, frequent electrolyte and glucose monitoring
 - insulin as required
 - identify and treat precipitant if present (the 5 Is)

Hypoglycemia

- very common ED presentation
- history and physical exam
 - last meal, known DM, prior similar episodes, drug therapy and compliance
 - liver/renal/endocrine/neoplastic disease
 - depression, alcohol or drug use
- management
 - IV access and rapid blood glucose measurement
 - D50W 50 mL IV push, glucose PO if mental status permits
 - ♦ if IV access not possible, glucagon 1-2 mg IM, repeat x 1 in 10-20 min
 - O₂, cardiac, frequent blood glucose monitoring
 - thiamine 100 mg IM
 - full meal as soon as mental status permits
 - if episode due to long-acting insulin, or sulfonylureas, watch for prolonged hypoglycemia due to long t_{1/2} (may require admission for monitoring)
 - search for cause (most often due to exogenous insulin, alcohol, or sulfonylureas)

4 Criteria for DKA Dx

- Hyperglycemia
- Metabolic acidosis
- Hyperketonemia
- Ketonuria

Cerebral edema may occur if hyperosmolality is treated too aggressively

Electrolyte Disturbances

- see [Nephrology](#), NP7 and [Endocrinology](#), E38

Table 16. Electrolyte Disturbances

Electrolyte Disturbance	Common Causes	Symptoms	Treatment	Special Considerations
Hypernatremia	Inadequate H ₂ O intake (elderly/disabled) or inappropriate excretion of H ₂ O (diuretics, Li, and DI)	Lethargy, weakness, irritability, and edema; seizures and coma occur with severe elevations of Na ⁺ levels (> 158 mEq/L)	Salt restrict and give free water	No more than 12 mEq/L in 24 h drop in Na ⁺ (0.5 mEq/L/h) due to risk of cerebral edema, seizures, death
Hyponatremia	Hypo-osmolar (dilutional e.g. CHF, cirrhosis, ascites) and hyper-osmolar (usually glucose)	Acute: Neurologic symptoms 2° to cerebral edema, headache, decreased LOC, depressed reflexes	Water restrict Acute: correct rapidly 3% NaCl 1-2 cc/kg/h Chronic: IV NS + furosemide	Limit total rise to 8 mEq/L in 24 h (0.5 mEq/L/h maximum) as patients are at risk of central pontine myelinolysis
Hyperkalemia	Rhabdomyolysis, insulin deficiency, metabolic acidosis	Nausea, palpitations, muscle stiffness, areflexia	Protect heart: calcium gluconate Shift K ⁺ into cells: insulin, NaHCO ₃ , salbutamol	ECG: peaked/narrow T wave, decreased P wave, prolonged PR interval, widening of QRS, AV block, ventricular fibrillation
Hypokalemia	Metabolic alkalosis, insulin, diuretics, anorexia, salbutamol	N/V, fatigue, muscle cramps, constipation	K-Dur®, K ⁺ sparing diuretics, IV solutions with 20-40 mEq/L over 3-4 h	ECG: U waves most important, flattened/inverted T waves, prolonged QT, depressed ST May need to restore Mg ²⁺
Hypercalcemia	Hyper-PTH and malignancy account for ~90% of cases	Multisystem including CVS, GI (groans), renal (stones), rheumatological, MSK (bones), psychiatric (moans)	Isotonic saline + furosemide if hypervolemic Bisphosphonates, dialysis, chelation (EDTA or oral PO ₄ ³⁻)	Patients with more severe or symptomatic hypercalcemia are usually dehydrated and require saline hydration as initial therapy
Hypocalcemia	Iatrogenic, low Mg ²⁺ , liver dysfunction, 1° hypo-PTH	Laryngospasm, hyperreflexia, paresthesia, tetany, Chvostek's and Trousseau's sign	Acute (ionized Ca ²⁺ <2.8 mg/dL) requires immediate treatment: IV calcium gluconate 1-2 g in 10-20 min followed by slow infusion	Prolonged QT interval can arise, leading to dysrhythmia as can upper airway obstruction

Hypertensive Emergencies

Hypertensive Emergency (Hypertensive Crisis)

Etiology

- essential HTN, emotional exertion, pain, use of sympathomimetic drugs (cocaine, amphetamine, etc.), MAOI use with ingestion of tyramine-containing food (cheese, red wine, etc.), pheochromocytoma, pregnancy

Presentation

- elevation of systolic and diastolic BP (irrespective of BP) with acute end-organ damage (CNS, renal, CVS, retinal)

HELLP Syndrome (seen only in preeclampsia/eclampsia)
Hemolytic anemia
Elevated Liver enzymes
Low Platelet count

Catecholamine-Induced Hypertensive Emergencies

Avoid use of non-selective β-blockers as they inhibit β-mediated vasodilation and leave α-adrenergic vasoconstriction unopposed

Table 17. Signs and Symptoms of Hypertensive Emergencies

	CNS	Retinal	Renal	Cardiac	Gastrointestinal
Complication	Stroke/TIA, headache, altered mental status, seizures, hemorrhage	Vision change, hemorrhage, exudates, papilledema	Nocturia, elevated Cr, proteinuria, hematuria, oliguria	Ischemia/angina, infarct, dissection (back pain), CHF	N/V, abdominal pain, elevated liver enzymes

Investigations

- CBC, electrolytes, BUN, Cr, U/A
- peripheral blood smear: to detect microangiopathic hemolytic anemia
- CXR: if SOB or chest pain
- ECG, troponins, CK: if chest pain
- CT head: if neurological findings or severe headache
- toxicology screen if sympathomimetic overdose suspected

Management

- in general, the strategy for management is to gradually and progressively reduce BP in 24-48 h
 - lower BP by 25% over the initial 60 min by initiating antihypertensive therapy (usually nitroprusside and labetalol) or adjusting antihypertensive
 - if preeclampsia, immediately consult OB/GYN (see **Obstetrics**, OB15)
 - transfer to ICU for further reduction in BP under monitored setting
- in case of ischemic stroke: do not rapidly reduce BP, maintain BP >150/100 for 5 d
- in case of aortic dissection: rapid reduction of sBP to 110-120 STAT (do not resuscitate with IV fluids)
- in case of excessive catecholamines: avoid β -blockers (except labetalol)
- in case of ACS: address ischemia initially, then BP

Hypertensive Urgency

- definition: severely elevated BP (usually sBP >180, dBP >115) with no evidence of end-organ damage
- most commonly due to non-adherence with medications
- treatment: initiate/adjust antihypertensive therapy, monitor in ED (up to 6 h) and discharge with follow up for 48-72 h
- goal: differentiate hypertensive emergencies from hypertensive urgencies

Table 18. Most Commonly Used Agents for the Treatment of Hypertensive Crisis

Drug	Dosage	Onset of Action	Duration of Action	Adverse Effects*	Special Indications
VASODILATORS					
Sodium Nitroprusside (vascular smooth muscle dilator) 1st line	0.25-10 μ g/kg/min	Immediate	3-5 min	N/V, muscle twitching, sweating, cyanide intoxication, coronary steal syndrome	Most hypertensive emergencies (especially CHF, aortic dissection) Use in combination with β -blockers (e.g. esmolol) in aortic dissection Caution with high ICP and azotemia
Nicardipine (CCB)	2 mg IV bolus, then 4 mg/kg/h IV	15-30 min	40 min	Tachycardia, headache, flushing, local phlebitis (e.g. encephalopathy, RF, eclampsia, sympathetic crisis)	Most hypertensive emergencies Caution with acute CHF
Fenoldopam Mesylate (dopamine receptor antagonist)	0.05-0.1 μ g/kg/min IV	<5 min	8-10 min	Tachycardia, headache, nausea, flushing (e.g. acute RF)	Most hypertensive emergencies Caution with glaucoma
Enalapril (ACEI)	0.625-1.25 mg IV q6h	15-30 min	12-24 h	Theoretical fall in pressure in high renin states not seen in studies	Acute LV failure Avoid in acute MI, pregnancy, acute RF
Nitroglycerin	5-20 μ g/min IV	1-2 min	3-5 min	Hypotension, bradycardia, headache, lightheadedness, dizziness	MI/pulmonary edema
Hydralazine	5-10 mg IV/IM q20min (max 20 mg)	5-20 min	2-6 h	Dizziness, drowsiness, headache, tachycardia, Na ⁺ retention	Eclampsia

Age-Adjusted D-Dimer Cutoff Levels to Rule Out Pulmonary Embolism: The ADJUST-PE Study

JAMA 2014;311(11):1117-1124

Background: D-dimer measurement is an important step in the diagnostic strategy of clinically suspected acute PE, but its clinical usefulness is limited in elderly patients.

Purpose: To prospectively validate whether an age-adjusted D-dimer cutoff, defined as age \times 10 in patients \geq 50 yr, is associated with an increased diagnostic yield of D-dimer in elderly patients with suspected PE.

Methods: A multicenter, multinational, prospective management outcome study was performed in 19 centers in Belgium, France, the Netherlands, and Switzerland between January 1, 2010 and February 28, 2013. All consecutive outpatients who presented to the ED with clinically suspected PE were assessed by a sequential diagnostic strategy based on the clinical probability assessed using either the simplified, revised Geneva score or the 2-level Wells' score for PE; highly sensitive D-dimer measurement; and CTPA.

Results: Of the 3,346 patients with suspected PE included, the prevalence of PE was 19%. Among the 2,898 patients with a non-high or an unlikely clinical probability, 817 patients (28.2%) had a D-dimer level lower than 500 μ g/L (95% CI 26.6%-29.9%) and 337 patients (11.6%) had a D-dimer between 500 μ g/L and their age-adjusted cutoff (95% CI 10.5%-12.9%). The 3 mo failure rate in patients with a D-dimer level higher than 500 μ g/L but below the age-adjusted cutoff was 1 of 331 patients (0.3% [95% CI 0.1%-1.7%]). Among the 766 patients \geq 75 yr, of whom 673 had a non-high clinical probability, using the age-adjusted cutoff instead of the 500 μ g/L cutoff increased the proportion of patients in whom PE could be excluded on the basis of D-dimer from 43 of 673 patients (6.4% [95% CI 4.8%-8.5%]) to 200 of 673 patients (29.7% [95% CI 26.4%-33.3%]), without any additional false-negative findings.

Conclusion: Compared with a fixed D-dimer cutoff of 500 μ g/L, the combination of pretest clinical probability assessment with age-adjusted D-dimer cutoff was associated with a larger number of patients in whom PE could be considered ruled out.

With CNS manifestations of severe HTN, it is often difficult to differentiate causal relationships (i.e. HTN could be secondary to a cerebral event with an associated Cushing reflex)

Table 18. Most Commonly Used Agents for the Treatment of Hypertensive Crisis (continued)

Drug	Dosage	Onset of Action	Duration of Action	Adverse Effects*	Special Indications
ADRENERGIC INHIBITORS					
Labetalol	20 mg IV bolus q10min or 0.5-2 mg/min	5-10 min	3-6 h	Vomiting, scalp tingling, burning in throat, dizziness, nausea, heart block, orthostatic hypotension	Most hypertensive emergencies (especially eclampsia) Avoid in acute CHF, heart block >1st degree
Esmolol	250-500 µg/kg/min 1 min, then 50 µg/kg/min for 4 min; repeat	1-2 min	10-20 min	Hypotension, nausea, bronchospasm	Aortic dissection, acute MI SVT dysrhythmias, perioperative HTN Avoid in acute CHF, heart block >1st degree
Phentolamine	5-15 mg q5-15min	1-2 min	3-10 min	Tachycardia, headache, flushing	Catecholamine excess (e.g. pheochromocytoma)

*Hypotension may occur with all of these agents

Stroke

- see [Neurology, N47](#)
- can be ischemic (80% of all strokes) or hemorrhagic

Presentation

- sudden onset persisting neurological deficits

Table 19. Signs and Symptoms of Stroke

	General	Language/Throat	Vision	Coordination	Motor	Sensation	Reflex
Signs/Symptoms	Decreased LOC, changed mental status, confusion, neglect	Dysarthria, aphasia, swallowing difficulty	Diplopia, eye deviation, asymmetric pupils, visual field defect	Ataxia, intention tremor, lack of coordination	Increased tone, loss of power, spasticity	Loss of sensation	Hyper-reflexia, clonus

- patients with hemorrhagic stroke can present with sudden onset thunderclap headache that is usually described as “worst headache of my life”
- constellation of neurological deficits can point to certain vascular territories
- stroke mimics: seizure, migraine, hypoglycemia, Todd's paralysis, peripheral nerve injury, Bell's palsy, tumor, syncope

Table 20. Stroke Syndromes

Region of Stroke	Stroke Syndrome
Anterior Cerebral Artery	Primarily frontal lobe function affected Altered mental status, impaired judgment, contralateral lower extremity weakness and hypoaesthesia, gait apraxia
Middle Cerebral Artery	Contralateral hemiparesis (arm and face weakness > leg weakness) and hypoaesthesia, ipsilateral hemianopsia, gaze preference to side of lesion ± agnosia, receptive/expressive aphasia
Posterior Cerebral Artery	Affects vision and thought Homonymous hemianopsia, cortical blindness, visual agnosia, altered mental status, impaired memory
Vertebrobasilar Artery	Wide variety of cranial nerve, cerebellar, and brainstem deficits: vertigo, nystagmus, diplopia, visual field deficits, dysphagia, dysarthria, facial hypoaesthesia, syncope, ataxia Loss of pain and temperature sensation in ipsilateral face and contralateral body

Investigations

- CBC, electrolytes, blood glucose, coagulation studies ± cardiac biomarkers ± toxicology screen
- non-contrast CT head: look for hemorrhage, ischemia
- ECG ± echocardiogram: rule out atrial fibrillation, acute MI as source of emboli
 - other imaging: carotid dopplers, CTA, MRA as appropriate

If patient presents within 4.5 h of onset of disabling neurological deficits greater than 60 min with no signs of resolution, they may be a candidate for thrombolysis; do brief assessment and order stat CT head

Exclusion Criteria for tPA:

- Suspected subarachnoid hemorrhage
- Previous intracranial hemorrhage
- Cerebral infarct or severe head injury within the past 3 mo
- Recent pericarditis
- Major surgery within the past 14 d
- GI or urinary hemorrhage within the past 21 d
- Recent LP or arterial puncture at noncompressible site
- Patient is pregnant
- BP > 185 mmHg systolic, or > 110 mmHg diastolic
- Bleeding diathesis
- Prolonged PTT (more than 40 s) or INR > 1.4
- Platelet count < 100,000
- Blood glucose < 50 or > 400 mg/dL
- Intracranial hemorrhage on CT or large volume infarct
- Seizure at onset causing deficit
- Previously ADL dependent (clinical judgment)

Differentiation of UMN Disease vs. LMN Disease

Category	UMN Disease	LMN Disease
Muscular deficit	Muscle groups	Individual muscles
Reflexes	Increased	Decreased/absent
Tone	Increased	Decreased
Fasciculations	Absent	Present
Atrophy	Absent/minimal	Present
Babinski	Upgoing	Downgoing

Management

- thrombolysis: immediate assessment for eligibility; need acute onset, <4.5 h from drug administration time AND compatible physical findings AND normal CT with no bleed
- intubation with RSI if GCS ≤ 8 , rapidly decreasing GCS, or inadequate airway protection reflexes
- elevating head of bed if risk of elevated ICP, aspiration, or worsening cardiopulmonary status
- NPO, IV \pm cardiac monitoring
 - judge fluid rate carefully to avoid overhydration (cerebral edema) as well as underhydration (underperfusion of the ischemic penumbra)
- BP control: only treat severe HTN (sBP >200, dBP >120, mean arterial BP >140) or HTN associated with hemorrhagic stroke transformation, cardiac ischemia, aortic dissection, or renal damage; use IV nitroprusside or labetalol
- glycemic control: keep fasting glucose <117 mg/dL in acute phase (5 d)
- cerebral edema control: hyperventilation, mannitol to decrease ICP if necessary
- consult neurosurgery, neurology, medicine as indicated

Medications

- acute ischemic stroke: thrombolytics (rt-PA, e.g. alteplase) if within 4.5 h of symptom onset with no evidence of hemorrhage on CT scan
- antiplatelet agents: prevent recurrent stroke or stroke after TIAs, e.g. Aspirin[®] (1st line); clopidogrel, Aggrenox[®] (2nd line)
- anticoagulation: DVT prophylaxis if immobile; treat atrial fibrillation if present

**7 Causes of Emboli from the Heart**

- Atrial fibrillation
- MI
- Endocarditis
- Valvular disease
- Dilated cardiomyopathy
- Left heart myxoma
- Prosthetic valves

Gynecologic/Urologic Emergencies

Vaginal Bleeding

- see [Gynecology](#), GY6 and [Obstetrics](#), OB21

Etiology

- pregnant patient
 - 1st/2nd trimester pregnancy: ectopic pregnancy, abortion (threatened, incomplete, complete, missed, inevitable, septic), molar pregnancy, implantation bleeding, friable cervix (most common cause)
 - 2nd/3rd trimester pregnancy: placenta previa, placental abruption, premature rupture of membranes, preterm labor
 - other: trauma, bleeding cervical polyp, passing of mucous plug
- postpartum
 - postpartum hemorrhage, uterine inversion, retained placental tissue, endometritis
- non-pregnant patients
 - dysfunctional uterine bleeding, uterine fibroids, pelvic tumors, trauma, endometriosis, PID, exogenous hormones

Vaginal bleeding can be life-threatening. Always start with ABCs and ensure your patient is stable

Vaginal bleeding (and its underlying causes) can be a very distressing event for patients; ensure appropriate support is provided

History

- characterize bleeding (frequency, duration, number of pads/tampons, cyclicity)
- pain, if present (OPQRSTU)
- menstrual history, sexual history, STD history, syncope/pre-syncope
- details of pregnancy, including gush of fluid and fetal movement (>20 wk)

Physical Exam

- ABC (especially noting postural BP/HR and mucous membrane)
- abdominal examination (peritoneal signs, tenderness, distention, mass)
- speculum examination (NOT IF 2nd/3rd trimester bleeding; perform only when placenta previa is ruled out with U/S)
 - look for active bleeding, trauma/anomaly, and cervical dilatation
 - use sterile speculum if pregnant
- bimanual examination (cervical tenderness, size of uterus, cervical length/dilatation)
 - sterile gloves if pregnant

Investigations

- β -hCG test for all patients with childbearing potential
- CBC, blood and Rh type, quantitative β -hCG, PTT, INR
- type and cross if significant blood loss
- transvaginal U/S (rule out ectopic pregnancy and spontaneous abortion)
- abdominal U/S (rule out placenta previa and fetal demise)
- postpartum
 - U/S for retained products
 - β -hCG if concerned about retained tissue

Need β -hCG $\geq 1,200$ to see intrauterine changes on transvaginal U/S

An ectopic pregnancy can be ruled out by confirming an intrauterine pregnancy by bedside U/S unless the patient is using IVF

Management

- ABCs
- pulse oximeter and cardiac monitors if unstable
- Rh immune globulin (Rhogam®) for vaginal bleeding in pregnancy and Rh-negative mother
- 1st/2nd trimester pregnancy
 - ectopic pregnancy: definitive treatment with surgery or methotrexate
 - intrauterine pregnancy, no concerns of coexistent ectopic: discharge patient with obstetrics follow-up
 - U/S indeterminate or β -hCG >1,000-2,000 IU: further workup and/or gynecology consult
 - abortions: if complete, discharge if stable; for all others, acquire gynecology consult
- 2nd/3rd trimester pregnancy
 - placenta previa or placental abruption: obstetrics consult for possible admission
- postpartum
 - manage ABCs: start 2 large bore IV rapid infusion, type and cross 4 units of blood, consult OB/GYN immediately
- non-pregnant
 - dysfunctional uterine bleeding (prolonged or heavy flow \pm breakthrough bleeding and without ovulation, a diagnosis of exclusion)
 - ♦ <35-40 yr of age: Provera® 10 mg PO OD x 10 d, warn patient of a withdrawal bleed, discharge if stable
 - ♦ if unstable, admit for IV hormonal therapy, possible D&C
 - ♦ >35-40 yr of age: uterine sampling necessary prior to initiation of hormonal treatment to rule out endometrial cancer, U/S for any masses felt on exam
 - ♦ tranexamic acid (Cyklokapron®) to stabilize clots
 - structural abnormalities: fibroids or uterine tumors may require excision for diagnosis/treatment, U/S for workup of other pelvic masses, Pap smear/biopsy for cervical lesions

Disposition

- the decision to admit or discharge should be based on the stability of the patient, as well as the nature of the underlying cause; consult gynecology for admitted patients
- if patient can be safely discharged, ensure follow up with family physician or gynecologist
 - instruct patient to return to ED for increased bleeding, presyncope

Classifying Miscarriage (Abortion)

- **Missed:** non-viable intrauterine pregnancy
- **Threatened:** viable intrauterine pregnancy with os closed
- **Inevitable:** os opened, no products of conception passed
- **Incomplete:** products of conception partially expelled
- **Complete:** products of conception completely expelled
- **Septic:** any of above with presence of infection (usually incomplete)
- **Recurrent:** >3 spontaneous abortions (recurrent pregnancy loss)

Pregnant Patient in the ED

Table 21. Complications of Pregnancy

Trimester	Fetal	Maternal
First 1-12 wk	Pregnancy failure <ul style="list-style-type: none"> • Spontaneous abortion • Fetal demise • Gestational trophoblastic disease 	Ectopic pregnancy Anemia Hyperemesis gravidarum UTI/pyelonephritis
Second 13-27 wk	Disorders of fetal growth <ul style="list-style-type: none"> • IUGR • Oligo/polyhydramnios 	Gestational DM Rh incompatibility UTI/pyelonephritis
Third 28-41 wk	Vasa previa	Preterm labor/PPROM Preeclampsia/eclampsia Placenta previa Placental abruption Uterine rupture DVT

Nephrolithiasis (Renal Colic)

- see [Urology](#), U16

Epidemiology and Risk Factors

- 10% of population (twice as common in males)
- recurrence 50% at 5 yr
- peak incidence 30-50 yr of age
- 75% of stones <5 mm pass spontaneously within 2 wk, larger stones may require consultation

Clinical Features

- urinary obstruction \rightarrow upstream distention of ureter or collecting system \rightarrow severe colicky pain
- may complain of pain at flank, groin, testes, or tip of penis
- writhing, never comfortable, N/V, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- fever, chills, rigors in secondary pyelonephritis
- peritoneal findings/anterior abdominal tenderness usually absent

Kidney Stones

- 80% Calcium oxalate
- 10% Struvite
- 10% Uric acid

Differential Diagnosis of Renal Colic

- acute ureteric obstruction
- acute abdomen: biliary, bowel, pancreas, AAA
- gynecological: ectopic pregnancy, torsion/rupture of ovarian cyst
- pyelonephritis (fever, chills, pyuria, vomiting)
- radiculitis (L1): herpes zoster, nerve root compression

Investigations

- screening
 - CBC → elevated WBC in presence of fever suggests infection
 - electrolytes, Cr, BUN → to assess renal function
 - U/A: R&M (WBCs, RBCs, crystals), C&S
- imaging
 - non-contrast spiral CT is the study of choice
 - abdominal U/S may demonstrate stone or hydronephrosis (consider in females of child-bearing age)
 - AXR will identify large radioopaque stones (calcium, struvite, and cystine stones), but may miss smaller stones, uric acid stones, or stones overlying bony structures; consider as an initial investigation in patients who have a history of radioopaque stones and similar episodes of acute flank pain (CT necessary if film is negative)
- strain all urine → stone analysis

Management

- analgesics: NSAIDs (usually ketorolac [Toradol*], preferable over opioids), antiemetics, IV fluids
- urology consult may be indicated, especially if stone >5 mm, or if patient has signs of obstruction or infection
- α-blocker (e.g. tamsulosin) helpful to increase stone passage in select cases

Disposition

- most patients can be discharged
- ensure patient is stable, has adequate analgesia, and is able to tolerate oral medications
- may advise hydration and limitation of protein, sodium, oxalate, and alcohol intake

Indications for Admission to Hospital

- Intractable pain
- Fever (suggests infection) or other evidence of pyelonephritis
- Single kidney with ureteral obstruction
- Bilateral obstructing stones
- Intractable vomiting
- Compromised renal function

Ophthalmologic Emergencies

- see [Ophthalmology](#), OP5, OP42

History and Physical Exam

- patient may complain of pain, tearing, itching, redness, photophobia, foreign body sensation, trauma
- mechanism of foreign body insertion – if high velocity injury suspected (welding, metal grinding, metal striking metal), must obtain orbital x-rays, U/S, or CT scan to exclude presence of intraocular metallic foreign body
- visual acuity in both eyes, pupils, extraocular structures, funduscopy, tonometry, slit lamp exam

Management of Ophthalmologic Foreign Body

- copious irrigation with saline for any foreign body
- remove foreign body under slit lamp exam with cotton swab or sterile needle
- antibiotic drops qid until healed
- patching may not improve healing or comfort – do not patch contact lens wearers
- limit use of topical anesthetic to examination only
- consider tetanus prophylaxis
- ophthalmology consult if globe penetration suspected

Table 22. Differential Diagnosis of Red Eye in the Emergency Department

Symptom	Possible Serious Etiology
Light sensitivity	Iritis, keratitis, abrasion, ulcer
Unilateral	Above + herpes simplex, acute angle closure glaucoma
Significant pain	Above + scleritis
White spot on cornea	Corneal ulcer
Blurred vision	All of the above
Non-reactive pupil	Acute glaucoma, iritis
Copious discharge	Gonococcal conjunctivitis
Blurred vision	All of the above

ALWAYS assess visual acuity in both eyes when a patient presents to the ER with an ophthalmologic complaint

Any etiology of red eyes may also present with blurred vision

Other Ophthalmologic Emergencies

Infectious: Red eye, endophthalmitis, hypopyon

Trauma: Globe rupture, orbital blow-out fractures, corneal injuries, eyelid laceration, hyphema, lens dislocation, retrobulbar hemorrhage

Painful vision loss: Acute iritis, corneal abrasion, globe rupture, lens dislocation, retrobulbar hemorrhage, optic neuritis, temporal arteritis, endophthalmitis, keratitis

Painless vision loss: Central retinal vein occlusion, amaurosis fugax, occipital stroke

Contraindications to Pupil Dilation

- Shallow anterior chamber
- Iris-supported lens implant
- Potential neurological abnormality requiring pupillary evaluation
- Caution with CV disease – mydriatics can cause tachycardia

Table 23. Select Ophthalmologic Emergencies

Condition	Signs and Symptoms	Management
Acute Angle Closure Glaucoma	Unilateral red, painful eye Decreased visual acuity, halos around lights Fixed, mid-dilated pupil N/V Marked increase in IOP (>40 mmHg) Shallow anterior chamber \pm cells	Ophthalmology consult for laser iridotomy Topical β -blockers, adrenergics, and cholinergics Systemic carbonic anhydrase inhibitors and hyperosmotic agents
Chemical Burn	Known exposure to acids or alkali (worse) Pain, decreased visual acuity Vascularization or defects of cornea Iris and lens damage	Irrigate at site of accident IV NS drip in ED with eyelid retracted Swab fornices Cycloplegic drops Topical antibiotics and patching
Orbital Cellulitis	Red, painful eye, decreased visual acuity Headache, fever Lid erythema, edema, and difficulty opening eye Conjunctival injection and chemosis Proptosis, ophthalmoplegia \pm RAPD	Admission, ophthalmology consult Blood cultures, orbital CT IV antibiotics (ceftriaxone+ vancomycin) Drainage of abscess
Retinal Artery Occlusion	Sudden, painless, monocular vision loss RAPD Cherry red spot and retinal pallor on fundoscopy	Restore blood flow <2 h Massage globe Decrease IOP (topical β -blockers, inhaled O_2/CO_2 mix, IV Diamox [®] , IV mannitol, drain aqueous fluid)
Retinal Artery Detachment	Flashes of light, floaters, and curtains of blackness/peripheral vision loss Painless Loss of red reflex, decreased IOP Detached areas are gray \pm RAPD	Ophthalmology consult for scleral buckle/pneumatic retinopexy

Dermatologic Emergencies

Life-Threatening Dermatoses

Rash Characteristics

A. Diffuse Rashes

- SSSS
 - ♦ caused by an exotoxin from infecting strain of coagulase-positive *S. aureus*
 - ♦ mostly occurs in children
 - ♦ prodrome: fever, irritability, malaise, and skin tenderness
 - ♦ sudden onset of diffuse erythema: skin is red, warm, and very tender
 - ♦ flaccid bullae that are difficult to see, then desquamate in large sheets
 - ♦ Nikolsky's sign: gentle lateral stroking of skin causes epidermis to separate
- TEN (>30% of BSA)
 - ♦ see [Dermatology, D21](#)
 - ♦ caused by drugs (e.g. phenytoin, sulfas, penicillins, and NSAIDs), bone marrow transplantation, and blood product transfusions
 - ♦ usually occurs in adults
 - ♦ diffuse erythema followed by necrosis
 - ♦ severe mucous membrane blistering
 - ♦ entire epidermis desquamation
 - ♦ high mortality (>50%)
- TSS
 - ♦ see [Infectious Diseases, ID24](#)
 - ♦ caused by superantigen from *S. aureus* or GAS activating T-cell and cytokines
 - ♦ patient often presents with onset of shock and multi-organ failure, fever
 - ♦ diffuse erythematous macular rash
 - ♦ at least 3 organ systems involved: CNS, respiratory, GI, muscular, mucous membranes, renal, liver, hematologic, and skin (necrotizing fasciitis, gangrene)
- vesicobullous lesions
 - EM
 - ♦ see [Dermatology, D21](#)
 - ♦ immunologic reaction to herpes simplex
 - ♦ viral prodrome 1-14 d before rash
 - ♦ "target lesion": central gray bulla or wheal surrounded by concentric rings of erythema and normal skin

- SJS (<10% of BSA)
 - ♦ see [Dermatology, D21](#)
 - ♦ related to drugs such as antiepileptics and biologic agents (e.g. infliximab)
 - ♦ EM with constitutional symptoms and mucous membrane involvement (milder mucous membrane involvement than TEN)

B. Discrete Lesions

- pyoderma gangrenosum
 - ♦ often associated with immunocompromised patients (HIV, leukemia, or lymphoma) with Gram-negative sepsis
 - ♦ often occurs in arms, hands, feet, or perineal region
 - ♦ usually begins as painless macule/vesicle → pustule/bulla on red/blue base → sloughing, leaving a gangrenous ulcer
- DGI
 - ♦ see [Dermatology, D31](#)
 - ♦ fever, skin lesions (pustules/vesicles on erythematous base ~5 mm in diameter), arthritis (joint swelling and tenderness), and septic arthritis (in larger joints, such as knees, ankles, and elbows)
 - ♦ most commonly in gonococcus positive women during menstruation or pregnancy
 - ♦ skin lesions usually appear in extremities and resolve quickly (<7 d)
- meningococcemia
 - ♦ flu-like symptoms of headache, myalgia, N/V
 - ♦ petechial, macular, or maculopapular lesions with gray vesicular centers
 - ♦ usually a few millimeters in size, but may become confluent and hemorrhagic
 - ♦ usually appear in extremities, but may appear anywhere
 - ♦ look for signs of meningeal irritation: Brudzinski, Kernig, nuchal rigidity, jolt accentuation

History and Physical Exam

- determine onset, course, and location of skin lesions
- fever, joint pain
- associated symptoms: CNS, respiratory, GU, GI, renal, liver, mucous membranes
- medication history
- vitals

Investigations

- immediate consultation if patient unstable
- CBC, electrolytes, Cr, AST, ALT, ALP, blood culture, skin biopsy, serum immunoglobulin levels (serum IgE)

Thorough dermatologic examinations are required; examination of asymptomatic skin may identify more lesions; ensure adequate draping during dermatologic examinations

Management

- general: judicious IV fluids and electrolyte control, consider vasopressors if hypotensive, prevention of infection
- determine if admission and consult needed: dermatology or infectious diseases
- specific management is determined by etiology
 - SSSS, TSS, DGI, and meningococcemia
 - ♦ IV antibiotics
 - EM, SJS, and TEN
 - ♦ stop precipitating medication
 - ♦ fluids
 - ♦ symptomatic treatment: antihistamines, antacids, topical corticosteroids, systemic corticosteroids (controversial), prophylactic oral acyclovir, consider IVIg
 - ♦ TEN: debride necrotic tissue

Disposition

- most cases will require urgent care and hospitalization
- TEN: early transfer to burn center improves outcome

Environmental Injuries

Heat Exhaustion and Heat Stroke

- predisposing factors: young persons who overexert themselves, older adults who cannot dissipate heat at rest (e.g. using anticholinergic drugs such as antihistamines or TCAs), and patients with schizophrenia who are using anticholinergic or antiepileptic medications

Heat Exhaustion

- clinical features relate to loss of circulating volume caused by exposure to heat stress
- “water depletion”: heat exhaustion occurs if lost fluid not adequately replaced
- “salt depletion”: heat exhaustion occurs when losses replaced with hypotonic fluid

Heat exhaustion may closely resemble heat stroke; heat exhaustion may eventually progress to heat stroke, so if diagnosis is uncertain treat as heat stroke

Heat Stroke

- life-threatening emergency resulting from failure of normal compensatory heat-shedding mechanisms
- divided into classical and exertional subtypes
- if patient does not respond relatively quickly to cooling treatments, consider other possible etiologies of hyperpyrexia (e.g. meningitis, thyroid storm, anticholinergic poisoning, delirium tremens, other infections)

Table 24. Heat Exhaustion vs. Heat Stroke

	Heat Exhaustion	Classical Heat Stroke	Exertional Heat Stroke
Clinical Features	<ul style="list-style-type: none"> • Non-specific malaise, headache, fatigue • Body temp < 104.9°F (usually normal) • No coma or seizures • Dehydration (↑ HR, orthostatic hypotension) 	<ul style="list-style-type: none"> • Occurs in setting of high ambient temperatures (e.g. heat wave, poor ventilation) • Often patients are older, poor, and sedentary or immobile • Dry, hot skin • Temp usually > 104.9°F • Altered mental status, seizures, delirium, or coma • May have elevated AST, ALT 	<ul style="list-style-type: none"> • Occurs with high endogenous heat production (e.g. exercise) that overwhelms homeostatic mechanisms • Patients often younger, more active • Skin often diaphoretic • Other features as for classical heat stroke, but may also have DIC, acute renal failure, rhabdomyolysis, marked lactic acidosis
Treatment	<ul style="list-style-type: none"> • Rest in a cool environment • IV NS if orthostatic hypotension; otherwise replace losses slowly PO 	<ul style="list-style-type: none"> • Cool body temperature with water mist (e.g. spray bottle) and standing fans • Ice water immersion also effective; monitor body temperature closely to avoid hypothermic overshoot • Secure airway because of seizure and aspiration risk • Give fluid resuscitation if still hypotensive after above therapy • Avoid α-agonists (e.g. epinephrine), peripheral vasoconstriction, and antipyretics (e.g. ASA) 	

Hypothermia and Cold Injuries

HYPOTHERMIA

- predisposing factors: extremes of age, lack of housing, drug overdose, EtOH ingestion, trauma (incapacitating), cold water immersion, outdoor sports
- treatment based on re-warming and supporting cardiorespiratory function
- complications: coagulopathy, acidosis, ventricular dysrhythmias (VFib), asystole, volume and electrolyte depletion
- labs: CBC, electrolytes, ABG, serum glucose, Cr/BUN, Mg²⁺, Ca²⁺, amylase, coagulation profile
- imaging: CXR (aspiration pneumonia, pulmonary edema are common)
- monitors: ECG, rectal thermometer, Foley catheter, NG tube, monitor metabolic status frequently

Table 25. Classification of Hypothermia

Class	Temp	Symptoms/Signs
Mild	89.6 - 94.8°F	Tachypnea, tachycardia, ataxia, dysarthria, shivering
Moderate	82.4 - 89.4°F	Loss of shivering, dysrhythmias, Osborne (J) waves on ECG, decreased LOC, combative behavior, muscle rigidity, dilated pupils
Severe	<82.4°F	Coma, hypotension, acidemia, VFib, asystole, flaccidity, apnea

Re-warming Options

- gentle fluid and electrolyte replacement in all (due to cold diuresis)
- Passive External Re-warming
 - suitable for most stable patients with core temperature >90°F
 - involves covering patient with insulating blanket; body generates heat and re-warms through metabolic process, shivering
- Active External Re-warming
 - involves use of warming blankets
 - beware of “afterdrop” phenomenon
 - safer when done in conjunction with active core re-warming
- Active Core Re-warming
 - generally for patients with core temperature <90°F, and/or with cardiovascular instability
 - avoids “afterdrop” seen with AER alone
 - re-warm core by using
 - ♦ warmed humidified oxygen, IV fluids
 - ♦ peritoneal dialysis with warm fluids
 - ♦ gastric/colonic/pleural irrigation with warm fluids
 - ♦ external circulation (cardiopulmonary bypass machine) is most effective and fastest

Afterdrop Phenomenon

Warming of extremities causes vasodilation and movement of cool pooled blood from extremities to core, resulting in a drop in core temperature leading to cardiac arrest

Approach to Cardiac Arrest in the Hypothermic Patient

- do all procedures gently or may precipitate VFib
- check pulse and rhythm for at least 1 min; may have profound bradycardia
- **if any pulse at all (even very slow) do NOT do CPR**
- if in VFib try to defibrillate up to maximum 3 shocks if core temperature $< 86^{\circ}\text{F}$
- intubate if required, ventilate with warmed, humidified O_2
- medications (vasopressors, antidysrhythmics) may not be effective at low temperatures
 - controversial; may try one dose
- focus of treatment is re-warming

FROSTBITE

Classification

- ice crystals form between cells
- classified according to depth – similar to burns (1st to 3rd degree)
- 1st degree
 - symptoms: initial paresthesia, pruritus
 - signs: erythema, edema, hyperemia, no blisters
- 2nd degree
 - symptoms: numbness
 - signs: blistering (clear), erythema, edema
- 3rd degree
 - symptoms: pain, burning, throbbing (on thawing); may be painless if severe
 - signs: hemorrhagic blisters, skin necrosis, edema, no movement

Management

- treat for hypothermia: O_2 , IV fluids, maintenance of body warmth
- remove wet and constrictive clothing
- immerse in $104\text{--}107.6^{\circ}\text{F}$ agitated water for 10–30 min (very painful; administer adequate analgesia)
- clean injured area and leave it open to air
- consider aspiration/debridement of blisters (controversial)
- debride skin
- tetanus prophylaxis
- consider penicillin G as frost bite injury at high risk of infection
- surgical intervention may be required to release restrictive eschars
- never allow a thawed area to re-chill/freeze

Burn Causes

- Thermal (flame, scald)
- Chemical
- Radiation (UV, medical/therapeutic)
- Electrical

Use palm of the patient's hand to estimate 1% of BSA affected

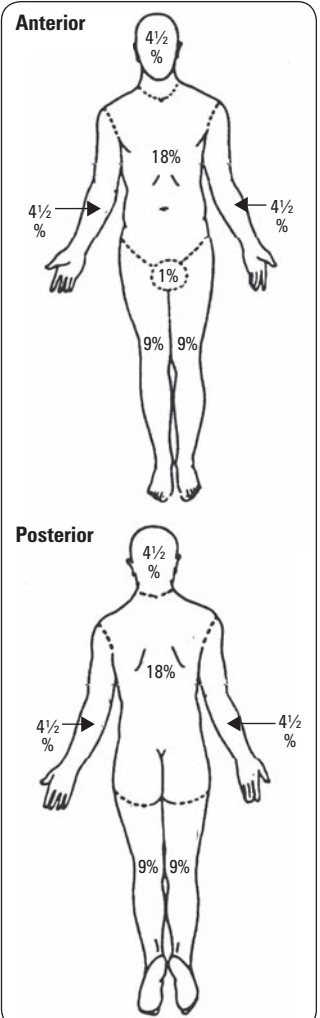

Figure 15. Rule of 9s for total BSA

Intubate early if you suspect inhalation injury, as airway can become obstructed due to edema

Burns

- see [Plastic Surgery, PL16](#)

Physical Exam

- burn size
 - rule of nines; does not include 1st degree burns
- burn depth
 - superficial: epidermis only (e.g. sunburn)
 - partial thickness: into superficial dermis or hair follicles, sweat glands
 - full thickness: all layers of the skin
 - deep: involvement of fat, muscle, even bone

Management

- remove noxious agent/stop burning process
- establish airway if needed (indicated with burns $> 40\%$ BSA or smoke inhalation injury)
- resuscitation for 2nd and 3rd degree burns (after initiation of 2 large bore IVs)
- fluid boluses if unstable
 - Parkland Formula: Ringer's lactate 4 cc/kg/% BSA burned; give half in first 8 h, half in next 16 h; maintenance fluids are also required if patient cannot tolerate PO hydration
 - urine output is best measure of resuscitation, should be 40–50 cc/h or 0.5 cc/kg/h; avoid diuretics
- pain relief: continuous morphine infusion with breakthrough bolus
- investigations: CBC, electrolytes, U/A, CXR, ECG, ABG, carboxyhemoglobin
- burn wound care: prevent infection, clean/debride with mild soap and water, sterile dressings
- escharotomy or fasciotomy for circumferential burns (chest, extremities)
- topical antibiotics, systemic antibiotics infrequently indicated
- tetanus prophylaxis if burn is deeper than superficial dermis

Disposition

- admit
 - 2nd degree burns $> 10\%$ BSA or any significant 3rd degree burns
 - 2nd degree burns on face, hands, feet, perineum, or across major joints
 - electrical, chemical burns, and inhalation injury
 - burn victims with underlying medical problems or immunosuppressed patients

Inhalation Injury

Etiology

- CO or cyanide poisoning
- direct thermal injury: limited to upper airway
- smoke causes bronchospasm and edema from particulate matter and toxic inhalants (tissue asphyxiates, pulmonary irritants, systemic toxins)

History and Physical Exam

- risk factors: closed space fires, period of unconsciousness, noxious chemicals involved
- cherry red skin (unreliable, usually post-mortem finding)
- singed nasal hairs, soot on oral/nasal membranes, sooty sputum
- hoarseness, stridor, dyspnea
- decreased LOC, confusion
- PO₂ normal but O₂ saturation low suggests CO poisoning

Investigations

- measure carboxyhemoglobin levels, co-oximetry
- ABG
- CXR ± bronchoscopy

Management

- CO poisoning: 100% O₂ ± hyperbaric O₂ (controversial)
- direct thermal injury: humidified oxygen, early intubation, pulmonary toilet, bronchodilators

Bites

MAMMALIAN BITES

- see [Plastic Surgery](#), PL10

History

- time and circumstances of bite, symptoms, allergies, tetanus immunization status, comorbid conditions, rabies risks, HIV/hepatitis risk (human bite)
- high morbidity associated with clenched fist injuries, “fight bites”

Physical Exam

- assess type of wound: abrasion, laceration, puncture, crush injury
- assess for direct tissue damage: skin, bone, tendon, neurovascular status

Investigations

- if bony injury or infection suspected, check for fracture and gas in tissue with x-rays
- get skull films in children with scalp bite wounds ± CT to rule out cranial perforation

Initial Management

- wound cleansing and copious irrigation as soon as possible
- irrigate/debride puncture wounds if feasible, but not if sealed or very small openings; avoid hydrodissection along tissue planes
- debridement is important in crush injuries to reduce infection and optimize cosmetic and functional repair
- culture wound if signs of infection (erythema, necrosis, or pus); obtain anaerobic cultures if wound foul smelling, necrotizing, or abscess; notify lab that sample is from bite wound

Prophylactic Antibiotics

- types of infections resulting from bites: cellulitis, lymphangitis, abscesses, tenosynovitis, osteomyelitis, septic arthritis, sepsis, endocarditis, meningitis
- a 3-5 d course of antibiotics is recommended for all bite wounds to the hand and should be considered in other bites if any high-risk factors present (efficacy not proven)
- dog and cat bites (pathogens: *Pasteurella multocida*, *S. aureus*, *S. viridans*)
 - 80% of cat bites, 5% of dog bites become infected
 - 1st line: amoxicillin + clavulanic acid
- human bites (pathogens: *Eikenella corrodens*, *S. aureus*, *S. viridans*, oral anaerobes)
 - 1st line: amoxicillin + clavulanic acid
- rabies (see [Infectious Diseases](#), ID21)
 - reservoirs: warm-blooded animals except rodents, lagomorphs (e.g. rabbits)
 - post-exposure vaccine is effective; treatment depends on local prevalence
- suturing
 - vascular structures (i.e. face and scalp) are less likely to become infected, therefore consider suturing
 - allow avascular structures (i.e. pretibial regions, hands, and feet) to heal by secondary intention
 - tetanus immunization if >10 yr or incomplete primary series

Consider Admission if:

- Moderate to severe infections
- Infections in immunocompromised patients
- Not responding to oral therapy
- Penetrating injuries to tendons, joints, CNS
- Open fractures

SNAKE BITES

- history, physical exam, investigations, and initial management similar to mammalian bites
- additional management issues
 - snake bites are rarely fatal, but proper precautions must be taken
 - supportive management, observe for compartment syndrome, analgesia, tetanus prophylaxis
 - contact State Poison Information Center for consultation
 - for the Massasauga rattlesnake ONLY: if no signs of local tissue damage AND an INR is normal at 6 h after the bite, the patient may be discharged
 - there is NO evidence that constriction bands are helpful AND can be harmful
- if envenomation present, administer antivenom as directed by local Poison Information Center

INSECT BITES

- bee stings
 - 5 types of reactions to stings (local, large local, systemic, toxic, unusual)
 - history and physical exam key to diagnosis; no lab test will confirm
 - investigations: CBC, electrolytes, BUN, Cr, glucose, ABGs, ECG
 - ABC management, epinephrine 0.1 mg IV over 5 min if shock, antihistamines, cimetidine 300 mg IV/IM/PO, steroids, β -agonists for SOB/wheezing 3 mg in 5 mL NS via nebulizer, local site management
- West Nile virus (see [Infectious Diseases, ID25](#))

Near Drowning

- most common in children <4 yr and teenagers
- causes lung damage, hypoxemia, and may lead to hypoxic encephalopathy
- must also assess for shock, C-spine injuries, hypothermia, and scuba-related injuries (barotrauma, air emboli, lung re-expansion injury)
- complications: volume shifts, electrolyte abnormalities, hemolysis, rhabdomyolysis, renal, DIC

Physical Exam

- ABCs, vitals: watch closely for hypotension
- lungs: rales (ARDS, pulmonary edema), decreased breath sounds (pneumothorax)
- CVS: murmurs, dysrhythmias, JVP (CHF, pneumothorax)
- H&N: assess for C-spine injuries
- neuro: GCS or AVPU, pupils, focal deficits

Investigations

- labs: CBC, electrolytes, ABGs, Cr, BUN, INR, PTT, U/A (drug screen, myoglobin)
- imaging: CXR (pulmonary edema, pneumothorax) \pm C-spine imaging
- ECG

Management

- ABCs, treat for trauma, shock, hypothermia
- cardiac and O₂ monitors, IV access
- intensive respiratory care
 - ventilator assistance if decreased respirations, pCO₂ >50 mmHg, or pO₂ <60 mmHg on maximum O₂
 - may require intubation for airway protection, ventilation, pulmonary toilet
 - high flow O₂/CPAP/BiPAP may be adequate but some may need mechanical ventilation with positive end-expiratory pressure
- dysrhythmias: usually respond to corrections of hypoxemia, hypothermia, and acidosis
- vomiting: very common, NG suction to avoid aspiration
- convulsions: usually respond to O₂; if not, diazepam 5-10 mg IV slowly
- bronchospasm: bronchodilators
- bacterial pneumonia: not necessary to prophylax with antibiotics unless contaminated water or hot-tub (*Pseudomonas*)
- always initiate CPR in drowning-induced cardiac arrest even if patient hypothermic; continue CPR until patient is fully rewarmed

Disposition

- non-significant submersion: discharge after short observation
- significant submersion (even if asymptomatic): long period of observation (24 h) as pulmonary edema may appear late
- CNS symptoms or hypoxemia: admit
- severe hypoxemia, decreased LOC: ICU

Toxicology

Principles of Toxicology

4 principles to consider with all ingestions:

- Resuscitation (ABCD₃EFG)
- Screening (toxidrome? clinical clues?)
- Decrease absorption of drug
- Increase elimination of drug

"ABCD₃EFG" of Toxicology

- basic axiom of care is symptomatic and supportive treatment
- address underlying problem only once patient is stable
 - A** Airway (consider stabilizing the C-spine)
 - B** Breathing
 - C** Circulation
 - D1** Drugs
 - ACLS as necessary to resuscitate the patient
 - universal antidotes
 - D2** Draw bloods
 - D3** Decontamination (decrease absorption)
 - E** Expose (look for specific toxidromes)/Examine the patient
 - F** Full vitals, ECG monitor, Foley, X-rays
 - G** Give specific antidotes and treatments
- go back and reassess
- call Poison Information Center
- obtain corroborative history from family, bystanders

D1 – Universal Antidotes

- treatments that will not harm patients and may be essential

Dextrose (glucose)

- give to any patient presenting with altered LOC
- measure blood glucose prior to glucose administration if possible
- adults: 0.5-1.0 g/kg (1-2 mL/kg) IV of D50W
- children: 0.25 g/kg (2-4 mL/kg) IV of D25W

Oxygen

- do not deprive a hypoxic patient of oxygen no matter what the antecedent medical history (i.e. even COPD with CO₂ retention)
- if depression of hypoxic drive, intubate and ventilate
- exception: paraquat or diquat (herbicides) inhalation or ingestion (oxygen radicals increase morbidity)

Naloxone (central μ -receptor competitive antagonist, shorter $t_{1/2}$ than naltrexone)

- antidote for opioids: administration is both diagnostic and therapeutic (1 min onset of action)
- used for the undifferentiated comatose patient
- loading dose
 - adults
 - ♦ response to naloxone can be drastic, so stepwise delivery of initial 2 mg bolus is recommended
 - ♦ draw up 2 mg to deliver IV/IM/SL/SC or via ETT (ETT dose = 2-2.5x IV dose)
 - 1st dose 0.4 mg
 - if no response, deliver 2nd dose 0.6 mg
 - if still no response, deliver remaining 1 mg
 - child
 - ♦ 0.01 mg/kg initial bolus IV/IO/ETT
 - ♦ 0.1 mg/kg if no response and opioid still suspected to max of 10 mg
- maintenance dose
 - may be required because half-life of naloxone (30-80 min) is much shorter than many opioids
 - ♦ hourly infusion rate at 2/3 of initial dose that produced patient arousal

Thiamine (Vitamin B1)

- 100 mg IV/IM with IV/PO glucose to all patients
- given to prevent/treat Wernicke's encephalopathy
- a necessary cofactor for glucose metabolism (may worsen Wernicke's encephalopathy if glucose given before thiamine), but do not delay glucose if thiamine unavailable
- must assume all undifferentiated comatose patients are at risk

Universal Antidotes

DONT

Dextrose

Oxygen

Naloxone

Thiamine (must give BEFORE dextrose)

Populations at Risk for Thiamine Deficiency

- Alcoholics
- Anorexics
- Hyperemesis of pregnancy
- Malnutrition states

Administration of naloxone can cause opioid withdrawal in chronic users:

Minor withdrawal may present as lacrimation, rhinorrhea, diaphoresis, yawning, piloerection, HTN, and tachycardia

Severe withdrawal may present as hot and cold flashes, arthralgias, myalgias, N/V, and abdominal cramps

D2 – Draw Bloods

- essential tests
 - CBC, electrolytes, BUN/Cr, glucose, INR/PTT, osmolality
 - ABGs, measure O₂ sat
 - ASA, acetaminophen, EtOH levels
- potentially useful tests
 - drug levels – this is NOT a serum drug screen
 - Ca²⁺, Mg²⁺, PO₄³⁻
 - protein, albumin, lactate, ketones, liver enzymes, CK – depending on drug and clinical presentation

Serum Drug Levels

- treat the patient, not the drug level
- negative toxicology screen does not rule out a toxic ingestion – signifies only that the specific drugs tested were not detectable in the specimen
- specific drugs available on general screen vary by institution; check before ordering
- urine screens also available (qualitative only)

Table 26. Toxic Gaps (see [Nephrology, NP14](#))

METABOLIC ACIDOSIS	
Increased AG: “MUDPILES CAT” (* = toxic)	Increased POG: “MAE DIE” (if it ends in “-ol”, it will likely increase the POG)
Methanol*	Methanol
Uremia	Acetone
Diabetic ketoacidosis/Starvation ketoacidosis	Ethanol
Phenformin*/Paraldehyde*	Diuretics (glycerol, mannitol, sorbitol)
Isoniazid, Iron, Ibuprofen	Isopropanol
Lactate (anything that causes seizures or shock)	Ethylene glycol
Ethylene glycol*	
Salicylates*	
Cyanide, CO*	
Alcoholic ketoacidosis	Note: normal POG does not rule out toxic alcohol; only an elevated gap is helpful
Toluene, theophylline*	
Decreased AG	Increased O₂ saturation gap
Electrolyte imbalance (increased Na ⁺ /K ⁺ /Mg ²⁺)	Carboxyhemoglobin
Hypoalbuminemia (50% fall in albumin ~5.5 mEq/L decrease in the AG)	Methemoglobin
Lithium, bromine elevation	Sulfmethemoglobin
Paraproteins (multiple myeloma)	
Normal AG	
High K ⁺ : pyelonephritis, obstructive nephropathy, renal tubular acidosis IV, TPN	
Low K ⁺ : small bowel losses, acetazolamide, renal tubular acidosis I, II	

Plasma Osmolar Gap

= (2 Na⁺ + glucose + urea) – plasma osmolality
 “2 salts and a sugar BUN”
 Normal POG <10 mOsm/kg

Anion Gap

= Na⁺ – Cl⁻ – HCO₃⁻
 Normal AG ≤12 mEq/L

Table 27. Use of the Clinical Laboratory in the Initial Diagnosis of Poisoning

Test	Finding	Selected Causes
ABG	Hypoventilation (↑ pCO ₂) Hyperventilation (↓ pCO ₂)	CNS depressants (opioids, sedative-hypnotic agents, phenothiazines, EtOH) Salicylates, CO, other asphyxiants
Electrolytes	↑ AG metabolic acidosis Hyperkalemia Hypokalemia	“MUDPILES CAT”: see Table 26 Digitalis glycosides, fluoride, potassium Theophylline, caffeine, β-adrenergic agents, soluble barium salts, diuretics, insulin
Glucose	Hypoglycemia	Oral hypoglycemic agents, insulin, EtOH, ASA
Osmolality and Osmolar Gap	Elevated osmolar gap	“MAE DIE”: see Table 26
ECG	Wide QRS complex Prolonged QT interval Atrioventricular block	TcAs, quinidine, other class Ia and Ic antidysrhythmic agents Terfenadine, astemizole, antipsychotics Ca ²⁺ antagonists, digitalis glycosides, phenylpropanolamine
Abdominal X-Ray	Radioopaque pills or objects	“CHIPES”: Calcium, Chloral hydrate, CCl ₄ , Heavy metals, Iron, Potassium, Enteric coated Salicylates, and some foreign bodies
Serum Acetaminophen	Elevated level (>140 mg/L or 1,000 μmol/L 4 h after ingestion)	May be only sign of acetaminophen poisoning

D3 – Decontamination and Enhanced Elimination

Ocular Decontamination

- saline irrigation to neutralize pH; alkali exposure requires ophthalmology consult

Dermal Decontamination (wear protective gear)

- remove clothing, brush off toxic agents, irrigate all external surfaces

Gastrointestinal Decontamination

- single dose activated charcoal
 - adsorption of drug/toxin to AC prevents availability
 - contraindications: caustics, small bowel obstruction, perforation
 - dose: 10 g/g drug ingested or 1g/kg body weight
 - odorless, tasteless, prepared as slurry with H₂O
- whole bowel irrigation
 - 500 mL/h (child) to 2,000 mL/h (adult) of polyethylene glycol solution by mouth until clear effluent per rectum
 - start slow (500 mL in an adult) and aim to increase rate hourly as tolerated
 - indications
 - ♦ awake, alert, can be nursed upright OR intubated and airway protected
 - ♦ delayed release product
 - ♦ drug/toxin not bound to charcoal
 - ♦ drug packages (if any evidence of breakage → emergency surgery)
 - ♦ recent toxin ingestion
 - contraindications
 - ♦ evidence of ileus, perforation, or obstruction
- surgical removal in extreme cases
 - indicated for drugs that are toxic, form concretions, or cannot be removed by conventional means
- no evidence for the routine use of cathartics (i.e. ipecac)

Urine Alkalinization

- may be used for: ASA, methotrexate, phenobarbital, chlorpropamide
- weakly acidic substances can be trapped in alkali urine (pH >7.5) to increase elimination

Multidose Activated Charcoal

- may be used for: carbamazepine, phenobarbital, quinine, theophylline
- for toxins which undergo enterohepatic recirculation
- removes drug that has already been absorbed by drawing it back into GI tract
- various regimens: 12.5 g (1/4 bottle) PO q1h or 25 g (1/2 bottle) PO q2h until non-toxic

Hemodialysis

- indications/criteria for hemodialysis
 - toxins that have high water solubility, low protein binding, low molecular weight, adequate concentration gradient, small volume of distribution, or rapid plasma equilibration
 - removal of toxin will cause clinical improvement
 - advantage is shown over other modes of therapy
 - predicted that drug or metabolite will have toxic effects
 - impairment of normal routes of elimination (cardiac, renal, or hepatic)
 - clinical deterioration despite maximal medical support
- useful for the following toxins
 - methanol
 - ethylene glycol
 - salicylates
 - lithium
 - phenobarbital
 - chloral hydrate (→ trichloroethanol)
- others include theophylline, carbamazepine, valproate, methotrexate

Substances NOT Adsorbed by Activated Charcoal

- Lithium
- Iron
- Lead
- Alcohols
- Caustics

Position Paper Update: Ipecac Syrup for Gastrointestinal Decontamination

Clin Toxicol 2013;51:134-139

Study: Systematic review of 12 new studies (2003-2011) and summary of older studies (animal studies, volunteer studies, marker studies, case reports).

Conclusions: There is debate in the literature as to whether or not the use of ipecac should be completely abandoned, or whether it may remain useful in certain special circumstances. Concerns regarding the use of ipecac include the variability of its effects depending on elapsed time of administration and its interference with other treatments such as activated charcoal. Furthermore, ipecac use has a number of side effects, such as diarrhea, drowsiness, and prolonged vomiting, as well as some rare side effects which may contribute to death. Despite these, ipecac has a high margin of safety. While routine administration of ipecac is not appropriate, it may be beneficial in certain circumstances. For example, its use may be considered when there is a substantial risk of serious toxicity, there are no contraindications (such as high risk of aspiration), no alternative treatment option exists (or when the administration of ipecac will have no effect on the alternative treatment option), and there can be timely delivery of ipecac (<90 min).

E – Expose and Examine the Patient

- vital signs (including temperature), skin (needle tracks, color), mucous membranes, pupils, odors, and CNS
- head-to-toe survey including
 - C-spine
 - signs of trauma, seizures (incontinence, “tongue biting”, etc.), infection (meningismus), or chronic alcohol/drug abuse (track marks, nasal septum erosion)
- mental status

Table 28. Specific Toxicidromes

Toxidrome	Overdose Signs and Symptoms	Examples of Drugs
Anticholinergic	Hyperthermia Dilated pupils Dry skin Vasodilation Agitation/hallucinations Ileus Urinary retention Tachycardia	“Hot as a hare” “Blind as a bat” “Dry as a bone” “Red as a beet” “Mad as a hatter” “The bowel and bladder lose their tone and the heart goes on alone” Antidepressants (e.g. TCAs) Cyclobenzaprine (Flexeril®) Carbamazepine Antihistamines (e.g. diphenhydramine) Antiparkinsonians Antipsychotics Antispasmodics Belladonna alkaloids (e.g. atropine)
Cholinergic	“DUMBELS” Diaphoresis, Diarrhea, Decreased BP Urination Miosis Bronchospasm, Bronchorrhea, Bradycardia Emesis, Excitation of skeletal muscle Lacrimation Salivation, Seizures	Natural plants: mushrooms, trumpet flower Anticholinesterases: physostigmine Insecticides (organophosphates, carbamates) Nerve gases
Extrapyramidal	Dysphonia, dysphagia Rigidity and tremor Motor restlessness, crawling sensation (akathisia) Constant movements (dyskinesia) Dystonia (muscle spasms, laryngospasm, trismus, oculogyric crisis, torticollis)	Major tranquilizers Antipsychotics
Hemoglobin Derangements	Increased respiratory rate Decreased LOC Seizures Cyanosis unresponsive to O ₂ Lactic acidosis	CO poisoning (carboxyhemoglobin) Drug ingestion (methemoglobin, sulfmethemoglobin)
Opioid, Sedative/ Hypnotic, EtOH	Hypothermia Hypotension Respiratory depression Dilated or constricted pupils (pinpoint in opioid) CNS depression	EtOH Benzodiazepines Opioids (morphine, heroin, fentanyl, etc.) Barbiturates Gamma hydroxybutyrate
Sympathomimetic	Increased temperature CNS excitation (including seizures) Tachycardia, HTN N/V Diaphoresis Dilated pupils	Amphetamines, caffeine, cocaine, LSD, phencyclidine Ephedrine and other decongestants Thyroid hormone Sedative or EtOH withdrawal
Serotonin Syndrome	Mental status changes, autonomic hyperactivity, neuromuscular abnormalities, hyperthermia, diarrhea, HTN	MAOI, TCA, SSRI, opiate analgesics Cough medicine, weight reduction medications

Note: ASA poisoning and hypoglycemia mimic sympathomimetic toxidrome

F – Full Vitals, ECG Monitor, Foley, X-Rays

G – Give Specific Antidotes and Treatments

Urine Alkalinization Treatment for ASA Overdose

- urine pH >7.5
- fluid resuscitate first, then 3 amps NaHCO₃/L of D5W @ 1.5 x maintenance
- add 20-40 mEq/L KCl if patient is able to urinate

Table 29. Protocol for Warfarin Overdose

INR	Management: Consider Prothrombin Complex Concentrate (Octaplex®, Beriplex®) for any elevated INR, AND either life-threatening bleeding, or a plan for the patient to undergo a surgical procedure within the next 6 h
<5.0	Cessation of warfarin administration, observation, serial INR/PT
5.1–9.0	If no risk factors for bleeding, hold warfarin x 1-2 d and reduce maintenance dose OR Vitamin K 1-2 mg PO if patient at increased risk of bleeding
9.1–20.0	Hold warfarin, vitamin K 2-4 mg PO, serial INR/PT, additional vitamin K if necessary
>20.0	Hold warfarin, vitamin K 10 mg IV over 10 min, increase vitamin K dosing (q4h) if needed

Table 30. Specific Antidotes and Treatments for Common Toxins*

Toxin	Treatment	Considerations
Acetaminophen	Decontaminate (activated charcoal) N-acetylcysteine	Often clinically silent; evidence of liver/renal damage delayed >24 h Toxic dose >200 mg/kg (>7.5 g adult) Monitor drug level 4 h post-ingestion; also liver enzymes, INR, PTT, BUN, Cr Hypoglycemia, metabolic acidosis, encephalopathy → poor prognosis
Acute Dystonic Reaction	Benztropine: 1-2 mg IM/IV then 2 mg PO x 3 d OR Diphenhydramine 1-2 mg/kg IV, then 25 mg PO qid x 3 d	Benzotropine (Cogentin®) has euphoric effect and potential for abuse
Anticholinergics	Decontaminate (activated charcoal) Supportive care	Special antidotes available; consult Poison Information Center
ASA	Decontaminate (activated charcoal) Alkalinize urine; want urine pH >7.5	Monitor serum pH and drug levels closely Monitor K ⁺ level; may require supplement for urine alkalinization Hemodialysis may be needed if intractable metabolic acidosis, very high levels, or end-organ damage (i.e. unable to diurese)
Benzodiazepines	Decontaminate (activated charcoal) Flumazenil Supportive care	
β-blockers	Decontaminate (activated charcoal) Consider high dose insulin euglycemia therapy Some dialyzable, some use intralipids	Consult Poison Information Center
Calcium Channel Blockers	Decontaminate (activated charcoal) CaCl ₂ 1-4 g of 10% solution IV if hypotensive Other: high dose insulin euglycemia, inotropes or intralipids	Order ECG, electrolytes (especially Ca ²⁺ , Mg ²⁺ , Na ⁺ , K ⁺)
Cocaine	Decontaminate (activated charcoal) if oral Aggressive supportive care	β-blockers are contraindicated in acute cocaine toxicity Intralipid for life-threatening symptoms
CO Poisoning	See <i>Inhalation Injury</i> , ER46 Supportive care 100% O ₂	
Cyanide	Hydroxocobalamin	
Digoxin	Decontaminate (activated charcoal) Digoxin-specific Ab fragments 10-20 vials IV if acute; 3-6 if chronic 1 vial (40 mg) neutralizes 0.5 mg of toxin	Use for life-threatening dysrhythmias unresponsive to conventional therapy, 6 h serum digoxin >9.4 ng/mL, initial K ⁺ >5 mEq/L, ingestion >10 mg (adult)/>4 mg (child) Common dysrhythmias include VFib, VTach, and conduction blocks
Ethanol	Thiamine 100 mg IM/IV Manage airway and circulatory support	Hypoglycemia very common in children Mouthwash = 70% EtOH; perfumes and colognes = 40-60% EtOH Order serum EtOH level and glucose level; treat glucose level appropriately
Ethylene Glycol/Methanol	Fomepizole (4-methylpyrazole) 15 mg/kg IV load over 30 min, then 10 mg/kg q12h OR Ethanol (10%) 10 mL/kg over 30 min, then 1.5 mL/h	CBC, electrolytes, glucose, ethanol level Consider hemodialysis
Heparin	Protamine sulfate 25-50 mg IV	For unfractionated heparin overdose only
Insulin IM/SC/Oral Hypoglycemic	Glucose IV/PO/NG tube Glucagon: 1-2 mg IM (if no access to glucose)	Glyburide carries highest risk of hypoglycemia among oral agents Consider octreotide for oral hypoglycemics (50-100 µg SC q6h) in these cases; consult local Poison Information Center
MDMA	Decontaminate (activated charcoal), supportive care	Monitor CK; treat rhabdomyolysis with high flow fluids; aggressive external cooling for hyperthermia
Opioids	See <i>Universal Antidotes</i> , ER48	
TCA's	Decontaminate (activated charcoal) Aggressive supportive care NaHCO ₃ bolus for wide QRS/seizures	Flumazenil antidote contraindicated in combined TCA and benzodiazepine overdose Also consider cardiac and hypotension support, seizure control Intralipid therapy (consult local Poison Information Center)

*Call local Poison Information Center for specific doses and treatment recommendations

Alcohol Related Emergencies

- see [Psychiatry](#), PS18

Acute Intoxication

- slurred speech, CNS depression, disinhibition, lack of coordination
- nystagmus, diplopia, dysarthria, ataxia → may progress to coma
- hypotension (peripheral vasodilation)
- if obtunded, rule out
 - head trauma/intracranial hemorrhage
 - associated depressants/street drugs, toxic alcohols
 - ♦ may also contribute to respiratory/cardiac depression
 - hypoglycemia (screen with bedside glucometer)
 - hepatic encephalopathy: confusion, altered LOC, coma
 - ♦ precipitating factors: GI bleed, infection, sedation, electrolyte abnormalities, protein meal
 - Wernicke's encephalopathy (ataxia, ophthalmoplegia, delirium)
 - post-ictal state, basilar stroke

Withdrawal

- beware of withdrawal signs
- treatment
 - diazepam 10-20 mg IV/PO or lorazepam 2-4 mg IV/PO q1h until calm
 - ♦ frequency of dosing may have to be increased depending on clinical response
 - may use CIWA protocol and give benzodiazepines as above until CIWA <10
 - thiamine 100 mg IM/IV then 50-100 mg/d
 - magnesium sulfate 4 g IV over 1-2 h (if hypomagnesemic)
 - admit patients with DT or multiple seizures

Table 31. Alcohol Withdrawal Signs

Time Since Last Drink	Syndrome	Description
6-8 h	Mild withdrawal	Generalized tremor, anxiety, agitation, but no delirium Autonomic hyperactivity (sinus tachycardia), insomnia, N/V
1-2 d	Alcoholic hallucinations	Visual (most common), auditory, and tactile hallucinations Vitals often normal
8 h-2 d	Withdrawal seizures	Typically brief generalized tonic-clonic seizures May have several within a few hours CT head if focal seizures have occurred
3-5 d	DT	5% of untreated withdrawal patients Severely confused state, fluctuating LOC Agitation, insomnia, hallucinations/delusions, tremor Tachycardia, hyperpyrexia, diaphoresis High mortality rate

Cardiovascular Complications

- HTN
- cardiomyopathy: SOB, edema
- dysrhythmias ("holiday heart")
 - AFib (most common), atrial flutter, SVT, VTach (especially Torsades if hypomagnesemic/hypokalemic)

Metabolic Abnormalities

- alcoholic ketoacidosis
 - AG metabolic acidosis, urine ketones, low glucose, and normal osmolality
 - history of chronic alcohol intake with abrupt decrease/cessation
 - malnourished, abdominal pain with N/V
 - treatment: dextrose, thiamine (100 mg IM/IV prior to dextrose), volume repletion (with NS)
 - generally resolves in 12-24 h
- other alcohols
 - ethylene glycol → CNS, CVS, renal findings
 - methanol
 - ♦ early: lethargy, confusion
 - ♦ late: headache, visual changes, N/V, abdominal pain, tachypnea
 - both ethylene glycol and methanol produce severe metabolic acidosis with anion gap (as the alcohol is metabolized) and osmolar gap (initially after ingestion but before metabolism)
 - EtOH co-ingestion is protective
 - treatment
 - ♦ urgent hemodialysis required
 - ♦ fomepizole 15 mg/kg IV bolus OR EtOH 10% IV bolus and infusion to achieve blood level of 100 mg/dL (EtOH loading may be done PO)

Alcohol levels correlate poorly with intoxication

Alcohol intoxication may invalidate informed consent

CIWA Withdrawal Symptoms

- N/V
- Tremor
- Paroxysmal sweats
- Anxiety
- Agitation
- Visual disturbances
- Tactile disturbances
- Auditory disturbances
- Headache
- Disorientation

10 symptoms each scored out of 7 except orientation is out of 4

Common Deficiencies

- Thiamine
- Niacin
- Folate
- Glycogen
- Magnesium
- Potassium

- ♦ consider folic acid for methanol, and pyridoxine and thiamine for ethylene glycol – both help reduce conversion to active metabolites
- other abnormalities associated with alcohol: hypomagnesemia, hypophosphatemia, hypocalcemia, hypoglycemia, hypokalemia

Gastrointestinal Abnormalities

- gastritis
 - common cause of abdominal pain and GI bleed in chronic alcohol users
- pancreatitis
 - serum amylase very unreliable in patients with chronic pancreatitis, may need serum lipase
 - hemorrhagic form (15%) associated with increased mortality
 - fluid resuscitation very important
- hepatitis
 - AST/ALT ratio >2 suggests alcohol as the cause as well as elevated GGT with acute ingestion
- peritonitis/spontaneous bacterial peritonitis
 - leukocytosis, fever, generalized abdominal pain/tenderness
 - occasionally accompanies cirrhosis
 - paracentesis for diagnosis (common pathogens: *E. coli*, *Klebsiella*, *Streptococcus*)
- GI bleeds
 - most commonly gastritis or ulcers, even if patient known to have varices
 - consider Mallory-Weiss tear secondary to retching
 - often complicated by underlying coagulopathies
 - minor: treat with antacids
 - severe or recurrent: endoscopy

Disposition

- before patient leaves ED ensure stable vital signs, can walk unassisted, fully oriented
- offer social services to find shelter or detox program
- ensure patient can obtain any medications prescribed and can complete any necessary follow-up

Approach to the Overdose Patient

History

- age, weight, underlying medical problems, medications
- substance and how much
- time and symptoms since exposure determines prognosis and need for decontamination
- route
- intention, suicidality

Physical Exam

- focus on: ABCs, LOC/GCS, vitals, pupils

Suspect Overdose when:

- Altered LOC/coma
- Young patient with life-threatening dysrhythmia
- Trauma patient
- Bizarre or puzzling clinical presentation

Disposition from the Emergency Department

- methanol, ethylene glycol
 - delayed onset, admit and watch clinical and biochemical markers
- TCAs
 - prolonged/delayed cardiotoxicity warrants admission to monitored (ICU) bed
 - if asymptomatic and no clinical signs of intoxication: 6 h ED observation adequate with proper decontamination and no ECG abnormalities
 - sinus tachycardia alone (most common finding) with history of OD warrants observation in ED
- hydrocarbons/smoke inhalation
 - pneumonitis may lag 6-8 h
 - consider observation for repeated clinical and radiographic examination
- ASA, acetaminophen
 - if borderline level, get second level 2-4 h after first
 - for ASA, must have at least 2 levels going down before discharge (3 levels minimum)
- oral hypoglycemics
 - admit all patients for minimum 24 h if hypoglycemic and 12 h after last octreotide dose
 - observe asymptomatic patient for at least 8 h

Psychiatric Consultation

- once patient medically cleared, arrange psychiatric intervention if required
- beware – suicidal ideation may not be expressed

Psychiatric Emergencies

Approach to Common Psychiatric Presentations

- see [Psychiatry, PS2](#)
- before seeing patient, ensure your own safety; have security/police available if necessary

History

- safety
 - assess suicidality: suicidal ideation (SI), intent, plan, lethal means, and past attempts
 - assess homicidality: homicidal ideation (HI), access to weapons, intended victim, and history of violence
 - driving and children
 - command hallucinations
- identify current stressors and coping strategies
- mood symptoms: manic, depressive
- anxiety: panic attacks, generalized anxiety, phobias, obsessive-compulsive disorder, post-traumatic stress disorder
- psychotic symptoms: delusions, hallucinations, disorganized speech, disorganized or catatonic behavior, negative symptoms (affective flattening, avolition, alogia)
- substance use history: most recent use, amount, previous withdrawal reactions
- past psychiatric history, medications, adherence with medications
- medical history: obtain collateral if available

Physical Exam

- complete physical exam focusing on: vitals, neurological exam, signs of head trauma, signs of drug toxicity, signs of metabolic disorder
- mental status exam: general appearance, behavior, cooperation, speech, mood and affect, thought content and form, perceptual disturbances, cognition (including MMSE if indicated), judgment, insight, reliability

Investigations

- investigations vary with age, established psychiatric diagnosis vs. first presentation, history and physical suggestive of organic cause
- as indicated: blood glucose, urine and serum toxicology screen, pregnancy test, electrolytes, TSH, AST/ALT, bilirubin, serum Cr, BUN, osmolality
- blood levels of psychiatric medications
- CT head if suspect neurological etiology
- LP if indicated

Key Functions of Emergency Psychiatric Assessment

- Is the patient medically stable?
- Rule out medical cause
- Is psychiatric consult needed?
- Are there safety issues (SI, HI)?
- Is patient certifiable? (must demonstrate risk [present/past test] and apparent mental illness [future test])

Psychiatric Review of Systems

MOAPS

Mood
Organic
Anxiety
Psychosis
Safety

Acute Psychosis

Differential Diagnosis

- primary psychotic disorder (e.g. schizophrenia)
- secondary to medical condition (e.g. delirium)
- drugs: substance intoxication or withdrawal, medications (e.g. steroids, anticholinergics)
- infectious (CNS)
- metabolic (hypoglycemic, hepatic, renal, thyroid)
- structural (hemorrhage, neoplasm)

Management

- violence prevention
 - remain calm, empathic, and reassuring
 - ensure safety of staff and patients, have extra staff and/or security on hand
 - patients demonstrating escalating agitation or overt violent behavior may require physical restraint and/or chemical tranquilization
- treat agitation: whenever possible, offer medication to patients as opposed to administering with force (helps calm and engage patient)
 - benzodiazepines: lorazepam 2 mg PO/IM/SL
 - antipsychotics: olanzapine 5 mg PO, haloperidol 5 mg PO/IM
- treat underlying medical condition
- psychiatry or Crisis Intervention Team consult

Suicidal Patient

Epidemiology

- attempted suicide F>M, completed suicide M>F
- second leading cause of death in people <24 yr

Management

- ensure patient safety: close observation, remove potentially dangerous objects from person and room
- assess thoughts (ideation), means, action (preparatory, practice attempts), previous attempts
- admit if there is evidence of intent and organized plan, access to lethal means, psychiatric disorder, intoxication (suicidal ideation may resolve with few days of abstinence)
- patient may require certification if unwilling to stay voluntarily
- do not start long-term medications in the ED
- psychiatry or Crisis Intervention Team consult

See [Psychiatry](#), PS2 for certification (involuntary assessment/admission) considerations

High Risk Patients

SAD PERSONS

Sex = male
Age >45 yr old
Depression
Previous attempts
Ethanol use
Rational thinking loss
Suicide in family
Organized plan
No spouse, no support system
Serious illness

Common Pediatric ED Presentations

Modified Glasgow Coma Score

Table 32. Modified GCS

Modified GCS for Infants		
Eye Opening	Verbal Response	Motor Response
4 – spontaneously	5 – coos, babbles	6 – normal, spontaneous movement
3 – to speech	4 – irritable cry	5 – withdraws to touch
2 – to pain	3 – cries to pain	4 – withdraws to pain
1 – no response	2 – moans to pain	3 – decorticate flexion
	1 – no response	2 – decerebrate extension
		1 – no response

Modified GCS for Children <4 yr		
Eye Opening	Verbal Response	Motor Response
4 – spontaneously	5 – oriented, social, speaks, interacts	6 – normal, spontaneous movement
3 – to speech	4 – confused speech, disoriented, consolable	5 – localizes to pain
2 – to pain	3 – inappropriate words, not consolable/aware	4 – withdraws to pain
1 – no response	2 – incomprehensible, agitated, restless, not aware	3 – decorticate flexion
	1 – no response	2 – decerebrate extension
		1 – no response

Any trauma or suspected trauma patient <1 yr of age with a large, boggy scalp hematoma requires U/S or CT

Respiratory Distress

- see [Pediatrics](#), P89

History and Physical Exam

- infants not able to feed, older children not able to speak in full sentences
- anxious, irritable, lethargic – may indicate hypoxia
- tachypnea >60 (>40 if preschool age, >30 if school age), retractions, tracheal tug
 - see [Pediatrics](#), P3 for age specific vital signs
- pulsus paradoxus
- wheezing, grunting, vomiting

Table 33. Stridorous Upper Airway Diseases: Diagnosis

Feature	Croup	Bacterial Tracheitis	Epiglottitis ¹
Age Range (yr)	0.5-4	5-10	2-8
Prodrome	Days	Hours to days	Minutes to hours
Temperature	Low grade	High	High
Radiography	Steeple sign	Exudates in trachea	Thumb sign
Etiology	Parainfluenza	<i>S. aureus</i> /GAS	<i>H. Influenzae</i> type b
Barky Cough	Yes	Yes	No
Drooling	Yes	No	Yes
Appear Toxic	No	Yes	Yes
Intubation/ICU	No	Yes	Yes
Antibiotics	No	Yes	Yes
NOTE	Oral exam	Oral exam	No oral exam, consult ENT

¹Now rare with Hib vaccine in common use

In Pediatric Respiratory Distress, Must also Rule Out:

- Anaphylaxis
- Foreign body
- Pneumonia
- Bronchiolitis

Management

- croup (usually laryngotracheitis caused by parainfluenza viruses)
 - humidified O₂ should not be given (no evidence for efficacy)
 - racemic epinephrine q1h x 3 doses, observe for 'rebound effects'
 - nebulized 1:1000 epi (racemic has limited availability)
 - dexamethasone x 1 dose
 - consider bacterial tracheitis/epiglottitis if unresponsive to croup therapy
- bacterial tracheitis
 - start croup therapy, but may have poor response
 - usually require intubation, ENT consult, ICU
 - start antibiotics (e.g. cloxacillin), pending C&S
- epiglottitis
 - 4 D's: drooling, dyspnea, dysphagia, dysphonia + tripod sitting
 - do not examine oropharynx or agitate patient
 - immediate anesthesia, ENT call – intubate
 - then IV fluids, antibiotics, blood cultures
- asthma
 - supplemental O₂ if saturation <90% or PaO₂ <60%
 - bronchodilator therapy: salbutamol (Ventolin®) 0.15 mg/kg by masks q20min x 3
 - add 250-500 µg ipratropium (Atrovent®) to first 3 doses salbutamol
 - give corticosteroid therapy as soon as possible after arrival (prednisolone 2 mg/kg, dexamethasone 0.3 mg/kg)
 - if critically ill, not responding to inhaled bronchodilators or steroids: give IV bolus, then infusion of MgSO₄
 - IV β₂-agonists if critically ill and not responding to above

Admission Criteria for Croup

- Stridor at rest or significant respiratory distress
- Relapse after 2 doses of epinephrine or incomplete response
- Comorbid respiratory or underlying condition

Admission Criteria for Asthma

- Respiratory distress 6 h after steroids
- Ventolin required >q3h
- Need for supplemental oxygen
- Consider if previous ICU admission
- Significant fatigue or lethargy

Febrile Infant and Febrile Seizures

FEBRILE INFANT

- see [Pediatrics, P54](#)
- for fever >100.4°F without obvious focus
 - <28 d
 - ♦ admit
 - ♦ full septic workup (CBC and differential, blood C&S, urine C&S, LP ± stool C&S, CXR if indicated)
 - ♦ treat empirically with broad spectrum IV antibiotics
 - 28-90 d
 - ♦ as above unless infant meets Rochester criteria (see sidebar), investigate as indicated by history and physical
 - >90 d
 - ♦ toxic: admit, treat, full septic workup
 - ♦ non-toxic and no focus: investigate as indicated by history and physical

FEBRILE SEIZURES

- see [Pediatrics, P86](#)

Etiology

- children aged 6 mo to 6 yr with fever or history of recent fever
- typical vs. atypical febrile seizures
- normal neurological exam afterward
- no evidence of intracranial infection or history of previous non-febrile seizures
- often positive family history of febrile seizures
- relatively well looking after seizure

Investigations and Management

- if it is a febrile seizure: treat fever and look for source of fever
- if not a febrile seizure: treat seizure and look for source of seizure
 - note: may also have fever but may not meet criteria for febrile seizure
- ± EEG (especially if first seizure), head U/S (if fontanelle open)

Table 34. Typical vs. Atypical Febrile Seizures

Characteristic	Typical	Atypical
Duration	<15 min	>15 min
Type of Seizure	Generalized	Focal features
Frequency	1 in 24 h	>1 in 24 h

Rochester Criteria for Febrile Infants Age 28-90 Days Old

- Non-toxic looking
- Previously well (>37 wk gestational age, home with mother, no hyperbilirubinemia, no prior antibiotics or hospitalizations, no chronic/underlying illness)
- No skin, soft tissue, bone, joint, or ear infection on physical exam
- WBC 5,000-15,000, bands <1,500, urine <10 WBC/HPF, stool <5 WBC/HPF

Abdominal Pain

- see [Pediatrics](#), P39

History

- nature of pain, associated fever
- associated GI, GU symptoms
- anorexia, decreased fluid intake

Physical Exam

- HEENT, respiratory, abdominal exam including DRE, testicular/genital exam

Table 35. Differential Diagnosis of Abdominal Pain in Infants/Children/Adolescents

Medical	Surgical
Colic	Malrotation with volvulus
UTI	Hirschsprung's disease
Constipation	Necrotizing enterocolitis
Gastroenteritis	Incarcerated hernia
Sepsis	Intussusception
Henoch-Schönlein purpura	Duodenal atresia
IBD	Appendicitis
Hemolytic uremic syndrome	Cholecystitis
Pneumonia	Pancreatitis
Strep throat	Testicular torsion
Sickle cell disease crisis	Ectopic pregnancy
DKA	Trauma
Functional	Pyloric stenosis

*Remember to keep an index of suspicion for child abuse

Red Flags for Abdominal Pain

- Significant weight loss or growth retardation (need growth chart)
- Fever
- Joint pain with objective physical findings
- Rash
- Rectal bleeding
- Rebound tenderness and radiation of pain to back, shoulders, or legs
- Pain wakes from sleep
- Severe diarrhea and encopresis

Common Infections

- see [Pediatrics](#), P54

Table 36. Antibiotic Treatment of Pediatric Bacterial Infections

Infection	Pathogens	Treatment
MENINGITIS SEPSIS		
Neonatal	GBS, <i>E. coli</i> , <i>Listeria</i> , Gram-negative bacilli	ampicillin + cefotaxime
1-3 mo	Same pathogens as above and below	ampicillin + cefotaxime + vancomycin
>3 mo	<i>S. pneumoniae</i> , <i>H. influenzae</i> type b (>5 yr), meningococcus	ceftriaxone + vancomycin
OTITIS MEDIA		
1st line	<i>S. pneumoniae</i> , <i>H. influenzae</i> type b, <i>M. catarrhalis</i>	amoxicillin 80-90 mg/kg per day
2nd line		clarithromycin 15 mg/kg/d bid (for penicillin allergy)
Treatment failure		90 mg/kg/d amoxicillin and 6.4 mg/kg/d clavulanate divided into bid dosage
STREP PHARYNGITIS		
	Group A β -hemolytic <i>Streptococcus</i>	penicillin/amoxicillin or erythromycin (penicillin allergy)
UTI		
	<i>E. coli</i> , <i>Proteus</i> , <i>H. influenzae</i> , <i>Pseudomonas</i> , <i>S. saprophyticus</i> , <i>Enterococcus</i> , GBS	Oral: cephalexin (older children) IV: ampicillin and aminoglycoside
PNEUMONIA		
1-3 mo	Viral, <i>S. pneumoniae</i> , <i>C. trachomatis</i> , <i>B. pertussis</i> , <i>S. aureus</i> , <i>H. influenzae</i>	cefuroxime \pm macrolide (erythromycin) OR ampicillin \pm macrolide
3 mo-5 yr	Viral, <i>S. pneumoniae</i> , <i>S. aureus</i> , <i>H. influenzae</i> , <i>Mycoplasma pneumoniae</i>	ampicillin/amoxicillin or cefuroxime
>5 yr	As above	ampicillin/amoxicillin + macrolide or cefuroxime + macrolide

Child Abuse and Neglect

- see [Pediatrics, P14](#)
- obligation to report any suspected/known case of child abuse or neglect to CAS yourself (do not delegate)
- document injuries
- consider skeletal survey x-rays (especially in non-ambulatory child), ophthalmology consult, CT head
- injury patterns associated with child abuse
 - HI: torn frenulum, dental injuries, bilateral black eyes, traumatic hair loss, diffuse severe CNS injury, retinal hemorrhage
 - Shaken Baby Syndrome: diffuse brain injury, subdural/SAH, retinal hemorrhage, minimal/no evidence of external trauma, associated bony fractures
 - skin injuries: bites, bruises/burns in shape of an object, glove/stocking distribution of burns, bruises of various ages, bruises in protected areas
 - bone injuries: rib fractures without major trauma, femur fractures age <1 yr, spiral fractures of long bones in non-ambulatory children, metaphyseal fractures in infants, multiple fractures of various ages, complex/multiple skull fractures
 - GU/GI injuries: chronic abdominal/perineal pain, injury to genitals/rectum, STD/pregnancy, recurrent vomiting or diarrhea

Presentation of Neglect

- Failure to thrive, developmental delay
- Inadequate or dirty clothing, poor hygiene
- Child exhibits poor attachment to parents

Procedures that may Require Sedation

- Setting fractures
- Reducing dislocations
- Draining abscesses
- Exploring wounds/ulcers/superficial infections
- Endoscopic examination
- Reduce patient anxiety/agitation for imaging/procedures

Common Medications

Table 37. Commonly Used Medications

Drug	Dosing Schedule	Indications	Comments
Acetaminophen	325-650 mg PO q4-6h prn	Pain control	Max 4 g daily
Activated charcoal	30-100 g PO in 250 mL H ₂ O	Poisoning/overdose	
ASA	325-650 mg PO q4h max 4g/d stroke/MI risk: 81-325 mg PO OD 160 mg chewed	Pain control Cardiac prevention ACS	
β-blockers (metoprolol)	5 mg slow IV q5min x 3 if no contraindications	Acute MI	
Diazepam	anxiety: 2-10 mg PO tid/qid alcohol withdrawal: 10-20 mg PO/IV q1h titrated to signs/symptoms	Anxiety Alcohol withdrawal	
Enoxaparin	1 mg/kg SC bid	Acute MI	
Epinephrine	anaphylaxis: 0.1-0.5 mg IM; can repeat q10-15min	Anaphylaxis	Max 1 mg/dose
Fentanyl	0.5-1.0 µg/kg IV	Procedural sedation	Very short acting narcotic (complication=apnea)
Flumazenil	0.3 mg IV bolus q5min x 3 doses	Reversal of procedural sedation	Benzodiazepine antagonist Can cause seizures/status epilepticus in chronic benzodiazepine users
Furosemide (Lasix®)	CHF: 40-80 mg IV HTN: 10-40 mg PO bid	CHF HTN	Monitor for electrolyte imbalances
Glucose	0.5-1.0 g/kg (1-2 mL/kg) IV of D50W	Hypoglycemia/DKA	
Haloperidol	2.5-5.0 mg PO/IM initial effective dose 6-20 mg/d	Psychosis	Monitor with Parkinson's; results in CNS depression
Ibuprofen	200-800 mg PO tid prn max 1,200 mg/d	Mild to moderate acute pain Analgesic and anti-inflammatory properties	
Insulin	bolus 5-10 U (0.2 U/kg) then 5-10 U (0.1 U/kg) per h	Hyperglycemia	Monitor blood glucose levels Consider K ⁺ replacement, also measure blood glucose levels before administration
Ipratropium bromide	2-3 puffs inhaled tid-qid, max 12 puffs/d	Asthma	Contraindicated with peanut/soy allergy Caution with narrow-angle glaucoma
Lidocaine with epi	max 7 mg/kg SC	Local anesthetic	Not to be used in fingers, nose, toes, penis, ears
Lidocaine w/o epi	max 5 mg/kg SC	Local anesthetic	
Lorazepam	anxiety: 0.5-2 mg PO/IM/IV q6-8h status epilepticus: 4 mg IV repeat up to q5min	Anxiety Status epilepticus	
Midazolam	50 µg/kg IV	Procedural sedation	Short acting benzodiazepine (complication=apnea when used with narcotic) Fentanyl and midazolam often used together for procedural sedation

Table 37. Commonly Used Medications (continued)

Drug	Dosing Schedule	Indications	Comments
Morphine	15-30 mg PO q8-12h 0.1-0.2 mg/kg max 15 mg IV q4h	Mild to moderate acute/chronic pain Prescribed in combination with NSAIDs or acetaminophen	GI and constipation side effects DO NOT CRUSH, CUT, or CHEW
Naloxone	0.5-2 mg or 0.01-0.02 mg/kg initial bolus IV/IM/SL/SC or via ETT (2-2.5x IV dose), increase dose by 2 mg until response/max 10 mg	Comatose patient Opioid overdose Reversal in procedural sedation	
Nitroglycerin	acute angina: 0.3-0.6 mg SL q5min, OR 5 µg/min IV increasing by 5-20 µg/min q3-5min	Angina Acute MI	Not to be used with other anti-hypertensives Not in right ventricular MI
Percocet 10/325®	1-2 tabs PO q6h prn	Moderate pain control	Oxycodone + acetaminophen Max 4 g acetaminophen daily
Phenytoin	Status epilepticus: see Table 14, ER26	Status epilepticus	Begin maintenance dose 12 h after loading dose Continuous ECG, BP monitoring mandatory
Polysporin®	Apply to affected area bid-tid	Superficial infections	
Propofol	0.25-1 mg/kg IV	Procedural sedation	Short acting Anesthetic/sedative (complication=apnea, decreased BP)
Salbutamol	2 puffs inhaled q4-6h (4 yr) max 12 puffs/d	Asthma	Caution with cardiac abnormalities
Thiamine	100 mg IV/IM initially, then 50-100 mg IM/IV/PO OD x 3d	To treat/prevent Wernicke's encephalopathy	Caution use in pregnancy
Tylenol #3®	1-2 tabs PO q4-6h prn	Pain control	Max 4 g acetaminophen daily

Basic Anatomy Review

Major Endocrine Organs

Figure 1. Endocrine system

Dyslipidemias

Definition

- metabolic disorders characterized by elevations of fasting plasma LDL-cholesterol, and/or triglycerides (TG), and/or low HDL-cholesterol

Overview of Lipid Transport

- lipoproteins are spherical complexes that consist of a lipid core surrounded by a shell of water-soluble cholesterol, apoproteins, and phospholipids
- lipoproteins transport lipids within the body
- apolipoproteins serve as enzyme co-factors, promote clearance of the particle by interacting with cellular receptors, and stabilize the lipoprotein micelle

GENERAL FUNCTION OF ORGANS

The Hypothalamic-Pituitary Axis

Information about cortical inputs, automatic function, environmental cues (light, temperature) and peripheral hormonal feedback is synthesized at the coordinating center of the endocrine system, the hypothalamus. The hypothalamus then sends signals to the pituitary to release hormones that affect the thyroid, adrenals, gonads, growth, milk production, and water balance.

Anatomy ↔ Function

Hypothalamic hormones: small peptides, non-binding protein → rapid degradation
High [] in pituitary-portal blood system
Low [] in peripheral circulation
Proximity of axis preserves the pulsatile output signals from the hypothalamic neurons.

Thyroid

Thyroid hormone is critical to 1) brain and somatic development in fetus and infants, 2) metabolic activity in adults, and 3) function of virtually every organ system.

Adrenal

Each gland, 6-8 g, has 1) a cortex with 3 layers that act like independent organs (zona glomerulosa → aldosterone, fasciculata → cortisol, reticularis → androgen and estrogen precursors), and 2) a medulla that acts like a sympathetic ganglion to store/synthesize adrenaline and noradrenaline.

Gonads

Bifunctional: sex steroid synthesis and gamete production.
Sex steroids control sexuality and affect metabolic and brain functions.

Parathyroid

Synthesize and secrete PTH, a principle regulator of ECF Ca²⁺, regulated by [Ca²⁺], [Mg²⁺], 1,25(OH)₂D (active metabolite of vit D), and phosphate.

Pancreas

Endocrine islet β-cells produce insulin: oppose glucose production (glycogenolysis, gluconeogenesis), increase glucose uptake into muscle and fat. Glucagon, epinephrine, cortisol, and GH are counterregulatory.

Table 1. Lipoproteins

Lipoprotein	Apolipoproteins	Function
Exogenous Pathway		
Chylomicron	B-48, C, E, A-I, A-II, A-IV	• Transports dietary TG from gut to adipose tissue and muscle
Endogenous Pathway		
VLDL	B-100, C, E	• Transports hepatic synthesized TG from liver to adipose tissue and muscle
IDL	B-100, E	• Product of hydrolysis of TG in VLDL by lipoprotein lipase resulting in depletion of TG core • Enriched in cholesterol esters
LDL	B-100	• Formed by further removal of residual TG from IDL core by hepatic lipase resulting in greater enriched particles with cholesterol esters • Transports cholesterol from liver to peripheral tissues (gonads, adrenals)
HDL	A-I, A-II, C, E	• Transports cholesterol from peripheral tissues to liver • Acts as a reservoir for apolipoproteins

Figure 2. Exogenous and endogenous biosynthetic lipid pathways

Hypercholesterolemia

PRIMARY HYPERCHOLESTEROLEMIA

Table 2. Primary Hypercholesterolemias

Hypercholesterolemia	Etiology/Pathophysiology	Labs	Clinical Presentation	Treatment
Familial Hypercholesterolemia	<ul style="list-style-type: none"> 1/500 in U.S. population Autosomal codominant with high penetrance More prevalent in French Canadian population Defect in the normal LDL receptor on cell membranes 	↑ LDL ↑ TC	<ul style="list-style-type: none"> Tendinous xanthomatosis (Achilles, patellar, and extensor tendons of hand) Arcus cornealis Xanthelasmata Heterozygotes: premature CAD, 50% risk of MI in men by age 30 Homozygotes: manifest CAD and other vascular disease early in childhood and can be fatal (<20 yr) if untreated 	<ul style="list-style-type: none"> Heterozygotes: improvement of LDL with HMG-CoA reductase inhibitors, often in combination with niacin, ezetimibe, or bile acid sequestrants Homozygotes: partial control with portacaval shunt or LDL apheresis in conjunction with niacin; large dose atorvastatin is modestly effective
Polygenic Hypercholesterolemia	<ul style="list-style-type: none"> Most common Few mild inherited defects in cholesterol metabolism 	↑ TC ↑ LDL	<ul style="list-style-type: none"> Asymptomatic until vascular disease develops No xanthomata 	<ul style="list-style-type: none"> HMG-CoA reductase inhibitors, ezetimibe, niacin, bile acid sequestrant

SECONDARY HYPERCHOLESTEROLEMIA

Etiology

- endocrine: hypothyroidism
- renal: nephrotic syndrome
- immunologic: monoclonal gammopathy
- hepatic: cholestatic liver disease (e.g. primary biliary cirrhosis)
- nutritional: diet, anorexia nervosa
- drugs: cyclosporin, anabolic steroids, carbamazepine

Hypertriglyceridemia (Elevated Triglycerides)

PRIMARY HYPERTRIGLYCERIDEMIA

Table 3. Primary Hypertriglyceridemias

Hypertriglyceridemia	Etiology/Pathophysiology	Labs	Clinical Presentation	Treatment
Familial Lipoprotein Lipase Deficiency	• Autosomal recessive deficiency of lipoprotein lipase or its cofactor	↑ TG ↑ Chylomicrons Moderate ↑ in VLDL	<ul style="list-style-type: none"> • Hepatosplenomegaly • Splenic infarct • Anemia, granulocytopenia, thrombocytopenia 2° to hypersplenism • Pancreatitis • Lipemia retinalis • Eruptive xanthomata 	<ul style="list-style-type: none"> • Decrease dietary fat intake to <10% of total calories • Decrease dietary simple carbohydrates • Cook with medium chain fatty acids • Abstain from EtOH
Familial Hypertriglyceridemia	• Several genetic defects resulting in ↑ hepatic VLDL synthesis or ↓ removal of VLDL	↑ TG ↑ VLDL	<ul style="list-style-type: none"> • Possible premature CAD • Develop syndrome of obesity, hypertriglyceridemia, hyperinsulinemia, and hyperuricemia in early adulthood 	<ul style="list-style-type: none"> • Decrease dietary simple carbohydrates and fat intake • Abstain from EtOH • Fibrates or niacin

SECONDARY HYPERTRIGLYCERIDEMIA

Etiology

- endocrine: obesity/metabolic syndrome, hypothyroidism (more for high LDL, not TG), acromegaly, Cushing's syndrome, DM
- renal: chronic renal failure, polyclonal and monoclonal hypergammaglobulinemia
- hepatic: chronic liver disease, hepatitis, glycogen storage disease
- drugs: alcohol, corticosteroids, estrogen, hydrochlorothiazide, retinoic acid, β-blockers without intrinsic sympathomimetic action (ISA), anti-retroviral drugs, atypical antipsychotics, oral contraceptive pills
- other: pregnancy

Combined Hyperlipidemia

Table 4. Primary Combined Hyperlipidemias

Hyperlipidemia	Etiology/Pathophysiology	Labs	Clinical Presentation	Treatment
Familial Combined Hyperlipidemia	<ul style="list-style-type: none"> • Over-population of VLDL and associated ↑ LDL 2° to excess hepatic synthesis of apolipoprotein B • Autosomal dominant 	↑ TC + TG ↑ VLDL ↑ LDL	<ul style="list-style-type: none"> • Xanthelasma • CAD and other vascular disease 	<ul style="list-style-type: none"> • Weight reduction • Decrease simple carbohydrates, fat, cholesterol, and EtOH in diet • HMG-CoA reductase inhibitors (statins) • Niacin, fibrates, ezetimibe
Dysbetalipoproteinemia	• Abnormal apolipoprotein E	↑ TC + TG ↑ VLDL ↑ IDL	<ul style="list-style-type: none"> • Tuberous, eruptive, palmar xanthomata • Impaired glucose tolerance • CAD and PAD 	<ul style="list-style-type: none"> • Weight reduction • Decrease fat, cholesterol, and EtOH in diet • HMG-CoA reductase inhibitors • Niacin, fibrates

Dyslipidemia and the Risk for Coronary Artery Disease

- increased LDL is a major risk factor for atherosclerosis and CAD as LDL is the major atherogenic lipid particle
- increased HDL is associated with decreased cardiovascular disease and mortality
- moderate hypertriglyceridemia (triglyceride level 2.3-9 mmol/L) is an independent risk factor for CAD, especially in people with DM and in post-menopausal women
- treatment of hypertriglyceridemia has not been shown to reduce CAD risk

Hypertriglyceridemia and Pancreatitis
Serum triglyceride levels >1,000 mg/dL increases the risk of developing pancreatitis

Low HDL
Common causes

- Obesity
- Physical inactivity
- Cigarette smoking
- Metabolic syndrome, type 2 DM

Side Effects of Atypical Antipsychotics
Increased risk of:

- Dyslipidemia
- HTN
- Metabolic syndrome
- Hyperglycemia

Screening

- screen men over age 40, women over age 50, or post-menopausal
- if following risk factors present, screen at any age
 - DM
 - cigarette smoking
 - HTN (sBP >140, dBP >90)
 - obesity
 - family history of premature CAD
 - clinical signs of hyperlipidemia (xanthelasma, xanthoma, arcus cornealis)
 - evidence of atherosclerosis
 - rheumatoid arthritis, SLE, psoriasis
 - HIV infection on highly active antiretroviral therapy (HAART)
 - chronic kidney disease (estimated GFR <60 mL/min/1.73 m²)
 - erectile dysfunction
- screen children with a family history of hypercholesterolemia or chylomicronemia

Factors Affecting Risk Assessment

- metabolic syndrome
- apolipoprotein B (apo B)
 - each atherogenic particle (VLDL, IDL, LDL, and lipoprotein A) contains one molecule of apo B
 - serum [apo B] reflects the total number of particles and may be useful in assessing cardiovascular risk and adequacy of treatment in high risk patients and those with metabolic syndrome
- C-reactive protein (hs-CRP) levels
 - highly sensitive acute phase reactant
 - may be clinically useful in identifying those at a higher risk of cardiovascular disease than predicted by the global risk assessment

Treatment Effect

Each 40 mg/dL (1.0 mmol/L) decrease in LDL corresponds to 20-25% relative risk reduction in cardiovascular disease

6% Rule

If the dose of a statin is doubled there is approximately a 6% increase in the LDL lowering efficacy

For Statin Follow-Up

- Liver enzymes and lipid profile: liver enzymes measured at the beginning of treatment then once after therapy initiated; lipids (once stabilized) measured annually; order both if patient complains of jaundice, RUQ pain, dark urine
- CK at baseline and if patient complains of myalgia
- D/C statin if CK >10x upper limit of normal or patient has persistent myalgia

Intensive Lipid Lowering in CAD: TNT

NEJM 2005;352:1425-1435

Study: Multicenter, randomized, double-blinded trial with median follow-up of 4.9 yr.

Patients: 10,001 patients with CAD and LDL-C <3.4 mmol/L (<131.5 mg/dL).

Intervention: 80 mg vs. 10 mg atorvastatin daily.

Main Outcomes: Death from CAD, MI, cardiac arrest, or stroke.

Results: A primary event occurred in 8.7% of the patients receiving intensive therapy, compared to 10.9% of patients receiving standard therapy (RR 0.78, p<0.001). There was no difference in overall mortality. Incidence of persistent transaminase elevations was higher in the intensive therapy group (1.2% vs. 0.2%, p<0.001).

Conclusion: Intensive statin therapy is associated with lower rates of CAD events than standard therapy, but also a higher rate of transaminase elevation.

Simvastatin to Lower CAD Risk – The Heart Protection Study (HPS)

Lancet 2002;360:7-22

Study: Randomized, double-blind, placebo-controlled trial (median follow-up 5.0 yr).

Patients: 20,536 patients with coronary disease, other occlusive arterial disease or diabetes (aged 40-80 yr) who had a total cholesterol level of ≥3.5 mmol/L.

Intervention: Simvastatin 40 mg/d or placebo.

Main Outcomes: Mortality, fatal or non-fatal vascular events.

Results: The use of simvastatin significantly decreased total mortality (12.9 vs. 14.7, p=0.0003) and the first event rate of any cardiovascular event by 25% (p<0.0001).

Conclusion: Treatment with simvastatin improved survival and cardiovascular outcomes in high-risk CAD patients.

Treatment of Dyslipidemias

Approach to Treatment

For clinical guidelines see National Institutes of Health: Adult Treatment Panel III <https://www.nhlbi.nih.gov/guidelines/cholesterol/atglance.pdf>

- determine lipoprotein levels – obtain complete profile after 9 to 12 h fast
- identify presence of clinical atherosclerotic disease that confers high risk for CHD events
- If 2+ risk factors (other than LDL) are present without CHD or CHD risk equivalent estimate 10 yr risk of CAD using Framingham model
- establish treatment targets according to level of risk

Table 5. LDL Cholesterol Goals and Cutpoints for Therapeutic Lifestyle Changes (TLC) and Drug Therapy in Different Risk Categories

Risk Category	LDL Goal	LDL Level at which to Initiate Therapeutic Lifestyle Changes (TLC)	LDL Level at which to Consider Drug Therapy
CHD or CHD Risk Equivalents (10 yr risk >20%)	<100 mg/dL	≥100 mg/dL	130 mg/dL (100-129 mg/dL: drug optional)
2+ Risk Factors (10 yr risk ≤20%)	<130 mg/dL	≥130 mg/dL	10 yr risk 10-20% ≥130 mg/dL 10 yr risk <10%: ≥160 mg/dL
0-1 Risk Factor	<160 mg/dL	≥160 mg/dL	190 mg/dL (160-189 mg/dL: LDL-lowering drug optional)

Table 6. Treatment of Hypercholesterolemia and Hypertriglyceridemia

Treatment of Hypercholesterolemia	Treatment of Hypertriglyceridemia
<ul style="list-style-type: none"> • Conservative: 4-6 mo trial unless high risk group, in which case medical treatment should start immediately <ul style="list-style-type: none"> • Diet <ul style="list-style-type: none"> ▪ Decrease fat: <30% calories ▪ Decrease saturated fat: <10% calories ▪ Decrease cholesterol: <200 mg/d ▪ Increase fiber: >30 g/d • Decrease alcohol intake to ≤1-2 drinks/d • Smoking cessation • Aerobic exercise: ≥150 min/wk in bouts of ≥10 min • Weight loss: target BMI <25 • Medical <ul style="list-style-type: none"> ▪ HMG-CoA reductase inhibitors, ezetimibe, bile acid sequestrants, niacin (see <i>Common Medications</i>, E53) 	<ul style="list-style-type: none"> • Conservative: 4-6 mo trial <ul style="list-style-type: none"> • Diet <ul style="list-style-type: none"> ▪ Decrease fat and simple carbohydrates ▪ Increase omega-3 polyunsaturated fatty acid • Control blood sugars • Decrease alcohol intake to ≤1-2 drinks/d • Smoking cessation • Aerobic exercise: ≥150 min/wk in bouts of ≥10 min • Weight loss: target BMI <25 • Medical: fibrates, niacin (see <i>Common Medications</i>, E53) <ul style="list-style-type: none"> • Indications: <ul style="list-style-type: none"> ▪ Failed conservative measures ▪ TG >10 mmol/L (885 mg/dL) to prevent pancreatitis ▪ Combined hyperlipidemia

Disorders of Glucose Metabolism

Overview of Glucose Regulation

Glucose Related Emergencies

- DKA
- HHS
- Hypoglycemia

Figure 3. Antihyperglycemic agents

Pre-Diabetes (Impaired Glucose Tolerance/ Impaired Fasting Glucose)

- 1-5% per yr go on to develop DM
- 50-80% revert to normal glucose tolerance
- weight loss may improve glucose tolerance
- increased risk of developing macrovascular complications
- lifestyle modifications decrease progression to DM by 58%

Diagnostic Criteria

- impaired fasting glucose (IFG): fasting blood glucose (FBG) 110-125 mg/dL (6.1-6.9 mmol/L)
- impaired glucose tolerance (IGT): 2h 75 g oral glucose tolerance test (OGTT) 140-200 mg/dL (7.8-11.0 mmol/L)

Diabetes Mellitus

Definition

- syndrome of disordered metabolism and inappropriate hyperglycemia secondary to an absolute/relative deficiency of insulin, or a reduction in biological effectiveness of insulin, or both

Diagnostic Criteria

- any one of the following is diagnostic
 - presence of classic symptoms of DM (polyuria, polydipsia, polyphagia, weight loss, blurry vision, nocturia, ketonuria) PLUS random blood glucose (BG) ≥ 200 mg/dL (11.1 mmol/L)
 - on at least two separate occasions
 - ♦ FPG ≥ 126 mg/dL (7.0 mmol/L) (fasting = no caloric intake for at least 8 h) OR
 - ♦ 2 h 75 g OGTT ≥ 200 mg/dL (11.1 mmol/L) OR
 - ♦ random PG ≥ 200 mg/dL (11.1 mmol/L) OR
 - ♦ HbA1c $\geq 6.5\%$

In the absence of symptomatic hyperglycemia, if a single laboratory test result is in the DM range, a repeat confirmatory laboratory test (FPG, A1c, 2hPG in a 75 g OGTT) must be done on another day

Etiology and Pathophysiology

Table 7. Etiologic Classification of Diabetes Mellitus

I. Type 1 DM (immune-mediated β cell destruction, usually leading to absolute insulin deficiency)
II. Type 2 DM (ranges from predominantly insulin resistance with relative insulin deficiency to a predominantly insulin secretory defect with insulin resistance 2° to β cell dysfunction)
III. Other specific causes of DM:
a. Genetic defects of β cell function (e.g. MODY – Maturity-Onset Diabetes of the Young) or insulin action
b. Diseases of the exocrine pancreas:
• Pancreatitis, pancreatectomy, neoplasia, cystic fibrosis, hemochromatosis (“bronze diabetes”)
c. Endocrinopathies:
• Acromegaly, Cushing’s syndrome, glucagonoma, pheochromocytoma, hyperthyroidism
d. Drug-induced:
• Glucocorticoids, thyroid hormone, β -adrenergic agonists, thiazides, phenytoin, clozapine
e. Infections:
• Congenital rubella, CMV, coxsackie
f. Genetic syndromes associated with DM:
• Down’s syndrome, Klinefelter’s syndrome, Turner’s syndrome
IV. Gestational Diabetes Mellitus (see Obstetrics , OB13)

Table 8. Comparison of Type 1 and Type 2 Diabetes Mellitus

	Type 1	Type 2
Onset	• Usually <30 yr of age	• Usually >40 yr of age • Increasing incidence in pediatric population 2° to obesity
Epidemiology	• More common in Caucasians • Less common in Asians, Hispanics, Aborigines, and Blacks • Accounts for 5-10% of all DM	• More common in Blacks, Hispanics, Aborigines, and Asians • Accounts for >90% of all DM
Etiology	• Autoimmune	• Complex and multifactorial
Genetics	• Monozygotic twin concordance is 30-40% • Associated with HLA class II DR3 and DR4, with either allele present in up to 95% of type 1 DM • Certain DQ alleles also confer a risk	• Greater heritability than type 1 DM • Monozygotic twin concordance is 70-90% • Polygenic • Non-HLA associated
Pathophysiology	• Synergistic effects of genetic, immune, and environmental factors that cause β cell destruction resulting in impaired insulin secretion • Autoimmune process is believed to be triggered by environmental factors (e.g. viruses, bovine milk protein, urea compounds) • Pancreatic cells are infiltrated with lymphocytes resulting in islet cell destruction • 80% of β cell mass is destroyed before features of DM present	• Impaired insulin secretion, peripheral insulin resistance (likely due to receptor and post receptor abnormality), and excess hepatic glucose production
Natural History	<p>• After initial presentation, honeymoon period often occurs where glycemic control can be achieved with little or no insulin treatment as residual cells are still able to produce insulin</p> <p>• Once these cells are destroyed, there is complete insulin deficiency</p>	<p>• Early on, glucose tolerance remains normal despite insulin resistance as β cells compensate with increased insulin production</p> <p>• As insulin resistance and compensatory hyperinsulinism continue, the β cells are unable to maintain the hyperinsulinemic state which results in glucose intolerance and DM</p>
Circulating Autoantibodies	• Islet cell Ab present in up to 60-85% • Most common islet cell Ab is against glutamic acid decarboxylase (GAD) • Up to 60% have Ab against insulin	• <10%

Three Year Efficacy of Complex Insulin Regimens in Type 2 DM: 4T Trial

NEJM 2009;361:1736-1747

Study: Randomized unblinded trial with 3 yr of follow-up.

Population: 708 patients with type 2 DM, not on insulin or thiazolidinedione therapy on maximal metformin and sulfonylurea therapy.

Intervention: Thrice-daily prandial insulin aspart, vs. twice-daily biphasic insulin aspart, vs. once-daily basal insulin detemir. Sulfonylurea therapy was replaced with a secondary insulin regime specific to each arm if there was persistent hyperglycemia.

Primary Outcome: 3 yr hemoglobin HbA1c.

Results: Significant difference in rates of patient withdrawal from the study: 5.1% biphasic, 11.7% prandial, 8.5% basal regimens ($p=0.04$). There were no significant differences in median HbA1c levels between all three arms from yr 1 to 3. A smaller proportion of patients reached HbA1c <6.5% or <7.0% in the biphasic arm. The basal arm had least weight gain and least weight circumference increase, but highest rate of secondary insulin requirement. The basal arm had fewest severe hypoglycemic events per patient yr, while the biphasic had the most serious adverse effects.

Conclusion: Basal insulin regime provides the best glycemic control over a 3 yr study; with better HbA1c control, fewer hypoglycemic events, and less weight gain.

Blood Glucose Control in Type 2 DM – UKPDS 33

Lancet 1998;352:837-853

Study: Randomized controlled trial (mean follow-up 10 yr).

Patients: 3,867 patients with newly diagnosed type 2 DM (mean age 53 yr, 61% men, 81% white, mean fasting plasma glucose [FPG] 6.1-15.0 mmol/L) (236mg/dL – 580 mg/dL). Exclusions included severe cardiovascular disease, renal disease, retinopathy, and others.

Intervention: Intensive treatment with a sulfonylurea or insulin (target FPG <6 mmol/L (<232 mg/dL)) vs. conventional treatment with diet alone (target FPG <15 mmol/L (<580 mg/dL) without hyperglycemic symptoms).

Main Outcomes: DM-related endpoints (MI, angina, heart failure, stroke, renal failure, amputation, retinopathy, blindness, death from hyperglycemia or hypoglycemia), DM-related death, and all-cause mortality.

Results: Patients allocated to intensive treatment had lower median HbA1c levels ($p<0.001$).

Outcome	RRR % (p value)
DM-related endpoint	12 (0.029)
DM-related death	10 (0.34)
All-cause mortality	6 (0.44)

Patients allocated to intensive therapy had more hypoglycemic episodes and greater weight gain.

Conclusion: Intensive blood glucose control reduces microvascular, but not macrovascular complications in type 2 DM.

Table 8. Comparison of Type 1 and Type 2 Diabetes Mellitus (continued)

	Type 1	Type 2
Risk Factors	<ul style="list-style-type: none"> Personal history of other autoimmune diseases including Graves', myasthenia gravis, autoimmune thyroid disease, celiac disease, and pernicious anemia 	<ul style="list-style-type: none"> Age >40 yr Abdominal obesity/overweight First-degree relative with DM Race/ethnicity (Black, Aboriginal, Hispanic, Asian-American, Pacific Islander) Hx of IGT or IFG HTN Dyslipidemia PCOS Hx of gestational DM or macrosomic baby Schizophrenia Fatty liver Hyperuricemia
Body Habitus	<ul style="list-style-type: none"> Normal to thin 	<ul style="list-style-type: none"> Typically overweight with increased central obesity
Treatment	<ul style="list-style-type: none"> Insulin 	<ul style="list-style-type: none"> Lifestyle modification Oral antihyperglycemic agents Incretin therapy Insulin therapy

Targeting Intensive Glycemic Control vs. Targeting Conventional Glycemic Control for Type 2 DM

Cochrane DB Syst Rev 2011;6:CD008143

Study: Systematic review of randomized clinical trials of glycemic control in adults with type 2 DM.

Patients: Twenty trials randomized 16,106 patients with type 2 DM to intensive control and 13,880 patients with type 2 DM to conventional glycemic control.

Intervention: Intensive glycemic control (HbA1c $\leq 6.5\%$) vs. conventional glycemic control (determined by local guidelines).

Primary Outcomes: All-cause mortality, composite macrovascular (death from cardiovascular cause, nonfatal MI, nonfatal stroke) and microvascular events (nephropathy, retinopathy).

Results: There was no significant difference between targeting intensive and conventional glycemic control for all-cause mortality or cardiovascular mortality. Targeting intensive glycemic control reduced the risk of amputation, the composite risk of microvascular disease, retinopathy, retinal photocoagulation, and nephropathy. The risks of both mild and severe hypoglycemia were increased with targeting intensive glycemic control.

Conclusions: Intensive glycemic control did not reduce all-cause mortality and cardiovascular mortality compared to conventional glycemic control. Intensive glycemic control reduced the risk of microvascular complications while increasing the risk of hypoglycemia. Intensive glycemic control may also reduce the risk of non-fatal MI in trials exclusively dealing with glycemic control in usual care settings.

American Diabetes Association (ADA) 2014 Guidelines

	Target
HbA1c	<7.0%
Fasting plasma glucose	
Pre-prandial glucose	70-130 mg/dL (4-7 mmol/L)
2h post-prandial glucose	<180 mg/dL (5-10 mmol/L)
	Post-prandial glucose measurement should be made 1-2 h after the beginning of a meal
Lipids	<100 mg/dL (<2.6 mmol/L) A lower LDL-C target of <70 mg/dL using a high dose of a statin may be appropriate in persons with overt CVD
Blood pressure	<140/<80 mmHg

Cardiovascular Effects of Intensive Lifestyle Intervention in Type 2 DM: the Look AHEAD Trial

NEJM 2013;369:145-154

Study: RCT, with 9.6 yr of median follow-up.

Population: 5,145 overweight or obese patients with type 2 DM.

Intervention: Intensive lifestyle intervention promoting weight loss through decreased caloric intake and increased physical activity (intervention) or diabetes support and education (control).

Primary Outcome: First occurrence of death from cardiovascular (CV) causes, non-fatal myocardial infarction, non-fatal stroke, or hospitalization for angina.

Results: Although the intensive lifestyle intervention produced greater weight loss and reductions in glycated hemoglobin, the intervention did not significantly reduce the risk of CV morbidity or mortality.

Conclusions: An intensive lifestyle intervention focusing on weight loss did not significantly reduce the rate of cardiovascular events in overweight or obese adults with type 2 DM.

Treatment of Diabetes

Glycemic Targets

- HbA1c reflects glycemic control over 3 mo and is a measure of patient's long-term DM control
- therapy in most individuals with type 1 or type 2 DM should be targeted to achieve a HbA1c $\leq 7.0\%$ in order to reduce the risk of microvascular and if implemented early in the course of disease, macrovascular complications
- more intensive glucose control, HbA1c <6.5%, may be targeted in patients with a shorter duration of DM with no evidence of significant CVD and longer life expectancy, to further reduce risk of nephropathy and retinopathy, provided this does not result in a significant increase in hypoglycemia
- less stringent HbA1c targets (7.1-8.5%) may be more appropriate in type 1 and type 2 patients with limited life expectancy, higher level of functional dependency, a history of recurrent severe hypoglycemia, multiple comorbidities, extensive CAD, or a failure to attain HbA1c <7.0% despite treatment intensification
- there may be harm associated with strategy to target HbA1c <6.0% in certain patients with type 2 DM (see [ACCORD trial](#), E9)

Diet

- daily carbohydrate intake 45-60% of energy, protein 15-20% of energy, and fat <35% of energy
- intake of saturated fats <7% and polyunsaturated fats <10% of total calories each
- limit sodium, alcohol, and caffeine intake
- type 1: carbohydrate counting is used to titrate insulin regimen
- type 2: weight reduction

Lifestyle

- regular physical exercise to improve insulin sensitivity, lower lipid concentrations and control blood pressure
- smoking cessation

Medical Treatment: Oral Antihyperglycemic Agents and/or Incretin Therapy (Type 2 DM)

- initiate oral antihyperglycemic therapy and/or incretin therapy within 2-3 mo if lifestyle management does not result in glycemic control
- if HbA1c >8.5%, initiate pharmacologic therapy immediately and consider combination oral therapy or insulin immediately
- see [Common Medications](#), E52 for details on antihyperglycemic agents

Medical Treatment: Insulin (Figure 5)

- used for type 1 DM at onset, may be used in type 2 DM at any point in treatment
- routes of administration: subcutaneous injections, continuous subcutaneous insulin infusion pump, IV infusion (regular insulin only)
- bolus insulins: short-acting (Insulin regular), rapid-acting analogue (Insulin aspart, Insulin lispro, Insulin glulisine)
- basal insulins: intermediate-acting (Insulin NPH), long-acting analogue (Insulin detemir, Insulin glargine)

- premixed insulins (% Humulin R and % NPH) 30/70; premixed insulin analogues (Biphasic Insulin aspart, Insulin lispro/lispro protamine)
- estimated total daily insulin requirement: 0.5-0.7 units/kg (often start with 0.3-0.5 units/kg/day)

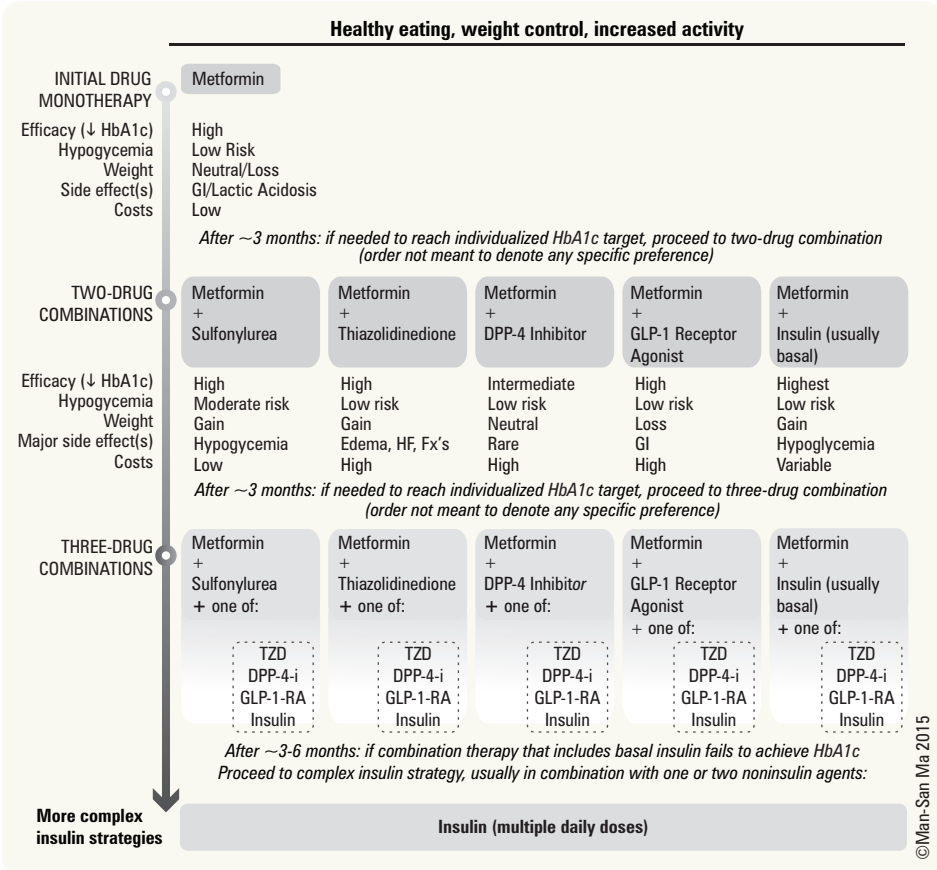

Figure 4. Approach to treatment of hyperglycemia in type 2 DM

Adapted from: Can J Diabetes 2008;32(suppl1):S56

Table 9. Available Insulin Formulations

Insulin Type (trade name)	Onset	Peak	Duration
PRANDIAL (BOLUS) INSULINS			
Rapid-acting insulin analogues			
• Insulin aspart (NovoRapid®)	10-15 min	1-1.5 h	3-5 h
• Insulin lispro (Humalog®)	10-15 min	1-2 h	3.5-4.75 h
• Insulin glulisine (Apidra®)	10-15 min	1-1.5 h	3-5 h
Short-acting insulins			
• Humulin R®	30 min	2-3 h	6.5 h
• Novolin Toronto®			
BASAL INSULINS			
Intermediate-acting			
• Humulin N®	1-3 h	5-8 h	Up to 18 h
• Novolin NPH®			
Long-acting basal insulin analogues			
Insulin detemir (Levemir®)	90 min	Not applicable	Up to 24 h (glargine 24 h, detemir 16-24 h)
Insulin glargine (Lantus®)			
PRE-MIXED INSULINS			
Premixed regular insulin – NPH			
• Humulin 30/70®			
• Novolin 30/70®			
Premixed insulin analogues			
• Biphasic insulin aspart (NovoMix 30®)			
• Insulin lispro/lispro protamine (Humalog Mix25® and Mix50®)			

Effects of Intensive Glucose Lowering in Type 2

DM: The ACCORD Trial

NEJM 2008;358:2545-2559

Study: Multicenter RCT.

Patients: 10,251 patients (mean age 62.2) with

type 2 DM, and cardiovascular risk factors.

Intervention: Intensive therapy targeting a HbA1c

level of less than 6.0% or standard therapy targeting

7.0 to 7.9%.

Outcomes: First occurrence of nonfatal MI, nonfatal

stroke, or death from CV causes.

Results: The intensive therapy arm was stopped

early (3.5 yr vs. 5.6 yr planned) due to evidence

of increased mortality. There was no difference in

primary outcome for either study arm. There was

a significant increase in all-cause mortality, CV

mortality, nonfatal MI, and CHF in the intensive

therapy group. There were increased rates of all

hypoglycemic events, any nonhypoglycemic serious

adverse events, fluid retention, and weight gain

>10 kg, but lower systolic and diastolic blood

pressure in the intensive therapy group. There

was an increased incidence of elevated ALT (>3

times upper limit) and ACE drug use in the standard

therapy group.

Conclusions: Intensive glucose lowering therapy in

type 2 DM does not improve clinic outcomes and

actually increases the risk of mortality with more

adverse events compared to standard therapy.

Additional research is required to discern the cause.

Effects of Intensive Blood Pressure Control in

Type 2 DM: The ACCORD Trial

NEJM 2010;362:1575-1585

Study: RCT, unblinded with 4.7 yr of mean

follow-up.

Population: 4,733 patients with type 2 DM, risk

factors for cardiovascular (CV) disease, systolic

blood pressure (sBP) between 130-180 mmHg.

Intervention: sBP control less than 120 mmHg

(intensive) or 140 mmHg (standard).

Primary Outcomes: Major CV event (composite

nonfatal MI, nonfatal stroke, or CV-related death).

Results: Mean number of medications at 1 yr for

intensive therapy was 3.4 (95% CI 3.4-3.5) vs. 2.1

(95%, 2.1-2.2) for standard therapy. There was a

significant increase in all serious adverse events

in the intensive treatment arm (3.3% vs. 1.27%,

p= <0.001); especially bradycardia or arrhythmia

(0.5% vs. 0.13%, p=0.02) and hyperkalemia (0.4%

vs. 0.04%, p=0.01). There was no significant

difference in primary outcomes in the two study

arms, or all-cause mortality. There was a significant

reduction in any stroke (0.32%/yr vs. 0.53%/yr,

p=0.01) and nonfatal stroke incidences (0.30%/yr

vs. 0.47%/yr, p=0.03) in the intensive therapy arm.

Conclusions: Intensive BP lowering to less than

120 mmHg vs. 140 mmHg in patients with

type 2 DM and CV risk factors does not reduce major

CV event risk reduction except for stroke events.

Effects of Combination Lipid Therapy in Type 2

DM: the ACCORD Trial

NEJM 2010;362:1563-1574

Study: RCT, double-blinded trial with 4.7 yr of mean

follow-up.

Population: 5,518 patients with type 2 DM.

Intervention: Statin with or without fibrate therapy.

Primary Outcome: Major cardiovascular (CV)

event (composite nonfatal MI, nonfatal stroke, or

CV-related death).

Results: No significant differences in primary

outcome between the two arms. No difference in

all MI, all stroke, or all-cause mortality between

study arms.

Conclusions: The addition of fibrate therapy to

statin therapy in patients with type 2 DM does not

reduce major CV event risk.

Figure 5. Duration of activity of different insulins

Insulin Regimens

Table 10. Insulin Regimens for Type 2 DM and Type 1 DM

Regimen	Administration
Type 2 DM Oral hypoglycemic agent + basal insulin	<ul style="list-style-type: none"> Start with 10 units at bedtime of basal insulin Titrate up by 1 unit until FBG <7.0 mmol/L (126 mg/dL)
Type 1 DM Multiple daily injections (MDI)	<ul style="list-style-type: none"> Estimated total insulin requirement is 0.5-0.7 U/kg 40% is given as basal insulin at bedtime 20% is given as bolus insulin before breakfast, lunch, and dinner Continue metformin but discontinue secretagogue
Split-mixed	<ul style="list-style-type: none"> Estimated total insulin requirement is 0.5-0.7 U/kg 2/3 dose is given as pre-mixed insulin before breakfast 1/3 dose is given as pre-mixed insulin before dinner Continue metformin but discontinue secretagogue

*Bolus insulin: Aspart, Glulisine, Lispro

*Basal insulin: Glargine, Detemir, NPH

*Pre-mixed insulin: Humulin 30/70, Novolin 30/70, Novomix 30, Humalog Mix25, Humalog Mix50

Table 11. Titrating Insulin Doses

Hyperglycemic Reading	Insulin Correction
High AM sugar	Increase bedtime basal insulin
High lunch sugar	Increase AM rapid/regular insulin
High supper sugar	Increase lunch rapid/regular insulin, or Increase AM basal insulin
High bedtime sugar	Increase supper rapid/regular insulin

Variable Insulin Dose Schedule ("Sliding/Supplemental/Correction Scale")

- for patients on Basal-Bolus MDI regimen: patient takes usual doses of basal insulin but varies doses of bolus insulin based on BG reading at time of dose
- use baseline bolus insulin dose when within BG target range; add or subtract units when above or below target
- when used in hospital (including perioperative management of DM) patient should also receive basal insulin to prevent fluctuations in blood sugar levels or long periods of hyperglycemia without intervention
- construction of a supplemental sliding scale for a patient on anti-hyperglycemics
 - Correction Factor (CF) = $100/\text{Total Daily Dose of insulin (TDD)}$
 - BG <4: call MD and give 15 g carbohydrates
 - BG between 4 to 8: no additional insulin
 - BG between 8 to (8 + CF): give one additional unit
 - BG between (8 + CF) to (8 + 2CF): give two additional units
 - BG between (8 + 2CF) to (8 + 3CF): give three additional units

Insulin Pump Therapy (continuous subcutaneous insulin infusion [CSII])

- external battery-operated device provides continuous basal dose of rapid-acting insulin analogue (aspart, glulisine, or lispro) through small subcutaneous catheter
- at meals, patient programs pump to deliver insulin bolus
- provides improved quality of life and flexibility
- risk of DKA if pump is inadvertently disconnected

Effects of a Mediterranean Diet in Preventing Cardiovascular Events in Type 2 DM: the PREDIMED Trial

NEJM 2013;368:1279-1290

Study: RCT, with 4.8 yr of median follow-up.

Population: 7,447 patients with type 2 DM or other high cardiovascular risk factors.

Intervention: Mediterranean diet supplemented with extra-virgin olive oil, Mediterranean diet supplemented with mixed nuts, or control diet with advice to reduce dietary fat.

Primary Outcome: Major cardiovascular (CV) event (myocardial infarction, stroke, or death from CV causes).

Results: Both Mediterranean diets were associated with a reduced incidence of major CV events compared to the control diet.

Conclusions: A Mediterranean diet with extra-virgin olive oil or nuts reduces rates of myocardial infarction, stroke, and CV death in those at high risk for CV disease.

DPP-IV Inhibitors

- Antihyperglycemic agents (e.g. sitagliptin, saxagliptin, linagliptin) that inhibit DPP-IV, an enzyme that degrades endogenous incretin hormones like GLP-1
- Incretin hormones stimulate glucose-dependent insulin secretion and inhibit glucagon release from the pancreas

GLP-1 Analogues (Incretins)

- Human glucagon-like peptide-1 analogues: exenatide, liraglutide
- These activate GLP-1 causing increased insulin secretion, decreased inappropriate glucagon secretion, increased B-cell growth/replication, slowed gastric emptying, and decreased food intake
- Associated with weight loss
- Subcutaneous formulation

Treatment of DKA/HHS

- Fluids
- Insulin
- Potassium
- Search for and treat precipitant

Conversion Chart for Percentage HbA1c to Average Blood Sugar Control

Average blood sugar level (mmol/L)	Hemoglobin A1c (% HbA1c)
17	12%
16	11%
14	10%
12	9%
10	8%
8	7%
6	6%

Conversion chart adapted from Nathan DM, et al. The clinical information value of a glycosylated hemoglobin assay. NEJM 1984;310:341-346

The 8 Is Precipitating DKA

- Infection
- Ischemia or Infarction
- Iatrogenic (glucocorticoids)
- Intoxication
- Insulin missed
- Initial presentation
- Intra-abdominal process (e.g. pancreatitis, cholecystitis)
- Intraoperative/perioperative stress

Acute Complications

Table 12. Acute Complications of Diabetes Mellitus: Hyperglycemic Comatose States

	Diabetic Ketoacidosis (DKA)	Hyperosmolar Hyperglycemic State (HHS)
Pathophysiology	<ul style="list-style-type: none"> Usually occurs in type 1 DM Insulin deficiency with ↑ counterregulatory hormones (glucagon, cortisol, catecholamines, GH) Can occur with lack of insulin (non-adherence, inadequate dosage, 1st presentation) or increased stress (surgery, infection, exercise) Unrestricted hepatic glucose production → hyperglycemia → osmotic diuresis → dehydration and electrolyte disturbance → ↓ Na⁺ (water shift to ECF causing pseudohyponatremia) Fat mobilization → ↑ FFA → ketoacids → metabolic acidosis Severe hyperglycemia exceeds the renal threshold for glucose and ketone reabsorption → glucosuria and ketonuria Total body K⁺ depletion but serum K⁺ may be normal or elevated 2° to shift from ICF to ECF due to lack of insulin, ↑ plasma osmolality Total body PO₄³⁻ depletion 	<ul style="list-style-type: none"> Occurs in type 2 DM Often precipitated by sepsis, stroke, MI, CHF, renal failure, trauma, drugs (glucocorticoids, immunosuppressants, phenytoin, diuretics), dialysis, recent surgery, burns Partial or relative insulin deficiency decreases glucose utilization in muscle, fat, and liver while inducing hyperglucagonemia and hepatic glucose production Presence of a small amount of insulin prevents the development of ketosis by inhibiting lipolysis Characterized by hyperglycemia, hyperosmolality, and dehydration without ketosis More severe dehydration compared to DKA due to more gradual onset and ↑ duration of metabolic decompensation plus impaired fluid intake which is common in bedridden or elderly Volume contraction → renal insufficiency → ↑ hyperglycemia, ↑ osmolality → shift of fluid from neurons to ECF → mental obtundation and coma
Clinical Features	<ul style="list-style-type: none"> Polyuria, polydipsia, polyphagia with marked fatigue, N/V Dehydration (orthostatic changes) LOC may be ↓ with ketoacidosis or with high serum osmolality (osm >330 mmol/L) Abdominal pain Fruity smelling breath Kussmaul's respiration 	<ul style="list-style-type: none"> Onset is insidious → preceded by weakness, polyuria, polydipsia History of decreased fluid intake History of ingesting large amounts of glucose containing fluids Dehydration (orthostatic changes) ↓ LOC → lethargy, confusion, comatose due to high serum osmolality Kussmaul's respiration is absent unless the underlying precipitant has also caused a metabolic acidosis
Serum	<ul style="list-style-type: none"> ↑ BG (typically 200-1000 mg/dL, 11-55 mmol/L), ↓ Na⁺ (2° to hyperglycemia → for every ↑ in BG by 180 mg/dL (10 mmol/L) there is a ↓ in Na⁺ by 3 mEq/L) Normal or ↑ K⁺, ↓ HCO₃⁻, ↑ BUN, ↑ Cr, ketonemia, ↓ PO₄³⁻ ↑ osmolality 	<ul style="list-style-type: none"> ↑ BG (typically 800-2400 mg/dL, 44.4-133.2 mmol/L) In mild dehydration, may have hyponatremia (spurious 2° to hyperglycemia → for every ↑ in BG by 180 mg/dL (10 mmol/L) there is a ↓ in Na⁺ by 3 mEq/L) <ul style="list-style-type: none"> if dehydration progresses, may get hypernatremia Ketosis usually absent or mild if starvation occurs ↑ osmolality
ABG	<ul style="list-style-type: none"> Metabolic acidosis with ↑ AG, possible 2° respiratory alkalosis If severe vomiting/dehydration there may be a metabolic alkalosis 	<ul style="list-style-type: none"> Metabolic acidosis absent unless underlying precipitant leads to acidosis (e.g. lactic acidosis in MI)
Urine	<ul style="list-style-type: none"> +ve for glucose and ketones 	<ul style="list-style-type: none"> -ve for ketones unless there is starvation ketosis Glycosuria
Treatment	<ul style="list-style-type: none"> Immediate resuscitation and emergency measures if patient is stuporous or comatose Monitor degree of ketoacidosis with AG, not BG or serum ketone level Rehydration: <ul style="list-style-type: none"> 1 L/h NS in first 2 h after 1st 2 L, 300-400 mL/h 0.45% NaCl (continue NS if corrected sodium is falling faster than 3 mosm/kg water/h) once BG reaches 250 mg/dL (13.9 mmol/L) then switch to D5W to maintain BG in the range of 250-300 mg/dL (13.9-16.6 mmol/L) Insulin therapy: <ul style="list-style-type: none"> critical to resolve acidosis, not hyperglycemia do not use with hypokalemia, until serum K⁺ is corrected to >3.3 mEq/L use only regular insulin (R) maintain on 0.1 U/kg/h insulin R infusion check serum glucose hourly K⁺ replacement: <ul style="list-style-type: none"> with insulin administration, hypokalemia may develop if serum K⁺ <3.3 mEq/L, hold insulin and give 40 mEq/L K⁺ replacement when K⁺ 3.5-5.0 mEq/L add KCL 20-40 mEq/L IV fluid to keep K⁺ in the range of 3.5-5 mEq/L HCO₃⁻: <ul style="list-style-type: none"> if pH <7.0 or if hypotension, arrhythmia, or coma is present with a pH of <7.1 give HCO₃⁻ in 0.45% NaCl do not give if pH >7.1 (risk of metabolic alkalosis) can give in case of life-threatening hyperkalemia ± mannitol (for cerebral edema) 	<ul style="list-style-type: none"> Same resuscitation and emergency measures as DKA Rehydration: <ul style="list-style-type: none"> IV fluids: 1 L/h NS initially evaluate corrected serum Na⁺ if corrected serum Na⁺ high or normal, switch to 0.45% NaCl (4-14 mL/kg/h) if corrected serum Na⁺ low, maintain NS (4-14 mL/kg/h) when serum BG reaches 250 mg/dL (13.9 mmol/L) switch to D5W K⁺ replacement: <ul style="list-style-type: none"> less severe K⁺ depletion compared to DKA if serum K⁺ <3.3 mEq/L, hold insulin and give 40 mEq/L K⁺ replacement if K⁺ is 3.3-5.0, give KCl 20-30 mEq/L IV fluid if serum K⁺ ≥5.5 mEq/L, check K⁺ every 2 h Search for precipitating event Insulin therapy: <ul style="list-style-type: none"> use only regular insulin (R) initially load 0.1 U/kg body weight insulin R bolus maintenance 0.1 U/kg/h insulin R infusion or IM check serum glucose hourly in general lower insulin requirement compared to DKA
Prognosis	<ul style="list-style-type: none"> 2-5% mortality in developed countries Serious morbidity from sepsis, hypokalemia, respiratory complications, thromboembolic complications, and cerebral edema (the latter in children) 	<ul style="list-style-type: none"> Overall mortality approaches 50% primarily because of the older patient population and underlying etiology/precipitant

All Ketonemia is not DKA:
Consider starvation or alcohol ketosis

Macrovascular Complications

- increased risk of CAD, ischemic stroke, and peripheral arterial disease secondary to accelerated atherosclerosis
- CAD (see [Cardiology and Cardiac Surgery, C25](#))
 - risk of MI is 3-5x higher in those with DM compared to age-matched controls
 - CAD is the leading cause of death in type 2 DM
 - most patients with DM are considered “high risk” under the risk stratification for CAD (see [Dyslipidemias, E2](#))
- ischemic stroke (see [Neurology, N46](#))
 - risk of stroke is approximately 2.5x higher in those with DM
 - level of glycemia is both a risk factor for stroke and a predictor of a poorer outcome in patients who suffer a stroke
 - HbA1c level is a significant and independent predictor of the risk of stroke
- peripheral arterial disease (see [Vascular Surgery, VS2](#))
 - manifested by intermittent claudication in lower extremities, intestinal angina, foot ulceration
 - risk of foot gangrene is 30x higher in those with DM compared to age-matched controls
 - risk of lower extremity amputation is 15x higher in those with DM
- treatment
 - tight blood pressure control (<130/80 mmHg); especially for stroke prevention
 - tight glycemic control in early DM without established CVD (refer to ACCORD, VADT, ADVANCE, DCCT, EDIC, UKPDS extension studies)
 - tight low density lipoprotein (LDL) cholesterol control (LDL 77 mg/dL [<2.0 mmol/L])
 - ACEI or angiotensin receptor blocker in high-risk patients
 - smoking cessation

Average fluid loss runs at 3-6 L in DKA, and 8-10 L in HHS

Laboratory Testing: Ketones

The nitroprusside test for ketones identifies acetone and acetoacetate but does NOT detect β -hydroxybutyrate (BHB), the ketone most frequently in excess; this has two clinical consequences:

- Be wary of a patient with a clinical picture of DKA but negative serum or urinary ketones; these could be false negatives because of the presence of BHB.
- As DKA is treated, BHB is converted to acetone and acetoacetate; serum or urinary ketones may therefore rise, falsely suggesting that the patient is worsening when in fact they are improving.

Microvascular Complications

DIABETIC RETINOPATHY (see [Ophthalmology, OP35](#))

Epidemiology

- type 1 DM: 25% affected at 5 yr, 100% at 20 yr
- type 2 DM: 25% affected at diagnosis, 60% at 20 yr
- leading cause of blindness in North America between the ages of 20-74
- most important factor is disease duration

Clinical Features

- nonproliferative
 - asymptomatic but if macular involvement occurs vision may be impaired
 - microaneurysms, hard exudates, dot-blot and flame hemorrhages
- preproliferative
 - macular edema, cotton wool spots, venous shunts and beading, intra-retinal microvascular abnormalities (IRMA)
- proliferative
 - with neovascularization and fibrous scarring; great risk for loss of vision secondary to vitreous hemorrhage (floaters) and/or retinal detachment

Treatment and Prevention

- tight glycemic control (delays onset, decreases progression), tight lipid control, manage HTN, smoking cessation
- pan-retinal laser photocoagulation for treatment of neovascularization
- vitrectomy
- annual follow-up visits with an optometrist or ophthalmologist examination through dilated pupils whether symptomatic or not (immediate referral after diagnosis of type 2 DM; 5 yr after diagnosis of type 1 DM)
- interval for follow-up should be tailored to severity of retinopathy

Effect of a Multifactorial Intervention on Mortality in Type 2 DM: The Steno-2 Study

NEJM 2008;358:580-591

Study: Single center RCT.

Patients: Patients (n=160) with type 2 DM and persistent microalbuminuria.

Intervention: Random assignment to receive either conventional multifactorial treatment or intensified, target-driven therapy involving a combination of medications and focused behavior modification. Targets included an HbA1c level of $<6.5\%$, a fasting serum total cholesterol level of <4.5 mmol/L, a fasting serum triglyceride level of <1.7 mmol/L, a sBP of <130 mmHg, and a dBP of <80 mmHg. Patients were treated with blockers of the renin-angiotensin system because of their microalbuminuria, regardless of blood pressure, and received low-dose Aspirin[®] as primary prevention.

Outcomes: The primary end point was the time to death from any cause. Other endpoints examined were death from CV causes and various CV events along with diabetic neuropathy, nephropathy, and retinopathy.

Results: Twenty-four patients in the intensive-therapy group died, as compared with 40 in the conventional-therapy group (hazard ratio, 0.54; 95% confidence interval [CI], 0.32-0.89; $p=0.02$). Intensive therapy was associated with a lower risk of death from CV causes (hazard ratio, 0.43; 95% CI 0.19-0.94; $p=0.04$) and of CV events (hazard ratio, 0.41; 95% CI 0.25-0.67; $p<0.001$). One patient in the intensive-therapy group had progression to end-stage renal disease, as compared with six patients in the conventional-therapy group ($p=0.04$). Fewer patients in the intensive-therapy group required retinal photocoagulation (relative risk, 0.45; 95% CI 0.23-0.86; $p=0.02$).

Conclusions: In at-risk patients with type 2 DM, intensive intervention with multiple drug combinations and behavior modification had sustained beneficial effects with respect to vascular complications and on rates of death from any cause and from CV causes.

DIABETIC NEPHROPATHY (see [Nephrology, NP28](#))**Epidemiology**

- DM-induced renal failure is the most common cause of renal failure in North America
- 20-40% of persons with type 1 DM (after 5-10 yr) and 4-20% with type 2 DM have progressive nephropathy

Pathophysiology

- thickening of capillary basement membrane and glomerular mesangium resulting in glomerulosclerosis and renal insufficiency
- diffuse glomerulosclerosis is more common than nodular intercapillary glomerulosclerosis (Kimmelstiel-Wilson lesions)

Screening

- serum creatinine
- random urine test for albumin to creatinine ratio (ACR) plus urine dipstick test for all type 2 DM patients at diagnosis, then annually, and for postpubertal type 1 DM patients with ≥ 5 yr duration of DM

Clinical Features

- initial changes include microalbuminuria, increased GFR (up to 140%) from hyperfiltration, enlarged kidneys
- microalbuminuria: 30 $\mu\text{g}/\text{mg}$
- macroalbuminuria: 300 $\mu\text{g}/\text{mg}$
- progression over 15 yr to cause HTN, persistent proteinuria (macroalbuminuria), nephrotic syndrome, and renal failure
- elevated HbA1c is an independent risk factor for progression to microalbuminuria

Treatment and Prevention

- tight glycemic control
- tight blood pressure control (<130/80 mmHg): can use either ACEI or ARB (often used first line for their CVD protection)
- even in the absence of glycemic control ACEIs or ARBs reduce the level of albuminuria and the rate of progression of renal disease in normotensive and hypertensive patients with type 1 or type 2 DM
- type 1 DM \rightarrow CKD with either HTN or albuminuria \rightarrow ACEIs 1st line; ARBs 2nd line
- type 2 DM \rightarrow CKD with HTN and albuminuria \rightarrow ACEIs or ARBs (dose adjust if creatinine clearance (CrCl) <60 mL/min)
- consider use of non-dihydropyridine calcium channel blocker (e.g. diltiazem) in those unable to tolerate both ACEIs and ARBs
- limit use of nephrotoxic drugs and dyes
- renal failure may necessitate hemodialysis and renal transplant

DIABETIC NEUROPATHY (see [Neurology, N42](#))**Epidemiology**

- approximately 50% of patients within 10 yr of onset of type 1 DM and type 2 DM

Pathophysiology

- can have peripheral sensory neuropathy, motor neuropathy, or autonomic neuropathy
- mechanism poorly understood
- acute cranial nerve palsies and diabetic amyotrophy are thought to be due to ischemic infarction of peripheral nerve
- the more common motor and sensory neuropathies are thought to be related to metabolic or osmotic toxicity secondary to increased sorbitol and/or decreased myoinositol (possible mechanisms include accumulation of advanced glycation endproducts [AGE], oxidative stress, protein kinase C, nerve growth factor deficiency)

Screening

- 128 Hz tuning fork or 10 g monofilament at diagnosis and annually in people with type 2 DM and after 5 yr duration of type 1 DM

**Management of Diabetic Retinopathy: A Systematic Review**

JAMA 2007;298:902-916

Purpose: To review the best evidence for primary and secondary interventions in the management of diabetic retinopathy (DR), including diabetic macular edema.

Study Selection: English-language RCTs with more than 12 mo of follow-up and meta-analyses were included.

Results: Forty-four studies (including 3 meta-analyses) met the inclusion criteria. Tight glycemic and blood pressure control reduces the incidence and progression of DR. Pan-retinal laser photocoagulation reduces the risk of moderate and severe visual loss by 50% in patients with severe nonproliferative and proliferative retinopathy. Focal laser photocoagulation reduces the risk of moderate visual loss by 50-70% in eyes with macular edema. Early vitrectomy improves visual recovery in patients with proliferative retinopathy and severe vitreous hemorrhage. Intravitreal injections of steroids may be considered in eyes with persistent loss of vision when conventional treatment has failed.

Conclusions: Tight glycemic and blood pressure control remains the cornerstone in the primary prevention of DR. Pan-retinal and focal retinal laser photocoagulation reduces the risk of visual loss in patients with severe DR and macular edema, respectively. There is currently insufficient evidence to recommend routine use of other treatments.

Clinical Features

Table 13. Clinical Presentation of Diabetic Neuropathies

Peripheral Sensory Neuropathy	Motor Neuropathy	Autonomic Neuropathy
Paresthesias (tingling, itching), neuropathic pain, radicular pain, numbness, decreased tactile sensation	Less common than sensory neuropathy	Postural hypotension, tachycardia, decreased cardiovascular response to Valsalva maneuver
Bilateral and symmetric with decreased perception of vibration and pain/temperature; especially true in the lower extremities but may also be present in the hands	Delayed motor nerve conduction and muscle weakness/atrophy	Gastroparesis and alternating diarrhea and constipation
Decreased ankle reflex	May involve one nerve trunk (mononeuropathy) or more (mononeuritis multiplex)	Urinary retention and erectile dysfunction
Symptoms may first occur in entrapment syndromes e.g. carpal tunnel	Some of the motor neuropathies spontaneously resolve after 6-8 wk	
May result in neuropathic ulceration of foot	Reversible CN palsies: III (ptosis/ophthalmoplegia, pupil sparing), VI (inability to laterally deviate eye), and VII (Bell's palsy)	
	Diabetic amyotrophy: refers to pain, weakness, and wasting of hip flexors or extensors	

Treatment and Management

- tight glycemic control
- for neuropathic pain syndromes: tricyclic antidepressants (e.g. amitriptyline), pregabalin, duloxetine, anti-epileptics (e.g. carbamazepine, gabapentin), and capsaicin
- foot care education
- Jobst® fitted stocking and tilting of head of bed may decrease symptoms of orthostatic hypotension
- treat gastroparesis with domperidone and/or metoclopramide (dopamine antagonists), erythromycin (stimulates motilin receptors)
- medical, mechanical, and surgical treatment for erectile dysfunction (see [Urology](#), U30)

Effects of Treatments for Symptoms of Painful Diabetic Neuropathy: Systematic Review

BMJ 2007;335:87

Purpose: To evaluate the effects of treatments for the symptoms of painful diabetic neuropathy.

Study Selection: RCTs comparing topically applied and orally administered drugs with a placebo in adults with painful diabetic neuropathy.

Results: 25 included reports compared anticonvulsants (n=1,270), antidepressants (94), opioids (329), ion channel blockers (173), NMDA antagonist (14), duloxetine (805), capsaicin (277), and isosorbide dinitrate spray (22) with placebo. The odds ratios in terms of 50% pain relief were 5.33 (95% CI 1.77-16.02) for traditional anticonvulsants, 3.25 (95% CI 2.27-4.66) for newer generation anticonvulsants, and 22.24 (95% CI 5.83-84.75) for tricyclic antidepressants. The odds ratios in terms of withdrawals related to adverse events were 1.51 (95% CI 0.33-6.96) for traditional anticonvulsants, 2.98 (95% CI 1.75-5.07) for newer generation anticonvulsants, and 2.32 (95% CI 0.59-9.69) for tricyclic antidepressants.

Conclusion: Anticonvulsants and antidepressants are still the most commonly used options to manage diabetic neuropathy. Tricyclic antidepressants and traditional anticonvulsants are better for short-term pain relief than newer anticonvulsants. Evidence of the long-term effects of antidepressants and anticonvulsants is lacking. Further studies are needed on opioids, NMDA antagonists, and ion channel blockers.

Other Complications

Dermatologic

- diabetic dermopathy: atrophic brown spots commonly in pretibial region known as “shin spots”, secondary to increased glycosylation of tissue proteins or vasculopathy
- eruptive xanthomas secondary to increased triglycerides
- necrobiosis lipidica diabetorum: rare complication characterized by thinning skin over the shins allowing visualization of subcutaneous vessels

Bone and Joint Disease

- juvenile cheiroarthropathy: chronic stiffness of hand caused by contracture of skin over joints secondary to glycosylated collagen and other connective tissue proteins
- Dupuytren's contracture
- bone demineralization: bone density 10-20% below normal
- adhesive capsulitis (“frozen shoulder”)

Cataracts

- subcapsular and senile cataracts secondary to glycosylated lens protein or increased sorbitol causing osmotic change and fibrosis

Infections

- see [Infectious Diseases](#), ID16

Hypoglycemia

Etiology and Pathophysiology

- hypoglycemia occurs most frequently in people with DM receiving insulin or certain antihyperglycemic therapies (insulin secretagogues)
- in people without DM, care must be taken to distinguish fasting from post-prandial hypoglycemia as each invokes separate differential diagnoses

Other Players in Glucose Homeostasis

These hormones act to increase blood glucose levels

- Glucagon
- Epinephrine
- Cortisol
- Growth hormone

C-Peptide

A short peptide released into the circulation when proinsulin is cleaved to insulin

Table 14. Common Causes of Hypoglycemia

Fasting		Post-Prandial (Nonfasting, Reactive)
Hyperinsulinism	Without Hyperinsulinism	
<ul style="list-style-type: none"> Exogenous insulin Sulfonylurea or meglitinide reaction Autoimmune hypoglycemia (autoantibodies to insulin or insulin receptor) Pentamidine Pancreatic β cell tumor – insulinoma 	<ul style="list-style-type: none"> Severe hepatic dysfunction Chronic renal insufficiency Hypocortisolism Alcohol use Non-pancreatic tumors Inborn error of carbohydrate metabolism, glycogen storage disease, gluconeogenic enzyme deficiency 	<ul style="list-style-type: none"> Alimentary Functional Noninsulinoma pancreatogenous hypoglycemic syndrome Occult DM Leucine sensitivity Hereditary fructose intolerance Galactosemia Newborn infant of diabetic mother

Clinical Features

- Whipple's triad
 - serum glucose 45 mg/dL (<2.5 mmol/L) in males and 40 mg/dL (<2.2 mmol/L) in females
 - neuroglycopenic symptoms
 - rapid relief provided by administration of glucose
- adrenergic symptoms (typically occur first; caused by autonomic nervous system activity)
 - palpitations, sweating, anxiety, tremor, tachycardia
- neuroglycopenic symptoms (caused by decreased activity of CNS)
 - dizziness, headache, clouding of vision, mental dullness, fatigue, confusion, seizures, coma

Investigations

- electrolytes, creatinine, LFTs, drugs/toxins, cortisol
- if concerned about possible insulinoma:
 - blood work to be drawn when patient is hypoglycemic (e.g. during hospitalized 72 h fast) for glucose, serum ketones, insulin, pro-insulin, C-peptide, insulin antibodies

Treatment

- for fasting hypoglycemia, must treat underlying cause
- for post-prandial (reactive) hypoglycemia, frequent small feeds
- see [Emergency Medicine, ER36](#)
- treatment of hypoglycemic episode in the unconscious patient or patient NPO
 - D50W 50 mL (1 ampule) IV or 1 mg glucagon SC (if no IV available)
 - may need ongoing glucose infusion once BG > 90 mg/dL (5 mmol/L)

Metabolic Syndrome

- several definitions, most widely used are National Cholesterol Education Program (NCEP/ATP III, updated by American Heart Association) and International Diabetes Federation (IDF) definitions
- postulated syndrome related to insulin resistance associated with hyperglycemia, hyperinsulinemia, HTN, central obesity, and dyslipidemia
- obesity aggravates extent of insulin resistance
- complications include DM, atherosclerosis, CAD, MI, and stroke
- women with PCOS are at increased risk for developing insulin resistance, hyperlipidemia, and metabolic syndrome
- not to be confused with syndrome X related to angina pectoris with normal coronary arteries (Prinzmetal angina)

Obesity

- see [Family Medicine, FM7](#)

Use C-peptide Levels to Distinguish between Exogenous and Endogenous Source of Hyperinsulinemia
 Increased = endogenous
 Decreased or normal = exogenous

Treatment of Acute Hypoglycemic Episode (Blood Glucose <72 mg/dL) in the Awake Patient (e.g. able to self-treat)

- Eat 15 g of carbohydrates (CHO)
(e.g. 3 packets sugar dissolved in water; 3/4 cup of juice)
- Wait 15 min
- Retest Blood Glucose (BG)
- Repeat steps 1-3 until BG > 90 mg/dL
- Eat next scheduled meal. If next meal is > 1 h away, eat snack including 15 g of CHO and protein.

Hypoglycemia Unawareness: (Type 1 DM >>> Type 2 DM)

Patient remains asymptomatic until severely hypoglycemic levels are reached

Causes:

- Decreased glucagon/epinephrine response
- History of repeated hypoglycemia or low HbA1c
- Autonomic neuropathy
- Not safe to drive

Suggest that patient obtain a Medic-Alert bracelet if at risk for hypoglycemia, especially with hypoglycemia unawareness

**Features of Metabolic Syndrome**

Risk Factor	IDF (2005): to make diagnosis requires abdominal obesity + ≥ 2 additional risk factors	ATP III (2005): requires $\geq 2-3$ risk factors
Abdominal Obesity		
Men	WC ≥ 37 inches (94 cm)	WC ≥ 40 inches (102 cm)
Women	WC ≥ 31.5 inches (80 cm)	WC ≥ 35 inches (88 cm)
Triglyceride Level		
	≥ 150 mg/dL (1.7 mmol/L)	≥ 150 mg/dL (1.7 mmol/L)
HDL-C Level		
Men	< 40 mg/dL (1.0 mmol/L)	< 40 mg/dL (1.0 mmol/L)
Women	< 50 mg/dL (1.3 mmol/L)	< 50 mg/dL (1.3 mmol/L)
Blood Pressure		
	$\geq 130/85$ mmHg	$\geq 130/85$ mmHg
Fasting Glucose Level		
	> 100 mg/dL (≥ 5.6 mmol/L)	> 100 mg/dL (≥ 5.6 mmol/L)

WC = waist circumference

Pituitary Gland

Pituitary Hormones

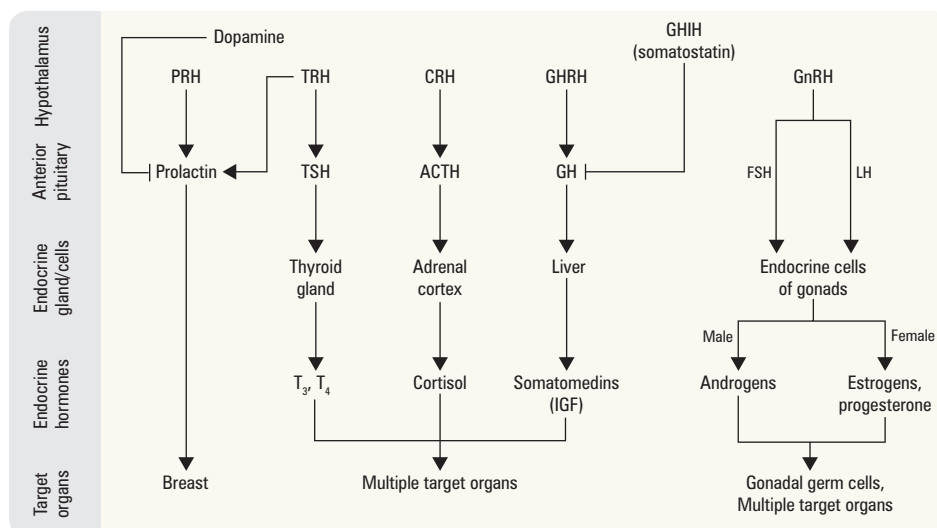

Figure 6. Hypothalamic-pituitary hormonal axes

CRH = corticotropin-releasing hormone; GnRH = gonadotropin-releasing hormone; GHIH = growth hormone-inhibiting hormone; GHRH = growth hormone-releasing hormone; PRH = prolactin-releasing hormone; TRH = thyrotropin-releasing hormone

Hypothalamic Control of Pituitary

- trophic and inhibitory factors control the release of pituitary hormones
- most hormones are primarily under trophic stimulation except prolactin which is primarily under inhibitory control by dopamine, as well as GH and TSH which are inhibited by SS (somatostatin)
- transection of the pituitary stalk (i.e. dissociation of hypothalamus and pituitary) leads to pituitary hypersecretion of prolactin and hyposecretion of all remaining hormones

Anterior Pituitary Hormones

- growth hormone (GH), luteinizing hormone (LH), follicle stimulating hormone (FSH), thyroid stimulating hormone (TSH), adrenocorticotrophic hormone (ACTH), and prolactin (PRL)

Posterior Pituitary (Hypothalamic) Hormones

- antidiuretic hormone (ADH) and oxytocin
- peptides synthesized in the supraoptic and paraventricular nuclei of the hypothalamus
- although ADH and oxytocin are produced in the hypothalamus these hormones are stored and released from the posterior pituitary

Table 15. The Physiology and Action of Pituitary Hormones

Hormone	Function	Physiology	Inhibitory Stimulus	Secretory Stimulus
ACTH	<ul style="list-style-type: none"> • Stimulates growth of adrenal cortex and secretion of its hormones 	<ul style="list-style-type: none"> • Polypeptide • Pulsatile and diurnal variation (highest in AM, lowest at midnight) 	<ul style="list-style-type: none"> • Dexamethasone • Cortisol 	<ul style="list-style-type: none"> • CRH • Metyrapone • Insulin-induced hypoglycemia • Vasopressin • Fever, pain, stress
GH	<ul style="list-style-type: none"> • Needed for linear growth • IGF-1 stimulates growth of bone and cartilage 	<ul style="list-style-type: none"> • Polypeptide • Acts indirectly through serum factors synthesized in the liver: IGF-1 (somatomedin-C) • Serum GH undetectable for most of the day and suppressed after meals high in glucose • Sustained rise during sleep 	<ul style="list-style-type: none"> • Glucose challenge • Glucocorticoids • Hypothyroidism • Somatostatin • Dopamine D2 receptor agonists • IGF-1 (long-loop) • Tonicity by dopamine 	<ul style="list-style-type: none"> • GHRH • Insulin-induced hypoglycemia • Exercise • REM sleep • Arginine, clonidine, propranolol, L-dopa

Table 15. The Physiology and Action of Pituitary Hormones (continued)

Hormone	Function	Physiology	Inhibitory Stimulus	Secretory Stimulus
LH/FSH	<ul style="list-style-type: none"> Stimulate gonads via cAMP Ovary: <ul style="list-style-type: none"> LH: production of androgens (thecal cells) which are converted to estrogens (granulosa cells); induces luteinization in follicles FSH: growth of granulosa cells in ovarian follicle; controls estrogen formation Testes: <ul style="list-style-type: none"> LH: production of testosterone (Leydig cells) FSH: production of spermatozoa (Sertoli cells) 	<ul style="list-style-type: none"> Polypeptide Glycoproteins (similar α subunit as TSH and hCG) Secreted in pulsatile fashion 	<ul style="list-style-type: none"> Estrogen Progesterone Testosterone Inhibin Continuous (i.e. non-pulsatile) GnRH infusion 	<ul style="list-style-type: none"> Pulsatile GnRH

Oxytocin	<ul style="list-style-type: none"> Causes uterine contraction Breast milk secretion 	<ul style="list-style-type: none"> Not a peptide Secreted by posterior pituitary 	<ul style="list-style-type: none"> EtOH 	<ul style="list-style-type: none"> Suckling Distention of female genital tract during labor via stretch receptors

Growth Hormone

GH DEFICIENCY

- cause of short stature in children (see [Pediatrics](#), P27)
- controversial significance in adults; often not clinically apparent, may present as fatigue

GH EXCESS

- in children (before epiphyseal fusion) leads to gigantism
- in adults (after epiphyseal fusion) leads to acromegaly

Signs and Symptoms of Acromegaly:

ABCDEF

Arthralgia/Arthritis
 Blood pressure raised
 Carpal tunnel syndrome
 Diabetes
 Enlarged organs
 Field defect (visual)

Etiology

- GH secreting pituitary adenoma, carcinoid or pancreatic islet tumors secreting ectopic GHRH resulting in excess GH

Pathophysiology

- normally GH is a catabolic hormone that acts to increase blood glucose levels
- in growth hormone excess states secretion remains pulsatile but there is loss of hypoglycemic stimulation, glucose suppression, and the nocturnal surge
- proliferation of bone, cartilage, soft tissues, organomegaly
- insulin resistance and IGT

Clinical Features

- enlargement of hands and feet, coarsening of facial features, thickening of calvarium, prognathism, thickening of skin, increased sebum production, sweating, acne, sebaceous cysts, fibromata mollusca, acanthosis nigricans, arthralgia, carpal tunnel syndrome, degenerative osteoarthritis, thyromegaly, renal calculi, HTN, cardiomyopathy, obstructive sleep apnea, colonic polyps, and DM

Investigations

- glucose suppression test is the most specific test (75 g of glucose PO suppresses GH levels in healthy individuals but not in patients with acromegaly)
- elevated serum insulin-like growth factor-1 (IGF-1) is usually first line diagnostic test

Treatment

- surgery, octreotide (somatostatin analogue), dopamine agonist (bromocriptine/cabergoline), growth hormone receptor antagonist (pegvisomant), radiation

Prolactin

HYPERPROLACTINEMIA**Etiology**

- pregnancy and breastfeeding
- prolactinoma: most common pituitary adenoma (prolactin-secreting tumors may be induced by estrogens and grow during pregnancy)
- pituitary masses with pituitary stalk compression causing reduced dopamine inhibition of prolactin release
- primary hypothyroidism (increased TRH)
- decreased clearance due to chronic renal failure or severe liver disease (prolactin is metabolized by both the kidney and liver)
- medications with anti-dopaminergic properties are a common cause of high prolactin levels: antipsychotics (common), antidepressants, antihypertensives, anti-migraine agents (triptans/ergotamines), bowel motility agents (metoclopramide/domperidone), H₂-blockers (ranitidine)
- macroprolactinemia (high molecular weight prolactin also known as big big prolactin)

Clinical Features

- galactorrhea (secretion of breast milk in women and, in rare cases, men), infertility, hypogonadism, amenorrhea, erectile dysfunction

Investigations

- serum PRL, TSH, liver enzyme tests, creatinine
- MRI of the sella turcica

Treatment

- long-acting dopamine agonist: bromocriptine, cabergoline, or quinagolide (Norprolac®)
- surgery ± radiation (rare)
- prolactin-secreting tumors are very slow-growing and sometimes require no treatment
- if medication-induced, consider stopping medication if possible
- in certain cases if microprolactinoma and not planning on becoming pregnant, may consider OCP

**Approach to Nipple Discharge**

- Differentiate between galactorrhea (fat droplets present) vs. breast discharge (usually unilateral, may be bloody or serous)
- If galactorrhea, determine if physiologic (e.g. pregnancy, lactation, stress) vs. pathologic
- If abnormal breast discharge, must rule out a breast malignancy

Thyroid Stimulating Hormone

- see *Thyroid*, E20

Adrenocorticotrophic Hormone

- see *Adrenal Cortex*, E29

Luteinizing Hormone and Follicle Stimulating Hormone

- see *Gynecology*, GY4

**HYPOGONADOTROPIC HYPOGONADISM****Clinical Features**

- hypogonadism, amenorrhea, erectile dysfunction (see *Urology*, U30), loss of body hair, fine skin, testicular atrophy, failure of pubertal development

**Treatment**

- Pergonal® (combined FSH/LH hormone therapy), hCG, or pulsatile GnRH analogue if fertility desired
- symptomatic treatment with estrogen/testosterone

HYPERGONADOTROPIC HYPOGONADISM

- 2° hypersecretion in gonadal failure (e.g. in menopause)

Antidiuretic Hormone

DIABETES INSIPIDUS

Definition

- disorder of ineffective ADH (decreased production or peripheral resistance) resulting in passage of large volumes of dilute urine

Etiology and Pathophysiology

- central DI: insufficient ADH due to pituitary surgery, tumors, idiopathic/autoimmune, stalk lesion, hydrocephalus, histiocytosis X, trauma, familial central DI
- nephrogenic DI: collecting tubules in kidneys resistant to ADH due to drugs (e.g. lithium), hypercalcemia, hypokalemia, chronic renal disease, hereditary nephrogenic DI
- psychogenic polydipsia and osmotic diuresis must be ruled out

Clinical Features

- passage of large volumes of dilute urine, polydipsia, and dehydration; hypernatremia can develop with inadequate water consumption or secondary to an impaired thirst mechanism

Diagnostic Criteria

- fluid deprivation will differentiate true DI (high urine output persists, urine osmolality < plasma osmolality) from psychogenic DI (psychogenic polydipsia)
- response to exogenous ADH (DDAVP) will distinguish central from nephrogenic DI

Treatment

- DDAVP/vasopressin for central DI
- chlorpropamide, clofibrate, thiazides, NSAIDs, or carbamazepine as second line or for partial DI
- nephrogenic DI treated with solute restriction NSAIDs and thiazide diuretics; DDAVP (if partial)

Diagnosing Subtypes of DI with DDAVP Response

Concentrated urine = Central
No effect = Nephrogenic

SYNDROME OF INAPPROPRIATE ADH SECRETION

Diagnostic Criteria

- hyponatremia with corresponding plasma hypo-osmolality, urine sodium concentration above 40 mEq/L, urine less than maximally diluted (>100 mOsm/kg), euvolemia (edema absent), and absence of adrenal, renal, or thyroid insufficiency

Etiology and Pathophysiology

- stress (pain, nausea, post-surgical)
- malignancy (lung, pancreas, lymphoma)
- CNS disease (inflammatory, hemorrhage, tumor, Guillain-Barré syndrome)
- respiratory disease (TB, pneumonia, empyema)
- drugs (SSRIs, vincristine, chlorpropamide, cyclophosphamide, carbamazepine, nicotine, morphine, DDAVP, oxytocin)

Treatment

- treat underlying cause, fluid restriction (800-1000 mL/day), vasopressin receptor antagonists (e.g. tolvaptan, conivaptan), and demeclocycline (antibiotic with anti-ADH properties, rarely-used) fludrocortisone, furosemide

SIADH vs. Cerebral Salt Wasting (CSW)
CSW can occur in cases of subarachnoid hemorrhage; Na^+ is excreted by malfunctioning renal tubules, mimicking findings of SIADH; hallmark is hypovolemia

Presentations of Pituitary Lesions

- Mass effect (visual field deficits, diplopia, ptosis, headaches, CSF leak)
- Hyperfunction
- Hypofunction

Important Deficiencies to Recognize are:

- Adrenal insufficiency
- Hypothyroidism

Concurrent adrenal insufficiency and hypothyroidism should be treated with glucocorticoids first and then with thyroid hormone to avoid adrenal crisis

Pituitary Pathology

PITUITARY ADENOMA (see [Neurosurgery, NS13](#))

Clinical Features

- local mass effects
 - visual field defects (bitemporal hemianopsia due to compression of the optic chiasm), diplopia (due to oculomotor nerve palsies), headaches; increased ICP is rare
- hypofunction
 - hypopituitarism
- hyperfunction
 - PRL (galactorrhea), GH (acromegaly in adults, gigantism in children), ACTH (Cushing's disease = Cushing's syndrome caused by a pituitary tumor)
 - tumors secreting LH, FSH, and TSH are rare

Investigations

- radiological evaluation (MRI is imaging procedure of choice)
- formal visual field testing
- hypothalamic-pituitary hormonal function

HYPOPITUITARISM

Etiology (the eight Is)

- Invasive
 - pituitary tumors, craniopharyngioma, cysts (Rathke's cleft, arachnoid, or dermoid), metastases
- Infarction/hemorrhage
 - Sheehan's syndrome (pituitary infarction due to excessive post-partum blood loss and hypovolemic shock)
 - pituitary apoplexy (acute hemorrhage/infarction of a pituitary tumor; presents with sudden loss of pituitary hormones, severe headache, and altered level of consciousness; can be fatal if not recognized and treated early)
- Infiltrative/inflammatory
 - sarcoidosis, hemochromatosis, histiocytosis
- Infectious
 - syphilis, TB, fungal (histoplasmosis), parasitic (toxoplasmosis)
- Injury
 - severe head trauma
- Immunologic
 - autoimmune destruction
- Iatrogenic
 - following surgery or radiation
- Idiopathic
 - familial forms, congenital midline defects

Investigations

- triple bolus test
 - stimulates release of all anterior pituitary hormones in normal individuals
 - rapid sequence of IV infusion of insulin, GnRH, and TRH
 - insulin (usual dose 0.1 unit/kg of human regular insulin) → hypoglycemia → increased GH and ACTH
 - GnRH (100 µg IV push) → increased LH and FSH
 - TRH (200 µg IV push over 120 s) → increased TSH and PRL (no longer available)

The Pituitary Hormones

Order they are usually lost with compression by a mass:

"Go Look For The Adenoma Please"

GH, LH, FSH, TSH, ACTH, PRL + posterior pituitary hormones: ADH and oxytocin

Thyroid

Thyroid Hormones

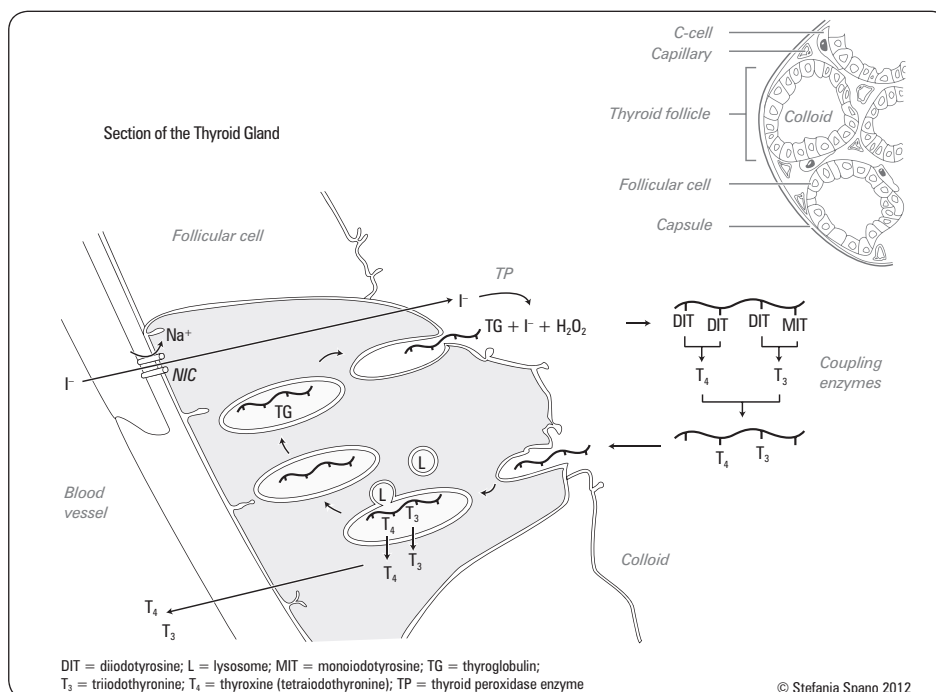

Figure 7. Thyroid hormone synthesis

Synthetic Function of Thyroid Gland

- the synthesis of thyroid hormones T₄ (thyroxine) and T₃ (triiodothyronine) by the thyroid gland involves trapping and oxidation of iodide, iodination of thyroglobulin, and release of T₃ and T₄

- free T_4 (0.03%) and free T_3 (0.3%) represent the hormonally active fraction of thyroid hormones
 - the remaining fraction is bound to thyroxine binding globulin (TBG) and albumin and is biologically inactive
- T_3 is more biologically active (3-8x more potent), but T_4 has a longer half-life
- 85% of T_4 is converted to T_3 or reverse T_3 (RT3) in the periphery by deiodinases
- RT3 is metabolically inactive but produced in times of stress to decrease metabolic activity
- most of the plasma T_3 pool is derived from the peripheral conversion of T_4
- calcitonin, a peptide hormone, is also produced in the thyroid, by the parafollicular cells or C cells
 - it functions by inhibiting osteoclast activity and increasing renal calcium excretion

Role of Thyroid Hormones

- thyroid hormones act primarily through modifying gene transcription by binding to nuclear receptors
- action of these hormones is diffuse, effecting nearly every organ system
- they produce an increase in basal metabolic rate including: increased Na^+/K^+ ATPase activity, increased O_2 consumption, increased respiration, heat generation, and increased cardiovascular activity
- also play crucial role during fetal life in both neurological and somatic development

Regulation of Thyroid Function

- extrathyroid
 - stimulation of thyroid by TSH, epinephrine, prostaglandins (cAMP stimulators)
 - T_3 negatively feeds back on anterior pituitary to inhibit TSH and on hypothalamus to inhibit TRH
- intrathyroid (autoregulation)
 - synthesis (Wolff-Chaikoff effect, Jod-Basedow effect)
 - there is varying thyroid sensitivity to TSH in response to iodide availability
 - increased ratio of T_3 to T_4 in iodide deficiency
 - increased activity of peripheral 5' deiodinase in hypothyroidism increases T_3 production despite low T_4 levels

Tests of Thyroid Function and Structure

TSH

- sensitive TSH (sTSH) is the best test for assessing thyroid function
- hyperthyroidism
 - primary: TSH is low because of negative feedback from increased levels of circulating T_3 and T_4
 - secondary: increased TSH results in increased T_3 and T_4
- hypothyroidism
 - primary: increased TSH (most sensitive test) because of less negative feedback from T_3 and T_4
 - secondary: TSH is low or normal with variable response to TRH depending on the site of the lesion (pituitary or hypothalamic)

Free T_3 and Free T_4

- standard assessment of thyroid function measures TSH and if necessary free T_4 , free T_3 should be measured if TSH is suppressed and free T_4 is normal to rule out T_3 toxicosis

Thyroid Autoantibodies

- anti-thyroglobulin antibodies (TgAb), anti-thyroid peroxidase antibodies, anti-TSH receptor inhibiting antibodies
 - increased in Hashimoto's disease; normal variant in 10-20% of individuals
- thyroid stimulating immunoglobulin (TSI)/TSH receptor stimulating antibodies

Plasma Thyroglobulin

- used to monitor for residual thyroid tissue post-thyroidectomy, e.g. tumor marker for thyroid cancer recurrence
- normal or elevated levels may suggest persistent, recurrent, or metastatic disease

Serum Calcitonin

- not routinely done to investigate thyroid nodules
- ordered if suspicion of medullary thyroid carcinoma or family history of MEN IIa or IIb syndromes
 - used to monitor for residual or recurrent medullary thyroid cancer

Thyroid Imaging/Scans

- normal gland size 15-20 g (estimated by palpation)
- thyroid U/S
 - to measure size of gland, solid vs. cystic nodule, facilitate fine needle aspirate biopsy (FNAB)
- radioisotope thyroid scan (Technetium-99)
 - *test of structure*: order if there is a thyroid nodule and patient is hyperthyroid with low TSH
 - differentiates between hot (functioning → excess thyroid hormone production) and cold (non-functioning) nodules
 - ♦ hot nodule → very low chance malignancy; treat hyperthyroidism
 - ♦ cold nodule → ~5% chance malignancy; further workup required (U/S and FNAB)

Thyroid Assessment

- Serum thyroid hormones (TSH, T_3 , T_4)
- Antibodies
- Thyroglobulin (to monitor thyroid cancer)
- Thyroid U/S
- Nuclear uptake and scan (for hyperthyroidism)
- Biopsy (FNA)

Patterns of Hormone Levels

	TSH	T_3 , T_4
1° Hyper	↓	↑
2° Hyper	↑	↑
1° Hypo	↑	↓
2° Hypo	↓	↓

Does this Patient have a Goiter?

From The Rational Clinical Examination

JAMA 2009; <http://www.jamaevidence.com/content/3480618>

Study: Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of a goiter.

Results: Clinical diagnosis was based on degree of lateral prominence, visibility, and palpability of the thyroid gland. No evidence exists to support the superiority of any one method.

The combined results of 4 studies detail the predictive utility of assessing grades of thyroid gland weight:

Weight	Reference	LR+	95% CI
0-20 g	normal	0.15	(0.10-0.21)
20-40 g	1-2x	1.9	(1.1-3.0)
>40 g	>2x	25.0	(2.6-175)

Alternatively, defining a goiter as mass larger than the distal phalanx of the thumb has been shown to have an LR+ of 3.0 (95% CI 2.5-3.5) and LR- of 0.30 (95% CI 0.24-0.37) in children, and an LR+ of 4.7 (95% CI 3.6-6.0) and LR- of 0.08 (95% CI 0.02-0.27) for the presence of a goiter.

Conclusions: Use of weight of thyroid tissue is an appropriate method of diagnosing a goiter, while comparing the size of thyroid mass to the distal phalanx of the thumb may be a useful alternative.

- radioactive iodine uptake (RAIU)
 - test of function*: order if patient is thyrotoxic
 - RAIU measures the turnover of iodine by thyroid gland *in vivo*
 - if ↑ uptake (i.e. incorporated) → gland is overactive (hyperthyroid)
 - if ↓ uptake (i.e. not incorporated) → gland is leaking thyroid hormone (e.g. thyroiditis), exogenous thyroid hormone use, or excess iodine intake (e.g. amiodarone or contrast dye, which has high iodine content)
- see Figure 8, *Approach to the Evaluation of a Thyroid Nodule*, E29 for further information regarding the utility of these scans

Thyroid Biopsy

- fine needle aspiration (FNA) for cytology
 - differentiates between benign and malignant disease
 - best done under U/S guidance
 - accuracy decreased if nodule is greater than 50% cystic, or if nodule located posteriorly in the gland

Table 16. Summary of Diagnostic Testing in Hyperthyroidism and Hypothyroidism

	Hyperthyroidism	Hypothyroidism
TSH	<ul style="list-style-type: none"> Decreased in 1° hyperthyroidism Increased in 2° hyperthyroidism 	<ul style="list-style-type: none"> Increased in 1° hypothyroidism Decreased in 2° hypothyroidism

Antibodies	Graves': thyroid stimulating Ig (TSI)	Hashimoto's: antithyroid peroxidase (TPO)
RAIU	Increased uptake: <ul style="list-style-type: none"> Graves' Toxic multinodular goiter Toxic adenoma 	Decreased uptake <ul style="list-style-type: none"> Subacute thyroiditis Recent iodine load Exogenous thyroid hormone
Radioisotope Thyroid Scan	<ul style="list-style-type: none"> Graves': homogenous diffuse uptake Multinodular goiter: heterogenous uptake Toxic adenoma: single intense area of uptake with suppression elsewhere 	

Caution with Amiodarone

Amiodarone-Induced Hypothyroidism (AIH): AIH occurs more often in iodine-sufficient areas, and is more common in populations with a higher prevalence of autoimmune thyroid disease, such as women and the elderly. AIH can also occur in patients without pre-existing thyroid dysfunction.

Amiodarone-Induced Thyrotoxicosis (AIT): AIT occurs more often in iodine-deficient areas. It may occur in patients with pre-existing thyroid deficiencies, as an iodine load on an already dysfunctional thyroid may result in excessive thyroid hormone synthesis and release. AIT may also occur in patients without thyroid abnormalities through a cytotoxic mechanism that results in leakage of thyroid hormone into the systemic circulation.

Common Etiologies

Thyrotoxicosis	Hypothyroidism
Graves' Disease	Hashimoto's
Toxic Nodular Goiter	Congenital
Toxic Nodule	Iatrogenic (thionamides, radioactive iodine, or surgery)
Thyroiditis	Hypothyroid phase of thyroiditis

Thyrotoxicosis

Definition

- clinical, physiological, and biochemical findings in response to elevated thyroid hormone

Epidemiology

- 1% of general population have hyperthyroidism
- F:M = 5:1

Etiology and Pathophysiology

Table 17. Differential Diagnosis of Thyrotoxicosis

Disorder	TSH	Free T ₄ /T ₃	Thyroid Antibodies	RAIU	Other
HYPERTHYROIDISM					
Graves' Disease	Decreased	Increased	TSI	Increased	Heterogeneous uptake on scan
Toxic Nodular Goiter	Decreased	Increased	None	Increased	Heterogeneous uptake on scan
Toxic Nodule	Decreased	Increased	None	Increased	Intense uptake in hot nodule on scan with no uptake in the rest of the gland
THYROIDITIS					
Subacute, Silent, Postpartum	Decreased	Increased	Up to 50% of cases	Decreased (becomes increased once entering hypothyroid phase, when TSH rises)	In classical subacute painful thyroiditis, ESR increased
EXTRATHYROIDAL SOURCES OF THYROID HORMONE					
Endogenous (struma ovariae, ovarian teratoma, metastatic follicular carcinoma)	Decreased	Increased	None	Decreased	
Exogenous (drugs)	Decreased	Increased (T ₄ would be decreased if taking T ₃)	None	Decreased	

Table 17. Differential Diagnosis of Thyrotoxicosis (continued)

Disorder	TSH	Free T ₄ /T ₃	Thyroid Antibodies	RAIU	Other
EXCESSIVE THYROID STIMULATION					
Pituitary thyrotrophoma	Increased	Increased	None	Increased	
Pituitary thyroid hormone receptor resistance	Increased	Increased	None	Increased	
Increased hCG (e.g. pregnancy)	Decreased	Increased	None	Increased DO NOT DO THIS TEST IN PREGNANCY	

Clinical Features**Table 18. Clinical Features of Thyrotoxicosis**

General	Fatigue, heat intolerance, irritability, fine tremor
CVS	Tachycardia, atrial fibrillation, palpitations Elderly patients may have only cardiovascular symptoms, commonly new onset atrial fibrillation
GI	Weight loss with increased appetite, thirst, increased frequency of bowel movements (hyperdefecation)
Neurology	Proximal muscle weakness, hypokalemic periodic paralysis (more common in Asians)
GU	Oligomenorrhea, amenorrhea, decreased fertility
Dermatology	Fine hair, skin moist and warm, vitiligo, soft nails with onycholysis (Plummer's nails), palmar erythema, pruritis Graves' disease: clubbing (acropachy), pretibial myxedema (rare)
MSK	Decreased bone mass, proximal muscle weakness
Hematology	Graves' disease: leukopenia, lymphocytosis, splenomegaly, lymphadenopathy (occasionally)
Eye	Graves' disease: lid lag, retraction, proptosis, diplopia, decreased acuity, puffiness, conjunctival injection

Treatment

- thionamides: PTU or MMI; MMI recommended (except in first trimester pregnancy)
- β -blockers for symptom control
- radioactive iodine thyroid ablation for Graves' disease
- surgery in the form of hemi, sub-total, or complete thyroidectomy

**Signs and Symptoms of HYPERthyroidism**

Tremor
Heart rate up
Yawning (fatigued)
Restlessness
Oligomenorrhea/amenorrhea
Intolerance to heat
Diarrhea
Irritability
Sweating
Muscle wasting/weight loss

**Caution with Thionamides**

These drugs are effective in controlling hyperthyroidism and induce permanent remission in 20-30% of patients with Graves' disease. They inhibit thyroid hormone synthesis. They are most often employed to achieve a euthyroid state before definitive treatment. Adverse effects include teratogenicity, agranulocytosis, hepatotoxicity, and ANCA-positive vasculitis.

**Graves' Disease****Definition**

- an autoimmune disorder characterized by autoantibodies to the TSH receptor that leads to hyperthyroidism

Epidemiology

- most common cause of thyrotoxicosis
- occurs at any age with peak in 3rd and 4th decade
- F>M = 7:1, 1.5-2% of U.S. women
- familial predisposition: 15% of patients have a close family member with Graves' disease and 50% have family members with positive circulating antibodies
- association with HLA B8 and DR3
- may be associated with other inherited autoimmune disorders (e.g. pernicious anemia, Hashimoto's disease)

Etiology and Pathophysiology

- autoimmune disorder due to a defect in T-suppressor cells
- B lymphocytes produce TSI that binds and stimulates the TSH receptor and stimulates the thyroid gland
- immune response can be triggered by postpartum state, iodine excess, lithium therapy, viral or bacterial infections, glucocorticoid withdrawal
- ophthalmopathy (thyroid associated orbitopathy) a result of increased tissue volume due to inflammation and accumulation of glycosaminoglycans, stimulated by TSI, that increase osmotic pressure within the orbitis leads to fluid accumulation and displacement of the eye ball forward
- dermopathy may be related to cutaneous glycosaminoglycan deposition

Clinical Features

- signs and symptoms of thyrotoxicosis
- diffuse thyroid goiter \pm thyroid bruit secondary to increased blood flow through the gland
- ophthalmopathy: proptosis, diplopia, conjunctival injection, corneal abrasions, periorbital puffiness, lid lag, decreased visual acuity if Graves' (plus signs of hyperthyroidism: lid retraction, characteristic stare)

**Graves' Ophthalmopathy****NO SPECS (in order of changes usually)**

No signs
Only signs: lid lag, lid retraction
Soft tissue: periorbital puffiness, conjunctival injection, chemosis
Proptosis/exophthalmos
Extraocular (diplopia)
Corneal abrasions (since unable to close eyes)
Sight loss

- dermatopathy (rare): pretibial myxedema (thickening of dermis that manifests as *non-pitting* edema)
- acropachy: clubbing and thickening of distal phalanges

Investigations

- low TSH
- increased free T_4 (and/or increased T_3)
- positive for TSI
- increased radioactive iodine (I^{131}) uptake
- homogeneous uptake on thyroid scan (only do this test in the presence of nodule)

Treatment

- thionamides
 - propylthiouracil (PTU) or methimazole (MMI)
 - inhibit thyroid hormone synthesis by inhibiting peroxidase-catalyzed reactions, thereby inhibiting organification of iodide, blocking the coupling of iodotyrosines
 - PTU also inhibits peripheral deiodination of T_4 to T_3
 - continue treatment until remission occurs (20-40% of patients achieve spontaneous remission at 6-18 mo of treatment)
 - small goiter and recent onset are good indicators for long-term remission with medical therapy
 - major side effects: hepatitis, agranulocytosis, and fever/arthritis
 - minor side effects: rash
 - iodinated contrast agents: sodium ipodate and iopanoic acid can inhibit conversion of T_4 to T_3 and are especially effective in combination with MMI
 - MMI preferred vs. PTU due to longer duration of action (once daily for most), more rapid efficacy, and lower incidence of side effects
 - MMI contraindicated in pregnancy (teratogenic), use PTU
- symptomatic treatment with β -blockers
- thyroid ablation with radioactive ^{131}I if PTU or MMI trial does not produce disease remission
 - high incidence of hypothyroidism after ^{131}I requiring lifelong thyroid hormone replacement
 - contraindicated in pregnancy
 - may worsen ophthalmopathy
- subtotal or total thyroidectomy (indicated rarely for large goiters, suspicious nodule for CA, if patient is intolerant to thionamides and refusing RAI ablation)
 - risks include hypoparathyroidism and vocal cord palsy
- ophthalmopathy/orbitopathy
 - smoking cessation is most important
 - prevent drying
 - high dose prednisone in severe cases
 - orbital radiation, surgical decompression

Prognosis

- course involves remission and exacerbation unless gland is destroyed by radioactive iodine or surgery
- lifetime follow-up needed
- risk of relapse is 37%, 21%, 6% in thionamides, radioiodine ablation, and surgery groups, respectively

Radioiodine Therapy for Graves' Disease and the Effect on Ophthalmopathy: A Systematic Review

Clin Endocrinol 2008;69:943-950

Purpose: To assess whether radioiodine therapy (RAI) for Graves' disease (GD) is associated with increased risk of ophthalmopathy compared with antithyroid drugs (ATDs) or surgery. To assess the efficacy of glucocorticoid prophylaxis in the prevention of occurrence or progression of Graves' ophthalmopathy (GO), when used with RAI.

Study Selection: Randomized controlled trials regardless of language or publication status.

Results: RAI was associated with an increased risk of GO compared with ATD (Relative Risk (RR) 4.23, 95% confidence interval (CI): 2.04-8.77) but compared with thyroidectomy, there was no statistically significant increased risk (RR 1.59, 95% CI 0.89-2.81). The risk of severe GO was also increased with RAI compared with ATD (RR 4.35, 95% CI 1.28-14.73). Prednisolone prophylaxis for RAI was highly effective in preventing the progression of GO in patients with pre-existing GO (RR 0.03; 95% CI 0.00-0.24). The use of adjunctive ATD with RAI was not associated with any significant benefit on the course of GO.

Conclusions: RAI therapy for GD is associated with a small but definite increased risk of development or worsening of GO compared with ATDs. Steroid prophylaxis is beneficial for patients with pre-existing GO.

Other Medications Used in the Treatment of Graves'

Glucocorticoids have been useful in the treatment of severe Graves' hyperthyroidism and thyroid storm, by inhibiting the conversion of peripheral T_4 to T_3

Lithium is also used to treat Graves' hyperthyroidism; it acts by blocking thyroid hormone release, but its toxicity has limited its use in practice

Subacute Thyroiditis (Thyrotoxic Phase)

Definition

- acute inflammatory disorder of the thyroid gland characterized by an initial thyrotoxic state followed by hypothyroidism eventually followed by euthyroidism in most cases
- two subtypes: painful and painless

Etiology and Pathophysiology

- acute inflammation of the thyroid gland characterized by giant cells and lymphocytes
- disruption of thyroid follicles by inflammatory process results in the release of stored hormone rather than excessive production of new thyroid hormone
- painful = viral (usually preceded by URTI), De Quervain's (granulomatous thyroiditis)
- painless = postpartum, auto-immune, lymphocytic
 - occurs in 5-10% of postpartum mothers and is symptomatic in 1/3 of patients

Clinical Features

- two forms
 - painful ("De Quervain's") thyroid, ears, jaw, and occiput
 - painless ("Silent")

- fever and malaise may be present, especially in De Quervain's
- postpartum: thyrotoxicosis 2-3 mo postpartum with a subsequent hypothyroid phase at 4-8 mo postpartum
- may be mistakenly diagnosed as postpartum depression

Laboratory Investigations

- initial elevated free T_4 , T_3 , low TSH, RAIU markedly reduced
- marked elevation of ESR in painful variety only
- as disease progresses values consistent with hypothyroidism may appear

Treatment

- painful – high dose NSAIDs, prednisone may be required for severe pain, fever, or malaise
- iodinated contrast agents (e.g. iopanoic acid, ipodate) to inhibit peripheral conversion of T_4 to T_3
- β -adrenergic blockade is usually effective in reversing most of the hypermetabolic and cardiac symptoms in both subtypes
- if symptomatically hypothyroid, may treat short-term with thyroxine

Prognosis

- full recovery in most cases, but permanent hypothyroidism in 10% of painless thyroiditis
- postpartum: most resolve spontaneously without need for supplementation, however may recur with subsequent pregnancies

Toxic Adenoma/Toxic Multinodular Goiter

Etiology and Pathophysiology

- autonomous thyroid hormone production from a functioning adenoma that is hypersecreting T_3 and T_4
- may be singular (toxic adenoma) or multiple (toxic multinodular goiter [Plummer's disease])

Clinical Features

- goiter with adenomatous changes
- tachycardia, heart failure, arrhythmia, weight loss, nervousness, weakness, tremor, and sweats
- seen most frequently in elderly people, often with presentation of atrial fibrillation

Investigations

- low TSH, high T_3 and T_4
- thyroid scan with increased uptake in nodule(s) and suppression of the remainder of the gland

Treatment

- initiate therapy with PTU or MMI to attain euthyroid state
- use high dose radioactive iodine (I^{-131}) to ablate hyperfunctioning nodules
- β -blockers often necessary for symptomatic treatment prior to definitive therapy
- surgical excision may also be used as 1st line treatment

Thyrotoxic Crisis/Thyroid Storm

Definition

- acute exacerbation of all of the symptoms of thyrotoxicosis presenting in a life-threatening state secondary to uncontrolled hyperthyroidism – medical emergency
- rare, but serious with mortality rate between 20-30%

Etiology and Pathophysiology

- often precipitated by infection, trauma, or surgery in a hyperthyroid patient

Differential Diagnosis

- sepsis, pheochromocytoma, malignant hyperthermia, drug overdose, neuroleptic malignant syndrome

Clinical Features

- hyperthyroidism
- extreme hyperthermia, tachycardia, vomiting, diarrhea, vascular collapse, hepatic failure with jaundice, and confusion
- tachyarrhythmia, CHF, shock
- mental status changes ranging from delirium to coma

Laboratory Investigations

- increased free T_3 and T_4 , undetectable TSH
- \pm anemia, leukocytosis, hyperglycemia, hypercalcemia, elevated LFTs

General Measures

- fluids, electrolytes, and vasopressor agents should be used as indicated
- a cooling blanket and acetaminophen can be used to treat the pyrexia
- propranolol or similar agents for beta-adrenergic blockade is used, which additionally causes decreased peripheral conversion of $T_4 \rightarrow T_3$
 - use with caution in CHF patients as it may worsen condition

Specific Measures

- PTU is the anti-thyroid drug of choice and is used in high doses
- Give iodide, which acutely inhibits the release of thyroid hormone, 1 h after the first dose of PTU is given
 - Sodium iodide 1 gm IV drip over 12h q12h
 - OR
 - Lugol's solution 2-3 drops q8h
 - OR
 - Potassium iodide (SSKI) 5 drops q8h
- dexamethasone 2-4 mg IV q6h for the first 24-48 h lowers body temperature and inhibits peripheral conversion of $T_4 \rightarrow T_3$

Prognosis

- probably <20% mortality rate if rapidly recognized and treated

Hypothyroidism

Definition

- clinical syndrome caused by cellular responses to insufficient thyroid hormone production

Epidemiology

- 2-3% of general population
- F:M = 10:1
- 10-20% of women over age 50 have subclinical hypothyroidism (normal T_4 , TSH mildly elevated)
- iodine deficiency most common cause worldwide, but not in North America

Etiology and Pathophysiology

- primary hypothyroidism (90%)
 - inadequate thyroid hormone production secondary to intrinsic thyroid defect
 - iatrogenic: post-ablative (^{131}I or surgical thyroidectomy)
 - autoimmune: Hashimoto's thyroiditis, chronic thyroiditis, idiopathic, burnt out Graves'
 - hypothyroid phase of subacute thyroiditis
 - drugs: goitrogens (iodine), PTU, MMI, lithium
 - infiltrative disease (progressive systemic sclerosis, amyloid)
 - iodine deficiency
 - congenital (1/4,000 births)
 - neoplasia
- secondary hypothyroidism: pituitary hypothyroidism
 - insufficiency of pituitary TSH
- tertiary hypothyroidism: hypothalamic hypothyroidism
 - decreased TRH from hypothalamus (rare)
- peripheral tissue resistance to thyroid hormone (Refetoff syndrome)

Table 19. Interpretation of Serum TSH and Free T_4 in Hypothyroidism

	Serum TSH	Free T_4
Overt Primary Hypothyroidism	Increased	Decreased
Subclinical Primary Hypothyroidism	Increased	Normal
Secondary Hypothyroidism	Decreased or not appropriately elevated	Decreased

Thyroid Hormone Replacement for Subclinical Hypothyroidism

Cochrane DB Syst Rev 2007;3:CD003419

Purpose: To assess the effects of thyroid hormone replacement for subclinical hypothyroidism.

Study Selection: RCTs comparing thyroid hormone replacement with placebo in adults with subclinical hypothyroidism. Minimum duration of follow-up was 1 mo.

Results: No trial assessed (cardiovascular) mortality or morbidity. Seven studies evaluated symptoms, mood, and quality of life with no statistically significant improvement. One study showed a statistically significant improvement in cognitive function. Six studies assessed serum lipids, there was a trend for reduction in some parameters following levothyroxine replacement. Some echocardiographic parameters improved after levothyroxine replacement therapy, like myocardial relaxation. Only four studies reported adverse events with no statistically significant differences between groups.

Conclusions: In current RCTs, levothyroxine replacement therapy for subclinical hypothyroidism did not result in improved survival or decreased cardiovascular morbidity. Data on health-related quality of life and symptoms did not demonstrate significant differences between intervention groups. Some evidence indicates that levothyroxine replacement improves some parameters of lipid profiles and left ventricular function.

Signs and Symptoms of Hypothyroidism

HIS FIRM CAP

Hypoventilation
Intolerance to cold
Slow HR
Fatigue
Impotence
Renal impairment
Menorrhagia/amenorrhea
Constipation
Anemia
Paresthesia

Clinical Features

Table 20. Clinical Features of Hypothyroidism

General	Fatigue, cold intolerance, slowing of mental and physical performance, hoarseness, macroglossia
CVS	Pericardial effusion, bradycardia, hypotension, worsening CHF + angina, hypercholesterolemia, hyperhomocysteinemia, myxedema heart
Respiratory	Decreased exercise capacity, hypoventilation secondary to weak muscles, decreased pulmonary responses to hypoxia, sleep apnea due to macroglossia
GI	Weight gain despite poor appetite, constipation
Neurology	Paresthesia, slow speech, muscle cramps, delay in relaxation phase of deep tendon reflexes ("hung reflexes"), carpal tunnel syndrome, asymptomatic increase in CK, seizures
GU	Menorrhagia, amenorrhea, impotence
Dermatology	Puffiness of face, periorbital edema, cool and pale, dry and rough skin, hair dry and coarse, eyebrows thinned (lateral 1/3), discoloration (carotenemia)
Hematology	Anemia: 10% pernicious due to presence of anti-parietal cell antibodies with Hashimoto's thyroiditis

Treatment

- L-thyroxine (dose range: 0.05-0.2 mg PO OD ~1.6 µg/kg/d)
- elderly patients and those with CAD: start at 0.025 mg daily and increase gradually every 6 wk (start low, go slow)
- after initiating L-thyroxine, TSH needs to be evaluated in 6 wk; dose is adjusted until TSH returns to normal reference range
- once maintenance dose achieved, follow-up TSH with patient annually
- secondary/tertiary hypothyroidism
 - monitor via measurement of free T₄ (TSH is unreliable in this setting)

CONGENITAL HYPOTHYROIDISM

- see [Pediatrics, P29](#)

Hashimoto's Thyroiditis

- most common form of primary hypothyroidism in North America
- chronic autoimmune thyroiditis characterized by both cellular and humoral factors in the destruction of thyroid tissue
- two major forms: goitrous and atrophic; both forms share same pathophysiology but differ in the extent of lymphocytic infiltration, fibrosis, and thyroid follicular cell hyperplasia
- goitrous variant usually presents with a rubbery goiter and euthyroidism, then hypothyroidism becomes evident
 - associated with fibrosis
- atrophic variant patients are hypothyroid from the start
 - associated with thyroid lymphoma

Etiology and Pathophysiology

- defect in clone of T-suppressors leads to cell-mediated destruction of thyroid follicles
- B lymphocytes produce antibodies against thyroid components including thyroglobulin, thyroid peroxidase, TSH receptor, Na⁺/I symporter

Risk Factors

- female gender
- genetic susceptibility: increased frequency in patients with Down's syndrome, Turner's syndrome, certain HLA alleles, cytotoxic T-lymphocyte-associated protein 4 (CTLA-4)
- family Hx or personal Hx of other autoimmune diseases
- cigarette smoking
- high iodine intake
- stress and infection

Investigations

- high TSH, low T₄ (not necessary to measure T₃ as it will be low as well)
- presence of thyroid peroxidase and thyroglobulin antibodies in serum

Treatment

- if hypothyroid, replace with L-thyroxine (analog of T₄)

Myxedema Coma

Definition

- severe hypothyroidism complicated by trauma, sepsis, cold exposure, MI, inadvertent administration of hypnotics or narcotics, and other stressful events – medical emergency!
- rare, high level of mortality when it occurs (up to 60%, despite therapy)

Clinical Features

- hallmark symptoms of decreased mental status and hypothermia; hyponatremia, hypotension, hypoglycemia, bradycardia, hypoventilation, and generalized edema often present

Investigations

- decreased T_4 , increased TSH, decreased glucose
- check ACTH and cortisol for evidence of adrenal insufficiency

Treatment

- aggressive treatment required
- ABCs: ICU admission
- corticosteroids (for risk of concomitant adrenal insufficiency): hydrocortisone 100 mg q8h
- L-thyroxine 0.2-0.5 mg IV loading dose, then 0.1 mg IV OD until oral therapy tolerated; also consider T_3 therapy
- supportive measures: mechanical ventilation, fluids, vasopressor drugs, passive rewarming, IV dextrose
- monitor for arrhythmia

Sick Euthyroid Syndrome

Definition

- changes in circulating thyroid hormones amongst patients with serious illness, trauma, or stress
- not due to intrinsic thyroid or pituitary disease
- initially low free T_3 may be followed by low TSH and if severe illness low free T_4
- with recovery of illness, TSH may overshoot and become transiently high

Pathophysiology

- abnormalities in SES include alterations in
 - peripheral transport and metabolism of thyroid hormone
 - regulation of TSH secretion
 - thyroid function itself
 - peripheral conversion of T_4 to T_3

Labs

- initially decreased free T_3 followed by decreased TSH and finally decreased free T_4

Treatment

- treat the underlying disease; thyroid hormone replacement worsens outcomes
- thyroid function tests normalize once patient is well (initially with a transient increase in TSH)

Non-Toxic Goiter

Definition

- generalized enlargement of the thyroid gland in a euthyroid individual that does not result from inflammatory or neoplastic processes

Pathophysiology

- the appearance of a goiter is more likely during adolescence, pregnancy, and lactation because of increased thyroid hormone requirements
 - early stages: goiter is usually diffuse
 - later stages: multinodular non-toxic goiter with nodule, cyst formation and areas of ischemia, hemorrhage, and fibrosis

Etiology

- iodine deficiency or excess
- goitrogens: brassica vegetables (e.g. turnip, cassava)
- drugs: iodine, lithium, para-aminosalicylic acid
- any disorder of hormone synthesis with compensatory growth
- peripheral resistance to thyroid hormone

Treatment

- remove goitrogens
- radioiodine therapy (need very high doses, low iodine uptake, used as last resort)
- suppression with L-thyroxine (rarely done)
- surgery may be necessary for severe compressive symptoms

Complications

- compression of neck structures causing stridor, dysphagia, pain, and hoarseness
- multinodular goiter may become autonomous leading to toxic multinodular goiter and hyperthyroidism

Thyroid Nodules

Definition

- clearly defined discrete mass, separated from the thyroid parenchyma
- palpable nodules are found in approximately 5% of the population
- M:F = 1:4

Etiology

- benign tumors (e.g. colloid nodule, follicular adenoma)
- thyroid malignancy
- hyperplastic area in a multinodular goiter
- cyst: true thyroid cyst, area of cystic degeneration in a multinodular goiter

Investigations

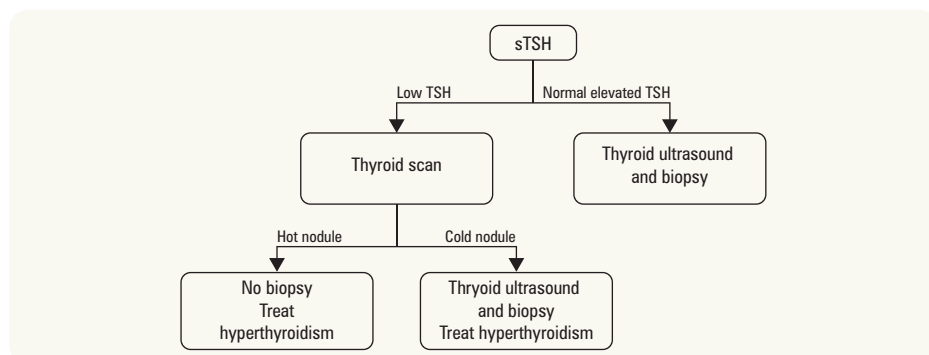

Figure 8. Approach to the evaluation of a thyroid nodule

Adapted from Dr. J Goguen, University of Toronto, MMMD 2013

Thyroid Malignancies

- see [Otolaryngology](#), OT38

Adrenal Cortex

Adrenocorticotrophic Hormone

- a polypeptide (cleaved from prohormone POMC), secreted in a pulsatile fashion from the anterior pituitary with diurnal variability (peak: 0200-0400; trough: 1800-2400)
- secretion regulated by corticotropin-releasing hormone (CRH) and arginine vasopressin (AVP)
- stimulates growth of adrenal cortex and release of glucocorticoids, androgens and, to a limited extent, mineralocorticoids
- some melanocyte stimulating activity

Adrenocortical Hormones

Aldosterone

- a mineralocorticoid which regulates extracellular fluid (ECF) volume through Na^+ (and Cl^-) retention and K^+ (and H^+) excretion (stimulates distal tubule Na^+/K^+ ATPase)
- regulated by the renin-angiotensin-aldosterone system (Figure 11)
- negative feedback to juxtaglomerular apparatus (JGA) by long loop (aldosterone \rightarrow volume expansion) and short loop (angiotensin II \rightarrow peripheral vasoconstriction)

Figure 9. Regulation of CRH-ACTH-adrenal gland axis

Figure 10. Pathways of major steroid synthesis in the adrenal gland and their enzymes

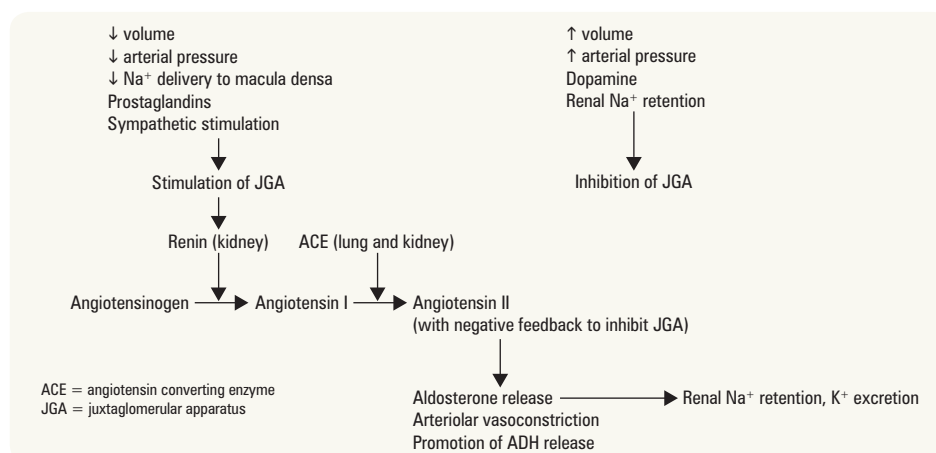

Figure 11. Renin-angiotensin-aldosterone axis (see [Nephrology, NP4](#))

Layers of the Adrenal Cortex

OUTSIDE

Zona Glomerulosa produces mineralocorticoids (aldosterone)

Zona Fasciculata produces glucocorticoids (cortisol)

Zona Reticularis produces androgens (DHEA, androstenedione)

INSIDE

Cortisol

- a glucocorticoid, regulated by the HPA axis
- involved in regulation of metabolism; counteracts the effects of insulin
- support blood pressure, vasomotor tone
- also involved in regulation of behavior and immunosuppression

Table 21. Physiological Effects of Glucocorticoids

Stimulatory Effects	Inhibitory Effects
Stimulate hepatic glucose production (gluconeogenesis)	Inhibit bone formation; stimulate bone resorption
Increase insulin resistance in peripheral tissues	Inhibit fibroblasts, causing collagen and connective tissue loss
Increase protein catabolism	Suppress inflammation; impair cell-mediated immunity
Stimulate leukocytosis and lymphopenia	Inhibit growth hormone axis
Increase cardiac output, vascular tone, Na ⁺ retention	Inhibit reproductive axis
Increase PTH release, urine calcium excretion	Inhibit vitamin D ₃ and inhibit calcium uptake

Androgens

- sex steroids regulated by ACTH; primarily responsible for adrenarche (growth of axillary and pubic hair)
- principal adrenal androgens are dihydroepiandrosterone (DHEA), androstenedione, and 11-hydroxyandrostenedione
- proportion of total androgens (adrenal to gonadal) increases in old age

Adrenocortical Functional Workup

STIMULATION TEST

- purpose: diagnosis of hormone deficiencies
- method: measure target hormone after stimulation with tropic (pituitary) hormone

1. Tests of Glucocorticoid Reserve

- Cosyntropin (ACTH analogue) Stimulation Test
 - give 1 µg or 250 µg cosyntropin IV, then measure plasma cortisol levels at time 0, 30, and 60 min
 - physiologic response: stimulated plasma cortisol of $>>18$ µg/dL (500 nmol/L)
 - inappropriate response: inability to stimulate increased plasma cortisol
- insulin tolerance test used to diagnose secondary or tertiary hypoadrenalism (see *Pituitary Gland*, E16)

Principles of Diagnosing Adrenal Disorders:

- Is the suspected hormone ↑ or ↓?
- Can it be suppressed/stimulated?
- Is the stimulating hormone ↑ or ↓? (primary vs. secondary)

SUPPRESSION TESTS

- purpose: diagnosis of hormone hypersecretion
- method: measure target hormone after suppression of its tropic (pituitary) hormone

1. Tests of Pituitary-Adrenal Suppressibility

- Dexamethasone (DXM) Suppression Test
 - principle: DXM suppresses pituitary ACTH → plasma cortisol should be lowered if HPA axis is normal
 - *Screening Test*: Overnight DXM Suppression Test
 - ♦ oral administration of 1 mg DXM at midnight → measure plasma cortisol levels the following day at 8 am
 - ♦ physiologic response: plasma cortisol <1.8 µg/dL (50 nmol/L), with 1.8-5.0 µg/dL (50-140 nmol/L) being a “grey zone” (cannot be certain if normal or not)
 - ♦ inappropriate response: failure to suppress plasma cortisol
 - ♦ $<20\%$ false positive results due to obesity, depression, alcohol, other medications
 - *Confirmatory Test*: Other testing is used to confirm the diagnosis, such as:
 - ♦ 24 h urine free cortisol (shows overproduction of cortisol)
 - ♦ midnight salivary cortisol (if available), shows lack of diurnal variation
 - ♦ inappropriate response: remains high (normally will be low at midnight)

2. Tests of Mineralocorticoid Suppressibility

- principle: expansion of extracellular fluid volume (ECFV) → plasma aldosterone should be lowered if HPA axis were normal
- ECFV Expansion with Normal Saline (NS)
 - IV infusion of 500 mL/h of NS for 4 h → then measure plasma aldosterone levels
 - plasma aldosterone >10 ng/dL (>277 pmol/L) is consistent with primary hyperaldosteronism, <5 ng/dL (<140 pmol/L) is normal
 - inappropriate response: failure to suppress plasma aldosterone

Mineralocorticoid Excess Syndromes

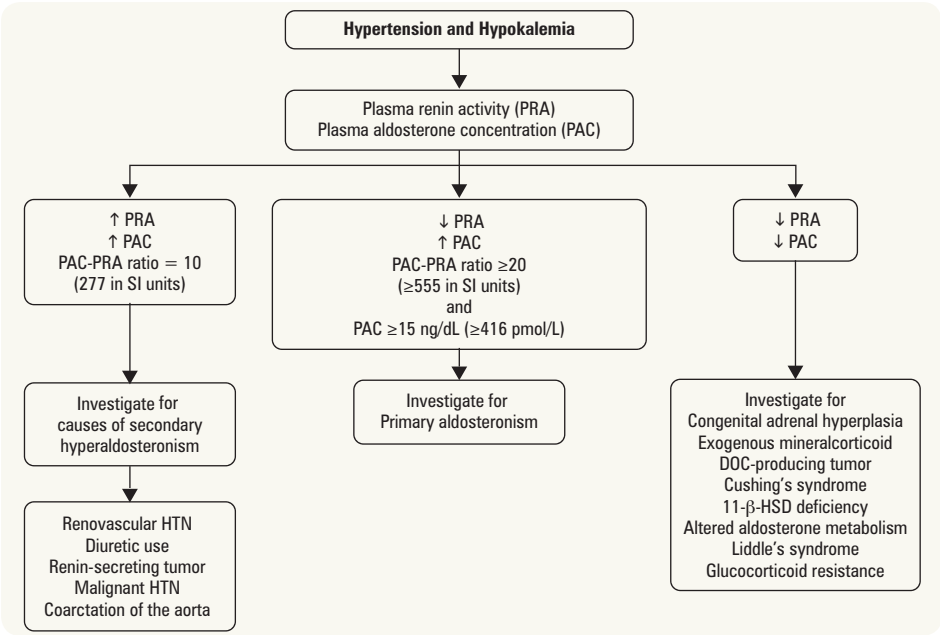

Figure 12. Approach to mineralocorticoid excess syndromes

Definition

- primary hyperaldosteronism (PH): excess aldosterone production (intra-adrenal cause)
- secondary hyperaldosteronism (SH): aldosterone production in response to excess RAAS (extra-adrenal cause)

Etiology

- primary hyperaldosteronism
 - aldosterone-producing adrenal adenoma (Conn's syndrome)
 - bilateral or idiopathic adrenal hyperplasia
 - glucocorticoid-remediable aldosteronism
 - aldosterone-producing adrenocortical carcinoma
 - unilateral adrenal hyperplasia
- secondary hyperaldosteronism

Clinical Features

- HTN
- hypokalemia (may have mild hyponatremia), metabolic alkalosis
- normal K⁺, low Na⁺ in SH (low effective circulating volume leads to ↑ ADH release) → edema
- increased cardiovascular risk: LV hypertrophy, atrial fibrillation, stroke, MI
- fatigue, weakness, paresthesia, headache; severe cases with tetany, intermittent paralysis

Diagnosis

- investigate plasma aldosterone to renin ratio in patients with HTN and hypokalemia
- confirmatory testing for PH: aldosterone suppression test (demonstrate inappropriate aldosterone secretion with ECFV expansion)
- imaging: CT adrenal glands

Table 22. Diagnostic Tests in Hyperaldosteronism

Test	Primary Hyperaldosteronism	Secondary Hyperaldosteronism
Plasma aldosterone to renin ratio (PAC/PRA)	Elevated (↑ aldo, ↓ renin)	Normal (↑ aldo, ↓ renin)
Salt loading test:		Not performed if normal PAC/PRA
A) Oral test:	↑ urine aldosterone	
B) IV saline test:	↑ plasma aldosterone	

Treatment

- inhibition action of aldosterone: spironolactone, eplerenone, triamterene, amiloride (act on sodium channels)
- surgical excision of adrenal adenoma
- secondary hyperaldosteronism: treat underlying cause

Cushing's Syndrome

Definition

- results from chronic glucocorticoid excess (endogenous or exogenous sources)

Etiology

- ACTH-dependent (85%) – bilateral adrenal hyperplasia and hypersecretion due to:
 - ACTH-secreting pituitary adenoma (Cushing's disease; 80% of ACTH-dependent)
 - ectopic ACTH-secreting tumor (e.g. small cell lung carcinoma, bronchial, carcinoid, pancreatic islet cell, pheochromocytoma, or medullary thyroid tumors)
- ACTH-independent (15%)
 - long-term use of exogenous glucocorticoids
 - primary adrenocortical tumors: adenoma and carcinoma (uncommon)
 - bilateral adrenal nodular hyperplasia

Clinical Features

- symptoms: weakness, insomnia, mood disorders, impaired cognition, easy bruising, oligo-/amenorrhea, hirsutism, and acne (ACTH dependent)
- signs: central obesity, round face, supraclavicular and dorsal fat pads, facial plethora, proximal muscle wasting, purple abdominal striae, skin atrophy, acanthosis nigricans, HTN, hyperglycemia, osteoporosis, pathologic fractures, hyperpigmentation, hyperandrogenism if ACTH-dependent

Figure 13. Clinical features of Cushing's syndrome

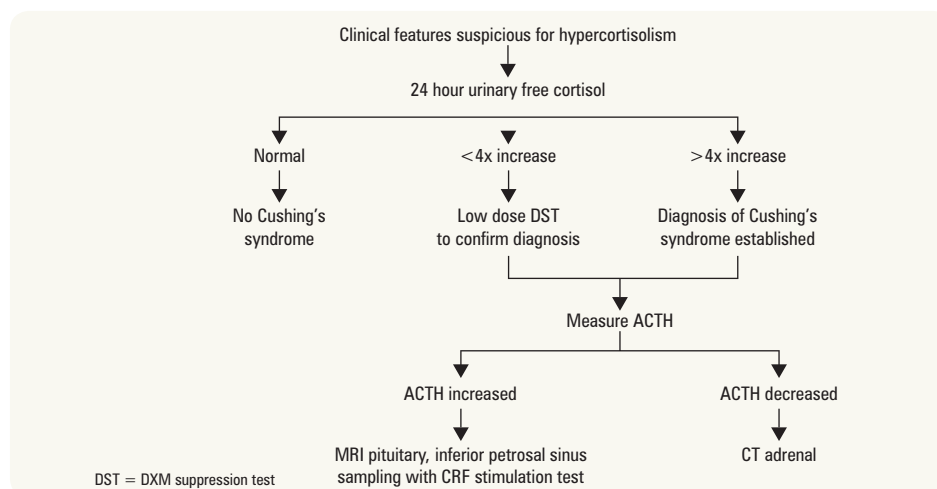

Figure 14. Hypercortisolism: algorithm for diagnosis

Treatment

- adrenal
 - adenoma: unilateral adrenalectomy (curative)
 - carcinoma: adjunctive chemotherapy often not useful (frequent metastases, poor prognosis)
 - medical treatment: mitotane, ketoconazole to reduce cortisol
- pituitary
 - trans-sphenoidal resection, with glucocorticoid supplement post-operatively
- ectopic ACTH tumor (paraneoplastic syndrome): usually bronchogenic cancer (poor prognosis)
 - surgical resection, if possible; chemotherapy/radiation for primary tumor
 - agents blocking adrenal steroid synthesis: metyrapone or ketoconazole

Congenital Adrenal Hyperplasia

- see [Pediatrics](#), P30

Hyperandrogenism

Definition

- state of having excessive secretion of androgens (DHEA, DHEA sulfate, testosterone)

Etiology and Pathophysiology

Table 23. Etiology of Hyperandrogenism

Constitutional/Familial	Family history, predisposing ethnic background Premature adrenarche
Medications Androgen-Mediated	Anabolic steroids, ACTH, androgens, progestational agents
Ovarian	PCOS Ovarian hyperthecosis Theca cell tumors Pregnancy: placental sulfatase/aromatase deficiency
Adrenal	Congenital adrenal hyperplasia (CAH, late-onset CAH) Tumors (adenoma, carcinoma)
Pituitary	Cushing's disease – high ACTH Hyperprolactinemia

Clinical Features

Females

- hirsutism
 - male pattern growth of androgen-dependent terminal body hair in women: back, chest, upper abdomen, face, linea alba
 - Ferriman-Gallwey scoring system is used to quantify severity of hirsutism
- virilization
 - masculinization: hirsutism, temporal balding, clitoral enlargement, deepening of voice, acne
 - increase in musculature
- defeminization
 - loss of female secondary sex characteristics (i.e. amenorrhea, ↓ breast size, infertility)

Males

- minimal effects on hair, muscle mass, etc.
- inhibition of gonadotropin secretion may cause reduction in: testicular size, testicular testosterone production, and spermatogenesis

Investigations

- testosterone, DHEA-S as a measure of adrenal androgen production
- LH/FSH (commonly in PCOS >2.5)
- 17-OH progesterone, elevated in CAH due to 21-OH deficiency
- for virilization: CT/MRI of adrenals and ovaries (identify tumors)
- if PCOS, check blood glucose, lipids, 75 g OGTT

Treatment

- discontinue causative medications
 - antiandrogens, e.g. spironolactone
- oral contraceptives (e.g. cyproterone acetate – blocks androgen receptor; found in Diane 35®)
- surgical resection of tumor
- low dose glucocorticoid ± mineralocorticoid if CAH suspected
- treat specific causative disorders, e.g. tumors, Cushing's, etc.
- cosmetic therapy (laser, electrolysis)

Conditions that do NOT Represent True Hirsutism

- Androgen-independent hair (e.g. lanugo hair)
- Drug-induced hypertrichosis (e.g. phenytoin, diazoxide, cyclosporine, minoxidil)
- Topical steroid use

Adrenocortical Insufficiency

Definition

- a state of inadequate cortisol and aldosterone production by the adrenal glands

Etiology

PRIMARY (ADDISON'S DISEASE)

Table 24. Etiology of Primary Adrenocortical Insufficiency

Autoimmune (70-90%)	Isolated adrenal insufficiency Polyglandular autoimmune syndrome type I and II Antibodies often directed against adrenal enzymes and 3 cortical zones
Infection	TB (7-20%) (most common in developing world) Fungal: histoplasmosis, paracoccidioidomycosis HIV, CMV Syphilis African trypanosomiasis
Infiltrative	Metastatic cancer (lung>stomach>esophagus>colon>breast); lymphoma Sarcoidosis, amyloidosis, hemochromatosis
Vascular	Bilateral adrenal hemorrhage Sepsis (meningococcal, <i>Pseudomonas</i>) Coagulopathy in adults or Waterhouse-Friderichsen syndrome in children Thrombosis, embolism, adrenal infarction
Drugs	Inhibit cortisol: ketoconazole, megestrol acetate Increase cortisol metabolism: rifampin, phenytoin, barbiturates, heparin, coumadin
Others	Adrenoleukodystrophy Congenital adrenal hypoplasia (impaired steroidogenesis) Familial glucocorticoid deficiency or resistance

SECONDARY ADRENOCORTICAL INSUFFICIENCY

- inadequate pituitary ACTH secretion
- multiple etiologies (see *Hypopituitarism*, E20), including withdrawal of exogenous steroids

Clinical Features

Table 25. Clinical Features of Primary and Secondary Adrenal Insufficiency (AI)

	Primary AI (Addison's or Acute AI)	Secondary AI
Skin and Mucosa	Dark (palmar crease, extensor surface)	Pale
Potassium	High	Normal
Sodium	Low	Normal or Low
Metabolic Acidosis	Present	Absent
Associated Diseases	Primary hypothyroidism, type 1 DM, vitiligo, neurological deficits	Central hypogonadism or hypothyroidism, growth hormone deficiency, DI, headaches, visual abnormalities
Associated Symptoms	Weakness, fatigue, weight loss, hypotension, salt craving, postural dizziness, myalgia, arthralgia GI: N/V, abdominal pain, diarrhea	Same except: NO salt craving GI less common
Diagnostic Test	Cosyntropin Stimulation Test High morning plasma ACTH	Insulin tolerance test Cosyntropin Stimulation Test Low morning plasma ACTH

Adapted from: Salvatori R. *JAMA* 2005;294:2481-2488

Treatment

- acute condition – can be life-threatening
 - IV NS in large volumes (2-3 L); add D5W if hypoglycemic from adrenal insufficiency
 - hydrocortisone 50-100 mg IV q6-8h for 24h, then gradual tapering
 - identify and correct precipitating factors
- maintenance
 - hydrocortisone 15-20 mg total daily dose, in 2-3 divided doses, highest dose in the AM
 - Florinef® (fludrocortisone, synthetic mineralocorticoid) 0.05-0.2 mg PO daily if mineralocorticoid deficient increase dose of steroids 2-3 fold for a few days during moderate-severe illness (e.g. with vomiting, fever)
 - major stress (e.g. surgery, trauma) requires 150-300 hydrocortisone IV daily divided into 3 doses
 - medical alert bracelet and instructions for emergency hydrocortisone/dexamethasone IM/SC injection

Adrenal Medulla

Catecholamine Metabolism

- catecholamines are synthesized from tyrosine in postganglionic sympathetic nerves (norepinephrine) and chromaffin cells of adrenal medulla (epinephrine)
- broken down into metanephrines and other metabolites (VMA, HVA) and excreted in urine

ABC of Adrenaline

Adrenaline activates β -receptors, increasing Cyclic AMP

Pheochromocytoma

Definition

- rare catecholamine secreting tumor derived from chromaffin cells of the sympathetic system

Epidemiology

- most commonly a single tumor of adrenal medulla
- rare cause of HTN (<0.2% of all hypertensives)

Etiology and Pathophysiology

- most cases sporadic (80%)
- familial: associated with multiple endocrine neoplasia II (MEN IIA and IIB) (50% penetrance; i.e. 50% of people with the mutation get pheochromocytoma), von Hippel-Lindau (10-20% penetrance), paraganglioma (20% penetrance), or neurofibromatosis type 1 (0.1-5.7% penetrance)
- tumors, via unknown mechanism, able to synthesize and release excessive catecholamines

Clinical Features

- 50% suffer from paroxysmal HTN; the rest have sustained HTN
- classic triad: episodic "pounding" headache, palpitations/tachycardia, diaphoresis
- other symptoms: tremor, anxiety, chest or abdominal pain, N/V, visual blurring, weight loss, polyuria, polydipsia
- other signs: orthostatic hypotension, papilledema, hyperglycemia, dilated cardiomyopathy
- symptoms may be triggered by stress, exertion, anesthesia, abdominal pressure, certain foods (especially tyramine containing foods)

Investigations

- urine catecholamines
 - increased catecholamine metabolites (metanephrines) and free catecholamines
 - plasma metanephrines if available (most sensitive)
 - ♦ cut-off values will depend on assay used
- CT abdomen
 - if negative, whole body CT and meta-iodo-benzoguanidine (MIBG) scintigraphy, Octreoscan, or MRI

Treatment

- surgical removal of tumor (curative) with careful pre- and post-operative ICU monitoring
- adequate pre-operative preparation
 - α -blockade for BP control: phenoxybenzamine (10-21 d pre-operative), IV phentolamine (perioperative, if required)
 - β -blockade for HR control once α blocked for a few days
 - metyrosine (catecholamine synthesis inhibitor) + phenoxybenzamine or prazosin
 - volume restoration with vigorous salt-loading and fluids
- rescreen urine 1-3 mo post-operatively
- screen urine in first degree relatives; genetic testing in patients <50 yr old

Pheochromocytomas 'Rule of 10s'

10% extra-adrenal
10% bilateral
10% malignant
10% familial

Classic Triad of PHEochromocytoma

Palpitations
Headache
Episodic sweating

Disorders of Multiple Endocrine Glands

Multiple Endocrine Neoplasm

- neoplastic syndromes involving multiple endocrine glands
- tumors of neuroectodermal origin
- autosomal dominant inheritance with variable penetrance
- genetic screening for RET proto-oncogene on chromosome 10 has long-term benefit in MEN II
 - early cure and prevention of medullary thyroid cancer

Table 26. MEN Classification

Type	Tissues Involved	Clinical Manifestations
MEN I (chromosome 11)		
Wermer's Syndrome	Pituitary Anterior pituitary adenoma	Headache, visual field defects. Often non-secreting but may secrete GH (acromegaly) and PRL (galactorrhea, erectile dysfunction, decreased libido, amenorrhea)
	Parathyroid Primary hyperparathyroidism from hyperplasia	Nephrolithiasis, bone abnormalities, MSK complaints, symptoms of hypercalcemia
	Entero-pancreatic endocrine Pancreatic islet cell tumors Gastrinoma Insulinomas	Epigastric pain (peptic ulcers and esophagitis) Hypoglycemia Secretory diarrhea
	Vasoactive intestinal peptide (VIP)-omas Glucagonoma Carcinoid syndrome	Rash, anorexia, anemia, diarrhea, glossitis Flushing, diarrhea, bronchospasm
MEN II (chromosome 10)		
1. IIa Sipple's Syndrome	Thyroid (>90%) Medullary thyroid cancer (MTC)	Physical signs are variable and often subtle
	Adrenal medulla (40-50%) Pheochromocytoma	Neck mass or thyroid nodule; non-tender, anterior lymph nodes HTN, palpitations, headache, sweating
	Parathyroid (10-20%) 1° parathyroid hyperplasia	Symptoms of hypercalcemia
	Skin Cutaneous lichen amyloidosis	Scaly skin rash
2. Familial Medullary Thyroid Ca (a variant of IIa)	Thyroid MTC	MTC without other clinical manifestations of MEN IIa or IIb
3. IIb	Thyroid MTC	MTC: most common component, more aggressive and earlier onset than MEN IIa
	Adrenal medulla Pheochromocytoma	HTN, palpitations, headache, sweating
	Neurons Mucosal neuroma, intestinal ganglioneuromas	Chronic constipation; megacolon
	MSK	Marfanoid habitus (no aortic abnormalities)

MEN I – Wermer's Syndrome Affects the 3 Ps

Pituitary
Parathyroid
Pancreas

Investigations

- MEN I
 - laboratory
 - ♦ may consider genetic screening for MEN-1 mutation in index patients
 - if a mutation is identified, screen family members who are at risk
 - ♦ gastrinoma: elevated serum gastrin level (>200 ng/mL) after IV injection of secretin
 - ♦ insulinoma: reduced fasting blood glucose (hypoglycemia) with elevated insulin and C-peptide levels
 - ♦ glucagonoma: elevated blood glucose and glucagon levels
 - ♦ pituitary tumors: assess GH, IGF-1 and prolactin levels (for over-production), TSH, free T₄, 8 AM cortisol, LH, FSH, bioavailable testosterone or estradiol (for underproduction due to mass effect of tumor)
 - ♦ hyperparathyroidism: serum Ca²⁺ and albumin, PTH levels; bone density scan (DEXA)
 - imaging
 - ♦ MRI for pituitary tumors, gastrinoma, insulinoma
- MEN II
 - laboratory
 - ♦ genetic screening for RET mutations in all index patients
 - if a mutation is identified screen family members who are at risk
 - ♦ calcitonin levels (MTC); urine catecholamines and metanephrines (pheochromocytoma); serum Ca²⁺, albumin and PTH levels (hyperparathyroidism)
 - ♦ pentagastrin ± calcium stimulation test if calcitonin level is within reference range
 - ♦ FNA for thyroid nodules → cytology
 - imaging
 - ♦ CT or MRI of adrenal glands, metaiodobenzylguanidine (MIBG) scan for pheochromocytoma
 - ♦ octreoscan and/or radionuclide scanning for determining the extent of metastasis

Treatment

- MEN I
 - medical
 - ♦ proton pump inhibitor (PPI) for acid hypersecretion in gastrinoma
 - ♦ cabergoline or other dopamine agonists to suppress prolactin secretion
 - ♦ somatostatin for symptomatic carcinoid tumors
 - surgery for hyperparathyroidism, insulinoma, glucagonoma, pituitary tumors (if medical treatment fails for the latter)
 - ♦ trans-sphenoidal approach with prn external radiation

• MEN II

- surgery for MEN IIa with pre-operative medical therapy
 - ♦ prostaglandin inhibitors to alleviate diarrhea associated with thyroid cancer
 - ♦ α -blocker for at least 10-21 d for pheochromocytoma pre-operatively
 - ♦ hydration, calcitonin, IV bisphosphonates for hypercalcemia

Calcium Homeostasis

- normal total serum Ca^{2+} : 8.5-10.5 mg/dL (2.2-2.6 mmol/L)
- ionic/free Ca^{2+} levels: 4.6-5.25 mg/dL (1.15-1.31 mmol/L)
- serum Ca^{2+} is about 50% protein bound (mostly albumin)
- regulated mainly by two factors: parathyroid hormone (PTH) and vitamin D
- actions mainly on three organs: GI tract, bone, and kidney

Table 27. Major Regulators in Calcium Homeostasis

Major Regulators	Source	Regulation	Net Effect
PTH	Parathyroid glands	Stimulated by low serum Ca^{2+} and high serum PO_4^{3-} ; inhibited by chronic low serum Mg^{2+} , high serum Ca^{2+} , and calcitriol	$\uparrow \text{Ca}^{2+}$ \uparrow Calcitriol $\downarrow \text{PO}_4^{3-}$
Calcitriol (1,25-(OH) $_2$ D $_3$)	Dietary intake Synthesized from cholesterol: UV on skin makes cholecalciferol (vitD $_3$) \rightarrow liver makes calcidiol (25-(OH)D $_3$) \rightarrow kidneys make calcitriol	Renal calcitriol production is stimulated by low serum PO_4^{3-} and PTH; inhibited by high serum PO_4^{3-} and calcitriol in negative feedback	$\uparrow \text{Ca}^{2+}$ $\uparrow \text{PO}_4^{3-}$
Calcitonin	Thyroid C cells	Stimulated by pentagastrin (GI hormone) and high serum Ca^{2+} ; inhibited by low serum Ca^{2+}	$\downarrow \text{Ca}^{2+}$ (in pharmacologic doses) $\downarrow \text{PO}_4^{3-}$
Mg^{2+}	Major intracellular divalent cation	See section on <i>Magnesium</i> (E42)	Cofactor for PTH secretion
PO_4^{3-}	Intracellular anion found in all tissues	See section on <i>Phosphate</i> (E41)	$\downarrow \text{Ca}^{2+}$

Pseudohypercalcemia: increased protein binding leading to an elevation in serum total Ca^{2+} without a rise in the ionized/free form, e.g. hyperalbuminemia from severe dehydration

Primary Hyperparathyroidism: Increased PTH secretion commonly due to parathyroid adenoma, lithium therapy; less often parathyroid carcinoma or parathyroid hyperplasia

Secondary Hyperparathyroidism: Partial resistance to PTH action leads to parathyroid gland hyperplasia and increased PTH secretion, often in patients with renal failure and osteomalacia (due to low or low normal serum calcium levels)

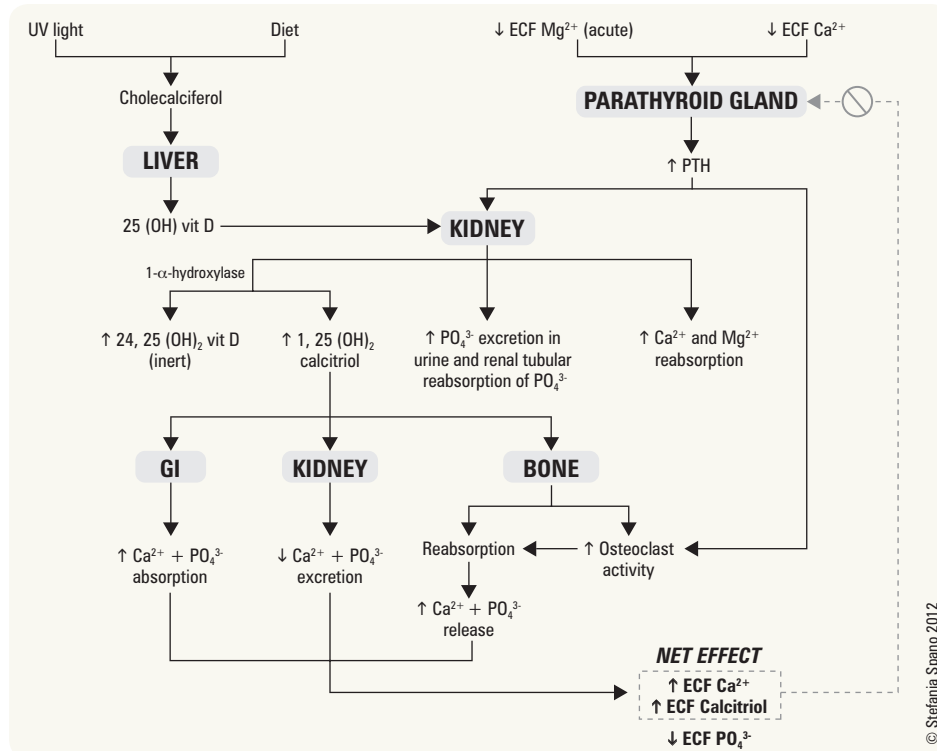

Tertiary Hyperparathyroidism: Irreversible clonal outgrowth of parathyroid glands, usually in long-standing inadequately treated chronic renal failure on dialysis

Primary Hyperparathyroidism is the most common cause of hypercalcemia in healthy outpatients. Most commonly related to a solitary adenoma or less commonly multiple gland hyperplasia. Surgical excision acts as a definitive treatment and is recommended for patients who are symptomatic. For mild asymptomatic disease medial surveillance may be appropriate with annual serum calcium, creatinine, and BMD.

For asymptomatic patients surgery is recommended for those who meet ≥ 1 of the following criteria:

- Serum calcium concentration more than 1.0 mg/dL (0.25 mmol/L) above the upper limit of normal
- Creatinine clearance < 60 mL/min
- BMD T-score < -2.5 at hip, spine, or distal radius, and/or previous fragility fracture
- Age < 50 yr

© Stefania Spano 2012

Figure 15. Parathyroid hormone (PTH) regulation

Hypercalcemia

Definition

- total corrected serum $\text{Ca}^{2+} > 10.5 \text{ mg/dL}$ (2.6 mmol/L) OR ionized $\text{Ca}^{2+} > 5.4 \text{ mg/dL}$ (1.35 mmol/L)

Approach to Hypercalcemia

1. Is the patient hypercalcemic? (correct for albumin – see sidebar)
2. Is the PTH high/normal or low?
3. If PTH is low, is phosphate high/normal or low? If phosphate is high/normal is the level of vitamin D metabolites high or low?

Corrected Ca^{2+} (mmol/L) = measured $\text{Ca}^{2+} + 0.02 (40 - \text{albumin})$

For every decrease in albumin by 10, increase in Ca^{2+} by 0.2

Benign (less likely malignant): $\text{Ca}^{2+} < 2.75 \text{ mmol/L}$ (11 mg/dL)

Pathologic (more likely malignant): $\text{Ca}^{2+} > 3.25 \text{ mmol/L}$ (13 mg/dL)

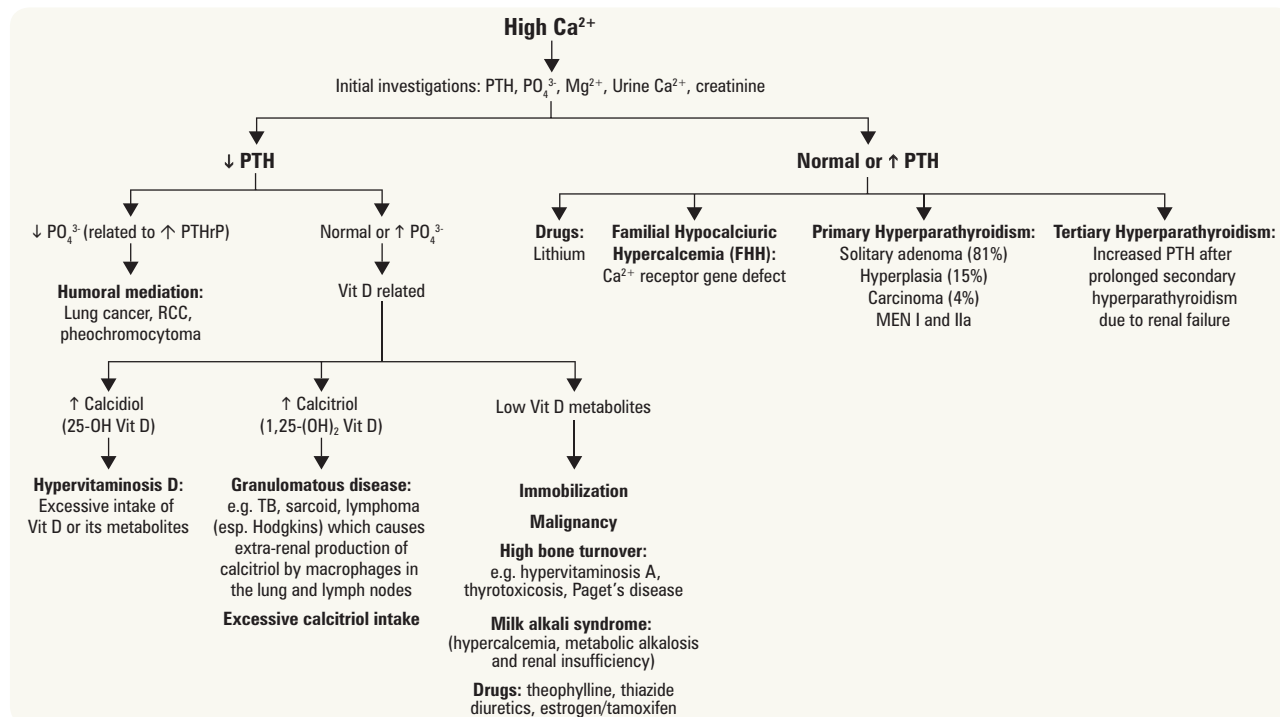

Figure 16. Differential diagnosis of hypercalcemia

Clinical Features

- symptoms depend on the absolute Ca^{2+} value and the rate of its rise (may be asymptomatic)

Table 28. Symptoms of Hypercalcemia

Cardiovascular	GI	Renal	Rheumatological	MSK	Psychiatric	Neurologic
HTN Arrhythmia Short QT Deposition of Ca^{2+} on valves, coronary arteries, myocardial fibers	Constipation Anorexia Nausea Vomiting (groans) PUD pancreatitis	Polyuria (Nephrogenic DI) Polydipsia Nephrolithiasis (stones) Renal failure (irreversible)	Gout Pseudogout Chondrocalcinosis	Weakness Bone pain (bones)	$> 12 \text{ mg/dL}$ (3 mmol/L) Increased alertness Anxiety Depression Cognitive dysfunction Organic brain syndromes $> 16 \text{ mg/dL}$ (4 mmol/L) Psychosis (moans)	Hypotonia Hyporeflexia Myopathy Paresis

** Hypercalcemic crisis (usually $> 4 \text{ mmol/L}$ or 16 mg/dL): primary symptoms include oliguria/anuria and mental status changes (including somnolence and eventually coma) → this is a medical emergency and should be treated immediately!

Treatment

- treatment depends on the Ca^{2+} level and the symptoms
- treat acute, symptomatic hypercalcemia aggressively

The symptoms and signs of hypercalcemia include: "Bones, stones, groans, and psychic overtones"

The most common cause of hypercalcemia in hospital is malignancy-associated hypercalcemia

- Usually occurs in the later stages of disease
- Most commonly seen in lung, renal, breast, ovarian, and squamous tumors, as well as lymphoma and multiple myeloma

Mechanisms:

- Secretion of parathyroid hormone-related protein (PTHrP) which mimics PTH action by preventing renal calcium excretion and activating osteoclast-induced bone resorption
- Cytokines in multiple myeloma
- Calcitriol production by lymphoma
- Osteolytic bone metastases direct effect
- Excess PTH in parathyroid cancer

Table 29. Treatment of Acute Hypercalcemia/Hypercalcemic Crisis

Increase Urinary Ca²⁺ Excretion	Isotonic saline (4-5 L) over 24 h ± loop diuretic (e.g. furosemide) but only if hypervolemic Calcitonin: <ul style="list-style-type: none"> • 4 IU/kg IM/SC q12h • 8 IU/kg IM/SC q6h • Only works for 48 h • Rapid onset within 4-6 h
Diminish Bone Resorption	Bisphosphonates (treatment of choice) <ul style="list-style-type: none"> • Inhibits osteoclastic bone resorption and promotes renal excretion of calcium • Acts rapidly but often transient response (decreased by 1.2-2.0 mg/dL [0.3-0.5 mmol/L] beginning within 4-6 h) max effect usually in 7 d • Combination of calcitonin and steroids may prolong reduction in calcium • Tachyphylaxis may occur • Indicated in malignancy-related hypercalcemia (IV pamidronate is most commonly used, zoledronic acid also now used in CA patient) Mithramycin (rarely used) – effective when patient cannot tolerate large fluid load <ul style="list-style-type: none"> • Dangerous – hematotoxic and hepatotoxic
Decrease GI Ca²⁺ Absorption	Corticosteroids in hypervitaminosis D and hematologic malignancies <ul style="list-style-type: none"> • Anti-tumor effects → decreased calcitriol production by the activated mononuclear cells in lung and lymph node • Slow to act (5-10 d); need high dose
Dialysis	Treatment of last resort <ul style="list-style-type: none"> • Indication: severe malignancy-associated hypercalcemia and renal insufficiency or heart failure

**Differential Diagnosis of Hypercalcemia**

- **Primary hyperparathyroidism**
- **Malignancy: hematologic, humoral, skeletal metastases (>90% from 1 or 2)**
- Renal disease: tertiary hyperparathyroidism
- Drugs: calcium carbonate, milk alkali syndrome, thiazide, lithium, theophylline, vitamin A/D intoxication
- Familial hypocalciuric hypercalcemia
- Granulomatous disease: sarcoidosis, TB, Hodgkin's lymphoma
- Thyroid disease: thyrotoxicosis
- Adrenal disease: adrenal insufficiency, pheochromocytoma
- Immobilization

**Watch Out For:**

- Volume depletion via diuresis
- Arrhythmias

**Acute Management of Hypercalcemia/Hypercalcemic Crisis**

- Volume expansion (e.g. NS IV 300-500 cc/h): initial therapy
- Calcitonin: transient, partial response
- Bisphosphonate: treatment of choice
- Corticosteroid: most useful in vit D toxicity, granulomatous disease, some malignancies
- Saline diuresis + loop diuretic (for volume overload): temporary measure

Hypomagnesemia can impair PTH secretion and action

**Differential Diagnosis of Tetany**

- Hypocalcemia
- Metabolic alkalosis (with hyperventilation)
- Hypokalemia
- Hypomagnesemia

**Signs and Symptoms of Acute Hypocalcemia**

- **Paresthesias:** perioral, hands, and feet
- **Chvostek's sign:** percussion of the facial nerve just anterior to the external auditory meatus elicits ipsilateral spasm of the orbicularis oculi or orbicularis oris muscles
- **Trousseau's sign:** inflation of a blood pressure cuff above systolic pressure for 3 min elicits carpal spasm and paresthesia

Hypocalcemia

Definition

- total corrected serum Ca²⁺ <8.5 mg/dL (2.2 mmol/L)

Table 30. Clinical Features of Hypocalcemia

Acute Hypocalcemia	Chronic Hypocalcemia
Paresthesia	CNS: lethargy, seizures, psychosis, basal ganglia calcification, Parkinson's, dystonia, hemiballismus, papilledema, pseudotumor cerebri
Laryngospasm (with stridor)	CVS: prolonged QT interval → Torsades de pointes (ventricular tachycardia)
Hyperreflexia	GI: steatorrhea
Tetany	ENDO: impaired insulin release
Chvostek's sign (tap CN VII)	SKIN: dry, scaling, alopecia, brittle and transversely fissured nails, candidiasis, abnormal dentition
Trousseau's sign (carpal spasm)	OCULAR: cataracts
ECG changes	MSK: generalized muscle weakness and wasting
Delirium	
Psychiatric Sx: emotional instability, anxiety, and depression	

Approach to Hypocalcemia

1. Is the patient hypocalcemic?
2. Is the PTH high or low?
3. If PTH is high, is phosphate low or normal?
4. Is the Mg²⁺ level low?

Approach to Treatment

- correct underlying disorder
- mild/asymptomatic (ionized Ca²⁺ >3.2 mg/dL, 0.8 mmol/L)
 - treat by increasing dietary Ca²⁺ by 1000 mg/d
 - calcitriol 0.25 µg/d
- acute/symptomatic hypocalcemia (ionized Ca²⁺ <2.8 mg/dL, 0.7 mmol/L)
 - immediate treatment required
 - IV calcium gluconate 1-2 g over 10-20 min followed by slow infusion if necessary
 - goal is to raise Ca²⁺ to low normal range (8.0-8.4 mg/dL, 2.0-2.1 mmol/L) to prevent symptoms but allow maximum stimulation of PTH secretion
- if PTH recovery not expected, requires long-term therapy with calcitriol and calcium
- **do not correct hypocalcemia if asymptomatic and suspected to be transient**

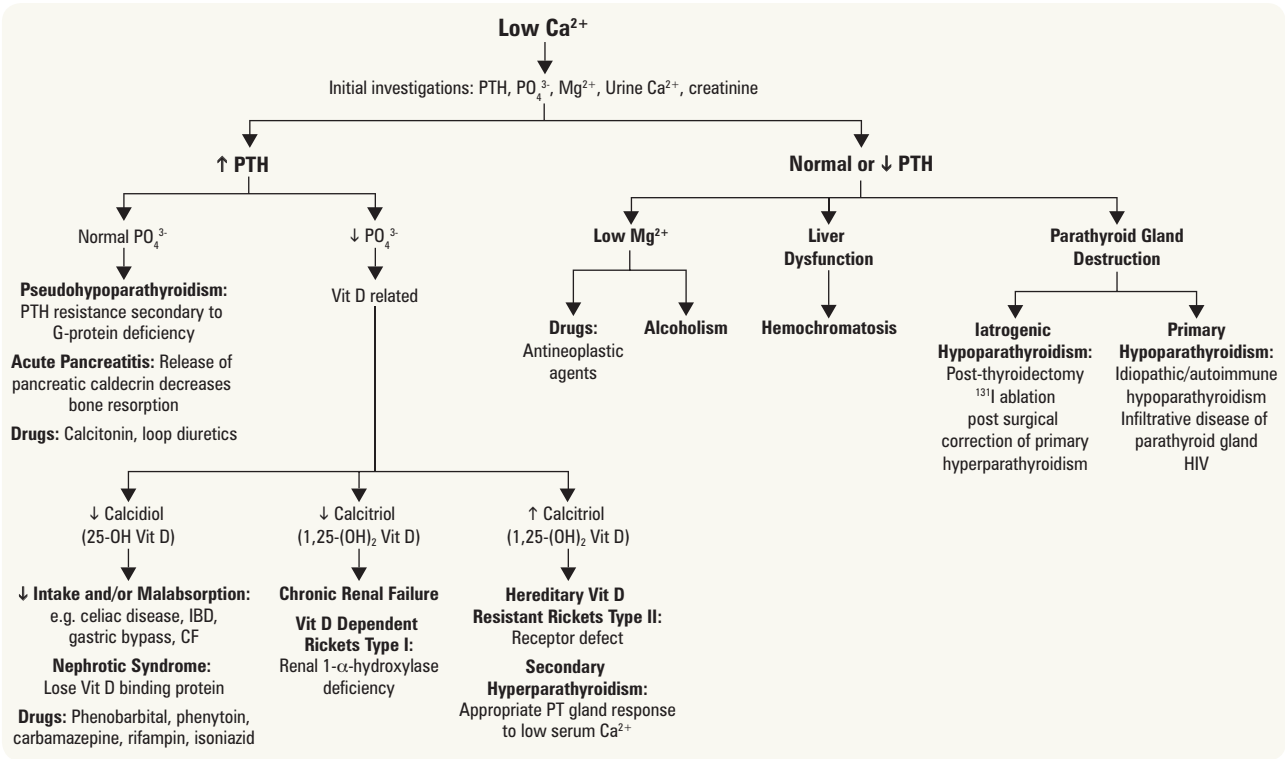

Figure 17. Etiology and clinical approach to hypocalcemia

Hyperphosphatemia

Definition

- serum phosphate >4.1 mg/dL (1.45 mmol/L)

Table 31. Etiology of Hyperphosphatemia

Increased Phosphate Load	Reduced Renal Clearance	Pseudohyperphosphatemia
GI intake (rectal enema, GI bleeding)	Acute/chronic renal failure	Hyperglobulinemia
IV phosphate load (K-Phos®, blood transfusion)	Hypoparathyroidism	Hyperlipidemia
Endogenous phosphate (tumor lysis syndrome, rhabdomyolysis, hemolysis, lactic and ketoacidosis)	Acromegaly	Hyperbilirubinemia
	Tumor calcinosis (ability of kidney to specifically clear phosphate is defective)	

Clinical Features

- non-specific, include ectopic calcification, renal osteodystrophy

Treatment

- acute: hemodialysis if symptomatic
- chronic: low PO₄³⁻ diet, phosphate binders (e.g. CaCO₃ with meals)

Hypophosphatemia

Definition

- serum phosphate <2.4 mg/dL (0.85 mmol/L)

Table 32. Etiology of Hypophosphatemia

Inadequate Intake	Renal Losses	Excessive Skeletal Mineralization	Shift into ICF
Starvation	Hyperparathyroidism	Osteoblastic metastases	Recovery from metabolic acidosis
Malabsorption (diarrhea, steatorrhea)	Diuretics	Post parathyroidectomy (referred to as 'hungry bone syndrome')	Respiratory alkalosis
Antacid use	X-linked or AD hypophosphatemic rickets		Starvation refeeding (stimulated by insulin)
Alcoholism	Fanconi syndrome		
	Multiple myeloma		

Symptoms usually present when phosphate <1.0 mg/dL (0.32 mmol/L)

Treat asymptomatic patients if phosphate <2.0 mg/dL (0.64 mmol/L)

Clinical Features

- non-specific (CHF, coma, hypotension, weakness, defective clotting)

Treatment

- treat underlying cause
 - Oral PO_4^{3-} : 2-4 g/d divided bid-qid (start at 1 g/d to minimize diarrhea)
 - IV PO_4^{3-} : only for severely symptomatic patients or inability to tolerate oral therapy

Hypermagnesemia

Definition

- serum magnesium $>2.1\text{ mg/dL}$ (0.85 mmol/L)

Etiology

- AKI/CRF
- Mg^{2+} -containing antacids or enemas
- IV administration of large doses of MgSO_4 (e.g. for preeclampsia; see [Obstetrics, OB16](#))

Clinical Features

- drowsiness, hyporeflexia, respiratory depression, heart block, cardiac arrest

Treatment

- discontinue Mg^{2+} -containing products
- IV calcium (Mg^{2+} -antagonist) for acute reversal of magnesium toxicity
- dialysis if renal failure

Hypomagnesemia

Definition

- serum magnesium $<1.7\text{ mg/dL}$ (0.70 mmol/L)

Etiology

- GI losses
 - starvation/malabsorption
 - vomiting/diarrhea
 - alcoholism
 - acute pancreatitis
- excess renal loss
 - 2° hyperaldosteronism due to cirrhosis and CHF
 - hyperglycemia
 - hypokalemia
 - hypercalcemia
 - loop and thiazide-type diuretics
 - nephrotoxic medications
 - proton-pump inhibitors

Clinical Features

- seizures, paresis, Chvostek and Trousseau signs, ECG changes (widened QRS, prolonged PR, T-wave abnormalities), and arrhythmias including Torsades de pointes

Treatment

- treat underlying cause
- Mg^{2+} IM/IV; cellular uptake of Mg^{2+} is slow, therefore repletion requires sustained correction
- discontinue diuretics
 - in patients requiring diuretics, use a K^+ -sparing diuretic to minimize magnesuria

You will be unable to correct hypokalemia or hypocalcemia without first supplementing magnesium if patient hypomagnesemic

Metabolic Bone Disease

Osteoporosis

Definition

- a condition characterized by decreased bone mass and microarchitectural deterioration of bone tissue with a consequent increase in bone fragility and susceptibility to fracture
- bone mineral density (BMD) ≥ 2.5 standard deviations below the peak bone mass for young adults (i.e. T-score ≤ -2.5)
- osteopenia: BMD with T-score between -1.0 and -2.5

ETIOLOGY AND PATHOPHYSIOLOGY**Primary Osteoporosis**

- primary type 1: most common in post-menopausal women, due to decline in estrogen, worsens with age
- primary type 2: occurs after age 75, seen in females and males at 2:1 ratio, possibly due to zinc deficiency

Online Clinical Tools
CAROC.pdf
FRAX
www.shef.ac.uk/FRAX/tool.aspx

Secondary Osteoporosis

- gastrointestinal diseases
 - gastrectomy
 - malabsorption (e.g. celiac disease)
 - chronic liver disease
- bone marrow disorders
 - multiple myeloma
 - lymphoma
 - leukemia
- endocrinopathies
 - Cushing's syndrome
 - hyperparathyroidism
 - hyperthyroidism
 - premature menopause
 - DM
- malignancy
 - secondary to chemotherapy
 - myeloma
- drugs
 - corticosteroid therapy
 - phenytoin
 - chronic heparin therapy
 - androgen deprivation therapy
 - aromatase inhibitors
- other
 - rheumatologic disorders
 - ♦ rheumatoid arthritis
 - ♦ SLE
 - ♦ ankylosing spondylitis
 - renal disease
 - poor nutrition
 - immobilization

Clinical Features

- commonly asymptomatic
- height loss due to collapsed vertebrae
- fractures: most commonly in hip, vertebrae, humerus, and wrist
 - fragility fractures: fracture with fall from standing height
 - Dowager's hump: collapse fracture of vertebral bodies in mid-dorsal region
 - x-ray: vertebral compression and crush fractures, wedge fractures, "codfishing" sign (weakening of subchondral plates and expansion of intervertebral discs)
- pain, especially backache, associated with fractures

Approach to Osteoporosis

1. Assess risk factors for osteoporosis on history and physical
2. Decide if patient requires BMD testing with dual-energy x-ray absorptiometry (DEXA): men and women ≥ 65 yr or younger if presence of risk factors (Table 33)
3. Initial investigations
 - all patients with osteoporosis: calcium corrected for albumin, CBC, creatinine, ALP, TSH
 - also consider serum and urine protein electrophoresis, celiac workup, and 24 h urinary Ca^{2+} excretion to rule out additional secondary causes
 - **25-OH-Vitamin D level should only be measured after 3-4 mo of adequate supplementation and should not be repeated if an optimal level ≥ 75 nmol/L is achieved**
 - lateral thoracic and lumbar x-ray if clinical evidence of vertebral fracture
4. Assess 10 yr fracture risk by combining BMD result and risk factors (only if ≥ 50 yr)
 - 1) WHO Fracture Risk Assessment Tool (FRAX)
 - 2) Canadian Association of Radiologists and Osteoporosis Canada Risk Assessment Tool (CAROC)
 - ♦ approach to management guided by 10 yr risk stratification into low, medium, high risk
5. For all patients being assessed for osteoporosis, encourage appropriate lifestyle changes (see Table 35)

Table 33. Osteoporosis Risk Stratification

Low Risk	Unlikely to benefit from pharmacotherapy; encourage lifestyle changes Reassess risk in 5 yr
10 yr fracture risk <10%	
Medium Risk	Discuss patient preference for management and consider additional risk factors Factors that warrant consideration for pharmacological therapy: <ul style="list-style-type: none"> • Additional vertebral fracture(s) identified on vertebral fracture assessment (VFA) or lateral spine x-ray • Previous wrist fracture in individuals ≥ 65 or with T-score ≤ -2.5 • Lumbar spine T-score much lower than femoral neck T-score • Rapid bone loss • Men receiving androgen-deprivation therapy for prostate cancer • Women receiving aromatase-inhibitor therapy for breast cancer • Long-term or repeated systemic glucocorticoid use (oral or parenteral) that does not meet the conventional criteria for recent prolonged systemic glucocorticoid use • Recurrent falls (defined as falling 2 or more times in the past 12 mo) • Other disorders strongly associated with osteoporosis
10 yr fracture risk 10-20%	
	Repeat BMD and reassess risk every 1-3 yr initially
High Risk	Start pharmacotherapy
10 yr fracture risk >20%; OR Prior fragility fracture of hip or spine; OR More than one fragility fracture	

Corticosteroid Therapy is a Common Cause of Secondary Osteoporosis

Individuals receiving ≥ 7.5 mg of prednisone daily for over 3 mo should be assessed for bone-sparing therapy
Mechanism: increased resorption + decreased formation

Use of Calcium or Calcium in Combination with Vitamin D Supplementation to Prevent Fractures and Bone Loss in People Aged ≥ 50 Yr: A Meta-Analysis

Lancet 2007;370:657-666

Purpose: To determine whether supplementation with calcium or calcium in combination with vitamin D reduces fractures of all types and percentage change of bone-mineral density from baseline.

Study Selection: RCTs that recruited people aged ≥ 50 yr.

Results: In trials that reported fracture as an outcome (17 trials, $n=52,625$), treatment was associated with a 12% risk reduction in fractures of all types (risk ratio 0.88, 95% CI 0.83-0.95; $p=0.0004$). In trials that reported bone-mineral density as an outcome (23 trials, $n=41,419$), the treatment was associated with a reduced rate of bone loss of 0.54% (0.35-0.73; $p<0.0001$) at the hip and 1.19% (0.76-1.61%; $p<0.0001$) in the spine. The fracture risk reduction was significantly greater (24%) in trials in which the compliance rate was high ($p<0.0001$). The treatment effect was better with calcium doses of 1200 mg or more (0.80 vs. 0.94; $p=0.006$), and with vitamin D doses of 800 IU or more (0.84 vs. 0.87; $p=0.03$).

Conclusion: Evidence supports the use of calcium, or calcium in combination with vitamin D supplementation, in the preventive treatment of osteoporosis in people aged 50 yr or older. For best therapeutic effect, use doses of 1200 mg of calcium, and 800 IU of vitamin D.

Table 34. Indications for BMD Testing

Older Adults (age ≥50 yr)	Younger Adults (age <50 yr)
All women and men age ≥65 yr Menopausal women, and men aged 50-64 yr with clinical risk factors for fracture: <ul style="list-style-type: none">• Fragility fracture after age 40• Prolonged glucocorticoid use• Other high-risk medication use (aromatase inhibitors, androgen deprivation therapy)• Parental hip fracture• Vertebral fracture or osteopenia identified on x-ray• Current smoking• High alcohol intake• Low body weight (<60 kg) or major weight loss (>10% of weight at age 25 yr)• Rheumatoid arthritis• Other disorders strongly associated with osteoporosis: primary hyperparathyroidism, type 1 DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<45 yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD and chronic inflammatory conditions (e.g. inflammatory bowel disease)	Fragility fracture <ul style="list-style-type: none">• Prolonged use of glucocorticoids• Use of other high-risk medications (aromatase inhibitors, androgen deprivation therapy, anticonvulsants)• Hypogonadism or premature menopause• Malabsorption syndrome• Primary hyperparathyroidism• Other disorders strongly associated with rapid bone loss and/or fracture

Clinical Signs of Fractures or Osteoporosis

- Height loss >3 cm (Sn 92%)
- Weight <51 kg
- Kyphosis (Sp 92%)
- Tooth count <20 (Sp 92%)
- Grip strength
- Armspan-height difference >5 cm (Sp 76%)
- Wall-occiput distance >0 cm (Sp 87%)
- Rib-pelvis distance ≤2 finger breadth (Sn 88%)

Treatment of Osteoporosis

Table 35. Treatment of Osteoporosis in Women and Men

Treatment for Both Men and Women	
Lifestyle	Diet: Elemental calcium 1000-1200 mg/d; Vit D 1000 IU/d Exercise: 3x30 min weight-bearing exercises/wk Cessation of smoking, reduce caffeine intake Stop/avoid osteoporosis-inducing medications
Drug Therapy	
Bisphosphonate: inhibitors of osteoclast binding	1st line in prevention of hip, nonvertebral, and vertebral # (Grade A): alendronate, risedronate, zoledronic acid 2nd line (Grade B): etidronate
RANKL Inhibitors	Denosumab: 1st line in prevention of hip, nonvertebral, vertebral # (Grade A)
Parathyroid Hormone	YES fragility #: 18-24 mo duration
Calcitonin (2nd line): osteoclast receptor binding	YES fragility #: Calcitonin 200 IU nasally OD with Calcitriol 0.25 µg bid
Treatment Specific to Post-Menopausal Women	
SERM (selective estrogen-receptor modulator): agonistic effect on bone but antagonistic effect on uterus and breast	Raloxifene: 1st line in prevention of vertebral # (Grade A) <ul style="list-style-type: none">• +ve: prevents osteoporotic # (Grade A to B evidence), improves lipid profile, decreased breast ca risk• -ve: increased risk of DVT/PE, stroke mortality, hot flashes, leg cramps
HRT: combined estrogen + progesterone (see Gynecology, GY32)	1st line in prevention of hip, nonvertebral, and vertebral # (Grade A) For most women, risks > benefits <ul style="list-style-type: none">• Combined estrogen/progestin prevents hip, vertebral, total #• Increased risks of breast cancer, cardiovascular events, and DVT/PE

Alendronate for the Primary and Secondary Prevention of Osteoporotic Fractures in Postmenopausal Women
Cochrane DB Syst Rev 2008;1:CD001155

Etidronate for the Primary and Secondary Prevention of Osteoporotic Fractures in Postmenopausal Women
Cochrane Database Syst Rev 2008;(1):CD003376

Risedronate for the Primary and Secondary Prevention of Osteoporotic Fractures in Postmenopausal Women
Cochrane Database Syst Rev 2008;(1):CD004523

Purpose: To assess the efficacy of three bisphosphonates in the primary and secondary prevention of osteoporotic fractures in postmenopausal women.

Study Selection: Women receiving at least one yr of bisphosphonates for postmenopausal osteoporosis were compared to those receiving placebo or concurrent calcium/vitamin D or both. The outcome was fracture incidence.

Results: Levels of evidence: <http://www.cochranemsk.org/review/writing/>.
%RRR and %ARR for 5 yr fracture incidence reduction.

Alendronate (10 mg/d)

1° Prevention – Vertebral (Gold)	45% RRR, 2% ARR
1° Prevention – Hip	Not significant
1° Prevention – Wrist	Not significant
2° Prevention – Vertebral (Gold)	45% RRR, 6% ARR
2° Prevention – Hip (Gold)	53% RRR, 1% ARR
2° Prevention – Wrist (Gold)	50% RRR, 2% ARR

Etidronate (400 mg/d)

1° Prevention – Vertebral	Not significant
1° Prevention – Hip	Not significant
1° Prevention – Wrist	Not significant
2° Prevention – Vertebral (Silver)	47% RRR, 5% ARR
2° Prevention – Hip	No benefit
2° Prevention – Wrist	No benefit

Risedronate (5 mg/d)

1° Prevention – Vertebral	Not significant
1° Prevention – Hip	Not significant
1° Prevention – Wrist	Not significant
2° Prevention – Vertebral (Gold)	39% RRR, 5% ARR
2° Prevention – Hip (Silver)	26% RRR, 1% ARR
2° Prevention – Wrist	Not significant

Figure 18. Physical examination test

Osteomalacia and Rickets

- **rickets:** osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue *prior* to epiphyseal closure (in childhood)
- **osteomalacia:** osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue *after* epiphyseal closure (in adulthood)

Etiology and Pathophysiology

Vitamin D Deficiency

- deficient uptake or absorption
 - nutritional deficiency
 - malabsorption: post-gastrectomy, small bowel disease (e.g. Celiac sprue), pancreatic insufficiency
- defective 25-hydroxylation
 - liver disease
 - anticonvulsant therapy
- loss of vitamin D binding protein
 - nephrotic syndrome
- defective 1- α -25 hydroxylation
 - hypoparathyroidism
 - renal failure
- pathophysiology: leads to secondary hyperparathyroidism and hypophosphatemia

Mineralization Defect

- abnormal matrix
 - osteogenesis imperfecta
 - fibrogenesis imperfecta
 - axial osteomalacia
- enzyme deficiency
 - hypophosphatasia (inadequate ALP bioactivity)
- presence of calcification inhibitors
 - bisphosphonates, aluminum, high dose fluoride, anticonvulsants

Factors Necessary for Mineralization

- Quantitatively and qualitatively normal osteoid formation
- Normal concentration of calcium and phosphate in ECF
- Adequate bioactivity of ALP
- Normal pH at site of calcification
- Absence of inhibitors of calcification

Table 36. Clinical Presentations of Rickets and Osteomalacia

Rickets	Osteomalacia
<ul style="list-style-type: none"> • Skeletal pain and deformities, bow legged • Fracture susceptibility • Weakness and hypotonia • Disturbed growth • Ricketic rosary (prominent costochondral junctions) • Harrison's groove (indentation of lower ribs) • Hypocalcemia 	<ul style="list-style-type: none"> • Not as dramatic • Diffuse skeletal pain • Bone tenderness • Fractures • Gait disturbances (waddling) • Proximal muscle weakness • Hypotonia

Investigations

Table 37. Laboratory Findings in Osteomalacia and Rickets

Disorder	Serum Phosphate	Serum Calcium	Serum ALP	Other Features
Vitamin D deficiency	Decreased	Decreased to normal	Increased	Decreased calcitriol
Hypophosphatemia	Decreased	Normal	Decreased to normal	
Proximal RTA	Decreased	Normal	Normal	Associated with hyperchloremic metabolic acidosis
Conditions associated with abnormal matrix formation	Normal	Normal	Normal	

- radiologic findings
 - pseudofractures, fissures, narrow radiolucent lines – thought to be healed stress fractures or the result of erosion by arterial pulsation
 - loss of distinctness of vertebral body trabeculae; concavity of the vertebral bodies
 - changes due to secondary hyperparathyroidism: subperiosteal resorption of the phalanges, bone cysts, resorption of the distal ends of long bones
 - others: bowing of tibia, coxa profundus hip deformity
- bone biopsy: usually not necessary but considered the gold standard for diagnosis

Treatment

- definitive treatment depends on the underlying cause
- vitamin D supplementation
- PO_4^{3-} supplements if low serum PO_4^{3-} ; Ca^{2+} supplements for isolated calcium deficiency
- bicarbonate if chronic metabolic acidosis

Renal Osteodystrophy

- changes to mineral metabolism and bone structure secondary to chronic kidney disease
- represents a mixture of four types of bone disease:
 - osteomalacia: low bone turnover combined with increased unmineralized bone (osteoid)
 - adynamic bone disease: low bone turnover due to excessive suppression of parathyroid gland
 - osteitis fibrosa cystica: increased bone turnover due to secondary hyperparathyroidism
 - mixed uremic osteodystrophy: both high and low bone turnover, characterized by marrow fibrosis and increased osteoid
- metastatic calcification secondary to hyperphosphatemia may occur

Pathophysiology

- metabolic bone disease secondary to chronic renal failure
- combination of hyperphosphatemia (inhibits $1,25(\text{OH})_2\text{-Vit D}$ synthesis) and loss of renal mass (reduced $1\text{-}\alpha\text{-hydroxylase}$)

Clinical Features

- soft tissue calcifications → necrotic skin lesions if vessels involved
- osteodystrophy → generalized bone pain and fractures
- pruritus
- neuromuscular irritability and tetany may occur
- radiologic features of osteitis fibrosa cystica, osteomalacia, osteosclerosis, osteoporosis

Investigations

- serum Ca^{2+} corrected for albumin, PO_4^{3-} , PTH, ALP, ± imaging (x-ray, BMD), ± bone biopsy

Treatment

- prevention
 - maintenance of normal serum Ca^{2+} and PO_4^{3-} by restricting PO_4^{3-} intake to 1 g OD
 - Ca^{2+} supplements; PO_4^{3-} binding agents (calcium carbonate, aluminum hydroxide)
 - vitamin D with close monitoring to avoid hypercalcemia and metastatic calcification

Paget's Disease of Bone

Definition

- a metabolic disease characterized by excessive bone destruction and repair

Epidemiology

- a common disease: 5% of the population, 10% of population >80 yr old

Etiology and Pathophysiology

- postulated to be related to a slow progressing viral infection of osteoclasts, possibly paramyxovirus
- strong familial incidence
- initiated by increased osteoclastic activity leading to increased bone resorption; osteoblastic activity increases in response to produce new bone that is structurally abnormal and fragile

Differential Diagnosis

- primary bone lesions
 - osteogenic sarcoma
 - multiple myeloma
 - fibrous dysplasia
- secondary bone lesions
 - osteitis fibrosa cystica
 - metastases

Clinical Features

- usually asymptomatic (routine x-ray finding or elevated ALP)
- severe bone pain (e.g. pelvis, femur, tibia) is often the presenting complaint
- skeletal deformities: bowed tibias, kyphosis, frequent fractures
- skull involvement: headaches, increased hat size, deafness
- increased warmth over involved bones due to increased vascularity
- high output CHF
- hypercalcemia with immobilization
- osteosarcoma

Comparison of a Single Infusion of Zoledronic Acid with Risedronate for Paget's Disease *NEJM* 2005;353:898-908

Study: Two identical, randomized, double-blind, actively controlled trials (combined for analysis).
Patients: 357 men and women who were ≥30 yr and had radiologically confirmed Paget's disease. All but 4 patients had alkaline phosphatase levels that were more than twice the upper limit of normal.
Intervention: One 15-min infusion of 5 mg of zoledronic acid compared with 60 d of oral risedronate (30 mg/d) with follow up at 6 mo.

Primary Outcome: Rate of therapeutic response at 6 mo, defined as a normalization of alkaline phosphatase levels or a reduction of at least 75% in the total alkaline phosphatase excess.

Results: At 6 mo, 96% of patients receiving zoledronic acid had a therapeutic response (169 of 176), as compared with 74.3% of patients receiving risedronate (127 of 171, $p < 0.001$). Alkaline phosphatase levels normalized in 88.6% of patients in the zoledronic acid group and 57.9% of patients in the risedronate group ($p < 0.001$). Zoledronic acid was associated with a shorter median time to a first therapeutic response (64 vs. 89 d, $p < 0.001$). Quality of life increased significantly from baseline at both 3 and 6 mo in the zoledronic acid group and differed significantly from those in the risedronate group at 3 mo. Pain scores improved in both groups. During post-trial follow-up (median, 190 d), 21 of 82 patients in the risedronate group had a loss of therapeutic response, as compared with 1 of 113 patients in the zoledronic acid group ($p < 0.001$).

Conclusions: A single infusion of zoledronic acid produces more rapid, more complete, and more sustained responses in Paget's disease than does daily treatment with risedronate.

Investigations

- laboratory
 - ↑↑ serum ALP (unless burnt out), Ca^{2+} normal or ↑, PO_4^{3-} normal
 - urinary hydroxyproline ↑ (indicates resorption)
- imaging
 - bone scan to evaluate the extent of disease
 - skeletal survey: involved bones are denser and expanded with cortical thickening
 - initial lesion may be destructive and radiolucent
 - multiple fissure fractures in long bones

Complications

- local
 - fractures; osteoarthritis
 - cranial nerve compression and palsies (e.g. deafness), spinal cord compression
 - osteosarcoma/sarcomatous change in 1-3%
 - indicated by marked bone pain, new lytic lesions and sudden increased ALP
- systemic
 - hypercalcemia and nephrolithiasis
 - high output CHF due to increased vascularity

Treatment

- symptomatic therapy (pain management)
- weight-bearing exercise
- adequate calcium and vitamin D intake to prevent development of secondary hyperparathyroidism
- treat medically if ALP >3x normal
 - bisphosphonates, e.g. alendronate 40 mg PO OD x 6 mo OR risedronate 30 mg PO OD x 3 mo OR zoledronic acid 5 mg IV per yr
 - calcitonin 50-100 U/d SC
- surgery for fractures, deformity, degenerative changes

Male Reproductive Endocrinology

Androgen Regulation

- negative feedback may occur by androgens directly or after conversion to estrogen
- testosterone (from Leydig cells) primarily involved in negative feedback on LH and GnRH, whereas inhibin (from Sertoli cells) suppresses FSH secretion

Tests of Testicular Function

- testicular size (lower limit = 4 cm x 2.5 cm)
- LH, FSH, total and/or bioavailable testosterone
- human chorionic gonadotropin (hCG) stimulation test
 - assesses ability of Leydig cell to respond to gonadotropin
- semen analysis
 - semen volume, sperm count, morphology, and motility
- testicular biopsy
 - indicated with normal FSH and azoospermia/oligospermia

Hypogonadism and Infertility

- see [Urology, U33](#)
- deficiency in gametogenesis or testosterone production

Etiology

- causes include primary (testicular failure), secondary (hypothalamic-pituitary failure), and idiopathic
- primary hypogonadism is more common than secondary

Figure 19. Hypothalmo-pituitary-gonadal axis

Table 38. Classification and Features of Hypogonadism

	Hypergonadotropic Hypogonadism (Primary Hypogonadism)	Hypogonadotropic Hypogonadism (Secondary Hypogonadism)
Definition	Primary testicular failure ↑ LH and FSH, ↑ FSH:LH ratio ↓ testosterone and sperm count	Hypothalamic-pituitary axis failure ↓ LH + FSH ↓ testosterone and sperm count
Etiology	Congenital: <ul style="list-style-type: none"> Chromosomal defects (Klinefelter's, Noonan) Cryptorchidism Disorders of sexual development (DSD) Bilateral anorchia (vanishing testicle syndrome) Myotonic dystrophy Mutation of FSH or LH receptor gene Disorders of androgen synthesis Germ cell defects <ul style="list-style-type: none"> Sertoli cell only syndrome Leydig cell aplasia/failure Infection/Inflammation <ul style="list-style-type: none"> Orchitis – TB, lymphoma, mumps, leprosy Genital tract infection Physical factors <ul style="list-style-type: none"> Trauma, heat, irradiation, testicular torsion, varicocele Drugs <ul style="list-style-type: none"> Marijuana, alcohol, chemotherapy, ketoconazole, glucocorticoid, spironolactone Autoimmune (antisperm antibodies) Chronic systemic diseases (AIDS) Idiopathic	Congenital <ul style="list-style-type: none"> Kallman's syndrome Prader-Willi syndrome Abnormal subunit of LH or FSH Infection <ul style="list-style-type: none"> Tuberculosis, meningitis Endocrine <ul style="list-style-type: none"> Adrenal androgen excess Cushing's syndrome Hypo or hyperthyroidism Hypothalamic-pituitary disease (tumor, hyperprolactinemia, hypopituitarism) Drugs <ul style="list-style-type: none"> Alcohol, marijuana, spironolactone, ketoconazole, GnRH agonists, androgen/estrogen/progestin use, chronic narcotic use Chronic illness <ul style="list-style-type: none"> Cirrhosis, chronic renal failure, AIDS Sarcoidosis, Langerhan's cell histiocytosis, hemochromatosis Critical illness <ul style="list-style-type: none"> Surgery, MI, head trauma Obesity Idiopathic
Diagnosis	Testicular size and consistency (soft/firm) Sperm count LH, FSH, total, and/or bioavailable testosterone hCG stimulation Karyotype	Testicular size and consistency (soft/firm) Sperm count LH, FSH, total, and/or bioavailable testosterone Prolactin levels MRI of hypothalamic-pituitary region

Treatment

- testosterone replacement (improve libido, muscle mass, strength, hair growth, bone mass)
 - IM injection, transdermal testosterone patch/gel, oral
 - side effects: acne, fluid retention, erythrocytosis, sleep apnea, benign prostatic hypertrophy, uncertain effects on cardiac events/mortality in older men
 - contraindicated if history of prostate cancer, severe LUTS associated with BPH, uncontrolled or poorly controlled CHF
- GnRH agonist to restore fertility, if hypothalamic dysfunction with intact pituitary
 - administered SC in pulsatile fashion using an external pump
- hCG ± recombinant follicular stimulating hormone (rFSH) can be used to restore fertility in cases of either hypothalamic or pituitary lesions
- testicular sperm extraction (TESE) or microscopic sperm extraction (MICROTESE) – only if testicular tissues are not functioning

Other Causes of Male Infertility

- hereditary disorders: Kartagener syndrome, cystic fibrosis
- anatomy: hypospadias, retrograde ejaculation
- obstruction: vasal occlusion, vasal aplasia, vasectomy, seminal vesicle disease
- sexual dysfunction: erectile dysfunction, premature ejaculation, infrequent coitus
- surgery: TURP, radical prostatectomy, orchiectomy

DEFECTS IN ANDROGEN ACTION**Etiology**

- complete androgen insensitivity (CAIS)
- partial androgen insensitivity (PAIS)
- 5- α -reductase deficiency
- mixed gonadal dysgenesis
- defects in testosterone synthesis
- infertile male syndrome
- undervirilized fertile male syndrome

**Two Distinct Features of Primary Hypogonadism**

- The decrease in sperm count is affected to a greater extent than the decrease in serum testosterone level
- Likely to be associated with gynecomastia

**Two Features of Secondary Hypogonadism**

- Associated with an equivalent decrease in sperm count and serum testosterone
- Less likely to be associated with gynecomastia

**Approach to Male Infertility**

Infertility: failure of a couple to conceive after 12 mo of regular intercourse without use of contraception in women <35 yr of age; and after 6 mo of regular intercourse without use of contraception in women ≥35 yr

History

- Partner status re: infertility
- Length of time for attempt to conceive
- Prior successes with other partners
- Ejaculation problems
- Frequency of intercourse
- Prev Surg, Med Hx, STD Hx
- Hx orchitis? Cryptorchidism?
- Hx toxic exposure?
- Medications
- Alcohol and illicit drug use
- Heat exposure: bath, sauna, whirlpool
- Smoking

P/E

- General (height, weight, gynecomastia, masculine)
- Testicular size and consistency
- Varicocele?
- Pituitary disease?
- Thyroid disease?

Investigations

Should be considered for couples unable to conceive after 12 mo of unprotected and frequent intercourse; consider earlier evaluation if suggestive medical hx and physical, and in women ≥35 yr of age

- Semen analysis x 2 (sperm count, morphology, motility)
- Scrotal/testicular U/S (look for varicocele)
- Blood work: LH, FSH, testosterone, prolactin, thyroid function tests, DNA fragmentation of sperm, karyotype, Y chromosome deletion
- Test female partner (see [Gynecology](#), GY20)

Treatment

- No specific therapy for majority of cases
- Treat specific causes
- Consider: intrauterine insemination, IVF, therapeutic donor insemination, testicular aspiration of sperm, adoption

Clinical Features

- depends on age of onset

Table 39. Effects of Testosterone Deficiency

First Trimester in utero	Incomplete virilization of external genitalia (ambiguous genitalia) Incomplete development of Wolffian ducts to form male internal genitalia (male pseudohermaphroditism)
Third Trimester in utero	Micropenis Cryptorchidism (failure of normal testicular descent)
Prepuberty	Incomplete pubertal maturation (high pitch voice, sparse pubic + axillary hair, absence of facial hair) Eunuchoidal body habitus (greater growth of extremity long bones relative to axial bones) Poor muscle development, reduced peak bone mass
Postpuberty	Decrease in energy, mood, and libido Fine wrinkles in corners of mouth and eyes Decrease in pubic/axillary hair, hematocrit, muscle mass, strength, and BMD

Adapted from: UpToDate, 2010; Cecil's Essentials of Medicine

Treatment

- appropriate gender assignment in the newborn
- hormone replacement or supplementation
- psychological support
- gonadectomy for cryptorchidism (due to increased risk for testicular cancer)
- reduction mammoplasty for gynecomastia

Erectile Dysfunction

- see [Urology](#), U30

Gynecomastia

Definition

- true gynecomastia refers to benign proliferation of the glandular component of the male breast, resulting in the formation of a concentric, rubbery, firm mass extending from the nipple(s)
- pseudogynecomastia or lipomastia refers to enlargement of soft adipose tissue, especially seen in obese individuals and does not warrant further evaluation

Etiology

Physiologic

- puberty
- elderly (involutional)
- neonatal (maternal hormone)

Pathologic

- endocrinopathies: primary or secondary hypogonadism, hyperthyroidism, extreme hyperprolactinemia, adrenal disease
- tumors: pituitary, adrenal, testicular, breast, ectopic production of hCG
- chronic diseases: cirrhosis, renal, malnutrition (with refeeding)
- drugs: estrogens and estrogen agonists, spironolactone, ketoconazole, cimetidine, digoxin, chemotherapy, marijuana, alcohol
- congenital/genetic: Klinefelter's syndrome, androgen insensitivity
- other: idiopathic, familial

Pathophysiology

- hormonal imbalance due to increased estrogen activity (increased production, or increased availability of estrogen precursors for peripheral conversion to estrogen) or decreased androgen activity (decreased androgen production, binding of androgen to sex hormone binding globulin (SHBG), or androgen receptor blockage)

History

- recent change in breast characteristics
- trauma to testicles
- mumps
- alcohol and/or drug use
- FHx
- sexual dysfunction

Occurrence of Gynecomastia

3 Peaks	% Affected
Infancy	60-90
Puberty	4-69
Ages 50-80 yr	24-65

Causes of Gynecomastia

DOC TECH

Drugs
Other
Congenital
Tumor
Endocrine
Chronic disease

Physical Exam

- signs of feminization
- breast
 - rule out red flags suggesting breast cancer: unilateral, eccentric, hard, or fixed mass, skin dimpling or retraction, and nipple discharge or crusting
 - gynecomastia occurs concentrically around nipple, is not fixed to underlying tissue, and no discrete mass is palpable
- genito-urinary exam
- stigmata of liver or thyroid disease

Investigations

- laboratory: serum TSH, PRL, LH, FSH, testosterone, estradiol, LFTs, creatinine, hCG (if hCG is elevated need to locate the primary tumor)
- CXR and CT of chest/abdomen/pelvis (to locate neoplasm)
- testicular U/S to rule out testicular mass
- MRI of hypothalamic-pituitary region if pituitary adenoma suspected

Treatment

- initial observation for most men with gynecomastia
- medical
 - correct the underlying disorder, discontinue responsible drug
 - androgens for hypogonadism
 - anti-estrogens: tamoxifen, clomiphene
- surgical
 - usually required for macromastia; gynecomastia present for >1 yr (fibrosis is unresponsive to medication); or failed medical treatment and for cosmetic purposes

Female Reproductive Endocrinology

- see [Gynecology](#), GY4

Paraneoplastic Syndrome

- clinical syndromes involving non-metastatic systemic effects that accompany malignant disease
- triggered by antibodies against neoplasm cross-reacting with normal tissue or by production of a physiologically active substance by the neoplasm
- commonly present with cancers of lung, breast, ovaries, or lymphatic system

Table 40. Clinical Presentation

Syndrome Class	Symptoms/Syndrome	Associated Malignancies	Mechanism
Endocrine	Cushing's syndrome	Small-cell lung cancer Pancreatic carcinoma Neural tumors Thymoma	Ectopic ACTH and ACTH-like substance secretion
	SIADH	Small-cell lung cancer CNS malignancies	Antidiuretic hormone secretion
	Hypercalcemia	Lung cancer Breast carcinoma Renal cell carcinoma Multiple myeloma Ovarian carcinoma	PTH-related protein, TGF- α , TNF secretion
	Hypoglycemia	Hepatocellular carcinoma Fibrosarcoma	Insulin or insulin-like substance secretion
	Carcinoid	Pancreatic carcinoma Gastric carcinoma	Serotonin, bradykinin secretion
Neurologic	Lambert-Eaton myasthenic syndrome (LEMS) • muscle weakness in limbs	Small-cell lung cancer	Ab interferes with ACh release
	Myasthenia gravis • fluctuating muscle weakness and fatiguability	Thymoma	Ab interferes with ACh release
	Paraneoplastic limbic encephalitis • depression, seizures, short-term memory loss	Small-cell lung cancer	Unknown
Renal	Hypokalemic nephropathy	Small-cell lung cancer	Ectopic ACTH and ACTH-like substance secretion
	Nephrotic syndrome	Lymphoma Melanomas	Immunocomplex sedimentation in nephrons
GI	Watery diarrhea	Medullary thyroid carcinomas	Prostaglandin secretion
Hematologic	Erythrocytosis	Renal cell carcinoma Hepatocellular carcinoma	EPO production
Rheumatologic	SLE	Lymphomas Lung cancer Breast carcinoma Gonadal carcinoma	Anti-nuclear Ab production
	Scleroderma	Breast carcinoma Lung cancer Uterine cancer	Anti-nuclear Ab production

Investigations

- CBC, electrolytes, creatinine, LFTs, ALP, ESR, CRP, serum/urine electrophoresis,
- serum autoantibodies, lumbar puncture
- imaging: skeletal survey, CT, MRI, PET scan
- \pm endoscopy

Treatment

- treat underlying tumor: surgery, radiation, chemotherapy
- treat immune-mediated disorder: IVIg, steroids, immunosuppressive drugs, plasmapheresis (reserved for patients with identifiable antibodies in serum)

Common Medications

Diabetes Medications

Drug Class	Mechanism of Action	Generic Drug Name	US Name	Dosing	Indications	Contraindications	Side Effects	Comments
Biguanide	<ul style="list-style-type: none">• Sensitizes peripheral tissues to insulin → increases glucose uptake• Decreases hepatic glucose production by stimulation of hepatic AMP-activated protein kinase (AMPK)	metformin	Glucophage® Glumetza®	500 mg OD titrated to 2000 mg/d maximum	<ul style="list-style-type: none">• Useful in obese type 2 DM• Improves both fasting and postprandial hyperglycemia• Also ↓ TG	ABSOLUTE: <ul style="list-style-type: none">• Moderate to severe liver dysfunction• Moderate renal dysfunction GFR <30 mL/min• Cardiac dysfunction	<ul style="list-style-type: none">• GI upset (abdo discomfort, bloating, diarrhea)• Lactic acidosis• Anorexia	↓ HbA1c 1.0-2.0%
Insulin Secretagogue	<ul style="list-style-type: none">• Stimulates insulin release from β cells by causing K⁺ channel closure → depolarization → Ca²⁺ mediated insulin release• Use in nonobese type 2 DM	sulfonylureas: glyburide	Micronase® Glynase PreTab®	2.5-5.0 mg/d titrated to >5 mg bid Max: 20 mg/d	<ul style="list-style-type: none">• Short t_{1/2} of 1 h causes brief but rapid ↑ in insulin, therefore effective for post-prandial control	ABSOLUTE: <ul style="list-style-type: none">• Moderate to severe liver dysfunction RELATIVE (glyburide and glimepiride): <ul style="list-style-type: none">• Adjust dose in mild to moderate kidney dysfunction and avoid in severe kidney dysfunction• Avoid glyburide in the elderly INTERACTIONS: <ul style="list-style-type: none">• Do not combine with a non-sulfonylurea insulin secretagogue or preprandial insulin	<ul style="list-style-type: none">• Hypoglycemia• Weight gain	↓ HbA1c 1.0-2.0%
		glipizide	Diamicron® Diamicron® MR	40-160 mg bid 30-120 mg OD		ABSOLUTE: <ul style="list-style-type: none">• Severe liver dysfunction INTERACTIONS: <ul style="list-style-type: none">• Do not combine with a non-sulfonylurea or pre-prandial insulin	<ul style="list-style-type: none">• Hypoglycemia• Weight gain	↓ HbA1c 1.0-1.5% for repaglinide and 0.5-1.0% for nateglinide
		glimepiride	Amaryl®	1-8 mg OD				
		non-sulfonylureas: repaglinide	GlucoNorm®	0.5-4 mg tid				
		nateglinide	Starlix®	60-120 mg tid				
Insulin Sensitizers (thiazolidinedione)	<ul style="list-style-type: none">• Sensitizes peripheral tissues to insulin → increases glucose uptake• Decreases FFA release from adipose• Binds to nuclear receptor PPAR-γ	rosiglitazone	Avandia®	2-8 mg OD	<ul style="list-style-type: none">• Rosiglitazone – indicated only in patients with type 2 DM for whom all other oral antidiabetic agents, in monotherapy or in combination, do not result in adequate glycemic control or are inappropriate due to contraindications or intolerance	ABSOLUTE: <ul style="list-style-type: none">• NYHA > class II CHF INTERACTIONS: <ul style="list-style-type: none">• Do not combine with insulin	<ul style="list-style-type: none">• Peripheral edema• CHF• Anemia• Fluid retention and CHF• Increased risk of cardiac events with rosiglitazone (requires written informed consent when prescribing)• Increased risk of bladder cancer with pioglitazone• Fractures	↓ HbA1c 1.0-1.5%
		pioglitazone	Actos®	15-45 mg OD				
α-Glucosidase Inhibitor	<ul style="list-style-type: none">• ↓ carbohydrate GI absorption by inhibiting brush border α-glucosidase	acarbose	Glucobay®	25 mg OD titrated to 100 mg tid	<ul style="list-style-type: none">• ↓ postprandial hyperglycemia	ABSOLUTE: <ul style="list-style-type: none">• Inflammatory bowel disease• Severe liver dysfunction	<ul style="list-style-type: none">• Flatulence• Abdominal cramps• Diarrhea	↓ HbA1c 0.5-1.0%
Dipeptidyl Peptidase-IV (DPP-IV) Inhibitor	<ul style="list-style-type: none">• Inhibits degradation of endogenous antihyperglycemic incretin hormones• Incretin hormones stimulate insulin secretion, inhibit glucagon release, and delay gastric emptying	sitagliptin	Januvia®	100 mg OD	<ul style="list-style-type: none">• Use with dose reduction in kidney dysfunction	ABSOLUTE (sitagliptin): <ul style="list-style-type: none">• Type 1 DM• DKA	<ul style="list-style-type: none">• Nasopharyngitis• URTI• Headache• Pancreatitis• Stevens-Johnson syndrome	↓ HbA1c 0.5-1.0%
		saxagliptin	Onglyza™	2.5-5 mg OD		RELATIVE (sitagliptin and saxagliptin): <ul style="list-style-type: none">• Use with dose reduction in kidney dysfunction		
		linagliptin	Trajenta®	5 mg OD				
Glucagon-Like Peptide (GLP)-1 Analogue	<ul style="list-style-type: none">• Binds to GLP-1 receptor to promote insulin release• Insulinotropic effect suppressed as plasma glucose <4 mmol/L• Slows gastric emptying, suppresses inappropriately elevated glucagon levels• Causes β-cell regeneration and differentiation <i>in vitro</i>	Exenatide	Byetta®	5-10 µg SC bid 1 h before meals	<ul style="list-style-type: none">• Personal or family history of medullary thyroid cancer (MTC)	ABSOLUTE: <ul style="list-style-type: none">• Type 1 DM• DKA• Acute pancreatitis Hx RELATIVE: <ul style="list-style-type: none">• Gastroparesis• ESRD	<ul style="list-style-type: none">• N/V, diarrhea• Dizziness, headache• Muscle weakness• Anti-exentide antibodies• Pancreatitis	↓ HbA1c 1.0-1.5%
		Liraglutide	Victoza®	0.6-1.8 mg OD SC				

For insulin formulations see Table 9, E9

Dyslipidemia Medications

Drug Class	Mechanism of Action	Generic Drug Name	US Name	Dosing	Indications	Contraindications	Side Effects
HMG-CoA Reductase Inhibitor	• Inhibits cholesterol biosynthesis, ↓ LDL synthesis, ↑ LDL clearance, modest ↑ HDL, limited ↓ VLDL	atorvastatin fluvastatin lovastatin pravastatin rosuvastatin simvastatin	Lipitor® Lescol® Mevacor® Pravachol® Crestor® Zocor®	10-80 mg/d 20-80 mg/d 20-80 mg/d 10-40 mg/d 5-40 mg/d 10-80 mg/d	• 1st line monotherapy • Used for ↑ LDL, ↑ TG	• Active liver disease • Persistent ↑ in AST, ALT unexplained	• GI symptoms • Rash, pruritus • ↑ liver enzymes • Myositis (↑ risk if combined with fibrates) • Rhabdomyolysis
Fibrates	• Upregulate lipoprotein lipase + apo A1, ↓ VLDL, ↓ TG, modest ↓ LDL, modest ↑ HDL	bezafibrate fenofibrate gemfibrozil	Bezalip® Lipidil® Lopid®	400 mg/d 48-200 mg/d 600-1200 mg/d	• Used for ↑ TG, hyperchylomicronemia	• Hepatic disease • Renal disease	• GI upset • Skin rashes • ↑ risk of gallstone formation • ↑ risk of rhabdomyolysis when combined with statins
Niacin	• Inhibits secretion of hepatic VLDL via lipoprotein lipase (LPL) pathway → decreased VLDL and LDL; decreased clearance of HDL	nicotinic acid	Niacor® generic niacin	0.5-2 g/d 1-3 g/d	• Used for ↑ LDL, ↑ VLDL	• Hypersensitivity • Hepatic dysfunction • Active PUD • Hyperuricemia	• Generalized flushing • Abnormal liver enzymes • Pruritus • IGT • Watch glucose control with overt DM
Bile Acid Sequestrants	• Resins that bind bile acids in intestinal lumen and prevent absorption thereby ↓ LDL	cholestyramine colestipol	Questran® Colestid®	2-24 g/d 5-30 g/d	• Used for ↑ LDL • Use as adjunct with statins or fibrates	• Complete biliary obstruction • Pregnancy, lactation • TG >3.5 mmol/L • GI motility disorder	• Constipation • Nausea • Flatulence • Bloating • Rise in TG
Cholesterol Absorption Inhibitors	• Inhibits cholesterol absorption at the small intestine brush border	ezetimibe	Zetia®	10 mg/d	• Used for ↑ LDL, apo B	• Hypersensitivity • Hepatic dysfunction • Do not combine with fibrates or bile acid resins	• Fatigue • Pharyngitis • Sinusitis • Abdominal pain • Diarrhea • Arthralgia

Thyroid Medications

Drug Class	Mechanism of Action	Generic Drug Name	US Name	Dosing	Indications	Contraindications	Side Effects
Antithyroid Agent (thionamides)	• Decreases thyroid hormone production by inhibiting iodine and peroxidase from interacting with thyroglobulin to form T ₄ and T ₃ • PTU also interferes with conversion of T ₄ to T ₃	propylthiouracil (PTU) methimazole (MMI)	Propyl-Thyracil® Tapazole®	Start 100 mg PO tid, then adjust accordingly Thyroid storm: start 200-300 PO qid, then adjust accordingly Start 5-20 mg PO OD, then adjust accordingly Up to 60 mg OD may be required	• Hyperthyroidism	• Hypersensitivity • Relative: renal failure, liver disease • PTU recommended in 1st trimester, MMI during 2nd and 3rd trimester • Lactation: safe with PTU <300 mg/day and MMI <20-30 mg/d	• N/V • Rash • Drug-induced hepatitis • Agranulocytosis • Hepatitis with PTU • Cholestasis with MMI
Thyroid Hormone	• Synthetic form of thyroxine (T ₄)	levothyroxine l-thyroxine	Synthroid® Levoxyl®	0.05-2.0 mg/d, usually 1.6x weight (kg) is dose in micrograms In elderly patients start at 0.025 mg/d	• Hypothyroidism	• Recent MI, thyrotoxicosis	• If wrong dosing: symptoms of hypothyroidism or hyperthyroidism • Skin rash from dye in pill
Antithyroid Agent Radiopharmaceutical	• Radioactive isotope of iodine that is incorporated into the thyroid gland irradiating the area and destroying local glandular tissue	sodium iodide I-131	Iodotope®	Dose corrected for 24 h radioactive iodine uptake Hyperthyroidism 4-12 mCi Thyroid Ca 50-150 mCi	• Hyperthyroidism • Thyroid malignancy	• Hypersensitivity • Concurrent antithyroid medication • Pregnancy, lactation	• N/V • Bone marrow suppression • Sialadenitis • Thyroiditis

Metabolic Bone Disease Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	Dosing	Indications	Contraindications	Side Effects
Bisphosphonates	<ul style="list-style-type: none"> Inhibits osteoclast-mediated bone resorption 	alendronate	Fosamax®	Osteoporosis: 5-10 mg OD 70 mg once weekly Paget's: 40 mg OD for 6 mo	<ul style="list-style-type: none"> Prevention of postmenopausal osteoporosis Treatment of osteoporosis Glucocorticoid-induced osteoporosis Paget's disease 	<ul style="list-style-type: none"> Esophageal stricture or achalasia (oral) Unable to stand or sit upright for >30 min (oral) Hypersensitivity Hypocalcemia Renal insufficiency 	<ul style="list-style-type: none"> GI MSK pain Headache Osteonecrosis of the jaw Atypical femoral shaft fractures
		risedronate	Actonel®	Osteoporosis: 5 mg OD 35 mg once weekly 150 mg once monthly Paget's: 30 mg OD for 2 mo	<ul style="list-style-type: none"> Treatment and prevention of postmenopausal osteoporosis Treatment and prevention of glucocorticoid-induced osteoporosis Paget's disease 		
		etidronate	Didronel®	Paget's: 5-10 mg /kg OD x 6 mo	<ul style="list-style-type: none"> Symptomatic Paget's disease Prevention and treatment of heterotopic ossification after total hip replacement or spinal cord injury 		
		ibandronate	Boniva®	2.5 mg OD or 150 mg once monthly	<ul style="list-style-type: none"> Treatment and prevention of postmenopausal osteoporosis (US only) 		
		pamidronate	Aredia®	Hypercalcemia of malignancy 60-90 mg IV over 2-24 h Wait at least 7 d before considering retreatment	<ul style="list-style-type: none"> Hypercalcemia of malignancy Paget's disease Osteolytic bone metastases of breast cancer Osteolytic lesions of multiple myeloma 		
		zoledronate	Zometa® Aclasta®	5 mg IV once yearly IV	<ul style="list-style-type: none"> Treatment of osteoporosis Hypercalcemia of malignancy Treatment and prevention of skeletal complications related to cancer 		
Selective Estrogen Receptor Modulators	<ul style="list-style-type: none"> Decreases resorption of bone through binding to estrogen receptors 	raloxifene	Evista®	60 mg OD	<ul style="list-style-type: none"> Treatment and prevention of postmenopausal osteoporosis (2nd line) 	<ul style="list-style-type: none"> Lactation Pregnancy Active or past history of DVT, PE, or retinal vein thrombosis 	<ul style="list-style-type: none"> Hot flashes Leg cramps Increased risk of fatal stroke, venous thromboembolism
Calcitonin	<ul style="list-style-type: none"> Inhibits osteoclast-mediated bone resorption 	calcitonin	Miacalcin®	One spray (200 IU) per day, alternating nostrils	<ul style="list-style-type: none"> Treatment of postmenopausal osteoporosis, greater than 5 yr postmenopause 	<ul style="list-style-type: none"> Clinical allergy to salmon-calcitonin 	<ul style="list-style-type: none"> Rhinitis Epistaxis Sinusitis Nasal dryness
Anti-RANKL Monoclonal Ab	<ul style="list-style-type: none"> Inhibits RANKL (osteoclast differentiating factor) → inhibit osteoclast formation and decrease bone resorption 	denosumab	Xgeva™	60 mg SC q6mo	<ul style="list-style-type: none"> Treatment of postmenopausal women at high risk of fracture Prevent skeletal-related events in patients with bone metastasis from solid tumors 	<ul style="list-style-type: none"> Hypocalcemia 	<ul style="list-style-type: none"> Fatigue/headache Dermatitis/rash Hypophosphatemia/Hypocalcemia Hypercholesterolemia GI discomfort
PTH	<ul style="list-style-type: none"> Stimulates new bone formation by preferential stimulation of osteoblastic activity over osteoclastic activity 	teriparatide	Forteo®	20 µg SC OD x 18-24 mo	<ul style="list-style-type: none"> Treatment of postmenopausal women with osteoporosis who are at high risk for fracture Treatment of men with primary or hypogonadal osteoporosis who are at high risk for fracture 	<ul style="list-style-type: none"> Paget's disease Prior external beam or implant radiation therapy involving the skeleton Bone metastases Metabolic bone diseases other than osteoporosis 	<ul style="list-style-type: none"> Orthostatic hypotension Hypercalcemia Dizziness Leg cramps

Metabolic Bone Disease Medications (continued)

Drug Class	Mechanism of Action	Generic Drug Name	US Name	Dosing	Indications	Contraindications	Side Effects
Calcium	• Inhibits PTH secretion			1200 mg/d (including diet) Divided in 3 doses	• Osteopenia • Osteoporosis • Prevention of metabolic bone disease	• Caution with renal stones	• Vomiting • Constipation • Dry mouth
Vitamin D	• Regulation of calcium and phosphate homeostasis	cholecalciferol (vitamin D3)		800 -2000 IU/d	• Osteopenia • Osteoporosis • Prevention of metabolic bone disease	• Caution in patients on digoxin (risk of hypercalcemia which may precipitate arrhythmia)	• Hypercalcemia • Headache • N/V • Constipation
		ergocalciferol (vitamin D2)	Drisdol® Erdol®	50,000 IU/wk	• Osteoporosis in patients with liver dysfunction, refractory rickets, hypoparathyroidism	• Hypercalcemia • Malabsorption syndrome • Decreased renal function	
		calcitriol (1,25(OH) ₂ -D)	Rocaltrol® Calcijex®	Start 0.25 µg/d Titrate up by 0.25 µg/d at 4-8 wk intervals to 0.5-1 µg/d Start 0.25 µg/d Titrate up by 0.25 µg/d at 2-4 wk intervals to 0.5-2 µg/d	• Hypocalcemia and osteodystrophy in patients with chronic renal failure on dialysis • Hypoparathyroidism	• Hypercalcemia • Vitamin D toxicity	

Adrenal Medications

Drug Class	Mineralocorticoid Activity	Generic Drug Name	Potency (Relative to Cortisol)	Equivalent Dose (mg)	Duration of Action (t _{1/2} in h)	Dosing	Comments
Hydrocortisone	Yes	Cortef Solu-Cortef	1.0	20	8	<u>Adrenal Crisis:</u> 50-100 mg IV bolus, then 50-100 mg q8h (continuous infusion x 24-48 h) PO once stable (50 mg q8h x 48 h, then taper over 14 d) <u>Chronic AI:</u> 15-20 mg PO OD (2/3 AM, 1/3 PM)	• In high doses, mineralocorticoid side effects may emerge (salt + water retention, ECF volume expansion, HTN, low K ⁺ metabolic alkalosis)
Cortisone Acetate	Yes	Cortisone Acetate	0.8	25	oral = 8 IM = 18+	<u>Adrenal Crisis:</u> 75-300 mg/d PO/IM divided q12-24h <u>Chronic AI:</u> 25 mg/d	• Pro-drug which is converted to active form as hydrocortisone • High doses can result in mineralocorticoid side effects (see above)
Prednisone	No	Prednisone	4	5	16-36	<u>Adrenal Crisis:</u> 15-60 mg/d PO qd or divided bid/qid <u>Chronic AI:</u> 5 mg daily	• Pro-drug which is converted to active form as prednisolone
Dexamethasone	No	Dexamethasone	30	0.7	36-54	<u>Adrenal Crisis:</u> 4 mg IV; repeat q2-6h if necessary	• Used for undiagnosed adrenal insufficiency (does not interfere with measurement of serum cortisol levels)

Landmark Endocrinology Trials

Trial	Reference	Results
DIABETES		
ACCORD	<i>NEJM</i> 2008; 358:2560-72	Compared with standard therapy the use of intensive therapy to target normal HbA1c levels (<6%) for 3.5 yr increased mortality and did not significantly reduce major cardiovascular events
ADVANCE	<i>NEJM</i> 2008; 358:2545-59	Intensive glucose control that lowered the HbA1c value to 6.5% reduced the incidence of nephropathy but did not significantly reduce major macrovascular events, death from cardiovascular events, or death from any cause; hypoglycemia was more common in the intensive control group
BARI-2D	<i>NEJM</i> 2009; 360:2503-15	In patients with both type 2 DM and CAD no significant difference was found in the rates of death and major cardiovascular events in patients undergoing prompt revascularization and those undergoing medical therapy or between strategies of insulin sensitization and insulin
DCCT	<i>NEJM</i> 1993; 329:977-86	Intensive blood glucose control delayed the onset and reduced the progression of microvascular complications (retinopathy, nephropathy, and neuropathy) in type 1 DM
EDIC	<i>NEJM</i> 2005; 353:2644-53	Compared with conventional therapy intensive DM therapy early on without macrovascular disease (goal HbA1c <6.05%) has long-term beneficial effects on the risk of cardiovascular disease in patients with type 1 DM
Look AHEAD	<i>NEJM</i> 2013; 369:145-54	Moderate weight loss (<7% BW) and increased exercise are not associated with reduction in CVD and its complications among overweight or obese patients with type 2 DM
NAVIGATOR	<i>NEJM</i> 2010; 362:1463-90	In patients with impaired glucose tolerance, nateglinide did not reduce progression to DM or risk of cardiovascular events while valsartan only reduced progression to DM
PREDIMED	<i>NEJM</i> 2013; 368:1279-90	A Mediterranean diet with extra-virgin olive oil or nuts reduces rates of MI, CVA, or CV death in those at high risk for CV disease (outcome was driven by reduction in rates of CVA)
Steno-2	<i>NEJM</i> 2008; 358:580-91	In at-risk patients with type 2 DM intensive intervention with multiple drug combinations and behavior modification had sustained significant beneficial effects with respect to vascular complications and mortality; multifactorial intervention is critical in the management of type 2 DM
UKPDS	<i>Lancet</i> 1998; 352:837-53	Intensive blood glucose control reduces microvascular but not macrovascular complications in type 2 DM
UKPDS Extension	<i>NEJM</i> 2008; 359:1577-89	Continued risk reduction in microvascular risk and emergent risk reductions for MI and death from any cause 10 yr post UKPDS trial follow up in type 2 DM
VADT	<i>NEJM</i> 2009; 360:1-11	In patients with longstanding poorly controlled type 2 DM intensive glucose control had no significant effect on the rates of major cardiovascular events, death, or microvascular complications; adverse events, predominantly hypoglycemia, were more common in the intensive control group
LIPIDS		
4S	<i>Lancet</i> 1994; 344:1383-89	In patients with angina or previous MI and high total cholesterol simvastatin reduced: all-cause mortality, fatal and nonfatal coronary events, and need for coronary artery bypass surgery or angioplasty
FIELD	<i>Lancet</i> 2005; 366:1849-61	In patients with type 2 DM not previously on statin therapy fenofibrate did not significantly reduce the risk of the primary outcome of coronary events; it did reduce non-fatal MIs and revascularizations
HPS	<i>Lancet</i> 2002; 360:7-22	In high-risk patients with various cholesterol values simvastatin reduced all-cause mortality, coronary deaths, and major vascular events
Jupiter	<i>NEJM</i> 2008; 359:2195-207	Rosuvastatin significantly reduced the incidence of major cardiovascular events in patients with elevated high-sensitivity CRP levels and no hyperlipidemia
TNT	<i>NEJM</i> 2005; 352:1425-35	Lipid-lowering therapy with atorvastatin 80 mg/d in patients with stable CHD provides clinical benefit beyond atorvastatin 10 mg/d

CA	cancer	HRT	hormone replacement therapy	QCD	obsessive compulsive disorder	SSRI	selective serotonin reuptake inhibitor
CABG	coronary artery bypass graft	HSIL	high-grade squamous intraepithelial lesion	OCP	oral contraceptive pill	STD	sexually transmitted disease
CAD	coronary artery disease	IBD	inflammatory bowel disease	OCPD	obsessive compulsive personality disorder	TC	total cholesterol
CBT	cognitive behavioral therapy	IBS	irritable bowel syndrome	OD	once daily	TCA	tricyclic antidepressant
CF	cystic fibrosis	ICS	inhaled corticosteroids	OGCT	oral glucose challenge test	TG	triglyceride
CHF	congestive heart failure	IFG	impaired fasting glucose	OGTT	oral glucose tolerance test	TIA	transient ischemic attack
CPAP	continuous positive airway pressure	IGT	impaired glucose tolerance	OTC	over the counter	TM	tympenic membrane
CRC	colorectal cancer	IHD	ischemic heart disease	PCOS	polycystic ovarian syndrome	TMJ	temporomandibular joint
CVD	cardiovascular disease	INH	isoniazid	PFT	pulmonary function test	TUIP	transurethral incision of the prostate
DHP	dihydropyridine	IPT	interpersonal therapy	PID	periodic health examination	TURP	transurethral resection of the prostate
DMPA	depot medroxyprogesterone	IVP	intravenous pyelogram	PMS	pelvic inflammatory disease	UC	ulcerative colitis
DRE	digital rectal exam	KUB	kidneys, ureter, bladder x-ray	PND	premenstrual syndrome	URT	upper respiratory tract infection
DS	double strength	LDL-C	low density lipoprotein cholesterol	PPI	paroxysmal nocturnal dyspnea	USPSTF	United States Preventive Services Task Force
ED	emergency department	LSIL	low-grade squamous intraepithelial lesion	PPD	proton pump inhibitor	UTI	urinary tract infection
ER	extended release	LV	left ventricle	PSA	purified protein derivative	VAIN	vaginal intraepithelial neoplasia
F/U	follow-up	LVH	left ventricle hypertrophy	PTSD	prostate specific antigen	VIN	vulvar intraepithelial neoplasia
FAP	familial adenomatous polyposis	MAOI	monoamine oxidase inhibitor	PUD	post-traumatic stress disorder	VBI	vertebrobasilar insufficiency
FBG	fasting blood glucose	MDI	metered dose inhaler	PUD	peptic ulcer disease		
				PVDF	polyunsaturated fatty acids		
				PVD	peripheral vascular disease		

Periodic Health Examination

- American Academy of Family Physicians (AAFP) represents 115,900 primary care physicians and student members nationwide
- approximately one in four of all office visits are made to family physicians (214 million office visits each yr)
- basis for recommendations is the analysis of scientific knowledge available as presented by the US Preventive Services Task Force (USPSTF) in the Guide to Clinical Preventive Services and ongoing updates
- recommendations are based on systematic analysis of scientific evidence
- most notable recommendation is the abolition of the annual physical exam; replaced by the PHE

Patient-Centered Clinical Method

- Explore/define patient problems and decide on management together
- Consider both agendas and find common ground

Agendas in Family Medicine

Doctor's Agenda

History, physical, investigations, diagnosis, plan

Patient's Agenda

FIFE

Feelings: related to the illness, fears (how do you feel about what is happening?)

Ideas: and explanations of the cause (what do you think is going on?)

Function: the illness' impact on daily life (how is it affecting your work or life?)

Expectations: of the doctor and the illness (what were you expecting at the visit?)

Adult Periodic Health Exam

Male and female evidence-based preventive care checklist forms are available online at <http://www.aafp.com>

When Ordering Fasting Blood Work

- Routinely ordered as ≥ 12 h of fasting
- Remember, "fasting" means no food, no drinks (except small quantities of water), no gum, no smoking
- Prescription medications are okay unless otherwise specified
- Special care should be taken when ordering fasting blood work in elderly or other medically fragile patients

Note About PSA

- Routine PSA screening is currently not recommended
- PSA testing is used in ongoing surveillance and management of men with prostate cancer (see [Urology](#), U25)

Purpose of the PHE

- primary prevention:** identify risk factors for common diseases; counsel patients to promote healthy behavior
- secondary prevention:** presymptomatic detection of disease to allow early treatment and to prevent disease progression
- update clinical data
- enhance patient-physician relationship

AAFP Grading System (for recommendations before 2007)

- the recommendations include the examinations that should be offered (strongly recommend and recommend), those that should not be done (recommend against), those considered an option (no recommendation for or against), and those with insufficient evidence to recommend for or against
- strongly recommend:** good quality evidence exists that demonstrates substantial net benefit over harm; the intervention is perceived to be cost effective and acceptable to nearly all patients
- recommend:** although evidence exists that demonstrates net benefit, the benefit is only moderate in magnitude or the evidence supporting a substantial benefit is only fair; the intervention is perceived to be cost effective and acceptable to most patients
- no recommendation for or against:** good or fair evidence exists of at least a small net benefit; cost effectiveness may not be known or patients may be divided about acceptability of the intervention
- recommend against:** good or fair evidence that demonstrates no net benefit over harm
- insufficient evidence to recommend for or against:** no evidence of even fair quality exists, or the existing evidence is conflicting

AAFP Grading System (for recommendations after 2007)

Grade	Definition	Suggestions for Practice
A	The USPSTF recommends the service. There is high certainty that the net benefit is substantial	Offer or provide this service
B	The USPSTF recommends the service. There is high certainty that the net benefit is moderate or there is moderate certainty that the net benefit is moderate to substantial	Offer or provide this service
C	The USPSTF recommends selectively offering or providing this service to individual patients based on professional judgment and patient preferences. There is at least moderate certainty that the net benefit is small	Offer or provide this service for selected patients depending on individual circumstances
D	The USPSTF recommends against the service. There is moderate or high certainty that the service has no net benefit or that the harms outweigh the benefits	Discourage the use of this service
I Statement	The USPSTF concludes that the current evidence is insufficient to assess the balance of benefits and harms of the service. Evidence is lacking, of poor quality, or conflicting, and the balance of benefits and harms cannot be determined	Read the clinical considerations section of USPSTF Recommendation Statement. If the service is offered, patients should understand the uncertainty about the balance of benefits and harms

Table 1. AAFP Recommendations for the Periodic Health Exam

Health Concern	AAFP Recommends	Grade
Abdominal Aortic Aneurysm	One-time screening by U/S in men ages 65 to 75 who have ever smoked (2014)	B
Intimate Partner Violence	Screening all women of childbearing age for intimate partner violence (2013)	B
Alcohol Misuse, Adults	Screening adults aged 18 yr or older for alcohol misuse and provide persons engaged in risky or hazardous drinking with brief behavioral counseling interventions	B
Bacteriuria, Asymptomatic	Screening for asymptomatic bacteriuria with urine culture for pregnant women at 12 to 16 wk gestation or at the first prenatal visit, if later (2008)	A
Behavioral Counseling to Prevent STD	High-intensity behavioral counseling all sexually active adolescents and for adults at increased risk for STDs (2008)	B
Breastfeeding	Interventions during pregnancy and after birth to promote and support breastfeeding (2008)	B
Cardiovascular Disease, Aspirin for the Prevention of	The use of aspirin for men age 45 to 79 when benefit of reduction in MI outweighs potential harm of GI bleed (2009)	A
Cardiovascular Disease, Aspirin for the Prevention of	The use of aspirin for women age 55 to 79 when benefit of reduction in strokes outweighs potential harm of increase in GI bleed (2009)	A
Chlamydia, Women	Screening for chlamydial infection for all sexually active non-pregnant young women aged 24 and younger and for older non-pregnant women who are at increased risk (2007)	A
Congenital Hypothyroidism	Screening for congenital hypothyroidism in newborns (2008)	A
Dental Caries, in Children (Birth through Age 5)	Primary care clinicians apply fluoride varnish to primary teeth of all infants and children starting at the age of primary tooth eruption and prescribe oral fluoride supplementation starting at age 6 mo for children whose water supply is deficient in fluoride (2014)	B
Depression, Adults	Screening adults for depression when staff-assisted depression care supports are in place to assure accurate diagnosis, effective treatment, and follow-up "Staff-assisted depression care supports" refers to clinical staff that assist the primary care clinician by providing some direct depression care and/or coordination, case management, or mental health treatment (2010)	B
Depression, Children and Adolescents	Screening of adolescents (12-18 yr of age) for major depressive disorder (MDD) when systems are in place to ensure accurate diagnosis, psychotherapy (cognitive behavioral or interpersonal), and follow-up (2009)	B
DM, Gestational	Screening for gestational DM in asymptomatic pregnant women after 24 wk of gestation (2014)	B
DM, Type 2	Screening for type 2 DM in asymptomatic adults with sustained blood pressure (either treated or untreated) > 135/80 mmHg (2008)	B
Falls Prevention in Older Adults	Exercise or physical therapy and vitamin D supplementation in community-dwelling adults aged 65 yr or older who are at increased risk for falls; see Clinical Considerations for information on risk assessment (2012)	B
Gonococcal Infection in Neonates	Strongly recommends prophylactic ocular topical medication for all newborns against gonococcal ophthalmia neonatorum (2005)	A
Health Concern	AAFP Recommends	Grade
Healthy Diet	Intensive behavioral dietary counseling for adult patients with hyperlipidemia and other known risk factors for cardiovascular and diet-related chronic disease. Intensive counseling can be delivered by primary care physicians or by other qualified professionals including dietitians and nutritionists (1996)	B
Hearing Loss (Sensorineural)	Screening for hearing loss in all newborn infants (2008)	B
Hemoglobinopathies, Newborns	Strongly recommends ordering screening tests for PKU, hemoglobinopathies, and thyroid function abnormalities in neonates (2007)	A
Hepatitis B & C	Screening for HBV and HCV infection in persons at high risks for infection. Also offering one-time screening for HCV infection to adults born between 1945 and 1965 (2013)	B
HIV Infection, Adolescents and Adults	That clinicians screen adolescents and adults ages 18 to 65 yr for HIV infection. Younger adolescents and older adults who are at increased risk should also be screened; refer to USPSTF guidelines for more detail	A
HTN, Adults	Screening for high blood pressure in adults aged 18 and older (2007)	A
Immunization	Immunizing all children 0-18 yr of age and all adults using AAFP guidelines unless contraindicated (2014)	A
Folic Acid Supplementation, Women	That all women planning or capable of pregnancy take a daily supplement containing 0.43 to 0.8 mg (400 to 800 µg) of folic acid (2009)	A
Sexually Transmitted Diseases (STDs)	High-intensity behavioral counseling to prevent sexually transmitted diseases (STDs) for all sexually active adolescents and for adults at increased risk for STDs (2008)	B
Skin Cancer, Behavioral Counseling	Counseling children, adolescents, and young adults ages 10 to 24 yr who have fair skin about minimizing their exposure to ultraviolet radiation to reduce risk of skin cancer (2012)	B
Tobacco Use, Adults	Screening all adults for tobacco use and provide tobacco cessation interventions for those who use tobacco products (2009)	A
Vision Screening, Children	Vision screening for all children at least once between the ages of 3 and 5 yr to detect the presence of amblyopia or its risk factors (2011)	B

Efficacy of Human Papillomavirus Vaccines – A Systematic Quantitative Review

Int J Gynecol Cancer 2009;19:1166-1176

Study: Systematic review of 6 randomized placebo-controlled double-blind trials.

Patients: 47,236 women between ages 9-26.

Intervention: Vaccination with HPV L1 virus-like particle in either quadrivalent (HPV 6, 11, 16, 18), bivalent (HPV 16, 18), or univalent (HPV 16) form vs. placebo.

Main Outcome: Prevention of cytologically and/or histologically proven lesions (including LSIL, HSIL, VIN, VAIN, AIN, adenocarcinoma *in situ* of the cervix, or cancer of the cervix associated with HPV infection).

Results: Bivalent and quadrivalent vaccines reduced the rate of lesions in the cervix, vulva, vagina, and anogenital region with efficacy of 93% and 62%, respectively.

Prostate Cancer Mortality at 11 Year of Follow-Up

NEJM 2012;366:981-990

Study: Updated "ERSPC" study – multicenter randomized trial of screening for prostate cancer using PSA.

Patients: 162,388 men, ages 55-69 from 8 different European countries.

Intervention: PSA-based screening.

Main Outcome: mortality from prostate cancer.

Results: After median follow-up of 11 yr, the RRR of death from prostate cancer was 21%. The ARR was 1.07 deaths/1,000 men. NNT = 1,055 – therefore to prevent one death from prostate cancer at 11 yr follow up, 1,055 men would need to be screened.

Folic Acid Supplementation in Pregnancy (Joint SOGC-Motherisk Clinical Guideline)

- To prevent neural tube defects in all women capable of becoming pregnant
- Low risk women (no personal health risks, planned pregnancy): 0.4-1.0 mg daily folic acid supplementation for at least 2-3 mo before conception and throughout pregnancy and postpartum period
- High risk women (health risks including epilepsy, insulin dependent DM, BMI > 35, family history of NTD, high risk ethnic group): at least 3 mo prior to conception until 10-12 wk post conception: daily supplementation with multivitamins with 5 mg folic acid
- From wk 12 post-conception until postpartum period: 0.4-1.0 mg of folic acid supplementation is sufficient
- Women with additional lifestyle issues (poor compliance with medications, no birth control, additional teratogenic substances): higher folic acid dose of 5 mg

Appropriate Use of Screening and Diagnostic Tests to Foster High-Value, Cost-Conscious Care

Ann Intern Med 2012;156:147-149

Suggested principles for providing high-value, cost-conscious care (see article Table 1 for specific examples):

- Diagnostic tests should not be performed if the results will not change management.
- When the pretest probability of disease is low, the likelihood of a false-positive test result is higher than the likelihood of a true-positive result. False-positive results often lead to further testing, which may be expensive and potentially harmful (e.g. anxiety for patient, inappropriate treatment).
- The true cost of a test includes not only the cost of the test itself but also the downstream costs incurred because the test was performed. These include the costs of subsequent testing, treatment, or follow-up.

See Choosing Wisely - a campaign to help physicians and patients make smart and effective choices to ensure high-quality care. <http://www.choosingwisely.org>.

Table 1. AAFP Recommendations for the Periodic Health Exam (continued)

Health Concern	AAFP Recommends AGAINST	Grade
COPD	Screening asymptomatic adults for COPD using spirometry (2008)	D
Hormone Replacement Therapy	The use of combined estrogen and progestin for the prevention of chronic conditions in postmenopausal women (2012)	D
Prostate Cancer	Prostate-specific antigen (PSA)-based screening for prostate cancer (2012)	D
Testicular Cancer	Screening for testicular cancer in asymptomatic adolescent or adult males (2011)	D
Thyroid Cancer	The use of ultrasound screening for thyroid cancer in asymptomatic persons (1996)	D

- more detailed recommendations: *Breast Cancer* FM4, *Colorectal Cancer* FM4, *Osteoporosis* FM47, *Obesity* FM7

Breast Cancer Screening Guidelines

2013 Recommendations on Screening for Breast Cancer in Average-Risk Women (USPSTF)

- average-risk women: women age 40-74 with no personal history of breast cancer, history of breast cancer in 1st degree relatives, known mutations of the BRCA1/BRCA2 genes or previous exposures of the chest wall to radiation

Mammography

- age <50: recommend that decision to conduct screening mammography should be individualized and take into account patient context including her risks as well as values regarding specific benefits and harms (Grade C)
- age 50-74: recommend routine screening q2yr (Grade B)
- age 75+: current evidence is insufficient to assess benefits and harms of screening mammography (Grade I)

Magnetic Resonance Imaging

- current evidence insufficient to assess benefits and harms of MRI or digital mammography as screening modalities for breast cancer (Grade I)

Clinical Breast Examination

- current evidence insufficient to assess benefits and harms of CBE for women age 40 and older (Grade I)

Breast Self-Examination

- AAFP recommends against clinicians teaching women CBE (Grade D)

Prevention Medication

- AAFP recommends that clinicians engage in shared, informed decision making with women who are at increased risk for breast cancer about medications to reduce their risk
- for women who are at increased risk for breast cancer and at low risk for adverse medication effects, clinicians should offer to prescribe risk-reducing medications such as tamoxifen or raloxifene (Grade B)

BRCA Mutation Testing

- the AAFP recommends that primary care providers screen women who have family members with breast, ovarian, tubal, or peritoneal cancer with one of several screening tools designed to identify a family history that may be associated with an increased risk for potentially harmful mutations in breast cancer susceptibility genes (BRCA1 or BRCA2)
- women with positive screening results should receive genetic counseling and, if indicated after counseling, BRCA testing (Grade B)
- for more information on breast cancer and benign breast lesions, see [General Surgery, GS54](#)

Colorectal Cancer Screening Guidelines

- recommendations for average risk individuals (asymptomatic, no family history of UC, polyps, or CRC)
 - note: individuals with a personal history of cancer or adenomatous polyps should be followed by a surveillance regimen (screening guidelines are not applicable)
- the AAFP recommends screening for CRC using fecal occult blood testing (FOBT), sigmoidoscopy, or colonoscopy, in adults 50-75 yr with the following intervals (Grade A recommendation)
 - annual screening with high-sensitivity FOBT
 - sigmoidoscopy every 5 yr, with high-sensitivity FOBT q3yr
 - screening colonoscopy q10yr
- the AAFP recommends against routine screening for CRC in adults 76-85 yr (Grade C) and 85+ (Grade D)

- the USPSTF recommends against the use of aspirin or NSAIDs for the primary prevention of CRC (Grade C)
- the AAFP concludes that the evidence is insufficient to assess the benefits and harms of CT colonography and fecal DNA testing as screening modalities for CRC (Grade I recommendation)
- the AAFP recommends offering genetic testing for Lynch syndrome to patients diagnosed with CRC to reduce morbidity and mortality in relatives
 - genetic testing should be offered to 1st degree relatives of patients with Lynch syndrome, and those positive for Lynch syndrome should be offered earlier and more frequent CRC screening
- for more information on colorectal neoplasms, see [General Surgery, GS33](#)

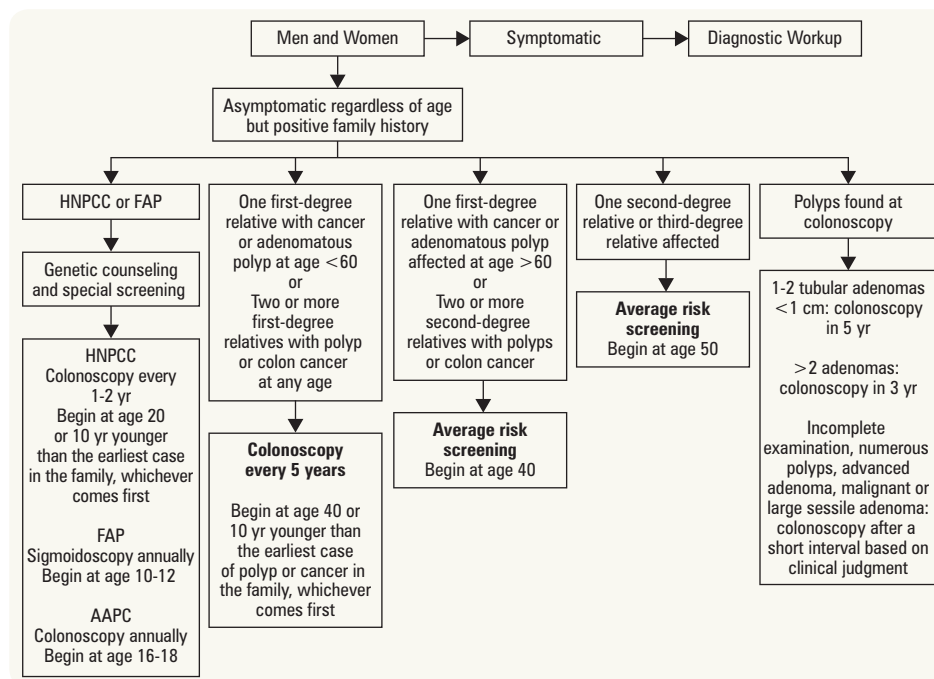

Figure 1. Approach to higher risk screening

AAPC = attenuated adenomatous polyposis; FAP = familial adenomatous polyposis; HNPCC = hereditary nonpolyposis colorectal cancer; 1st degree relatives: parents, siblings, children; 2nd degree relatives: grandparents, aunts, uncles; 3rd degree relatives: great grandparents or cousins. Figure printed with permission from Can J Gastroenterol 2004;18:93-99. Refer to: Colorectal Screening for Cancer Prevention in Asymptomatic Patients, March 2013. Available from http://www.bcguidelines.ca/pdf/colorectal_screening.pdf

Health Promotion and Counseling

- health promotion is the most effective preventive strategy
- 40-70% of productive life lost annually is preventable
- there are several effective ways to promote healthy behavioral change, such as discussions appropriate to a patient's present stage of change
- for more information about motivational interviewing, see <http://www.motivationalinterviewing.org>

Motivational Strategies for Behavioral Change

Table 2. Motivational Strategies for Behavioral Change

Patient's Stage of Change	Physician's Aim	Physician's Plan
Pre-Contemplation	Encourage patient to consider the possibility of change Assess readiness for change Increase patient's awareness of the problem and its risks	Raise issue in a sensitive manner Offer (not impose) a neutral exchange of information to avoid resistance
Contemplation	Understand patient's ambivalence and encourage change Build confidence and gain commitment to change	Offer opportunity to discuss pros and cons of change using reflective listening
Preparation	Explore options and choose course most appropriate to patient Identify high-risk situations and develop strategies to prevent relapse Continue to strengthen confidence and commitment	Offer realistic options for change and opportunity to discuss inevitable difficulties
Action	Help patients design rewards for success Develop strategies to prevent relapse Support and reinforce convictions towards long-term change	Offer positive reinforcement and explore ways of coping with obstacles Encourage self-rewards to positively reinforce change
Maintenance	Help patient maintain motivation Review identified high-risk situations and strategies for preventing relapse	Discuss progress and signs of impending relapse
Relapse	Help patient view relapse as a learning experience Provide support appropriate to present level of readiness post-relapse	Offer a non-judgmental discussion about circumstances surrounding relapse and how to avoid relapse in the future Reassess patient's readiness to change

Adapted from: Hunt P. Motivating Change. *Nursing Standard* 2001;16:45-52, 54-55

Figure 2. Plate layout

Handy Serving Size Comparisons

- 3 oz meat, fish, poultry → palm of hand
- 1 cup dairy (milk/yogurt) → size of fist
- Bread/grains → one slice, palm of hand
- ½ cup rice/pasta → one hand cupped
- 1 cup of fruit/vegetables → two cupped hands
- 1 oz cheese → full length of thumb
- 1 tsp oil/butter → tip of thumb
- Nuts/chips/snacks → palm covered

Energy Content of Food

- Carbohydrates 4 kcal/g
- Protein 4 kcal/g
- Fat 9 kcal/g
- Ethanol 7 kcal/g

Calculating Total Daily Energy Expenditure (TDEE)

- Roughly 35 kcal/kg/d
- Varies by age, weight, sex, and activity level
- Average 2000-2100 kcal/d for women, 2700-2900 kcal/d for men

Nutrition

General Population

- patients should refer to USDA Dietary Guidelines for Americans (2010) available from: <http://www.cnpp.usda.gov/>
- key recommendations
 - choose foods that provide more potassium, calcium, vitamin D, and dietary fiber; these include vegetables, fruits, whole grains, and milk/milk products
 - **Sodium Intake**
 - ♦ < 2,300 mg/d
 - ♦ further reduce intake to <1,500 mg/d in 51+ yr, those of any age who are African American, or have HTN, DM, or CKD (this recommendation applies to about 50% of the US population, including children)
 - **Fats**
 - ♦ consume <10% of calories from saturated fatty acids (replace with MUFA and PUFA)
 - ♦ consume <300 mg per d of dietary cholesterol
 - ♦ limit trans fatty acid consumption (especially synthetic sources of trans fats, such as partially hydrogenated oils)
 - **Vegetables and Fruits**
 - ♦ Increase vegetable and fruit intake; favor a variety of vegetables (dark-green, red, and orange), beans, and peas
 - **Grains**
 - ♦ consume at least 50% of all grains as whole grains (replace refined grains with whole grains)
 - **Dairy**
 - ♦ increase dairy intake overall (milk, yogurt, cheese, or alternatively fortified soy beverages), and favor fat-free or low-fat products
 - **Proteins**
 - ♦ eat a variety of protein foods (seafood, lean meat and poultry, eggs, beans/peas, soy products, unsalted nuts/seeds)
 - ♦ try to increasingly substitute a variety of seafood in place of meat and poultry
 - ♦ replace protein foods that are higher in solid fats with others with a lower solid fat content and/or are a source of oils
 - **Refined Foods**
 - ♦ reduce the intake of calories from solid fats and added sugars
 - ♦ limit the consumption of refined grain foods that also contain solid fats, added sugars, and sodium

- recommendations for specific population groups
 - **Women Capable of Becoming Pregnant**
 - ♦ choose foods rich in heme iron (more readily absorbed), and enhancers of iron absorption (e.g. vitamin C-rich foods)
 - ♦ consume at least 400 µg/d of folic acid (from foods and supplements) in addition to food forms of folate from a varied diet
 - **Pregnant or Breastfeeding Women**
 - ♦ consume 8-12 oz of seafood/wk (limit white albacore tuna to 6 oz/wk and do not consume tilefish, shark, swordfish, or king mackerel as they are high in methyl mercury)
 - ♦ take an iron supplement if pregnant, as recommended by your healthcare provider
 - **Individuals >50 yr**
 - ♦ consume foods fortified in vitamin B12 (e.g. fortified cereals) or use dietary supplements
- counsel on variety, portion size, and plate layout
- vitamins and minerals: see CDC-Vitamins and Minerals, available from: <http://www.cdc.gov/nutrition/everyone/basics/vitamins/>

Cardiovascular Disease Prevention

Table 3. Dietary Guidelines for Reducing Risk of Cardiovascular Disease

	Recommendations	Effects
Fat, Carbohydrates, Protein	Overall fat intake: 26-27% of total energy Saturated fat: 5-6% of total energy Trans fat: reduce intake, replace with MUFA or PUFA Carbohydrates: 55-59% of total energy Protein: 15-18% of total energy	Lower LDL
Omega-3 Fatty Acid Rich Foods	≥2 servings/wk of fish (especially oily fish like salmon)	Decreased sudden death, death from CAD Lower TG
Salt	≤2,300 mg/d	Lower BP Combining decreased sodium intake with the DASH diet (see below) achieves even greater BP-lowering effects
Alcohol	≤2 drinks/d for men, ≤1 drink/d for women	Decreased risk of hypertriglyceridemia, HTN
Dietary Approaches	DASH diet (Dietary Approaches to Stop HTN), recommended by the American Heart Association (AHA) Diet: high in vegetables/fruits, low-fat dairy, whole grains, poultry, fish and nuts; Low in sweets, sugar-sweetened beverages, red meats Macronutrients: low in saturated/total fat and cholesterol; high in potassium, magnesium, calcium, protein, and fiber	Lower BP, lower LDL

MUFA = monounsaturated fatty acids; PUFA = polyunsaturated fatty acids

Obesity

- body mass index (BMI) = weight (kg)/height (m)² = weight (lbs)/height (in)² x 703; BMI is a poor predictor of obesity
- waist circumference (WC) = flexible tape placed on horizontal plane at level of iliac crest
 - should be measured in all adults to assess obesity-related health risks
 - WC measurement for individuals of BMI >35 kg/m² is not necessary (almost all individuals with this BMI will have an abnormal WC)

Table 4. Classification of Weight by BMI, Waist Circumference, and Associated Disease Risks in Adults

	BMI (kg/m ²)	Men ≤102 cm (40 in) Women ≤88 cm (35 in)	Men >102 cm (40 in) Women >88 cm (35 in)
Underweight	<18.5		
Normal	18.5-24.9		
Overweight	25.0-29.9	Increased	High
Obesity Class I	30.0-34.9	High	Very High
Obesity Class II	35.0-39.9	Very High	Very High
Obesity Class III (Extreme Obesity)	40.0 +	Extremely High	Extremely High

From: Classification of Overweight and Obesity by BMI, Waist Circumference, and Associated Disease Risks, National Institute of Health, National Heart Lung and Blood Institute, Obesity Education Initiative, http://www.nhlbi.nih.gov/health/public/heart/obesity/lose_wt/bmi_dis.htm

Burning Fat

3500 kcal of energy are used for every pound of human fat burned during activity

Losing Weight

- Aim for caloric intake 500-1000 kcal/d less than total daily energy expenditure (TDEE)
- Results in 1-2 lb (0.5-1 kg) weight loss per wk
- Achieved by combination of increased activity and/or decreased caloric intake

Low BMI Associations

- Osteoporosis
- Eating disorders
- Under-nutrition
- Pregnancy complications

Adverse Medical Consequences of Obesity

- Type 2 DM
- CAD
- Stroke
- HTN
- Gallbladder disease
- Non-alcoholic steatohepatitis
- Complications of pregnancy
- Dyslipidemia
- Osteoarthritis
- Sleep apnea
- Certain cancers
- CHF
- Low back pain
- Increased total mortality

Epidemiology

- more than one-third of U.S. adults (34.9%) are obese
- non-Hispanic blacks have the highest age-adjusted rates of obesity (47.8%) followed by Hispanics (42.5%), non-Hispanic whites (32.6%), and non-Hispanic Asians (10.8%)
- obesity is higher among middle age adults, 40-59 yr old (39.5%) than among younger adults, age 20-39 (30.3%) or adults over 60 or above (35.4%) adults
- overweight and obesity rates in children are directly proportional to screen time (see *Exercise, FM9*)
- only 10-15% of population consume <30% fat daily
- obese persons generally consume more energy-dense food which tends to be highly processed, micronutrient poor, and high in fats, sugars, or starch

AAFP Guidelines For Adults (2012)

- the AAFP recommends screening all adults for obesity; clinicians should offer or refer patients with a BMI of 30 kg/m² or higher to intensive, multicomponent behavioral interventions (Grade B recommendation)
- intensive, multicomponent behavioral interventions include behavioral management activities (12 to 26 sessions in the first yr) such as setting weight loss goals, improving diet/nutrition and increasing physical activity, addressing barriers to change, self-monitoring, and strategizing how to maintain lifestyle changes. For more information: <http://www.uspreventiveservicestaskforce.org/uspstf11/obeseadult/obesenum.htm>

AAFP Guidelines For Children and Adolescents (2010)

- the AAFP recommends that clinicians screen children aged 6 yr and older for obesity and offer them or refer them to comprehensive, intensive behavioral interventions to promote improvement in weight status (Grade B recommendation)
- the definitions for specific interventions (targeted to diet and physical activity) and intensity (>25 h with child and/or family over 6 mo) are noted at: <http://www.ahrq.gov/clinic/uspstf10/childobes/chobesrs.htm#clinical>

Dyslipidemia

- see *Endocrinology, E2*
- defined as abnormal elevation of plasma cholesterol or triglyceride levels
- increased risk associated with obesity, DM, alcohol use

Assessment

- measure fasting serum, LDL-C, HDL-C, and TG
- screen with full fasting lipid profile q1-3yr in males >40 yr, females >50 yr or who are menopausal, or any adults with additional CAD risk factors
- assess for presence of other CAD risk factors (smoking, DM, HTN, obesity)
- screen for secondary causes: hypothyroidism, CKD, DM, nephrotic syndrome, liver disease
- risk category
 - estimate using the model for 10 yr CAD risk developed from the Framingham data (Framingham Risk Score – FRS)
 - ♦ FRS calculated based on the following factors: gender, age, HDL-C, total cholesterol, SBP, smoking, DM
 - if positive family Hx of CVD in a first degree relative before age 60 then multiply 10 yr CVD risk (%) x 2
 - to be completed for men age 40-75, and women age 50-75 q3-5yr
 - ♦ cardiovascular age calculated as patient's age ± the difference between his or her estimated remaining life expectancy
 - used to increase adherence to therapy and reaffirm positive effect of following therapy
 - primary target of therapy is LDL-C levels; the alternate primary targets are apolipoprotein B (apo B) and non-HDL-C (not used widely yet)
 - optional secondary targets once LDL-C/apo B is at target include TC:HDL-C ratio, apo B:apo AI ratio, hs-CRP (used more for risk stratification of CAD), non-HDL-C, and serum TG levels
- emerging risk factors (from Framingham group)
 - lipoprotein a
 - metabolic syndrome
 - genetic risk
 - hormone replacement therapy
 - infectious agents

Pharmacotherapy for Obesity

- Orlistat: gastrointestinal lipase inhibitor, reduces fat absorption by 30% by inhibition of pancreatic lipase
- Orlistat is associated with several adverse effects and not approved for clinical use longer than 2 yr
- Orlistat should be avoided in people with inflammatory or chronic bowel disease

"The Latest Evidence on Fad Diets..."

Comparison of the Atkins, Ornish, Weight Watchers, and Zone Diets for Weight Loss and Heart Disease Risk Reduction

JAMA 2005;293:43-53

Purpose: To assess the effectiveness and adherence rates of four popular diets for weight loss and reduction of cardiac risk factors.

Study Characteristics: Single center RCT at academic medical center in Boston, MA; 160 participants were randomized to either Atkins (carbohydrate restriction), Zone (macronutrient balanced and low glycemic load), Weight Watchers (low calorie/portion size), or Ornish (fat restriction) diet groups for a period of 18 mo.

Participants: Adults age 22-72 with known HTN, dyslipidemia, or fasting hyperglycemia.

Results: Assuming that participants who discontinued the study remained at baseline, the mean weight loss at 1 yr (and self selected dietary adherence rates per self report) were 2.1 kg for Atkins (53% of participants completed, p=0.009), 3.2 kg for the Zone (65% of participants completed, p=0.002), 3.0 kg for Weight Watchers (65% completed, p<0.001), 3.3 kg for Ornish (50% completed, p=0.007). Each diet significantly reduced the LDL/HDL ratio by ~10% (p<0.05), with no significant effects on blood pressure or glucose. Amount of weight loss was associated with adherence level (r = 0.60; p<0.001) but not with diet type (r = 0.07; p=0.40). Weight loss for each diet was significantly associated with reduction in levels of total/HDL cholesterol (r=0.36), C-reactive protein (r=0.37), and insulin (r=0.39), with no significant difference between diets.

Conclusion: Each popular diet was associated with modest weight loss and reduction of several cardiac risk factors. Adherence level, and not diet type, was the most important predictor of weight loss and cardiac risk factor reduction.

Hyperlipidemia Signs

- Atheromata: plaques in blood vessel walls
- Xanthoma: plaques or nodules composed of lipid-laden histiocytes in the skin (especially the eyelids)
- Tendinous xanthoma: lipid deposit in tendon (especially Achilles)
- Corneal arcus (arcus senilis): lipid deposit in cornea

LDL cannot be calculated when TG ≥4.5 mmol/L

Safety of Statins: An Update

Therapeutic Advances in Drug Safety 2012;3:133-144

Trials have shown that statin therapy slightly increases the incidence of DM; however, the absolute risk is small. Relative to the reduction in coronary events, the clinical significance is not great enough to recommend against their use.

Table 5. LDL Cholesterol Goals and Cut Points for Therapeutic Lifestyle Changes (TLC) and Drug Therapy in Different Risk Categories

Risk Category	LDL Goal	LDL Level at Which to Initiate TLC	LDL Level at Which to Consider Drug Therapy
CHD or CHD risk equivalent (10 yr risk >20%)	<100 mg/dL (2.60 mmol/L)	≥100 mg/dL	≥130 mg/dL (at 100-129 mg/dL, drug optional)*
2 or more risk factors (10 yr risk <20%)	<130 mg/dL (3.35 mmol/L)	≥130 mg/dL	≥130 mg/dL for 10 yr risk of 10-20%; 160 mg/dL for 10 yr risk of <10%
0-1 risk factor†	<160 mg/dL (4.15 mmol/L)	≥160 mg/dL	≥190 mg/dL (at 160-189 mg/dL, LDL-lowering drug optional)

CHD = coronary heart disease; HDL = high-density lipoprotein; LDL = low-density lipoprotein

*—If an LDL cholesterol level of <100 mg/dL cannot be achieved by therapeutic lifestyle changes, some authorities recommend use of LDL-lowering drugs in this category. Others prefer using drugs that primarily modify triglycerides and HDL (i.e., nicotinic acid or fibrate). Clinical judgment also may call for deferring drug therapy in this subcategory

†—People with zero to one risk factor almost always have a 10 yr risk <10%; thus, 10 yr risk assessment is not necessary in this group

Adapted with permission from Executive Summary of the Third Report of the National Cholesterol Education Program (NCEP) Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults (Adult Treatment Panel III). *JAMA* 2001;285:2486-97

Management

- intensity and type of treatment is guided by “risk category” assigned
- health behaviors (can decrease LDL-C by up to 10%)
 - smoking cessation: probably the most important for preventing CAD
 - dietary modification: reduce saturated fats, refined sugars, alcohol; increase fruits, vegetables, and fiber
 - physical activity: at least 150 min of moderate to vigorous intensity aerobic exercise per wk
 - employ consistent lifestyle modifications for at least 3 mo before considering drug therapy; high risk patients should start treatment immediately with concurrent health behavior interventions
- pharmacologic therapy (can decrease LDL-C by up to 40%)
 - for a comparison of dyslipidemia medications, see [Endocrinology, E5](#)
 - statins (HMG-CoA reductase inhibitors)
 - currently recommended as 1st line monotherapy following unsuccessful lifestyle modifications
 - risks: myopathy and hepatotoxicity – must follow LFTs q6-12mo
 - other agents: bile acid sequestrants, nicotinic acid, fibrates, psyllium, cholesterol absorption inhibitors (e.g. ezetimibe)
- after initiating drug therapy
 - monitor ALT, AST, CK, Cr at baseline then 6 wk later for signs of transaminitis or myositis; tolerate rise in CK up to 10 times upper limit of normal (2-3 times upper limit of normal if symptomatic), or serum creatinine of ≤25%; repeat ALT, AST, and CK with lipid blood work
 - fasting lipids should be measured at 3 mo
 - if adequate response is achieved, evaluate fasting lipids q6-12mo
- isolated hypertriglyceridemia (does not increase your cardiovascular risk)
 - normal HDL-C and TC, elevated TG
 - mild ≥2.2 mmol/L (≥85 mg/dL); marked ≥5.6 mmol/L (≥217 mg/dL)
 - principal therapy is lifestyle modification
 - weight loss, exercise, avoidance of smoking and alcohol, effective blood glucose control in diabetics, increased omega-3 fatty acid intake
 - severe hypertriglyceridemia (typically ≥10 mmol/L [≥387 mg/dL]) is associated with an increased risk of acute pancreatitis
 - drug therapy (used to prevent pancreatitis, NOT CVD)
 - nicotinic acid
 - fibrates

Clinical Definition of Metabolic Syndrome

- Central obesity:
 - Men – waist circumference ≥37 in
 - Women – waist circumference ≥31.5 in
- Plus any TWO of the following four factors:

Risk Factor	Defining Level
TG level	≥1.7 mmol/L (150 mg/dL)
HDL-C level:	
Men	<1.0 mmol/L (40 mg/dL)
Women	<1.3 mmol/L (50 mg/dL)
Blood pressure	≥130/85 mmHg
Fasting glucose level	≥5.6 mmol/L (100 mg/dL)

To calculate Framingham Risk Score, go to <http://www.framinghamheartstudy.org/risk-functions/cardiovascular-disease/10-year-risk.php#>

Use with caution when prescribing combined statin and fibrate therapy as there has been concern regarding the safety of certain combinations

Statin-Related Adverse Events: A Meta-Analysis

Clin Ther 2006;28:26-35

Study: Meta-analysis of 18 RCTs (N=71,108)

focused on adverse effects of statins.

Patients: Those taking statin monotherapy for primary or secondary prevention of CVD.

Intervention: Statin vs. placebo.

Main Outcome: Adverse events (AE) including elevated liver enzymes or myopathy (myalgias, elevated CK, rhabdomyolysis).

Results: Statin therapy increased the risk of any AE by 39% (OR 1.4; 95% CI 1.09-1.80; p=0.008) compared with placebo. Treating 1,000 patients with a statin would cause 5 AE. Serious events (CK >10 times the upper limit of normal or rhabdomyolysis) are infrequent (NNH 3,400) and rhabdomyolysis, although serious, is rare (NNH 7,428).

Conclusion: Statin therapy was associated with greater odds of AEs compared with placebo but with substantial clinical benefit. Similar rates of serious AEs were observed between statin and placebo.

The Benefits of Statins in People Without Established Cardiovascular Disease but with Cardiovascular Risk Factors: Meta-Analysis of Randomized Controlled Trials

Brit Med J 2009;338:b2376

Study: Meta-analysis of 10 RCTs.

Population: 70,388 participants (minimum of 80% without established cardiovascular (CV) disease).

Intervention: Statins, placebo, active control, usual care.

Main Outcome: All-cause mortality. Other outcomes: major coronary events, major cerebrovascular events.

Results: Statin use significantly reduced the incidence of all-cause mortality (OR 0.88; 95% CI 0.81-0.96), major coronary events (OR 0.70; 95% CI 0.61-0.81), and major cerebrovascular events (OR 0.81; 95% CI 0.71-0.93).

Conclusion: Statins largely reduce the risk of major CV events and improve survival in patients with CV risk factors without established CV disease.

Exercise

Epidemiology

- 25% of the population exercises regularly, 50% occasionally, 25% are sedentary
- screen time (time spent watching TV/movies, playing video games, or using the computer) has been increasing steadily in the last several years, while time spent being physically active has been decreasing
- current recommendation from international pediatric societies is that children (>2 yr old) should limit their screen time to less than 2 h/d

Management

- assess current level of fitness, motivation, and access to exercise
- encourage warm up and cool down periods to allow transition between rest and activity and to avoid injuries
- exercise with caution for patients with CAD, DM (risk of hypoglycemia), exercise-induced asthma
- patients with known CAD should have cardiac assessment prior to commencing exercise
- AAFP recommends that physicians counsel patients to meet recommended levels of physical activity
- key recommendations from Physical Activity Guidelines for Americans (2008) (available from <http://www.health.gov/PAGuidelines/guidelines/>)
 - adults: ≥ 150 min of moderate- to vigorous-intensity aerobic physical activity per wk, or ≥ 75 min of vigorous activity, or an equivalent combination of moderate-to-vigorous activity, in bouts of ≥ 10 min. For additional benefits, can increase to 300 min of moderate intensity or 150 min of vigorous intensity aerobic physical activity
 - ♦ moderate-intensity: brisk walking, bike riding
 - ♦ vigorous-intensity: jogging, cross-country skiing
 - children and adolescents: ≥ 60 min of moderate-to vigorous-intensity aerobic physical activity daily (with vigorous activity at least 3x wk)
 - older adults (65 yr and older): same as adult guidelines; in addition individuals with poor mobility should perform physical activities to aid with balance and prevent falls
 - ♦ when older adults cannot meet the adult guidelines due to chronic illness, they should be as physically active as their abilities and conditions allow
 - every age group: muscle and bone strengthening activities using major muscle groups,
 - ♦ adults and older adults: ≥ 2 d/wk
 - ♦ children and adolescents: ≥ 3 d/wk
- benefits of exercise
 - reduces risk of premature death, heart disease, stroke, HTN, certain types of cancer, type 2 DM, osteoporosis, and overweight/obesity
 - leads to improved fitness, strength, and mental health (morale and self-esteem)

Smoking Cessation

Epidemiology

- smoking is the single most preventable cause of premature illness and death
 - each yr, 440,000 deaths in the US are attributable to smoking or second-hand smoking exposure
- 70% of smokers see a physician each year, but only 28% receive advice or assistance from their physician regarding quitting
- of the 46 million current US smokers, 70% say they would like to quit, but without help only 5% actually quit
- most smokers try to quit on their own (without using evidence-based approaches), and >95% relapse

Management

- general approach
 - the AAFP encourages family physicians to ask about smoking, and then to act to help them quit
 - ♦ identify tobacco users; elicit smoking habits, previous quit attempts and results
 - AAFP Clinical Preventive Service Recommendation - Tobacco Use
 - ♦ clinicians should screen all adults for tobacco use and provide tobacco cessation interventions for those who use tobacco products (Grade A recommendation, 2009)
 - ♦ clinicians should screen all pregnant women for tobacco use and provide 5-15 min of smoking cessation counseling using messages and self-help materials tailored for pregnant smokers (Grade A recommendation, 2003)
 - every smoker should be offered treatment
 - ♦ combining counseling and smoking cessation medication is more effective than either alone (Grade 1A)
 - ♦ individual, phone, and group counseling are effective modalities of counseling (effectiveness increases with treatment intensity); combining two or more components is especially effective
 - make patient aware of withdrawal symptoms
 - ♦ low mood, insomnia, irritability, anxiety, difficulty concentrating, restlessness, decreased heart rate, increased appetite
 - ≥ 4 counseling sessions >10 min each with 6-12 mo follow-up yields better results
 - 14% abstinent with counseling vs. 10% without counseling
 - approach depends on patient's stage of change (see *Motivational Strategies for Behavioral Change*, FM6)

Physician Advice for Smoking Cessation

Cochrane DB Syst Rev 2013;5:CD000165

This systematic review of 17 trials compared brief advice by the physician vs. no advice.

Conclusions: Simple advice can increase cessation rates by 1-3%. More intensive advice and providing follow-up support may further increase the quit rates.

Assist Patient in Developing Quit Plan

STAR

Set quit date

Tell family and friends (for support)

Anticipate challenges (e.g. withdrawal)

Remove tobacco-related products (e.g. ashtrays/lighters)

- willing to quit
 - provision of social support, community resources (self-help, group, helpline, web-based strategies)
 - pregnant patients: counseling is recommended as 1st line treatment, as there is insufficient data regarding safety and effectiveness of nicotine replacement therapies (NRT) in this population
- pharmacologic therapy
 1. nicotine replacement therapy
 - 19.7% abstinent at 12 mo with NRT vs. 11.5% for placebo
 - no difference in achieving abstinence for different forms of NRT
 - reduces cravings and withdrawal symptoms without other harmful substances that are contained in cigarettes
 - use with caution: immediate post-MI, serious/worsening angina, serious arrhythmia
 - advise NO smoking while using NRT
 2. antidepressants (note: mode of action appears to be independent of antidepressant effect)
 - Bupropion SR (Zyban®)
 - ♦ 21% abstinent at 12 mo vs. 8% for placebo
 - ♦ no advantage for NRT vs. bupropion (similarly effective)
 - Nortriptyline (2nd line, not officially approved for smoking cessation)
 - ♦ effectiveness comparable to bupropion
 3. Varenicline (Champix®)
 - partial nicotinic receptor agonist (to reduce cravings) and partial competitive nicotinic receptor antagonist (to reduce the response to smoked nicotine)
 - more effective than bupropion (23% abstinent from 9-52 wk with varenicline vs. 16% for bupropion vs. 9% with placebo)

Table 6. Types of Nicotine Replacement Therapy

Type	Dosage	Comment	Side Effects
Nicotine Gum (OTC)	2 mg if <25 cig/d 4 mg if >25 cig/d 1 piece q1-2h for 1-3 mo (max 24 pieces/d)	Chew until "peppery" taste then "park" between gum and cheek to facilitate absorption Continue to chew-park intermittently for 30 min	Mouth soreness Hiccups Dyspepsia Jaw ache Most are transient
Nicotine Patch (OTC)	Use for 8 wk 21 mg/d x 4 wk 14 mg/d x 2 wk 7 mg/d x 2 wk	Start with lower dose if <10 cig/d Change patch q24h and alternate sides	Skin irritation Insomnia Palpitations Anxiety
Nicotine Inhaler (OTC)	6-16 cartridges/d for up to 12 wk	Nicotine inhaled through mouth, absorbed in mouth and throat not in lungs	Local irritation Coughing
Nicotine Nasal Spray (Rx)		Newer form of NRT	Local irritation, coughing

Table 7. Pharmacologic Treatments for Smoking Cessation

Drug	Mechanism	Dosage	Prescribing*	Contraindications
Bupropion	Inhibits re-uptake of dopamine and/or norepinephrine Side effects: insomnia, dry mouth	1. 150 mg qAM x 3 d 2. Then 150 mg bid x 7-12 wk 3. For maintenance consider 150 mg bid for up to 6 mo	1. Decide on a quit date 2. Continue to smoke for first 1-2 wk of treatment and then completely stop (therapeutic levels reached in 1 wk)	Seizure disorder Eating disorder MAOI use in past 14 d Simultaneous use of bupropion (Wellbutrin®) for depression
Nortriptyline (2nd line)	Inhibits adrenergic re-uptake (may also inhibit serotonin/histamine re-uptake) Side effects: drowsiness, dry mouth, constipation	1. Initial titration before the quit attempt (10-28 d) 2. Then 12-wk therapeutic dose of 70-100 mg daily	Usually prescribed when 1st line treatments have been unsuccessful	Acute recovery period following MI MAOI use in past 14 d
Varenicline	Partial nicotinic receptor agonist, and partial nicotinic receptor competitive antagonist • Side effects: N/V, constipation, headache, dream disorder, insomnia, increased risk of psychosis, depression, suicidal ideation	1. 0.5 mg qAM x 3 d 2. Then 0.5 mg bid x 4 d 3. Continue 1 mg bid x 12 wk ± additional 12 wk as maintenance	1. Decide on a quit date 2. Continue to smoke for first wk of treatment and then completely stop	Caution with pre-existing psychiatric condition

*May be used in combination with nicotine replacement therapy

**Nicotine Replacement Therapy for Smoking Cessation**

Cochrane DB Syst Rev 2012; 11:CD000146

This systematic review of 132 randomized trials compared NRT to placebo or no treatment or compared different NRT doses.

Conclusions: All commercially available forms of NRT (gum, transdermal patch, nasal spray, inhaler, and sublingual tablets/lozenges) are effective as part of a strategy to promote smoking cessation. They increase the rate of quitting by 50-70% regardless of setting and independent on the level of additional support provided to the smoker. Compared to a single form of NRT, combining a nicotine patch with a rapid delivery form of NRT may be more effective.

**Antidepressants for Smoking Cessation**

Cochrane DB Syst Rev 2014;1:CD000031

This systematic review of 90 randomized trials compared antidepressant medication to placebo or alternative pharmacotherapy for smoking cessation and where follow-up was longer than 6 mo.

Conclusions: The antidepressants bupropion and nortriptyline can aid smoking cessation and have a similar efficacy to NRT. Bupropion is less effective than varenicline. Neither SSRIs (e.g. fluoxetine) nor MAOIs aid smoking cessation.

**Nicotine Partial Receptor Agonists for Smoking Cessation**

Cochrane DB Syst Rev 2012;4:CD006103

Conclusions: Varenicline increases the chances of quitting, although absolute quit rates were modest in two recent trials. Varenicline at standard dose increased the chances of successful long-term smoking cessation between two- and threefold compared with pharmacologically unassisted quit attempts. Lower dose regimens also conferred benefits for cessation, while reducing the incidence of adverse events. More participants quit successfully with varenicline than with bupropion.

**The 2-3 Pattern of Smoking Cessation**

- Onset of withdrawal is 2-3 h after last cigarette
- Peak withdrawal is at 2-3 d
- Expect improvement of withdrawal symptoms at 2-3 wk
- Resolution of withdrawal at 2-3 mo
- Highest relapse rate within 2-3 mo

- unwilling to quit
 - motivational intervention (5 Rs)
 1. Relevance to patient
 - ♦ relevant to patient's disease status or risk, family or social situation (e.g. having children in the home), health concerns, age, gender
 2. Risks of smoking
 - ♦ short-term: SOB, asthma exacerbation, impotence, infertility, pregnancy complications, heartburn, URTI
 - ♦ long-term: MI, stroke, COPD, lung CA, other cancers
 - ♦ environmental: higher risk in spouse/children for lung CA, SIDS, asthma, respiratory infections
 3. Rewards: benefits
 - ♦ improved health, save money, food tastes better, good example to children
 4. Roadblocks: obstacles
 - ♦ fear of withdrawal, weight gain, failure, lack of support
 5. Repetition
 - ♦ reassure unsuccessful patients that most people try many times before successfully quitting (average number of attempts before success is 7)
- recent quitter
 - highest relapse rate within 3 mo of quitting
 - ♦ minimal practice: congratulate on success, encourage ongoing abstinence, review benefits and problems
 - ♦ prescriptive interventions: address problem of weight gain, negative mood, withdrawal, lack of support

Alcohol

- see [Psychiatry](#), PS19

Definition

- diagnostic categories occur along a continuum

Epidemiology

- 10-15% of patients in family practice are problem drinkers
- more likely to miss diagnosis in women or elderly patients with high socioeconomic status

Assessment

- screen for alcohol dependence with CAGE questionnaire
 - if CAGE positive, explore with further questions for alcohol abuse/dependence
- assess drinking profile
 - setting, time, place, occasion, with whom
 - impact on: family, work, social
 - quantity-frequency history
 - ♦ how many drinks per d?
 - ♦ how many days per wk?
 - ♦ maximum number of drinks on any 1 d in the past month?
- if identified positive for alcohol problem
 - screen for other drug use
 - identify medical/psychiatric complications
 - ask about drinking and driving
 - ask about past recovery attempts and current readiness for change

Investigations

- GGT and MCV for baseline and follow-up monitoring
- AST, ALT (usually AST:ALT approaches 2:1 in an alcoholic)
- CBC (anemia, thrombocytopenia), INR (decreased clotting factor production by liver)

Management

- intervention should be consistent with patient's motivation for change
- regular follow-up is crucial
- 10% of patients in alcohol withdrawal will have seizures or delirium tremens
- Alcoholics Anonymous/12-steps program
 - outpatient/day programs for those with chronic, resistant problems
 - family treatment (Al-Anon, Alateen, screen for spouse/child abuse)
- in-patient program if
 - dangerous or highly unstable home environment
 - severe medical/psychiatric problem

Standard Drink Equivalents

One standard drink = 14 g of pure alcohol

- Beer (5% alcohol) = 12 oz
- Wine (12-17% alcohol) = 5 oz
- Fortified wine = 3 oz
- Hard liquor (40%) = 1.5 oz

CAGE Questionnaire

C Have you ever felt the need to **CUT** down on your drinking?

A Have you ever felt **ANNOYED** at criticism of your drinking?

G Have you ever felt **GUILTY** about your drinking?

E Have you ever had a drink first thing in the morning to steady your nerves or get rid of a hangover?

(**EYE OPENER**)

≥2 for men or ≥1 for women suggests possibility of problem drinking (sensitivity 85%, specificity 89%)

Some Adverse Medical Consequences of Problem Drinking

- GI: gastritis, dyspepsia, pancreatitis, liver disease, bleeds, diarrhea, oral/esophageal cancer
- Cardiac: HTN, alcoholic cardiomyopathy
- Neurologic: Wernicke-Korsakoff syndrome, peripheral neuropathy
- Hematologic: anemia, coagulopathies
- Other: trauma, insomnia, family violence, anxiety/depression, social/family dysfunction, sexual dysfunction, fetal damage

- addiction to drug that may require in-patient detoxification
- refractory to other treatment programs
- pharmacologic
 - diazepam for withdrawal
 - disulfiram (Antabuse®): impairs metabolism of alcohol by blocking conversion of acetaldehyde to acetic acid, leading to flushing, headache, N/V, hypotension if alcohol is ingested
 - naltrexone: competitive opioid antagonist that reduces cravings and pleasurable effects of drinking
 - ♦ may trigger withdrawal in opioid-dependent patients

Prognosis

- relapse is common and should not be viewed as failure
- monitor regularly for signs of relapse
- 25-30% of abusers exhibit spontaneous improvement over 1 yr
- 60-70% of individuals with jobs and families have an improved quality of life 1 yr post-treatment

Key Definitions for Alcohol

What is moderate alcohol consumption?

Moderate alcohol consumption is defined as up to 1 drink per d for women and up to 2 drinks per d for men.

What is heavy or high-risk drinking?

Heavy or high-risk drinking is the consumption of more than 3 drinks on any day or more than 7 per wk for women and more than 4 drinks on any day or more than 14 per wk for men.

What is binge drinking? Binge drinking is the consumption within 2 h of 4 or more drinks for women and 5 or more drinks for men.

U.S. Department of Agriculture and U.S. Department of Health and Human Services. In: Dietary Guidelines for Americans, 2010. Chapter 3 – Foods and Food Components to Reduce, 7th Edition, Washington, DC: US Government Printing Office; 2010, p. 30–32.

Common Presenting Problems

Abdominal Pain

- see [Gastroenterology](#), G4 and [General Surgery](#), GS4

Epidemiology

- 20% of individuals have experienced abdominal pain within the last 6-12 mo
- 90% resolve in 2-3 wk
- only 10% are referred to specialists, of those <10% admitted to hospital

Etiology

- most common diagnosis is “nonspecific abdominal pain,” which has no identifiable cause and is usually self-limited
- GI disorders (e.g. PUD, pancreatitis, IBD, appendicitis, gastroenteritis, IBS, diverticular disease, biliary tract disease)
- urinary tract disorders (e.g. UTI, renal calculi)
- gynecological disorders (e.g. PID, ectopic pregnancy, endometriosis)
- cardiovascular disorders (e.g. CAD, AAA, ischemic bowel)
- other: medications (e.g. NSAIDs), alcohol, toxic ingestion, foreign body, psychogenic

Pathophysiology

- type of pain
 - somatic pain: sharp, localized pain
 - visceral pain: dull, generalized pain
- location of pain
 - epigastric (foregut): distal esophagus, stomach, proximal duodenum, biliary tree, pancreas, liver
 - periumbilical (midgut): distal duodenum to proximal 2/3 of transverse colon
 - hypogastric (hindgut): distal 1/3 of transverse colon to rectosigmoid region

Investigations

- guided by findings on history and physical
- possible blood work: CBC, electrolytes, BUN, Cr, amylase, lipase, AST, ALT, ALP, bilirubin, glucose, INR/PTT, tox screen, β-hCG
- imaging
 - CXR (for free air under the diaphragm) in setting of perforation in surgical abdomen
 - abdominal x-ray, KUB (consider: gas pattern, free air, kidney stones, constipation)
 - ultrasound (gallbladder disease, gynecological problems, liver disease, pancreatitis, diverticular disease, appendicitis)
 - CT scan (AAA, appendicitis)
- other tests
 - urinalysis
 - endoscopy (for peptic ulcers, gastritis, tumors, etc.)
 - *H. pylori* testing (urea breath test, serology, biopsy)

In patient age >50, keep a high index of suspicion for AAA – its presentation may mimic renal colic or diverticulitis

If pain precedes N/V, cause of abdominal pain is more likely to be surgical

Abdominal Pain Red Flags

- Severe pain
- Signs of shock
- Peritoneal signs
- Abdominal distention
- Pain out of proportion to clinical findings
- New onset pain, change in pain, or altered bowel habits in elderly
- Weight loss
- Blood per rectum/melena
- Anemia
- Supraclavicular nodes
- Family history of serious bowel disease

Allergic Rhinitis

- see [Otolaryngology](#), OT24

Definition

- inflammation of the nasal mucosa that is triggered by an allergic reaction
- classification
 - seasonal
 - ♦ symptoms during a specific time of the yr
 - ♦ common allergens: trees, grass and weed pollens, airborne molds
 - perennial
 - ♦ symptoms throughout the yr with variation in severity
 - ♦ common allergens: dust mites, animal dander, molds

Etiology

- increased IgE levels to certain allergens → excessive degranulation of mast cells → release of inflammatory mediators (e.g. histamine) and cytokines → local inflammatory reaction

Epidemiology

- affects approximately 40% of children and 20-30% of adults
- prevalence has increased in developed countries, particularly in the past two decades
- associated with asthma, eczema, sinusitis, and otitis media

Assessment

- identify allergens
- take an environmental/occupational history
- ask about related conditions (e.g. atopic dermatitis, asthma, sinusitis, and family history)

Management

- conservative
 - minimize exposure to allergens
 - ♦ most important aspect of management, often sufficient (may take months)
 - maintain hygiene, saline nasal rinses
- pharmacologic agents
 - oral antihistamines – first line therapy for mild symptoms
 - ♦ e.g. cetirizine (Reactine®), fexofenadine (Allegra®), loratadine (Claritin®)
 - intranasal corticosteroids for moderate/severe or persistent symptoms (>1 mo of consistent use to see results)
 - intranasal decongestants (use must be limited to <5 d to avoid rhinitis medicamentosa)
- allergy skin testing
 - for patients with chronic rhinitis
 - symptoms not controlled by allergen avoidance, pharmacological therapy
 - may identify allergens to include in immunotherapy treatment
- immunotherapy (allergy shots)
 - reserved for severe cases unresponsive to pharmacologic agents
 - consists of periodic (usually weekly) subcutaneous injections of custom prepared solutions of one or more antigens to which the patient is allergic

Differential Diagnosis

- Acute viral infection
- Vasomotor rhinitis
- Deviated septum
- Nasal polyps
- Acute/chronic sinusitis
- Drug-induced rhinitis

Rhinitis medicamentosa: Rebound nasal congestion. Occurs with prolonged use (>5-7 d) of vasoconstrictive intranasal medications. Patient may become dependent, requiring more frequent dosing to achieve the same decongestant effect

Amenorrhea

- see [Gynecology](#), G9

Anxiety

- see [Psychiatry](#), PS10

Epidemiology

- 25-30% of patients in primary care settings have psychiatric disorders
- many are undiagnosed or untreated; hence the need for good screening
- high rate of coexistence of anxiety disorders and depression

Screening

- screening questions
 - Do you tend to be an anxious or nervous person?
 - Have you felt unusually worried about things recently?
 - Has this worrying affected your life? How?

Assessment

- associated symptoms
- risk factors
 - family history of anxiety or depression, past history of anxiety, stressful life event, social isolation, female, comorbid psychiatric diagnosis (e.g. depression)
- assess substance abuse, comorbid depression, stressful life events, trauma, suicidal ideation/self-harm
- to differentiate anxiety disorders, consider symptoms (panic attacks, specific situations/stressors, excessive worry about common concerns, repetitive thoughts and/or behaviors to neutralize the anxiety) and their duration

Generalized Anxiety Disorder 7-item (GAD - 7) scale to assess level of anxiety

Management

- patient education: emphasize prevalence, good recovery rate of anxiety conditions
- lifestyle advice: decrease caffeine and alcohol intake, exercise, relaxation techniques, mindfulness strategies
- self-help materials, community resources (e.g. support groups)
- CBT: cognitive interventions, exposure therapy, etc.
- treat any underlying medical and/or comorbid conditions
- provide support to family and caregivers
- for pharmacotherapy, see [Psychiatry](#), PS47

Differential Diagnosis of Anxiety Disorders

- Panic disorder
- GAD
- Social Anxiety Disorder (previously Social Phobia)
- Agoraphobia
- Specific phobia
- Selective Mutism
- Separation Anxiety Disorder
- Other: AMC, mood disorder, psychotic disorder, OCD, PTSD

Rule Out

- Cardiac (post MI, arrhythmias)
- Endocrine (hyperthyroidism, DM, pheochromocytoma)
- Respiratory (asthma, COPD)
- Somatoform disorders
- Psychotic disorders
- Mood disorders (depression, bipolar)
- Personality disorder (OCPD)
- Drugs (amphetamines, thyroid preparations, caffeine, OTC for colds/decongestants, alcohol/benzodiazepine withdrawal)

Symptoms of GAD

AND I C REST

Anxious, nervous, or worried
 No control over the worry
 Duration >6 mo
 Irritability
 Concentration impairment
 Restlessness
 Energy decreased
 Sleep impairment
 Tension in muscles

Can Fam Physician 2005;51:1340-1342

Asthma/COPD

- see [Respirology](#), R7

Definition

- asthma
 - chronic but reversible airway inflammation characterized by periodic attacks of wheezing, SOB, chest tightness, and coughing
 - airways hyper-responsive to triggers/antigens leading to acute obstructive symptoms by bronchoconstriction, mucous plugs, and increased inflammation
 - cannot be diagnosed at first presentation; called reactive airway disease until recurrent presentations
 - pulmonary function tests (PFTs) can be done from age 6 or when child able to follow instructions to do PFTs
 - peak flow meters are useful in the office and at home for monitoring
- chronic obstructive pulmonary disease (COPD)
 - a group of chronic, progressive, expiratory lung diseases characterized by limited airflow with variable degrees of air sac enlargement and lung tissue destruction
 - emphysema and chronic bronchitis are the most common forms of COPD

Table 8. Differentiating COPD from Asthma

	COPD	Asthma
Age of Onset	Usually in 6th decade	Any age (but 50% of cases diagnosed in children age <10)
Role of Smoking	>10 pack yr	Not causal, known trigger
Reversibility of Airflow Obstruction	Airflow obstruction is chronic and persistent	Airflow obstruction is episodic and usually reversible with therapy
Evolution	Slow, progressive worsening (with periodic exacerbations)	Stable, episodic, less than 50% will outgrow
History of Allergy	Infrequent	Over 50% patients
Precipitators	Environmental irritants (air pollution), cigarette smoking, α -1 antitrypsin deficiency, viral infection, occupational exposure (firefighters, dusty jobs)	Environmental irritants (dust, pollen), animal fur, cold air, exercise, URTIs, cigarette smoke, use of β -blockers/ASA
Symptoms/Signs	Chronic cough, sputum, and/or dyspnea	Wheeze (hallmark symptom), dyspnea, chest tightness, cough which is worse in cold, at night, and in early AM, prolonged expiration
Diffusion Capacity	Decreased (more so in pure emphysema)	Normal (for pure asthma)
Hypoxemia	Chronic in advanced stages	Not usually present
		Episodic with severe attacks
Spirometry	May have improvement with bronchodilators but not universally seen	Marked improvement with bronchodilators or steroids

Figure 3. Expiratory flow volume curves (obstructive, normal, and restrictive disease)

See [Respirology](#), R4. Adapted from: Weinberger SE. Principles of pulmonary medicine, 5th ed. With permission from Elsevier. ©2008.

Signs of Poorly Controlled Asthma

- β_2 agonist use >4x/wk
- Asthma-related absence from work/school
- Exercise induced asthma
- Night-time symptoms >1x/wk

Table 8. Differentiating COPD from Asthma (continued)

	COPD	Asthma
Chest X-Ray	Often normal Increased bronchial markings (chronic bronchitis) and chronic hyperinflation (emphysema) often co-exist, bullae	Often normal or episodic hyperinflation Hyperinflation during asthma attack
Management	Mild Step 1: SABA prn (salbutamol) Step 2: SABA prn + LAAC (i.e. tiotropium) or + LABA (e.g. salmeterol) Moderate Step 3: SABA prn + LAAC + low-dose combined ICS/LABA; consider inhaled vs. oral steroids Severe Step 4: \pm theophylline Pneumococcal vaccination, annual influenza immunization	Ongoing patient education, and environmental control SABA taken prn as rescue medication + maintenance meds Maintenance medications: Step 1: Low-dose ICS Step 2: Medium/high-dose ICS or low-dose ICS plus either LABA, LT modifier, or long-acting theophylline Step 3: Medium/high-dose ICS plus either LABA, LT modifier, or long-acting theophylline Step 4: As above plus immunotherapy \pm oral glucocorticosteroids + pneumococcal vaccination, annual influenza immunization

LAAC = long-acting anticholinergic; LABA = long-acting β -agonist; LT modifier = leukotriene modifier; SABA = short-acting β -agonist

What Color is Your Inhaler?

Name	Body/Cap Color
β_2-Agonists	
Salbutamol – Ventolin®	light blue/navy
Salmeterol – Serevent®	teal/light teal
Terbutaline – Bricanyl®	blue/white
ICS	
Fluticasone – Flovent®	orange/peach
Budesonide – Pulmicort®	white/brown
Combined Long-Acting β_2-Agonist + ICS	
Fluticasone/Salmeterol – purple discus Advair®	purple discus
Budesonide/Formoterol – red/white Symbicort®	red/white
Ipratropium/Albuterol – clear/orange Combivent®	clear/orange
Anticholinergics	
Ipratropium – Atrovent®	clear/green
Tiotropium – Spiriva®	white/turquoise

Benign Prostatic Hyperplasia

- see [Urology, U7](#)

Definition

- hyperplasia of the stroma and epithelium in the periurethral transition zone

History and Physical

- include current/past health, surgeries, trauma, current and OTC meds
- specific urinary symptoms
- physical exam must include DRE for size, symmetry, nodularity, and texture of prostate (prostate is symmetrically enlarged, smooth, and rubbery in BPH)

Investigations

- urinalysis to exclude UTI and for microscopic hematuria (common sign)
- serum PSA: protein produced by prostatic tissue, see [Urology, U25](#)
 - values
 - ♦ <4.0 ng/mL: normal, but must take into account patient's age and velocity of PSA increase
 - ♦ 4-10 ng/mL: consider measuring free/total PSA
 - ♦ >10 ng/mL: high likelihood of prostate pathology
 - PSA testing is inappropriate in men with a life expectancy less than 10 yr or patients with prostatitis, UTI
 - increased PSA in a younger man is more often due to cancer than other causes
 - abnormal DRE or PSA should trigger further assessment
 - discuss test with men at increased risk of prostate cancer (FHx, African ancestry) or who are concerned about development of prostate cancer
 - decision to test PSA in an asymptomatic man should involve discussion about the risks and possible benefits
- other tests
 - Cr, BUN
 - post-void residual volume by ultrasound
 - renal ultrasound
 - patient voiding diary
- tests NOT recommended as part of routine initial evaluation include
 - cystoscopy
 - cytology
 - prostate ultrasound or biopsy
 - IVP
 - urodynamic studies

More About Inhalers

- Aerosols (puffers=MDI, MDI + spacer)
MDIs should be used with spacers to:
 - Reduce side effects
 - Improve amount inhaled
 - Increase efficiency of use
- Dry Powder Inhaler (discus, turbuhaler and diskhaler), they require deep and fast breathing (may not be ideal for children)
- Nebulizers can be used to convert liquid medications into a fine mist: recommended for use if contraindications to MDIs

Differential Diagnosis of Wheezing

- Allergies, anaphylaxis
- Asthma, reactive airway disease
- GERD
- Infections (bronchitis, pneumonia)
- Obstructive Sleep Apnea
- COPD
- Less common: congestive heart disease, foreign body, malignancy, cystic fibrosis, vocal cord dysfunction

When prescribing salbutamol, watch out for signs of **hypokalemia**: lethargy, irritability, paresthesias, myalgias, weakness, palpitations, N/V, polyuria

Self-Management Asthma and COPD Education and Written Action Plan

- Education is a key component in management of asthma and COPD
- Guided self-management combining education, regular medical review, self-assessment, and written action plan have been shown to reduce hospitalizations, ER visits, and missed days at work or school
- Sample action plans available online: <http://www.respiratoryguidelines.ca>

Table 9. Symptoms and Complications of BPH

Obstructive Symptoms	Irritative Symptoms	Late Complications
Hesitancy (difficulty starting urine flow) Diminution in size and force of urinary stream Stream interruption (double voiding) Urinary retention (bladder does not feel completely empty) Post-void dribbling Overflow incontinence Nocturia	Urgency Frequency Nocturia Urge incontinence Dysuria	Hydronephrosis Loss of renal concentrating ability Systemic acidosis Renal failure

Management

- referral to urologist if moderate/severe symptoms
- conservative: for patients with mild symptoms or moderate/severe symptoms considered by the patient to be non-bothersome
 - fluid restriction (avoid alcohol and caffeine)
 - avoidance/monitoring of certain medications (e.g. antihistamines, diuretics, antidepressants, decongestants)
 - pelvic floor/Kegel exercises
 - bladder retraining (scheduled voiding)
- pharmacological: for moderate/severe symptoms
 - α -receptor antagonists (e.g. terazosin [Hytrin[®]], doxazosin [Cardura[®]], tamsulosin [Flomax[®]], alfuzosin [Xatral[®]])
 - ♦ relaxation of smooth muscle around the prostate and bladder neck
 - 5- α reductase inhibitor (e.g. finasteride [Proscar[®]])
 - ♦ only for patients with demonstrated prostatic enlargement due to BPH
 - ♦ inhibits enzyme responsible for conversion of testosterone into dihydrotestosterone (DHT) thus reducing growth of prostate
 - phytotherapy (e.g. saw palmetto berry extract, *Pygeum africanum*)
 - ♦ more studies required before this can be recommended as standard therapy
 - ♦ considered safe
- surgical
 - TURP (transurethral resection of the prostate), TUIP (transurethral incision of the prostate, for prostates <30 g)
 - ♦ absolute indications: failed medical therapy, intractable urinary retention, benign prostatic obstruction leading to renal insufficiency
 - ♦ complications: impotence, incontinence, ejaculatory difficulties (retrograde ejaculation), decreased libido

**Differential Diagnosis**

- Prostate cancer
- Urethral obstruction
- Bladder neck obstruction
- Neurogenic bladder
- Overactive bladder
- Cystitis
- Prostatitis

**Prostate Cancer Mortality at 11 Yr of Follow-Up**

NEJM 2012;366:981-90

Study: Updated "ERSPC" study – multicenter randomized trial of screening for prostate cancer using PSA.

Patients: 162,388 men, age 55-69 from 8 different European countries.

Intervention: PSA-based screening.

Main Outcome: Mortality from prostate cancer.

Results: In screening group, RRR = 21%

ARR = 1.07 deaths/1,000 men

NNT = 1,055 – therefore to prevent one death from prostate cancer, 1,055 men would need to be screened.

Bronchitis (Acute)

Definition

- acute infection of the tracheobronchial tree causing inflammation leading to bronchial edema and mucus formation

Epidemiology

- 5th most common diagnosis in family medicine, most common is URTI

Etiology

- 80% viral: rhinovirus, coronavirus, adenovirus, influenza, parainfluenza, respiratory syncytial virus (RSV)
- 20% bacterial: *M. pneumoniae*, *C. pneumoniae*, *S. pneumoniae*

Investigations

- acute bronchitis is typically a clinical diagnosis
- sputum culture/Gram stain is not very informative
- CXR if suspect pneumonia (cough >3 wk, abnormal vital signs, localized chest findings) or CHF
- PFT with methacholine challenge if suspect asthma

Management

- primary prevention: frequent hand washing, smoking cessation, avoid irritant exposure
- symptomatic relief: rest, fluids (3-4 L/d when febrile), humidity, analgesics and antitussives as required
- bronchodilators may offer improvement of symptoms (e.g. salbutamol)
- current literature does not support routine antibiotic treatment for the management of acute bronchitis because it is most likely to be caused by a viral infection
 - antibiotics may be useful if elderly, comorbidities, suspected pneumonia, or if the patient is toxic (see *Antimicrobial Quick Reference*, FM53)
 - antibiotics in children show no benefit

**Differential Diagnosis of Bronchitis**

- URTI
- Asthma
- Acute exacerbation of chronic bronchitis
- Sinusitis
- Pneumonia
- Bronchiolitis
- Pertussis
- Environmental/occupational exposures
- Post-nasal drip
- Others: GERD, CHF, cancer, aspiration syndromes, CF, foreign body

**How to Tell if Viral or Bacterial?**

Bacterial infections tend to give a higher fever, excessive amounts of purulent sputum production, and may be associated with concomitant COPD

Note: Purulent sputum is not necessarily bacterial

Chest Pain

- see [Cardiology and Cardiac Surgery](#), C4 and [Emergency Medicine](#), ER21

Differential Diagnosis

Table 10. Differential Diagnosis of Chest Pain

Cardiac	Pulmonary	GI	MSK/Neuro	Psychologic
Angina*	Hemothorax*	Cholecystitis	Arthritis	Anxiety
Aortic dissection*	Lung CA	Esophageal spasm	Costochondritis	Depression
Endocarditis	PE*	GERD	Herpes zoster	Panic
MI*	Pneumonia	Hepatitis	Intercostal strain	
Myocarditis	Pneumothorax*	Perforated viscus*	Rib fractures	
Pericarditis*	Pulmonary HTN	PUD	Trauma	

*Emergent

Investigations

- ECG, CXR, and others if indicated (cardiac enzymes, d-dimers, liver function tests [LFTs], etc.)
- refer to ED if suspect serious etiology (e.g. aortic dissection, MI)

Management of Common Causes of Chest Pain

- angina/ischemic heart disease
 - nitroglycerin (NTG): wait 5 min between sprays and if no effect after 3 sprays, send to ED
- myocardial infarction
 - ASA (160-325 mg, chewed stat), clopidogrel (Plavix*), LMWH (enoxaparin), morphine, oxygen, NTG
 - \pm reperfusion therapy with fibrinolytics (e.g. tPA, RPA, TNK, or SK) if within 12 h (ideally <30 min) or percutaneous intervention (cath lab) if <90 min
 - start β -blocker (e.g. metoprolol starting dose 25 mg PO q6h or bid, titrating to HR goal of 55-60 bpm)
- endocarditis: antibiotic choice is based on whether patient has a native or prosthetic heart valve as well as culture and sensitivity results
- GERD: antacids, H₂ blockers, PPIs, patient education
- costochondritis: NSAIDs

Treatment of Stable Ischemic Heart Disease

- see [Cardiology and Cardiac Surgery](#), C26

Common Cold (Acute Rhinitis)

- see [Infectious Diseases](#), ID8 (Pneumonia and Influenza)

Definition

- viral URTI with inflammation

Epidemiology

- most common diagnosis in family medicine, peaks in winter months
- incidence: adults = 2-4/yr, children = 6-10/yr
- organisms
 - mainly rhinoviruses (30-35% of all colds)
 - others: coronavirus, adenovirus, RSV, influenza, parainfluenza, coxsackie virus
- incubation: 1-5 d
- transmission: person-person contact via secretions on skin/objects and by aerosol droplets

Risk Factors

- psychological stress, excessive fatigue, allergic nasopharyngeal disorders, smoking, sick contacts

Clinical Features

- symptoms
 - local: nasal congestion, clear to mucopurulent secretions, sneezing, sore throat, conjunctivitis, cough
 - general: malaise, headache, myalgias, mild fever
- signs
 - boggy and erythematous nasal/oropharyngeal mucosa, enlarged lymph nodes
 - normal chest exam

Risk Factors for CAD

Major

- Smoking
- DM
- HTN
- Hyperlipidemia
- Family history of early CAD in first degree relative (males <55 yr, females <65 yr)
- Untreated obstructive sleep apnea
- Chronic kidney disease

Minor

- Obesity
- Sedentary lifestyle
- Age

Ruling Out CAD in Primary Care

CMAJ 2010;182(12):1295-1300

Components of the prediction rule used to determine the presence or absence of CAD in patients with chest pain in primary care:

- Age/sex (female ≥ 65 , male ≥ 55): 1 pt
 - Known clinical vascular disease (coronary artery disease, occlusive vascular disease, or cerebrovascular disease): 1 pt
 - Pain worse during exercise: 1 pt
 - Pain not reproducible by palpation: 1 pt
 - Patient assumes pain is of cardiac origin: 1 pt
- Positive result: 3-5 pts; negative result: ≤ 2 pts (sensitivity: 87.1%, specificity: 80%)

High-Risk Symptoms and Signs of Chest Pain include:

- Severe pain
- Pain for >20 min
- New onset pain at rest
- Severe SOB
- Loss of consciousness
- Hypotension
- Tachycardia
- Bradycardia
- Cyanosis

MI in Elderly Women

Elderly women can often present with dizziness, back pain, lightheadedness, or weakness, in the absence of chest pain

MI in Diabetics

May present with dyspnea, syncope, and fatigue in the absence of chest pain

Influenza vs. Colds: A Guide to Symptoms

Features	Flu	Cold
Onset of illness	Sudden	Slow
Fever	High fever	None
Exhaustion level	Severe	Mild
Cough	Dry severe or hacking	\pm
Throat	Fine	Sore
Nose	Dry and clear	Runny
Head	Achy	Headache-free
Appetite	Decreased	Normal
Muscles	Achy	Fine
Chills	Yes	No

- complications
 - secondary bacterial infection: otitis media, sinusitis, bronchitis, pneumonia
 - asthma/COPD exacerbation

Differential Diagnosis

- allergic rhinitis, pharyngitis, influenza, laryngitis, croup, sinusitis, bacterial infections

Management

- patient education
 - symptoms peak at 1-3 d and usually subside within 1 wk
 - cough may persist for days to weeks after other symptoms disappear
 - no antibiotics indicated because of viral etiology
 - secondary bacterial infection can present within 3-10 d after onset of cold symptoms
- prevention
 - frequent hand washing, avoidance of hand to mucous membrane contact, use of surface disinfectant
 - yearly influenza vaccination
- symptomatic relief
 - rest, hydration, gargling warm salt water, steam, nasal irrigation (spray/pot)
 - analgesics and antipyretics: acetaminophen, ASA (not in children because risk of Reye's syndrome)
 - cough suppression: dextromethorphan or codeine if necessary (children under 6 yr of age should not use any cough/cold medications)
 - decongestants, antihistamines
 - zinc lozenge use may help to reduced the duration of cold symptoms
- patients with reactive airway disease will require increased use of bronchodilators and inhaled steroids

Zinc for the Treatment of the Common Cold: A Systemic Review and Meta-Analysis of Randomized Controlled Trials

CMAJ 2012;184:E551-561

Study: Meta-analysis of 17 randomized control trials with a total of 2,121 participants.

Patients: All populations.

Intervention: Orally administered zinc vs. placebo or no treatment.

Results: Patients receiving zinc had a shorter duration of cold symptoms compared with those given placebo (mean difference -1.65 d). Zinc shortened the duration of symptoms in adults but no significant difference was seen in children. Adverse events such as nausea were more common in the zinc group (RR 1.640).

Echinacea for Preventing and Treating the Common Cold

Cochrane DB Syst Rev 2014;2:CD000530

This systematic review of 24 trials assessed the effect of Echinacea in preventing and treating common colds. Trials compared preparations containing Echinacea with placebo, no treatment, or an alternative common cold treatment.

Conclusions: Echinacea products have not been shown to provide benefits for treating colds, although, it is possible there is a weak benefit from some Echinacea products. Individual prophylaxis trials consistently show positive (if non-significant) trends, although potential effects are of questionable clinical relevance.

Concussion/Mild Traumatic Brain Injury

- see [Neurosurgery](#), NS29, and [Emergency Medicine](#), ER7
- a useful tool for the assessment of individuals and athletes with concussion is the Sport Concussion Assessment Tool, 3rd edition (SCAT3), *Br J Sports Med* 2013;47:259

Contraception

- see [Gynecology](#), GY16

Table 11. Methods of Contraception

	Advantages	Disadvantages
Combined OCP (e.g. Alesse®, Tri-Cyclen®)	99.9% effective with perfect use, 97-99% with typical use, cycle control, ↓ dysmenorrhea, ↓ menstrual flow, ↓ ovarian cancer, ↓ endometrial cancer, ↓ risk of fibroids, ↓ acne, ↓ hirsutism	Irregular bleeding, systemic hormonal side effects (breast tenderness, nausea, mood changes), no STD protection, slightly increased risk of venous thromboembolism (VTE), MI, stroke, decreased quantity of breast milk postpartum **Diane 35 is to be used for the treatment of severe acne ONLY, and not for OCP
Progestin Only Pill (e.g. Micronor®)	At least 95% effective with perfect use, no increased risk of VTE, MI, or stroke, suitable for postpartum	Hormonal side effects (see Combined OCP) Irregular bleeding, no STD protection, contraceptive reliability requires taking pill at the same time each d (within 3 h), no pill free interval
Transdermal Patch (e.g. Evra®)	Same as OCP, easy to use, changed weekly, 99% effective with correct use	Same as OCP, skin irritation
NuvaRing® (inserted by patient)	Same as OCP, easy to use (in for 3 wk, out for 1 wk), less systemic hormonal side effects, 99% effective with correct use	Same as OCP, vaginitis, some women may be uncomfortable with self-insertion
DMPA IM progesterone injection q12wk (e.g. DepoProvera®)	99.7% effective against pregnancy, infrequent dosing, ↓ menstrual flow or amenorrhea, ↓ risk of endometrial cancer	Irregular bleeding, delayed return of fertility, no STD protection, systemic hormonal side effects (most common is headache), weight gain, ↓ bone mineral density (check after 5 yr)
Male Condom	97% effective against pregnancy and STDs when used properly; when used properly WITH spermicide they are close to 99.9% effective, no Rx required	Latex allergy, irritation, only effective before the expiry date, must be applied properly, can only be used once
Diaphragm	92-96% effective with perfect use, non-hormonal, female-controlled method of contraception, ↓ risk of cervical cancer	Must be left in for 6 h after intercourse, must be used with spermicide, incomplete STD protection, latex allergy, must be fitted by health care worker, ↑ risk of UTI, risk of toxic shock syndrome
Sponge	One-size-fits-all barrier method, does not require fitting by MD, available in pharmacies, 90% effective without a condom, 98% effective with a condom	Relatively expensive, only ~60% effective in parous women, incomplete STD protection, risk of toxic shock syndrome

Table 11. Methods of Contraception (continued)

	Advantages	Disadvantages
Intrauterine Device (IUD)	99% effective against pregnancy, effective for 5 yr, no daily regimen required, can be easily removed, ideal in post-partum women	No STD protection, ↑ relative risk of PID in first mo, must be inserted by MD, risk of post-insertion vaso-vagal response, risk of uterine rupture is 0.6-1.6/1,000, 2-10% expulsion rate
Levonorgestrel (e.g. Mirena®)	Spotting, less systemic hormonal side effects than OCP	Hormonal side effects are possible with levonorgestrel IUD, but less than OCP (see combined OCP), expensive (~\$400)
Copper IUD (e.g. Nova T®)	↓ risk of endometrial cancer, less expensive than Mirena® (~\$170)	Irregular bleeding or ↑ menstrual flow with copper IUD, 6-20% women discontinue use in first 5 yr because of pain or ↑ bleeding
Fertility Awareness/Natural Family Planning (e.g. symptothermal method)	Effectiveness: 95-98% with perfect use, 75-88% with typical use, increased awareness of gynecological health, reasonable for couples for whom an unplanned pregnancy would be acceptable	High probability of failure if not used consistently and correctly, no STD protection
Lactational Amenorrhea	Can be effective in breastfeeding women if menses not returned, fully or nearly fully breastfeeding baby and baby is under 6 mo old	Not effective if infant receives any food supplementary to breastfeeding Must breastfeed regularly, even through the night (at least q6h) Most effective is breastfeeding q2-3h

EMERGENCY CONTRACEPTION

- hormonal EC (Yuzpe® or Plan B®, usually 2 doses taken 12 h apart) or post-coital IUD insertion
- hormonal EC is effective if taken within 72 h of unprotected intercourse (reduces chance of pregnancy by 75-85%), most effective if taken within 24 h, does not affect an established pregnancy
- post-coital IUDs inserted within 5 d of unprotected intercourse are significantly more effective than hormonal EC (reduces chance of pregnancy by ~99%)
- pregnancy test should be performed if no menstrual bleeding within 21 d of either treatment
- advance provision of hormonal EC increases the use of EC without decreasing the use of regular contraception
- pharmacists across Canada can dispense Plan B® OTC

Absolute Contraindications to Estrogen Containing Contraception (Combined OCP/Transdermal Patch/Nuvaring)

- Known/suspected pregnancy
- Undiagnosed abnormal vaginal bleeding
- Thromboembolic disorders (e.g. previous DVT, PE)
- Cerebrovascular disease or CAD
- Estrogen dependent tumors (breast, uterus)
- Impaired liver function with acute liver disease
- Congenital hypertriglyceridemia
- Smoker age > 35 yr
- Migraines with focal neurological symptoms
- Uncontrolled HTN

Cough

History and Physical

- duration (chronic - 8 wk), onset, frequency, quality (dry vs. productive), sputum characteristics, provoking/relieving factors, recent changes
- associated symptoms: fever, dyspnea, hemoptysis, wheezing, chest pain, orthopnea, PND, rhinitis, reflux, post-nasal drip
- constitutional symptoms: fever, chills, fatigue, night sweats
- risk factors: smoking, occupation, exposure, family history of lung CA or other CA, TB status, recent travel
- medications (e.g. ACEI, β-blockers), allergies
- PMH: lung (asthma, COPD, CF), heart (CHF, MI, arrhythmias), chronic illness, GI (reflux)
- vitals including O₂ saturation, respiratory exam, HEENT and precordial exam

Investigations

- guided by findings on history and physical
 - consider throat swab, CXR, PFTs, upper GI series, sputum culture test for acid-fast bacilli (if TB is suspected)

Differential Diagnosis

Common Causes

- Upper airway cough syndrome (post-nasal drip)
- Asthma/COPD
- GERD
- Non-asthmatic eosinophilic bronchitis

Other Causes

- ACEI
- Aspiration
- Bronchiectasis
- Cystic fibrosis
- Chronic interstitial lung disease
- CHF
- Lung/laryngeal cancer
- Pertussis
- Psychogenic
- Restrictive lung disease
- TB, atypical mycobacterium, and other chronic lung infections

Dementia (Major Neurocognitive Disorder)

- see [Psychiatry, PS17](#)

Epidemiology

- 10% in patients over the age of 65, 25% in patients over the age of 85, 50% in patients over the age of 90
- prevalence increases with age, Down syndrome, and head trauma
- differential diagnosis: Alzheimer's dementia, vascular dementia, Lewy-Body dementia, frontotemporal dementia

Investigations

- history, physical exam, MMSE, MOCA (best screening test), dementia quick screen (see sidebar)
- investigations are completed to exclude reversible causes of dementia and should be selected based on the clinical circumstances
- CBC, liver enzymes, TSH, renal function tests, serum electrolytes, serum calcium, serum glucose, vitamin B₁₂, folate, VDRL, HIV, head CT

Management

- treat and prevent reversible causes
- provide orientation cues (e.g. calendars, clocks) and optimize vision and hearing
- family education, counseling, and support (respite programs, group homes)
- pharmacologic therapy: NMDA receptor antagonists and cholinesterase inhibitors slow rate of cognitive decline; low-dose neuroleptics and antidepressants can be used to treat behavioral and emotional symptoms
- 20% of patients develop clinical depression, most commonly seen in vascular dementia

Depression

- see [Psychiatry](#), PS6

Etiology

- often presents as non-specific complaints (e.g. sleep disturbance, chronic fatigue, pain)
- depression is a clinical diagnosis and tests are done in order to rule out other causes of symptoms
- 2/3 of depressed persons may not receive appropriate treatment for their depression
- identification and early treatment improve outcomes

Screening Questions

- the AAFP recommends screening adults for depression when staff-assisted depression care supports are available (Grade B)
 - “staff-assisted depression care supports” refers to clinical staff that assist the primary care physician in providing direct depression care and/or coordination, case management, or mental health treatment
- if staff-assisted depression care supports are not available, the AAFP recommends against routine screening of adults (Grade C) (note: there may be considerations that support screening for depression in an individual patient)
 - “Are you depressed?” (high specificity and sensitivity)
 - “Have you lost interest or pleasure in the things you usually like to do?” (anhedonia)
 - “Do you have problems sleeping?”
- for geriatric population, use the Geriatric Depression Scale (GDS) short form for screening

Assessment

- risk factors: see [Psychiatry](#), PS7
- personal or family history of depression
- medications and potential substance abuse problems
- high risk suicidality/homicidality
 - fill out Form 1 (in Ontario): application by physician to hospitalize a patient against his/her will for psychiatric assessment (up to 72 h)
- functional impairment (e.g. work, relationships)
- at least 5 out of 9 criteria including at least one of anhedonia or depressed mood ≥ 2 wk for actual diagnosis to be met (see sidebar)
- validated depression rating scales: Beck's depression inventory, Zung's self-rating depression scale, Children's depression inventory, Geriatric Depression Scale, Personal Health Questionnaire Depression Scale (PHQ-9)
- routine medical workup (physical exam, CBC, TSH, ferritin, folate, B₁₂, electrolytes, urinalysis, glucose, etc.)

Treatment

- goal: full remission of symptoms and return to baseline psychosocial function
- phases of treatment
 - acute phase (8-12 wk): relieve symptoms and improve quality of life
 - maintenance phase (6-12 mo after symptom resolution): prevent relapse/recurrence, must stress importance of continuing medication treatment for full duration to patients
- treatment can consist of pharmacotherapy alone or psychotherapy alone
- combination of antidepressant drug therapy and psychotherapy results in synergistic effects
- treatment of youth (age 10-21)
 - for mild depression, a period of active support and monitoring before initiating treatment is recommended
 - fluoxetine is first line among SSRIs (most evidence)
 - ♦ monitor closely for adverse effects such as suicidal ideation and behavior
 - psychotherapy
 - ♦ CBT or interpersonal therapy (IPT) alone can be used for mild depression
 - ♦ psychotherapy plus medication is recommended for moderate to severe depression
 - treatment should continue for at least 6 mo
 - ♦ ongoing management should include assessment in key domains (school, home, social setting)
 - ♦ reassessment and referral recommended if no improvement after 6-8 wks of treatment
- for adolescents with moderate/severe depression and coexisting psychosis and/or substance abuse, consider referral

Dementia Quick Screen

- 3 simple tests, takes about 2 min
- Use when suspect mild cognitive impairment or when patient is at high risk
- Screen involves:
 1. 3 word recall (normal = recalls 2-3 words)
 2. Naming animals in 1 min (normal = > 12 in one min)
 3. Clock Drawing – including numbers and hands so time shows 10 min past 11 (normal = correct number/hand placing, or only minor spacing problems)

Interpretation: If all 3 results within normal range, cognitive impairment unlikely. If any results abnormal, possible cognitive impairment, further evaluation necessary.

Must Ask About/Rule Out

- Suicidal/homicidal ideation
- Psychosis
- Substance use/abuse/withdrawal
- Anxiety
- Bipolar/manic/hypomanic episodes
- Bereavement
- Intimate partner violence
- Post-partum depression
- Organic cause

Differential Diagnosis

- Other psychiatric disorders (e.g. anxiety, personality, bipolar, adjustment disorder, schizoaffective, seasonal affective disorder, substance abuse/withdrawal)
- Cancer (50% of patients with tumors, especially of brain, lung, and pancreas, develop symptoms of depression before the diagnosis of cancer is made)
- Chronic fatigue syndrome
- Early dementia
- Endocrine (e.g. hyper/hypothyroidism, DM, adrenal disorders)
- Infections (mononucleosis)
- Liver failure, renal failure
- Medication side effects (β -blockers, benzodiazepines, glucocorticoids, interferon)
- Menopause
- Neurological (Parkinson's, MS)
- Vitamin deficiency (pernicious anemia, pellagra)

Table 12. Common Medications

Class	Examples	Action	Side Effects	Notes
SSRI	paroxetine (Paxil®) fluoxetine (Prozac®) sertraline (Zoloft®) citalopram (Celexa®) fluvoxamine (Luvox®) escitalopram (Cipralex®)	Block serotonin reuptake	Sexual dysfunction (impotence, decreased libido, delayed ejaculation, anorgasmia), headache, GI upset, weight loss, tremors, insomnia, fatigue, increase QT interval (baseline ECG is suggested)	First line therapy for youth is fluoxetine; paroxetine is not recommended for youth (controversial)
SNRI	venlafaxine (Effexor®) duloxetine (Cymbalta®)	Block serotonin and NE reuptake	Insomnia, tremors, tachycardia, sweating	
SDRI	bupropion (Wellbutrin®)	Block dopamine and NE reuptake	Headache, insomnia, nightmares, seizures, less sexual dysfunction than SSRIs	Often chosen for lack of sexual side effects, can be used for augmentation of anti-depressant effects with other classes of medication
TCA	amitriptyline (Elavil®)	Block serotonin and NE reuptake	Sexual dysfunction, weight gain, tremors, tachycardia, sweating	Narrow therapeutic window, lethal in overdose

Prognosis

- up to 40% resolve spontaneously within 6-12 mo
- risks of recurrence: 50% after 1 episode; 70% after 2 episodes; 90% after 3 episodes

Diabetes Mellitus

- see [Endocrinology, E6](#)
- see 2014 American Diabetes Association Clinical Practice recommendations, available from <http://professional.diabetes.org/ResourcesForProfessionals.aspx?cid=84160>

Epidemiology

- incidence of type 2 DM is rising dramatically as a result of an aging population, rising rates of obesity, and sedentary lifestyles
- leading cause of new-onset blindness and renal dysfunction
- adults with DM are twice as likely to die prematurely, compared to persons without DM

Risk Factors

- type 1 DM
 - personal or family history of autoimmune disease
- type 2 DM
 - first degree relative with DM
 - age ≥40
 - obesity (especially abdominal), HTN, hyperlipidemia, CAD, vascular disease
 - prior GDM, macrosomic baby (>8 lb 13 oz)
 - PCOS
 - history of IGT or IFG
 - presence of complications associated with DM
 - presence of associated diseases: PCOS, acanthosis nigricans, psychiatric disorders, HIV
 - medications: glucocorticoids, atypical antipsychotics, HAART
- both
 - member of a high risk population (e.g. Aboriginal, Hispanic, Asian, or African descent)

Diagnosis

- persistent hyperglycemia is the hallmark of all forms of DM

**Selective Serotonin Reuptake Inhibitors in Pregnancy and Infant Outcomes**

Arch Gen Paediatr Child Health 2011;16(9):562
SSRI use during the first trimester of pregnancy is not found to increase risk of major congenital malformations overall. Paroxetine use in the first trimester may be associated with increased risk of cardiovascular malformation, but studies have been inconclusive. Other SSRIs may increase the risk of specific birth defects and further, sufficiently powered studies are required to assess this. SSRI neonatal behavioral syndrome, consisting of central nervous system, respiratory, motor, and gastrointestinal symptoms, is seen in 10-30% of newborns exposed to SSRIs in late gestation. The syndrome is generally mild and self-limited but may be more severe in up to 10% of infants. The most concerning possible association of exposure to SSRIs during the second half of pregnancy is PPHN, although the absolute rate is likely less than 1%.

**Criteria for Depression (≥5/9 with at least one of anhedonia or depressed mood for ≥2 wk)****M-SIGECAPS**

- M** Depressed Mood
- S** Increased/decreased Sleep
- I** Decreased Interest
- G** Guilt
- E** Decreased Energy
- C** Decreased Concentration
- A** Increased/decreased Appetite and weight
- P** Psychomotor agitation/retardation
- S** Suicidal ideation

Common Antidepressants and Dosing

Drug	Starting Dose	Maximum Dose
citalopram (Celexa®)	10-20 mg PO OD	40 mg PO OD
escitalopram (Cipralex®)	5-10 mg PO OD	20 mg PO OD
fluoxetine (Prozac®)	20 mg PO qam	80 mg PO OD
paroxetine (Paxil®)	20 mg PO qam	50 mg PO OD
sertraline (Zoloft®)	25-50 mg PO OD	200 mg PO OD
fluvoxamine (Luvox®)	50 mg PO qhs	300 mg PO OD
venlafaxine (Effexor®)	37.5 mg PO OD	375 mg PO OD
(Effexor XR®)	37.5 mg PO OD	225 mg PO OD
bupropion (Wellbutrin®-immed)	150 mg PO bid	450 mg PO OD
(Sustained release)	150 mg PO qam	400 mg PO OD
amitriptyline (Elavil®)	25 mg PO qhs	300 mg PO OD
mirtazapine (Remeron®)	15 mg PO qhs	45 mg PO OD

**Combined Pharmacotherapy and Psychological Treatment for Depression: A Systematic Review**

Arch Gen Psychiatry 2004;61:714-719

Study: Systematic review of randomized clinical trials.

Patients: 16 trials comprising 1,842 patients.

Intervention: Antidepressant treatment alone vs. combination of psychological intervention and antidepressant therapy.

Main Outcomes: Efficacy of and adherence to therapy.

Results: Overall, combined therapy was significantly more effective than antidepressant therapy alone (OR 1.86; 95% CI 1.38-2.52), however there was no difference in the rate of dropouts and non-responders in either treatment arm. In studies lasting >12 wk, combined therapy showed a reduction in dropouts compared to non-responders (OR 0.59; 95% CI 0.39-0.88).

Table 13. Diagnosis of Prediabetes and Diabetes

Condition	Diagnostic Criteria
DM	One of the following on 2 occasions: <ul style="list-style-type: none"> • Random BG ≥ 200 mg/dL OR • Fasting BG ≥ 126 mg/dL OR • BG 2 h post 75 g OGTT ≥ 200 mg/dL OR HbA1c $\geq 6.5\%$ (in adults) **If asymptomatic (and meet any of the above criteria) a repeat test must be done to confirm the diagnosis. If symptomatic (fatigue, polyuria, polydipsia, unexplained weight loss), the diagnosis is made with one test.
Impaired Fasting Glucose (IFG)	Fasting BG = 110-124 mg/dL
Impaired Glucose Tolerance (IGT)	BG 2 h post 75 g OGTT = 141-198 mg/dL

Screening

- type 2 DM
 - FBG in everyone ≥ 40 q3yr, or at high risk using the CANRISK calculator
 - more frequent and/or earlier testing if presence of ≥ 1 risk factor (see above)
- GDM (see [Obstetrics, OB14](#))
 - all pregnant women between 24-28 wk gestation

Goals of Therapy

Table 14. Goals of Therapy in Diabetes

General	Avoid complications (e.g. ketoacidosis, hyperglycemia, infection) Prevent long-term complications (microvascular and macrovascular) Minimize negative sequelae associated with therapies (e.g. hypoglycemia, weight gain)
Fasting or Preprandial BG	Ideal: 72-126 mg/dL Suboptimal: 128-180 mg/dL; action may be required Inadequate: > 180 mg/dL; action required
HbA1c	$\leq 7\%$ or $\leq 6.5\%$ in some type 2 DM patients at risk for nephropathy Suboptimal: 7-8.4% Inadequate: $> 8.4\%$
2 h Postprandial BG	90-180 mg/dL if HbA1c target met 90-144 mg/dL if HbA1c target not met
Blood Pressure	$< 130/80$ in adults (DM and HTN guidelines)
Lipids	LDL < 36 mg/dL Triglycerides < 27 mg/dL Total cholesterol/HDL ratio < 72 mg/dL

Assessment and Monitoring

Table 15. Assessment and Monitoring

	Initial Assessment	q2-4mo	Annually
History	<ul style="list-style-type: none"> • Symptoms of hyperglycemia, ketoacidosis, hypoglycemia • Past medical history • Functional inquiry • Family history • Risk factors • Medications • Sexual function • Lifestyle 	<ul style="list-style-type: none"> • DM-directed history • Screen for awareness and frequency of hypoglycemia and DKA • Glucose monitoring • Use of insulin and oral agents 	<ul style="list-style-type: none"> • DM-directed history • Screen for awareness and frequency of hypoglycemia and DKA • Glucose monitoring • Use of insulin and oral agents • Sexual function • Lifestyle counseling • Psychosocial issues
Physical Exam	<ul style="list-style-type: none"> • General: Ht, Wt, BMI, BP, WC • Head and neck: funduscopy, thyroid exam • Cardiovascular exam: signs of PVD, pulses, bruits • Abdominal exam (e.g. for organomegaly) • Hand/foot/skin exam • Neurological exam 	<ul style="list-style-type: none"> • Wt, BP, BMI, WC • Foot exam for sensation (using a 10 g monofilament), ulcers, or infection 	<ul style="list-style-type: none"> • Complete neurological exam for peripheral neuropathy • Remainder of exam as per PHE

DM Related Symptoms

Hyperglycemia: polyphagia, polydipsia, polyuria, weight change, blurry vision, yeast infections

Diabetic Ketoacidosis (DKA): fruity breath, anorexia, N/V, fatigue, abdominal pain, Kussmaul breathing, dehydration

Hypoglycemia: hunger, anxiety, tremors, palpitations, sweating, headache, fatigue, confusion, seizures, coma

Long-Term Complications of DM

- Microvascular: nephropathy, retinopathy, neuropathy
- Macrovascular: CAD, CVD, PVD

Screening for Microvascular Complications

- **Nephropathy**
 - Urine ACR, serum Cr – type 2: at diagnosis, then annually; type 1: 5 yr after diagnosis, then annually)
- **Retinopathy**
 - Ophthalmology consult – type 2: at diagnosis then ophtho follow-up q1-2yr; type 1: 5 yr after diagnosis, then annual follow-up

Long-Term Non-Pharmacological Weight Loss Interventions for Adults with Prediabetes

Cochrane DB Syst Rev 2005;2:CD005270
A meta-analysis, using 9 studies comprising 5,168 patients, investigated the effectiveness of diet control, physical activity, behavioral weight programs, and weight control interventions in adults with pre-DM. The analysis was limited by heterogeneous patient populations, but when compared with usual care, weight loss was 2.8 kg and BMI decrease was 1.3 kg/m² at 1 yr. Modest but non-significant improvements in glycemic control, BP, and blood lipid concentrations were noted. Studies with a follow-up of 3-6 yr showed a significant decrease in DM onset when compared with controls.

Dietary Advice for Treatment of Type 2 DM in Adults

Cochrane DB Syst Rev 2007;3:CD004097
A meta-analysis, using 36 articles reporting a total of 18 trials following 1,467 participants, showed that there is no high quality data on the efficacy of dietary treatment of type 2 DM. After 6 and 12 mo, adoption of exercise improved HbA1c.

Table 15. Assessment and Monitoring (continued)

	Initial Assessment	q2-4mo	Annually
Investigations	<ul style="list-style-type: none"> • FBG, HbA1c, fasting lipids, Cr, microalbumin:creatinine ratio • ECG 	<ul style="list-style-type: none"> • HbA1c q3mo • FBG as needed 	<ul style="list-style-type: none"> • Fasting lipid profile • Resting or exercise ECG if age >35 • Dipstick analysis for gross proteinuria; if negative: annual microalbuminuria screening with random albumin:creatinine ratio for type 2 DM and type 1 DM (5 yr post puberty) If positive: 24 h urine for endogenous creatinine clearance rate and microalbuminuria q6-12mo
Management	<ul style="list-style-type: none"> • Nutritional and physical education • Consider referral to DM education program if available • Monitoring BG: explain methods and frequency • Medication counseling: oral hypoglycemics and/or insulin, method of administration, dosage adjustments • Pneumococcal vaccination • Ophthalmology consult <ul style="list-style-type: none"> • type 1 DM within 5 yr • type 2 DM at diagnosis 	<ul style="list-style-type: none"> • Assess progress towards long-term complications • Adjust treatment plan if necessary 	<ul style="list-style-type: none"> • Calibrate home glucose monitor • Arrange ophthalmology follow-up annually for type 1 DM and q2yr for type 2 DM • Influenza vaccination annually

Nonpharmacologic Management

- diet
 - all diabetics should see a registered dietician
 - can reduce HbA1c by 1-2%
 - strive to attain healthy body weight
 - decrease combined saturated fats and trans-fatty acids to <10% of calories
 - avoid simple sugars, encourage complex carbohydrates, choose low glycemic-index foods
- physical activity and exercise
 - at least 150 min of aerobic exercise per wk, plus 2 sessions per wk of resistance exercise is recommended
 - encourage 30-45 min of moderate exercise 4-7 d/wk
 - promote cardiovascular fitness: increases insulin sensitivity, lowers BP, and improves lipid profile
 - if insulin treated, may require alterations of diet, insulin regimen, injection sites, and self-monitoring

Self-Monitoring of Blood Glucose

- type 1 DM: 3 or more self-tests/d is associated with a 1% reduction in HbA1c
- type 2 DM: recommendations vary based on treatment regimen (e.g. insulin dependent requires more frequent monitoring - refer to 2014 American Practice Guidelines)
- if FBG >252 mg/dL, perform ketone testing to rule out DKA
- if bedtime level is <126 mg/dL, have bedtime snack to reduce risk of nocturnal hypoglycemia

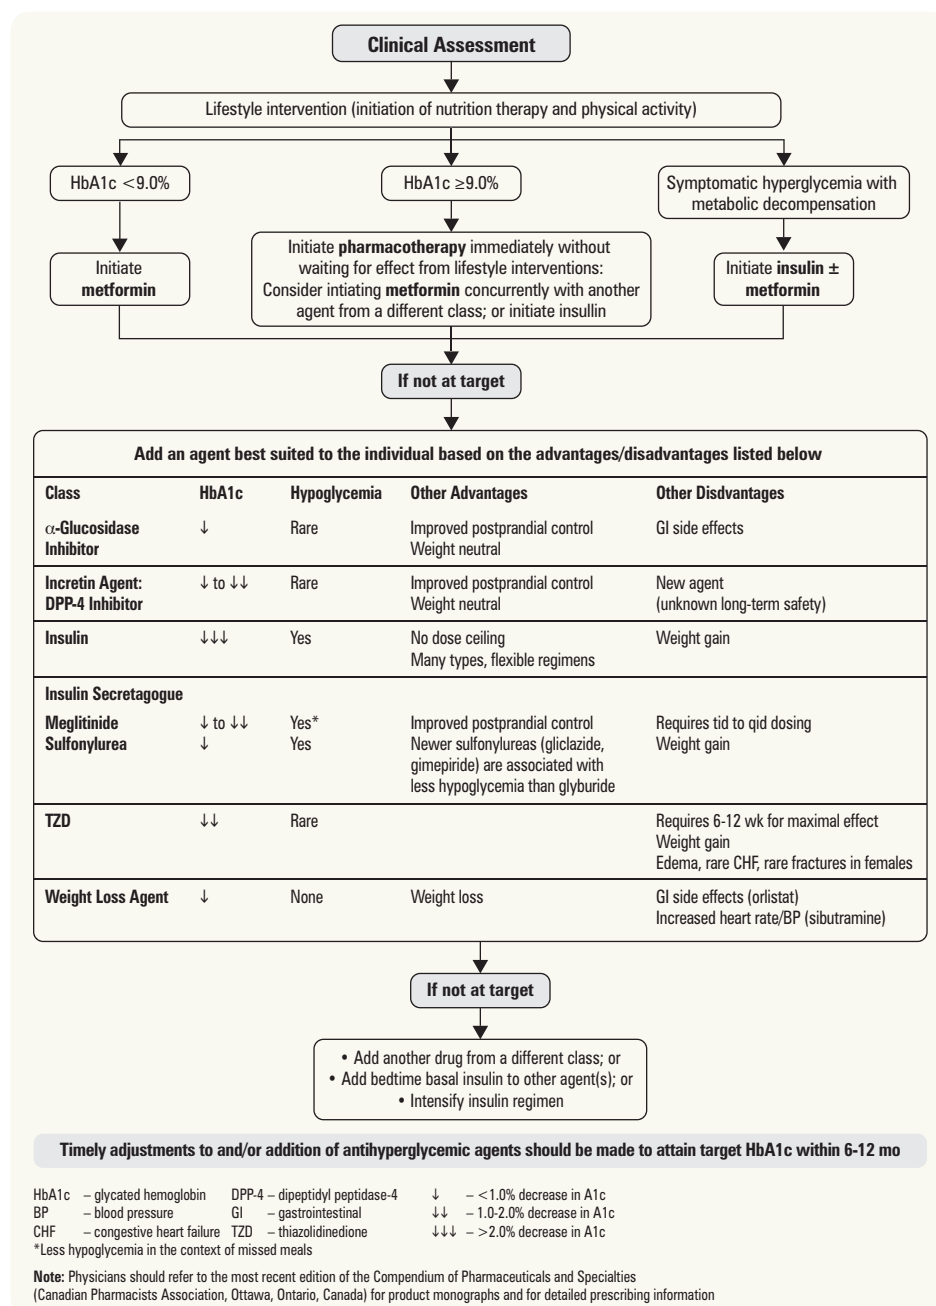

Figure 4. Types of insulin preparation

Calculate Total Insulin Required:

Type 1 DM: 0.5-0.7 units/kg/d

Type 2 DM: 0.3 units/kg/d

Metformin Monotherapy for Type 2 DM

Cochrane DB Syst Rev 2005;3:CD002966

A Cochrane Review of 29 trials with 37 arms (5,259 participants) compared metformin with sulfonylureas, placebo, diet, thiazolidinediones, insulin, meglitinides, and glucosidase inhibitors. The authors concluded that metformin may prevent some vascular complications and mortality in overweight and obese type 2 DM patients and as such may be considered first line therapy. There is no evidence that the studied alternative therapies have more benefit for glycemia control, body weight, or lipids than does metformin.

Rosiglitazone Revisited: An Updated Meta-Analysis of Risk for Myocardial Infarction and Cardiovascular Mortality

Arch Intern Med 2010;170:1191-1201

11 yr after the introduction of rosiglitazone, the totality of randomized clinical trials continue to demonstrate increased risk for MI although not for CV or all-cause mortality. The current findings suggest an unfavorable benefit to risk ratio for rosiglitazone.

Figure 5. Management of hyperglycemia in type 2 diabetes

Canadian Diabetes Association Clinical Practice Guidelines Expert Committee. Pharmacologic Management of Type 2 Diabetes. *Can J Diabetes* 2013;37:S61-S68 (used with permission)

Hypoglycemic Agents (Type 2 DM)

- oral
 - biguanide: metformin (Glucophage®)
 - thiazolidinedione: troglitazone (Rezulin®), rosiglitazone (Avandia®), pioglitazone (Actos®)
 - α-glucosidase inhibitor: acarbose (Precose®)
 - nonsulfonylureas: nateglinide (Starlix®), repaglinide (Gluconorm®)
 - sulfonylureas: glyburide (DiaBeta®), glimepiride (Amaryl®), gliclazide (Diamicon®)
 - DPP-4 inhibitor: sitagliptin (Januvia®)
- injectable
 - GLP-1 analogue: liraglutide (Victoza®)

Other Medications Used in DM

- ACEI for
 - all hypertensive diabetics
 - elevated microalbuminuria (30-300 mg albumin in urine in 24 h)
 - overt nephropathy (>300 mg albumin in urine in 24 h)
- ARBs are second line for these conditions

- ASA 81 mg OD for secondary prevention of CVD (should not be used for primary prevention of CVD in people with DM)
- statins
 - as required to attain target lipid profile (LDL-C <36 mg/dL)

Diarrhea

- see [Gastroenterology](#), G15, and [Infectious Diseases](#), ID11

Definition

- passage of 3 or more loose or liquid stools in a day or more frequently than is normal for the individual (WHO definition)
- can be acute (<14 d duration) or chronic (>14 d duration)

Etiology and Clinical Features

- acute diarrhea
 - majority of cases are self-limiting
 - most commonly caused by viral infection (e.g. rotavirus, norovirus)
 - fever and bloody stools increase probability of bacterial infection
 - consider *C. difficile* infection if recent hospitalization, recent antibiotic use (e.g. broad spectrum antibiotics, fluoroquinolones, clindamycin), chronic use of PPIs, age >65, immunosuppression
- chronic diarrhea
 - most commonly of non-infectious etiology
 - common causes include drugs (e.g. laxatives, antibiotics), infection (e.g. bacteria, parasites), inflammation (e.g. IBD, diverticulitis), neoplasia (e.g. colon cancer), malabsorption (e.g. celiac disease), maldigestion (e.g. lactose intolerance), and idiopathic

Treatment

- acute diarrhea: ensure adequate hydration, treat underlying cause (e.g. antibiotics for bacterial infection)
- chronic diarrhea: nonspecific treatment often required before workup is complete
 - oral rehydration solution (if needed): offset electrolyte imbalances
 - lifestyle modification (dietary changes, exercise)
 - fiber (e.g. psyllium): commonly used as adjunctive treatment
 - antidiarrheal opiates (e.g. loperamide): most effective nonspecific treatment
 - should be used on a scheduled basis before meals rather than prn

Dizziness

- see [Otolaryngology](#), OT6

Epidemiology

- 70% see general practitioners initially; 4% referred to specialists
- frequency proportional to age; commonest complaint of ambulatory patients age >75

Differential Diagnosis

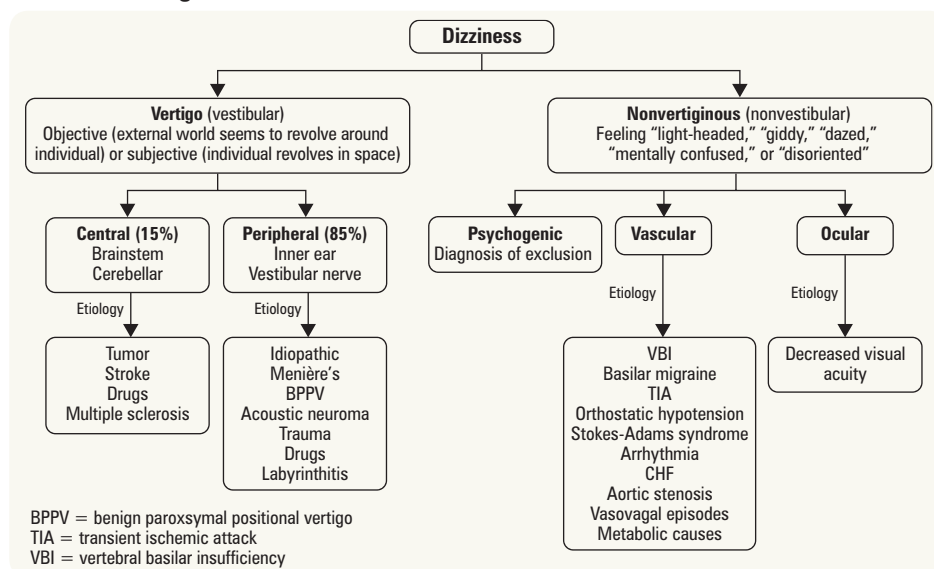

Figure 6. Differential diagnosis of dizziness

History

- clarify type of dizziness: vertigo, pre-syncope, disequilibrium, light-headedness
- duration (seconds, minutes, hours, days, weeks, or persistent)
- exacerbations
 - worse with head movement or eye closure (vestibular)
 - no change with head movement and eye closure (nonvestibular)
 - worse with exercise (cardiac/pulmonary causes)
- associated symptoms
 - neurologic (central)
 - transient diplopia, dysphagia, dysarthria, ataxia (TIA, VBI, migraine)
 - persistent headache, alterations in level of consciousness, sensory and/or motor deficits (CNS)
 - audiologic (peripheral)
 - hearing loss, tinnitus, otalgia, aural fullness
 - others
 - N/V (peripheral vestibular disorders)
 - SOB, palpitations (hyperventilation, cardiac problem)
- general medical history
 - HTN, DM, heart disease, fainting spells, seizures, cerebrovascular disease, migraines
 - ototoxic drugs: aminoglycosides (gentamicin, streptomycin, tobramycin), erythromycin, ASA, antimalarials
 - hypotension (secondary to diuresis): furosemide, caffeine, alcohol

Physical Exam/Investigations

- syncopal
 - cardiac (orthostatic changes in vitals), peripheral vascular, and neurologic exams
 - blood work, ECG, 24 h Holter, treadmill stress test, loop ECG, tilt table testing, carotid and vertebral doppler, EEG
- vertiginous
 - ENT and neurologic exams
 - Dix-Hallpike, consider audiometry and MRI if indicated
- non-syncopal, non-vertiginous
 - cardiac and neurologic exams
 - 3-min hyperventilation trial (patient is coached to hyperventilate until patient becomes dizzy to identify if symptoms are reproducible and confirm that hyperventilation is the etiology of the symptoms), ECG, EEG

Treatment

- guided by history, physical exam, and investigations
- include education, lifestyle modification, physical maneuvers (e.g. Epley for BPPV), symptomatic management (e.g. antiemetics), pharmacotherapy, and surgery
- refer when significant central disease is suspected, when vertigo of peripheral origin is persistent (lasting >2-4 wk), or if atypical presentation

DDx of Vertigo

	BPPV	Labyrinthitis	Menière's	Acoustic Neuroma
Onset	sudden	sudden	gradual	insidious
Duration	seconds	days	min-hours	chronic
Hearing	—	+	+	+
Loss	—	—	—	—
Tinnitus	—	+	+	+
Neuro Sx	—	—	—	+

Dix-Hallpike Test

- Have the patient seated with legs extended and head at 45° rotation
- Rapidly shift patient to supine position with head fully supported in slight extension (for 45 s)
- Observe for rotatory nystagmus and ask about sensation of vertigo

Domestic Violence/Elder Abuse

INTIMATE PARTNER VIOLENCE

Definition

- includes physical, sexual, emotional, psychological, and financial abuse (see [Emergency Medicine, ER29](#))

Epidemiology

- lifetime prevalence of intimate partner violence against women is between 25-30%
- women who experience abuse have increased rates of injury, death, and health consequences including 50-70% increase in gynecological, central nervous system, stress-related problems
- occurs in all socioeconomic, educational, and cultural groups with increased incidence in pregnancy, disabled women, and 18-24 age group
- 25-50% chance of child abuse or neglect in families where partner abuse occurs
- physician recognition rates as low as 5%

Presentation

- multiple visits with vague, ill-defined complaints such as: headaches, gastrointestinal symptoms, insomnia, chronic pain, hyperventilation
- may also present with injuries inconsistent with history

Management

- screen ALL patients
 - always have a high index of suspicion
 - asking about abuse is the strongest predictor of disclosure
 - several screening tools (see sidebar) exist to identify victims of partner violence
 - make sure to determine the victim's level of immediate and long-term danger and ask if there are weapons in the house
- ensure patient safety
 - victim most at risk for homicide when attempting to leave home or following separation
- provide community resources
 - safety planning includes ensuring that there is access to an exit in the home, establishing a safe place to go and having money, clothes, keys, medications, important documents, and other emergency items prepared should the patient need to leave quickly
 - shelter or helpline number with legal advocacy and counseling services
 - involve social workers or domestic violence advocates
- appointment for follow-up to assess whether condition is better or worse
- reassure patient she/he is not to blame and that the assault is a crime
 - goal is to convey the message that "As your doctor, I am concerned for your safety" and "Your partner has a problem that he/she needs help with" and "I want to help you"
 - reporting suspected or known child abuse is mandatory (see [Emergency Medicine, ER59](#))
 - spousal abuse is a criminal act, but not reportable without the woman's/man's permission
- DOCUMENT all evidence of abuse-related visits for medico-legal purposes

ELDER ABUSE

- see [Geriatric Medicine, GM4](#)

Dyspepsia

- see [Gastroenterology, G10](#)

Definition and Clinical Features

- defined as epigastric pain or discomfort
- can be associated with fullness, belching, bloating, heartburn, food intolerance, N/V

Epidemiology

- annual incidence 1-2%, prevalence 20-40%

Etiology

- common: functional, PUD, GERD, gastritis
- others: cholelithiasis, irritable bowel syndrome, esophageal or gastric cancer, pancreatitis, pancreatic cancer, Zollinger-Ellison syndrome, and abdominal angina

History

- symptoms may not be useful in finding cause
- association with food, anorexia, N/V alcohol, NSAID use

How to Document Abuse

- Take photographs (with permission) of known or suspected injuries
- Use an injury location chart or "body map" when documenting physical findings
- Document any investigations ordered (e.g. x-ray)
- Write legibly or use a computer
- Record the patient's own words in quotation marks
- Avoid phrases that imply doubt about the patient's reliability (e.g. "patient claims that...")
- Record the patient's demeanor (e.g. upset, agitated)
- Record the time of day the patient is examined and how much time has elapsed since the abuse occurred

Screening Instruments for Domestic Violence

A) Woman Abuse Screening Tool (WAST)-SHORT

- In general how would you describe your relationship?
 - A lot of tension
 - Some tension
 - No tension
- Do you and your partner work out arguments with . . . ?
 - Great difficulty
 - Some difficulty
 - No difficulty

Endorsing either question 1 ("a lot of tension") or question 2 ("great difficulty") makes intimate partner violence exposure likely

B) HITS

- How often does your partner:
- Physically hurt you?
 - Insult you?
 - Threaten you with harm?
 - Scream or curse at you?

Each question on HITS to be answered on a 5 point scale ranging from 1 (= never) to 5 (= frequently)
A total score of 10.5 is significant

Investigations and Management

- lifestyle modifications: dietary changes, smaller and more frequent meals, avoid supine position right after meals, decreased EtOH consumption, smoking cessation
- empiric therapy: H₂ receptor blockers, PPIs for short periods of time (8 wk with taper)
- testing for *H. pylori*: serology, urea breath test
- upper endoscopy (preferred), upper GI series

Dyspnea

- see [Respirology, R3](#) and [Emergency Medicine, ER27](#)

History and Physical Exam

- history
 - cough, sputum, hemoptysis, wheezing, chest pain, palpitations, dizziness, edema
 - asthma, allergy, eczema, ASA/NSAID sensitivity, nasal polyps
 - constitutional symptoms
 - smoking, recreational drugs, medications
 - occupational exposure, environmental exposure (e.g. pets, allergens, smoke)
 - travel and birth place
 - FHx of atopy
 - previous CXR or PFTs
- physical exam: vitals, respiratory, precordial, HEENT, signs of anemia/liver failure/heart failure

Investigations

- CXR, ECG
- PFTs, ABG acutely if indicated

Management

- ABCs: send to ED if in severe respiratory distress
- depends on cause

DDx of Dyspnea

Pulmonary

- COPD
- Asthma
- Restrictive lung disease
- Pneumothorax
- Congenital lung disease
- PE

Cardiac

- CHF
- CAD
- MI (recent or past)
- Cardiomyopathy
- Valve dysfunction
- Pericarditis
- Arrhythmia
- Hypertrophy

Mixed/Other

- Deconditioning
- Trauma
- Pain
- Neuromuscular
- Metabolic condition
- Functional: anxiety, panic attack, hyperventilation

- see [Urology, U10](#)

Definition

- the sensation of pain, burning, or discomfort on urination

Epidemiology

- in adulthood, more common in women than men
- approximately 25% of women report one episode of acute dysuria per yr
- most common in women age 25-54 and in those who are sexually active
- in men, dysuria becomes more prevalent with increasing age

Etiology

- infectious
 - most common cause
 - ♦ presents as cystitis, urethritis, pyelonephritis, vaginitis, cervicitis, epididymo-orchitis, or prostatitis
- non-infectious
 - hormonal conditions (hypoestrogenism), obstruction (BPH, urethral strictures), allergic reactions, radiation, drugs/chemicals, foreign bodies, trauma, neoplasm, kidney stones, inflammatory diseases, endometriosis, psychogenic

UTI Clinical Decision Aid

- Dysuria
- +Leukocytes
- +Nitrites

if 2 or more criteria MET, then treat without culture, otherwise culture required prior to treatment

Arch Intern Med 2007;167:2201-2206

Risk Factors for Complicated UTI

- Male
- Pregnancy
- Recent urinary tract instrumentation
- Functional or anatomic abnormality of the urinary tract
- Chronic renal disease
- DM
- Immunosuppression
- Indwelling catheter

Table 16. Etiology, Signs and Symptoms of Common Causes of Dysuria

Infection	Etiology	Signs and Symptoms
UTI/Cystitis	KEEPS bacteria (<i>Klebsiella</i> , <i>E. coli</i> , <i>Enterobacter</i> , <i>Proteus mirabilis</i> , <i>Pseudomonas</i> , <i>S. saprophyticus</i>)	Internal dysuria throughout micturition, frequency, urgency, incontinence, hematuria, nocturia, back pain, suprapubic discomfort, low grade fever (rare)
Urethritis	<i>C. trachomatis</i> , <i>N. gonorrhoeae</i> , <i>Trichomonas</i> , <i>Candida</i> , herpes	Initial dysuria, urethral/vaginal discharge, history of STD
Vaginitis	<i>Candida</i> , <i>Gardnerella</i> , <i>Trichomonas</i> , <i>C. trachomatis</i> , atrophic, herpes, lichen sclerosis	External dysuria/pain, vaginal discharge, irritation, dyspareunia, abnormal vaginal bleeding
Prostatitis	<i>E. coli</i> , <i>C. trachomatis</i> , <i>S. saprophyticus</i> , <i>Proteus mirabilis</i> , <i>Enterobacter</i> , <i>Klebsiella</i> , <i>Pseudomonas</i>	Dysuria, fever, chills, urgency, frequency, tender prostate, rectal pain
Pyelonephritis	<i>E. coli</i> , <i>S. saprophyticus</i> , <i>Proteus mirabilis</i> , <i>Enterobacter</i> , <i>Klebsiella</i> , <i>Pseudomonas</i>	Internal dysuria, fever, chills, flank pain radiating to groin, CVA tenderness, N/V

Investigations

- no investigations necessary when history and physical consistent with uncomplicated UTI – treat empirically (urinalysis can be performed when indicated by dipstick or microscopy)
- urinalysis/dipstick: positive for nitrites and leukocytes
- urine R&M: pyuria, bacteriuria, hematuria
- urine C&S
- CBC and differential if suspecting pyelonephritis
- if vaginal/urethral discharge present: wet mount, Gram stain, KOH test, vaginal pH, culture for yeast and trichomonas, endocervical/urethral swab or urine PCR for *N. gonorrhoeae* and *C. trachomatis*
- radiologic studies and other diagnostic tests if atypical presentation
- see [Pediatrics, P64](#) for UTI in children

Management

- see [Antimicrobial Quick Reference, FM52](#) for treatment
- UTI/cystitis
 - pregnant women with bacteriuria (2-7%) must be treated even if asymptomatic, due to risk of preterm labor; need to follow with monthly urine cultures and retreat if still infected
 - patients with recurrent UTIs (>3/yr) should be considered for prophylactic antibiotics
 - if complicated UTI, patients require longer courses of broader spectrum antibiotics
- urethritis
 - when swab or PCR is positive for chlamydia or gonorrhea must report to Public Health
 - all patients should return 4-7 d after completion of therapy for clinical evaluation

Cranberries for Preventing Urinary Tract Infections

Cochrane DB Syst Rev 2008;1:CD001321

Study: Meta-analysis of 10 RCTs, (n=1,049).

Patients: All populations.

Intervention: Cranberry juice vs. placebo, juice or water was evaluated in seven studies, and cranberry tablets vs. placebo in four studies.

Main Outcome: UTIs – symptomatic and asymptomatic.

Results: Cranberry products significantly reduced the incidence of UTIs at 12 mo (RR 0.65, 95% CI 0.46-0.90) compared with placebo/control.

Conclusion: There is some evidence that cranberry products may decrease the number of symptomatic UTIs over a 12 mo period, particularly for women with recurrent UTIs.

Epistaxis

- see [Otolaryngology, OT27](#)

Erectile Dysfunction

- see [Urology, U30](#)

Definition

- consistent or recurrent inability to attain and/or maintain penile erection sufficient for sexual performance of ≥ 3 mo duration

Epidemiology

- ~20% of men age 40; ~50% of men age 70

Etiology

- organic: vascular (90%) (arterial insufficiency, atherosclerosis), endocrine (low testosterone, DM), anatomic (structural abnormality, e.g. Peyronie's), neurologic (post-operative, DM), medications (clonidine, antihypertensives, psychotropics)
- psychogenic (10%)

Table 17. Differentiation Between Organic and Psychogenic Erectile Dysfunction

Characteristic	Organic	Psychogenic
Onset	Gradual	Acute
Circumstances	Global	Situational
Course	Constant	Varying
Non-Coital Erection	Poor	Rigid
Morning Erection	Absent	Present
Psychosexual Problem	Secondary	Long history
Partner Problem	Secondary	At onset
Anxiety and Fear	Secondary	Primary

Walsh: Campbell's Urology, 8th ed. Table 46-4

DDx of Erectile Dysfunction

PENIS

Psychogenic

Endocrine (type 2 DM, testosterone)

Neurogenic (type 2 DM, post-operative)

Insufficiency of blood (atherosclerosis)

Substances

The Effect of Lifestyle Modification and Cardiovascular Risk Factor Reduction on Erectile Dysfunction

Arch Intern Med 2011;171:1797-1803

Study: Meta-analysis of 6 RCTs.

Population: 740 male participants.

Intervention: Lifestyle modification and pharmacotherapy targeting CAD risk factors.

Main Outcome Measure: International Index of Erectile Dysfunction (IIEF-5) score.

Results: Lifestyle modifications and pharmacotherapy for cardiovascular risk factors had a statistically significant association with improved sexual function (weighted mean difference 2.66; 95% CI 1.86-3.47). Lifestyle modification without use of statins was also statistically significantly associated with improved sexual function (weighted mean difference 2.40; 95% CI 1.19-3.61).

Conclusion: Lifestyle modification alone or combined with pharmacotherapy can improve sexual function.

History

- comprehensive sexual, medical, and psychosocial history
- time course
 - last satisfactory erection
 - gradual or sudden onset
 - attempts at sexual activity
- quantify
 - presence of morning or night time erections
 - stiffness (scale of 1-10)
 - ability to initiate and maintain an erection with sexual stimulation
 - erection stiffness during sex (scale of 1-10)
- qualify
 - partner or situation specific
 - loss of erection before penetration or climax
 - degree of concentration required to maintain an erection
 - percentage of sexual attempts satisfactory to patient and/or his partner
 - significant bends in penis or pain with erection
 - difficulty with specific positions
 - impact on quality of life and relationship

Investigations

- hypothalamic-pituitary-gonadal axis evaluation: testosterone (free + total), prolactin, LH
- risk factor evaluation: fasting glucose, HbA1c, lipid profile
- others: TSH, CBC, urinalysis
- specialized testing
 - psychological and/or psychiatric consultation
 - in-depth psychosexual and relationship evaluation
 - nocturnal penile tumescence and rigidity (NPTR) assessment
 - vascular diagnostics (e.g. doppler studies, angiography)

Management

Table 18. Management of Erectile Dysfunction

Nonpharmacologic	Pharmacologic	Surgical
Lifestyle changes (alcohol, smoking, exercise)	Oral agents	Implants
Relationship/sexual counseling	Suppository	Vascular repair
Vacuum devices	Male urethral suppository for erection (MUSE)	Realignment
	Injections	

- pharmacologic treatment
 - phosphodiesterase type 5 inhibitors
 - α -adrenergic blockers (e.g. yohimbine)
 - serotonin antagonist and reuptake inhibitor (e.g. trazodone)
 - testosterone – currently only indicated in patients presenting with hypogonadism and testosterone deficiency (note: breast/prostate cancer are absolute contraindications)

Table 19. Phosphodiesterase Type 5 Inhibitors

Examples	Dosing (1 dose/d)	Specifics	Side Effects	Contraindications
sildenafil (Viagra®)	25-100 mg/dose	Take 0.5-4 h prior to intercourse May last 24 h	Flushing, headache, indigestion	Not to be used in patients taking nitrates
tadalafil (Cialis®)	5-20 mg/dose	Effects may last 36 h	As above	As above
vardeafil (Levitra®)	2.5-20 mg/dose	Take 1 h prior to intercourse	As above	As above

Reasons for Referral to Urology

- Significant penile anatomic disease
- Younger patient with a history of pelvic or perineal trauma
- Cases requiring vascular or neuro-surgical intervention
- Complicated endocrinopathies
- Complicated psychiatric or psychosocial problems
- Patient or physician desire for further evaluation

Fatigue

Epidemiology

- 25% of office visits to family physicians
 - peaks in ages 20-40
 - F:M = 3-4:1
- 50% have associated psychological complaints/problems, especially if <6 mo duration

Fatigue Red Flags

- Fever
- Weight loss
- Night sweats
- Neurological deficits
- Ill-appearing

Differential Diagnosis

Table 20. Differential Diagnosis of Fatigue: PS VINDICATE

P	Psychogenic	Depression, life stresses , anxiety disorder, chronic fatigue syndrome, fibromyalgia
	Physiologic	Pregnancy, excessive caregiving demands (young children, elderly)
S	Sleep disturbance	Obstructive sleep apnea, sleep disorder , poor sleep hygiene, BPH, shift work, pain
	Sedentary	Unhealthy/sedentary lifestyle
V	Vascular	Stroke
I	Infectious	Viral (e.g. mononucleosis, hepatitis, HIV), bacterial (e.g. TB), fungal, parasitic
N	Neoplastic	Any malignancy
	Nutrition	Anemia (Fe^{2+} deficiency, B_{12} deficiency)
	Neurogenic	Myasthenia gravis, multiple sclerosis, Parkinson's disease
D	Drugs	β -blockers, antihistamines, anticholinergics, benzodiazepines, antiepileptics, antidepressants
I	Idiopathic	
C	Chronic illnesses	CHF, lung diseases (e.g. COPD, sarcoidosis), renal failure, chronic liver disease
A	Autoimmune	SLE, RA, mixed connective tissue disease, polymyalgia rheumatica
T	Toxin	Substance abuse (e.g. alcohol), heavy metal
E	Endocrine	Hypothyroidism, DM , Cushing's syndrome, adrenal insufficiency, pregnancy

Common causes are in **bold**

Investigations

- psychosocial causes are common, so usually minimal investigation is warranted
- physical causes of fatigue usually have associated symptoms/signs that can be elicited from a focused history and physical exam
- investigations should be guided by history and physical exam and may include
 - CBC and differential, electrolytes, BUN, Cr, ESR, glucose, TSH, ferritin, vit B_{12} , serum protein electrophoresis, Bence-Jones protein, albumin, AST, ALT, ALP, bilirubin, calcium, phosphate, ANA, β -hCG
 - urinalysis, CXR, ECG
 - additional tests: serologies (Lyme disease, hepatitis B and C screen, HIV, ANA) and Mantoux skin tests

Treatment

- treat underlying cause
- if etiology cannot be identified (1/3 of patients)
 - reassurance and follow-up, especially with fatigue of psychogenic etiology
 - quick follow-up for reassurance
 - supportive counseling, behavioral, or group therapy
 - encourage patient to stay physically active to maximize function
 - review all medications, OTC, and herbal remedies for drug-drug interactions and side effects
 - prognosis: after 1 yr, 40% are no longer fatigued

CHRONIC FATIGUE SYNDROME

Definition (CDC 2006) – must meet both criteria

1. new or definite onset of unexplained, clinically evaluated, persistent or relapsing chronic fatigue, not relieved by rest, which results in occupational, educational, social, or personal dysfunction
 2. concurrent presence of at least 4 of the following symptoms for a minimum of 6 mo
 - impairment of short-term memory or concentration, severe enough to cause significant decline in function
 - sore throat
 - tender cervical or axillary lymph nodes
 - muscle pain
 - multi-joint pain with no swelling or redness
 - new headache
 - unrefreshing sleep
 - post-exertion malaise lasting >24 h
- exclusion criteria: medical conditions that may explain the fatigue, certain psychiatric disorders (depression with psychotic or melancholic features, schizophrenia, eating disorders), substance abuse, severe obesity (BMI >45)

Exercise Therapy for Chronic Fatigue

Cochrane Depression, Anxiety, and Neurosis Group
Cochrane DB Syst Rev 2004;Issue 3

Purpose: To determine the effectiveness of exercise therapy for Chronic Fatigue Syndrome (CFS).

Methods: Systematic review of 5 RCTs with 336 patients of all ages with a clinical diagnosis of CFS.

Interventions: Exercise therapy alone was compared with treatment as usual (or relaxation and flexibility), pharmacotherapy (fluoxetine), or exercise therapy combined with either pharmacotherapy or patient education.

Results: At 12 wk, patients undergoing exercise therapy were less fatigued than controls (SMD -0.77; 95% CI -1.26 to -0.28). Physical functioning was also significantly improved, but there were more dropouts with exercise therapy. Compared with fluoxetine, patients receiving exercise therapy were less fatigued (WMD -1.24; 95% CI -5.31-2.83). Patients receiving combination therapy with exercise therapy and either fluoxetine or patient education, did better than those on monotherapy.

Conclusions: Patients may benefit from exercise therapy. Combination therapy with either fluoxetine or education may offer additional benefit. Further high quality trials are needed.

Epidemiology

- F>>M, Caucasians > other groups, majority in their 30s
- found in <5% of patients presenting with fatigue

Etiology

- unknown, likely multifactorial
- may include infectious agents, immunological factors, neurohormonal factors, and/or nutritional deficiency

Investigations

- no specific diagnostic laboratory tests

Treatment

- promote sleep hygiene
- provide support and reassurance that most patients improve over time
- non-pharmacological
 - regular physical activity, optimal diet, psychotherapy (e.g. CBT), family therapy, support groups
- pharmacological
 - to relieve symptoms: e.g. antidepressants, anxiolytics, NSAIDs, antimicrobials, antiallergy therapy, antihypertensive therapy

Fever

- see [Pediatrics, P54](#), for fever in pediatric population

**Definition**

- temperature >100.4°F (38 °C)
- fever in children under 2 must be a rectal temperature for accuracy
- TM not accurate for measurement until child is over the age of 5

Table 21. Differential Diagnosis of Fever

Infection	Cancer	Medications		Other
Bacterial	Leukemia	Allopurinol	Nifedipine	Irritable Bowel Syndrome
Viral	Lymphoma	Captopril	Phenytoin	Collagen Vascular Disease
TB	Other Malignancies	Cimetidine	Diuretics	DVT
		Heparin	Barbiturates	
		INH	Antihistamines	
		Meperidine		

History

- fever
 - peak temperature, thermometer, route, duration
 - time of day
 - response to antipyretics
- systemic symptoms
 - weight loss, fatigue, rash, arthralgia, night sweats
- symptoms of possible source
 - UTI/pyelonephritis: dysuria, foul-smelling urine, incontinence, frequency, hematuria, flank pain
 - pneumonia: cough, pleuritic chest pain
 - URTI: cough, coryza, ear pain
 - meningitis: headache, confusion, stiff neck, rash
 - osteomyelitis: bone pain
 - skin: purulent discharge
 - PID: discharge, dyspareunia, lower abdominal pain
 - gastroenteritis: abdominal pain, diarrhea, blood per rectum, vomit
 - medications
 - PE/DVT: swollen legs, pain in calf, SOB, pleuritic chest pain
 - history of cancer/family history of cancer
- infectious contacts
 - travel history, camping, day care, contact with TB, foodborne, animals

Possible Investigations

- CBC and differential, blood culture, urine culture, urinalysis
- stool O&P, Gram stain, culture
- CXR, Mantoux skin test, sputum culture
- LP

Management

- increase fluid intake
- general: sponge bath, light clothing
- acetaminophen/ibuprofen as needed
- treat underlying cause

Headache

- see [Neurology, N43](#)

Primary Headaches**Table 22. Primary Headaches**

	Migraine	Tension-Type	Cluster	Caffeine Withdrawal
Epidemiology	12% of adults F>M 20% with aura 80% without aura	38% of adults, can be episodic or chronic	<0.1% of adults, M>>F	~50% of people drinking >2.5 cups/d
Duration	5-72 h	May occur as isolated incident or daily, duration is variable	<3 h at same time of day	Begins 12-24 h after last caffeine intake, can last ~1 wk
Pain	Classically unilateral and pulsatile, but 40% are bilateral, moderate-severe intensity, N/V, photo-/phonophobia	Mild to moderate pain, bilateral, fronto-occipital or generalized pain, band-like pain, ± contracted neck/scalp muscles, associated with little disability	Sudden, unilateral, severe, usually centered around eye, frequently awakens patient Associated conjunctival injection and tearing "Suicide" headache	Severe, throbbing, associated with drowsiness, anxiety, muscle stiffness, nausea, waves of hot or cold sensations
Triggers	Numerous (e.g. food, sleep disturbance, stress, hormonal, fatigue, weather, high altitude) Aggravated by physical activity	Stressful events, NOT aggravated by physical activity	Often alcohol	Discontinuing caffeine
Treatment of Acute Headache	1st line: acetaminophen, NSAIDs, ASA ± caffeine 2nd line: NSAIDs 3rd line: 5-HT agonists ± antiemetic	Rest and relaxation NSAIDs or acetaminophen	Sumatriptan Dihydroergotamine High-flow O ₂ Intranasal lidocaine	Caffeine Acetaminophen or ASA ± caffeine
Prophylactic Therapy	1st line: β-blockers 2nd line: TCAs 3rd line: anticonvulsants	Rest and relaxation, physical activity, biofeedback	Lithium carbonate, prednisone, methysergide	Cut down on caffeine

Secondary Headaches

- caused by underlying organic disease
- account for <10% of all headaches, may be life-threatening
- etiology
 - aneurysm
 - medication overuse headache
 - space-occupying lesion
 - systemic infection (meningitis, encephalitis)
 - stroke
 - subarachnoid hemorrhage
 - systemic disorders (thyroid disease, HTN, pheochromocytoma, etc.)
 - temporal arteritis
 - traumatic head injuries
 - TMJ or C-spine pathology
 - serious ophthalmological and otolaryngological causes of headache
- treatment
 - based on underlying disorder
 - analgesics may provide symptomatic relief

Investigations

- indicated only when red flags are present and may include:
 - CBC for suspected systemic or intracranial infection
 - ESR for suspected temporal arteritis
 - neuroimaging (CT or MRI) to rule out intracranial pathology
 - CSF analysis for suspected intracranial hemorrhage, infection

**Migraine Screen****POUND**

Pulsatile quality
Over 4-72 h
Unilateral
N/V
Disabling intensity

if ≥4 present then a diagnosis is likely
(+ LR = 24)

**Acupuncture for Migraine Prophylaxis**

Cochrane DB Syst Rev 2009;4:CD001218

Study: Meta-analysis of 22 RCTs.

Population: 4,419 participants with diagnosed migraine.

Intervention: Preventive treatment with acupuncture, sham acupuncture, no prophylactic treatment/routine care only, other interventions.

Main Outcome Measure: Proportion of responders in 3-4 mo.

Other Outcomes: Frequency of migraine attacks, number of migraine days, headache frequency.

Results: Patients receiving acupuncture had higher response rates and fewer headaches after 3-4 mo than those with no prophylactic treatment or routine care only. There was no statistically significant difference between "true" vs. "sham" acupuncture.

Conclusion: Acupuncture is a viable prophylactic treatment option for migraine attacks. Selecting specific points for acupuncture is not as important as believed by practitioners.

Hearing Impairment

- see [Otolaryngology](#), OT9

Definition

- hearing impairment: a raised hearing threshold measured as decibels of hearing loss relative to the normal population at specific frequencies
- hearing disability: hearing impairment that interferes with performing daily tasks

Epidemiology

- prevalence increases with age (6% of 35-44 yr old, 43% of 65-84 yr old)
- 90% of age-related hearing loss (presbycusis) is sensorineural
- hearing loss detectable by audiology is present in greater than 1/3 of people over 65
- associated with significant physical, functional, and mental health consequences

Classification

- conductive (external sound does not reach the middle ear)
- sensorineural involving the inner ear, cochlea, or auditory nerve)
- mixed

Assessment

- infants
 - universal newborn hearing screening program
- elderly
 - presbycusis is characterized by the progressive, symmetric loss of high-frequency hearing
 - ♦ tinnitus, vertigo, and disequilibrium may be present
 - ♦ can cause low self-esteem, isolation, and depression
 - whispered-voice test
 - ♦ whisper 6 test words 6 in to 2 ft away from the patient's ear out of the visual field, ask patient to repeat the words (with non-test ear distraction)
 - tuning fork test (to distinguish conductive from sensorineural hearing loss)
 - ♦ Rinne and Weber (not for general screening)
 - formal audiologic assessment
 - ♦ pure tone, air, and bone conduction testing
 - ♦ speech audiometry
 - ♦ impedance audiometry

Management

- counsel about noise control and hearing protection programs (Grade A evidence)
- investigations in patients with unexplained sensorineural hearing loss
 - blood sugar, CBC+ differential, TSH, syphilis testing
- referral
 - refer patients with hearing loss for a complete audiological examination
 - unclear etiology of hearing loss: referral to ENT
 - **sudden hearing loss: urgent referral** as treatment success is related to early treatment
- patients with progressive asymmetric sensorineural hearing loss should have an MRI/CT scan to exclude vestibular schwannoma (acoustic neuroma)
- hearing amplification (e.g. hearing aids), assistive listening devices, and cochlear implants can dramatically improve quality of life

Does this Patient have Hearing Impairment?
JAMA 2006;295:416-428

Purpose: To evaluate bedside clinical maneuvers used to evaluate the presence of hearing impairment.

Study: Evidence-based review of studies examining the accuracy or precision of screening questions and tests. 24 studies were included in this analysis.

Conclusions: Elderly patients who admit to having hearing impairment should be offered audiometry, while those who do not should undergo a whispered-voice test. Those who hear the whispered voice require no further testing, while those who do not require audiometry. The Weber and Rinne tests are not useful in screening for hearing impairment.

Hypertension

Hypertension Guidelines are reviewed and updated annually.

For up to date recommendations, please see www.hypertension.ca/chep

Epidemiology

- about 1 in 3 U.S. adults (67 million people) have HTN, only half of these individuals are able to control their condition
- 3rd leading risk factor associated with death

Definition

- HTN
 - BP $\geq 140/90$ mmHg, unless DM ($\geq 130/80$ mmHg), or age ≥ 80 yr ($\geq 150/90$ mmHg)
- isolated systolic HTN
 - sBP ≥ 140 and dBP < 90
 - associated with progressive reduction in vascular compliance
 - usually begins in 5th decade

Symptoms of HTN are usually NOT PRESENT (this is why it is called the "silent killer")

May have occipital headache upon awakening or organ specific complaints if advanced disease

Hypertensive Emergencies

- **Malignant HTN**
- **Cerebrovascular:**
 - Hypertensive encephalopathy
 - CVA
 - Intracerebral hemorrhage
 - SAH
- **Cardiac:**
 - Acute aortic dissection
 - Acute refractory LV failure
 - Myocardial infarction/ischemia
 - Acute pulmonary edema
- **Renal Failure**

- hypertensive urgency
 - sBP >210 or dBP >120 with minimal or no target-organ damage
- hypertensive emergency
 - severe HTN + acute target-organ damage
 - accelerated HTN
 - ♦ significant recent increase in BP over previous hypertensive levels associated with evidence of vascular damage on fundoscopy, but without papilledema
 - malignant HTN
 - ♦ sufficient elevation in BP to cause papilledema and other manifestations of vascular damage (retinal hemorrhages, bulging discs, mental status changes, increasing creatinine)

Etiology

- essential (primary) HTN (>90%)
 - undetermined cause
- secondary HTN (10%)
- watch for labile, “white coat” HTN (office-induced elevated BP)

Predisposing Factors

- family history
- obesity (especially abdominal)
- alcohol consumption
- stress
- sedentary lifestyle
- smoking
- male
- age >30
- excessive salt intake/fatty diet
- African American ancestry
- dyslipidemia

Table 23. Causes of Secondary Hypertension

	Common Cause		
Renal	Renovascular HTN Renal parenchymal disease, glomerulonephritis, pyelonephritis, polycystic kidney		
Endocrine	1° hyperaldosteronism Pheochromocytoma Cushing's syndrome Hyperthyroidism/hyperparathyroidism Hypercalcemia of any cause		
Vascular	Coarctation of the aorta Renal artery stenosis		
Drug-Induced	Estrogens/OCP MAOIs Cocaine	Steroids Lithium Amphetamines	NSAIDs Decongestants Alcohol

Investigations

- for all patients with HTN
 - electrolytes, Cr, fasting glucose and/or HbA1c, lipid profile, 12-lead ECG, urinalysis
 - self-measurement of BP at home is encouraged
- for specific patient subgroups
 - DM or CKD: urinary protein excretion
 - if suspected renovascular HTN: renal ultrasound, captopril renal scan (if GFR >60 mL/min), MRA/CTA (if normal renal function)
 - if suspected endocrine cause: plasma aldosterone, plasma renin
 - ♦ measured from morning samples taken from patients in sitting position after resting 15 min
 - ♦ discontinue aldosterone antagonists, ARBs, β -blockers, and clonidine prior to testing
 - if suspected pheochromocytoma: 24 h urine for metanephrines and creatinine
 - echocardiography for left ventricular dysfunction assessment if indicated

Renovascular HTN Suspected if Patient Presenting with 2 or More of:

- Sudden onset or worsening of HTN and age >55 or <30 yr
- Presence of abdominal bruit
- HTN resistant to 3 or more drugs
- Rise in Cr of 30% or more associated with use of an ACEI or ARB
- Other atherosclerotic vascular disease, particularly in patients who smoke or have dyslipidemia
- Recurrent pulmonary edema associated with hypertensive surges

Suspect Hyperaldosteronism when:

- HTN refractory to treatment with 3 or more drugs
- Spontaneous hypokalemia
- Profound diuretic-induced hypokalemia (<3.0 mmol/L)
- Incidental adrenal adenomas

Diagnosis

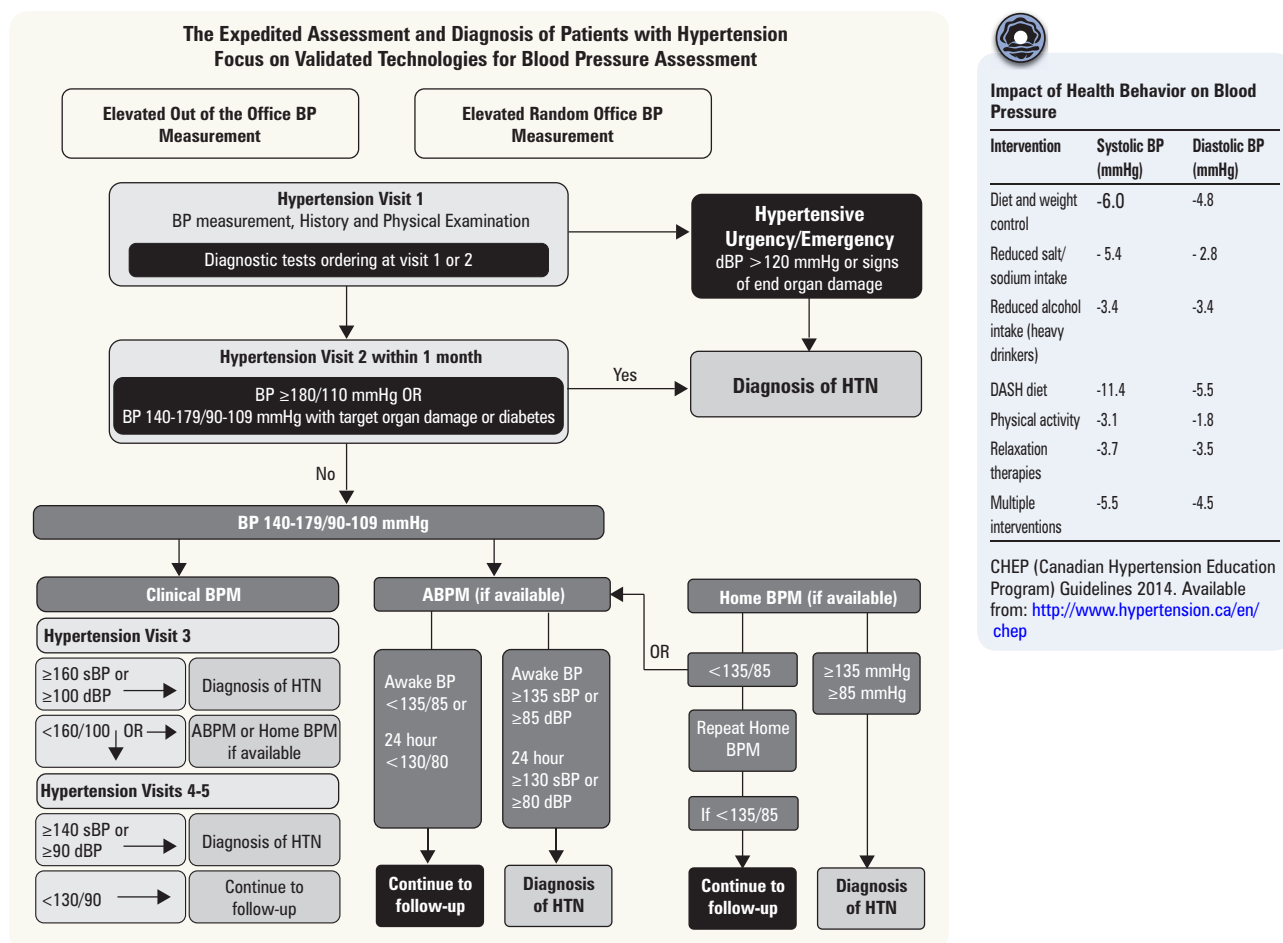

Figure 7. Assessment of patients with hypertension

Adapted from: CHEP 2014 Guidelines

Treatment

- target BP is <140/90 mmHg, <130/80 mmHg if DM
- lifestyle modification (in all HTN patients)
 - may be sufficient in patients with stage 1 HTN (140-159/90-99)
 - diet
 - follow Dietary Guidelines for Americans (see *Nutrition*, FM6) and Dietary Approaches to Stop HTN (DASH) (reduced cholesterol and saturated fats)
 - limit daily sodium intake to 65-100 mmol (1.5-2.3 g)
 - potassium/magnesium/calcium supplementations are NOT recommended for HTN
 - moderate intensity dynamic exercise: 30-60 min, 4-7 x/wk; higher intensity exercise is no more effective
 - smoking cessation
 - stress management
 - low-risk alcohol consumption (see *Alcohol*, FM12)
 - achieve and maintain a healthy BMI (18.5-24.9 kg/m²) and waist circumference (<40.2 in for men, <34.6 in for women); use multidisciplinary approach to weight loss
 - individualized cognitive behavioral interventions for stress management
- pharmacological
 - indications regardless of age (caution with elderly patients)
 - dBP ≥90 mmHg with target organ damage or independent cardiovascular risk factors
 - dBP ≥100 mmHg or sBP ≥160 mmHg without target organ damage or cardiovascular risk factors
 - sBP ≥140 with target organ damage
 - first line antihypertensives: thiazide/thiazide-like diuretic, ACEI (for non-African patients), ARB, long-acting CCB, β-blocker (if age <60)
 - if partial response to standard dose monotherapy, add another first-line drug
 - caution with combination of non-DHP CCB and β-blocker
 - combination of ACEI and ARB is not recommended
 - be cautious of hypokalemia in patients treated with thiazide/thiazide-like diuretic monotherapy
 - if still not controlled or adverse effects, can add other classes of anti-hypertensives

Table 24. Pharmacologic Treatment of Hypertension in Patients with Unique Conditions

Condition or Risk Factor	Recommended Drugs	Alternative Drugs	Not Recommended/Notes
Isolated Diastolic HTN	Thiazide diuretic, β -blocker, ACEI, ARB, or long-acting CCB (consider ASA and statin in select patients)	Combinations of first-line drugs	β -blocker monotherapy (age > 60) or combination of ACEI with an ARB
Isolated Systolic HTN	Thiazide diuretic, ARB, or long acting dihydropyridine CCB	Combinations of first-line drugs	Same as above
CAD	ACEI or ARB; β -blocker for patients with stable angina	Long acting CCB, when combination therapy for high risk patients, ACEI/DHP CCB is preferred	Short-acting CCB (nifedipine) or ACEI + ARB is not recommended dBP 60 mmHg may exacerbate MI
Prior MI	β -blocker + ACEI (ARB if cannot tolerate ACEI)	Long-acting CCB	ACEI + ARB combination is not recommended
Left Ventricular Hypertrophy	ACEI, ARB, thiazide, or long-acting CCB	Combination of additional agents	Hydralazine and minoxidil can increase LVH, thus not recommended
Cerebrovascular Disease (stroke/TIA)	ACEI + diuretic	Combination of additional agents	ACEI + ARB combination after a stroke is not recommended
Heart Failure	ACEI (ARB if ACEI intolerant) and β -blocker Spironolactone in patients with NYHA class II-IV	ARB in addition to ACEI Hydralazine/isosorbide dinitrate combination if ARB or ACEI not tolerated/contraindicated Thiazide or loop diuretic is recommended as additive therapy DHP CCB can also be used	Non-DHP CCB not recommended Carefully monitor for side effects if using ACEI + ARB
Dyslipidemias	Does not affect initial treatment recommendations	Combination of additional agents	
DM with Albuminuria (ACR >2.0 mg/mmol in men and >2.8 mg/mmol in women)	ACEI or ARB (DHP CCB > HCTZ for combination therapy with ACEI)	Add thiazide diuretic, cardioselective β -blocker, long acting CCB	If serum Cr > 150 μ mol/L, a loop diuretic should be considered instead of low-dose thiazide diuretic
DM without Albuminuria (criteria listed above)	ACEI, ARB, DHP CCB, or thiazide diuretic	Combination of first-line drugs or, first-line agents not tolerated, cardioselective β -blocker or non-DHP CCB	ACEI + ARB combination not recommended
Non-Diabetic Chronic Kidney Disease with Proteinuria (urinary protein >500 mg/24 h or ACR >30 mg/mmol)	ACEI (ARB if ACEI intolerant), diuretic as additive therapy	Thiazide for additive antihypertensive therapy, loop diuretic for volume overload	ACEI + ARB combination is not recommended
Renovascular Disease	Same as HTN without other indications		Caution in using ACEI or ARB – monitor for AKI
Asthma	K ⁺ -sparing + thiazide diuretic for patients on salbutamol		β -blocker, unless specific indications like angina or post-MI
Gout			Thiazide, but asymptomatic hyperuricemia is not a contraindication
Smoking	Low dose thiazide ACEI		β -blocker
Pregnancy	Methyldopa Hydralazine	Labetolol Nifedipine	ACEI
Elderly (> 60 yr)	As for uncomplicated isolated diastolic HTN, except for use of β -blocker		β -blocker not recommended as first line treatment
Emergency	BP > 169/90 = labetalol, nifedipine		
If > 3 Cardiovascular Risk Factors or Established Atherosclerotic Disease	Statin (age >40), low-dose ASA (age >50)		Caution with use of ASA in patients with uncontrolled BP

Adapted from: McAlister FA, Zamke KB, Campbell NRC, et al. The 2001 Canadian recommendations for the management of HTN: Part two – Therapy. *Can J Cardiol* 2002;18:625-641. The 2012 Canadian Hypertension Education Program Recommendations

**Calcium Channel Blockers**

Dihydropyridine CCBs

- amlodipine
- nifedipine
- felodipine

Non-Dihydropyridine CCBs

- diltiazem
- verapamil

**How to Combine Antihypertensive Medications (in general)****Thiazides as First-Line Antihypertensive Therapy – ALLHAT**

JAMA 2002;288:2981-2997

Study: Randomized, double-blind, active-controlled clinical trial with mean follow-up of 4.9 yr.

Patients: 33,357 participants (mean age 67 yr, 53% male, 47% white) with stage 1 or 2 HTN and at least one other CHD risk factor.

Intervention: Participants were randomly assigned to receive chlorthalidone (12.5-25 mg/d), amlodipine (2.5-10mg/d), or lisinopril (10-40 mg/d). Target BP was <140/90 mmHg, achieved by titrating the assigned study drug, and adding open-label agents when necessary.

Outcomes: The primary outcome was combined fatal CHD or non-fatal MI. Secondary outcomes were all-cause mortality, stroke, combined CHD, and combined CVD.

Results: There were no significant differences in either the primary outcome or all-cause mortality between treatment groups. For amlodipine vs. chlorthalidone, secondary outcomes were similar except for a higher 6 yr rate of heart failure with amlodipine (10.2% vs. 7.7%; $p < 0.001$). For lisinopril vs. chlorthalidone, lisinopril had higher 6 yr rates of combined CVD (33.3% vs. 30.9%; $p < 0.001$), stroke (6.3% vs. 5.6%; $p = 0.02$) and heart failure (8.7% vs. 7.7%; $p < 0.001$).

Conclusion: Thiazide-type diuretics are superior to CCB and ACEI for preventing one or more major forms of CVD, with similar risks of death and non-fatal MI.

**ACEI**

Not recommended as monotherapy in people of African descent

 **β -blocker**

Not recommended as first line for patients of age ≥ 60

Follow-Up

- assess and encourage adherence to pharmacological and non-pharmacological therapy at every visit
- lifestyle modification → q3-6mo
- pharmacological
 - q1-2mo until BP under target for 2 consecutive visits
 - more often for symptomatic HTN, severe HTN, antihypertensive drug intolerance, target organ damage
 - q3-6mo once at target BP
- referral is indicated for cases of refractory HTN, suspected secondary cause or worsening renal failure
- hospitalization is indicated for malignant HTN

Joint Pain

- see [Rheumatology, RH3](#)

**Table 25. Differential Diagnosis of Joint Pain**

Non-Articular		Articular		
Localized	Generalized	Inflammatory	Degenerative	Other
Bursitis Tendonitis Capsulitis	Fibromyalgia Polymyalgia rheumatica Myofascial pain syndrome	Seropositive <ul style="list-style-type: none"> • RA • Systemic lupus erythematosus • Scleroderma • Polymyositis/Dermatomyositis • Sjögren's syndrome Seronegative <ul style="list-style-type: none"> • Ankylosing spondylitis • Inflammatory bowel disease • Psoriatic arthritis • Reactive arthritis Crystal <ul style="list-style-type: none"> • Gout • Pseudogout • Hydroxyapatite Infectious/septic <ul style="list-style-type: none"> • Gonococcal • Non-gonococcal Systemic vasculitis disease	Primary <ul style="list-style-type: none"> • Familial Heberden's node • Osteoarthritis • Regional hip or knee Secondary <ul style="list-style-type: none"> • Metabolic • Hemophiliac • Neuropathic • Traumatic 	<ul style="list-style-type: none"> • Neoplastic • Drug-induced • Endocrine (hyperthyroid, hypothyroid, hyperparathyroid)

History

- number of joints involved: monoarticular, oligoarticular, polyarticular
- pattern of joints involved: symmetrical vs. asymmetrical, large vs. small joints, axial skeleton
- onset: acute vs. chronic (>6 wk)
- trauma, infection, medications (steroids, diuretics)
- morning stiffness (duration) vs. worse at end of day
- FHx of arthritis
- comorbidities: DM (carpal tunnel syndrome), renal insufficiency (gout), psoriasis (psoriatic arthritis), myeloma (low back pain), osteoporosis (fracture), obesity (OA)
- constitutional symptoms (neoplasm)

Physical Exam

- vitals
- specific joint exams
- systemic features (skin, nails, eyes, hands)

Investigations (Guided by the History and Physical Exam)

- general: CBC and differential, electrolytes, Cr
- acute phase reactants: ESR, CRP, ferritin, albumin, fibrinogen
- complement (C3, C4)
- urinalysis to detect disease complications (proteinuria, active sediment)
- serology (ANA, anti-dsDNA, HLA-B27, anti-Jo-1, anti-Sm, anti-La, anti-Ro, RhF, and anti-CCP, etc.)
- synovial fluid analysis (cell count + differential, culture, Gram stain, microscopy)
- tissue cultures
- radiology (plain film, CT, MRI, U/S, bone densitometry, angiography, bone scan)

**Signs and Symptoms of Inflammatory Arthritis****WARM(S) Joints**

Worse with rest, better with activity
Awakening in the latter half of the night
Redness around joint
Morning stiffness (>30 min)
Soft tissue swelling, erythema

**Systemic Features**

- Fever (SLE, infection)
- Rash (SLE, psoriatic arthritis)
- Nail abnormalities (psoriatic, reactive arthritis)
- Uveitis (psoriatic, reactive arthritis, ankylosing spondylitis)
- Myalgias (fibromyalgia, myopathy)
- Weakness (polymyositis, neuropathy)
- GI symptoms (scleroderma, IBD)
- GU symptoms (reactive arthritis, gonococcemia)

Treatment

- patient education including lifestyle modifications
- physiotherapy, occupational therapy
- manage pain (acetaminophen, NSAIDs)
- treat specific causes (e.g. antibiotics, DMARDs etc., see [Rheumatology, RH30](#))

**Red Flags**

Bowel or bladder dysfunction
Anesthesia (saddle)
Constitutional symptoms/malignancy
Chronic disease
Paresthesias
Age >50 and mild trauma
IV drug use/Infection
Neuromotor deficits

Low Back Pain

- see [Orthopedics, OR23](#)
- see <https://www.bigbackpain.com> for more information

Definition

- acute: <6 wk
- subacute: 6-12 wk
- chronic: >12 wk

Epidemiology

- 5th most common reason for visiting a physician
- lifetime prevalence: 90%
- peak prevalence: age 45-60
- most common cause of chronic disability for individuals <45 yr old
- 90% resolve in 6 wk, <5% become chronic

Etiology

- source of pain can be local, radicular, referred, or related to a psychiatric illness
- 98% are mechanical causes
 - pain is worse with movement, better with rest
 - sprain (ligament), strain (muscle), facet joint degeneration, disc degeneration/herniation, spinal stenosis (e.g. spondylosis), spondylolisthesis, compression fracture, pregnancy
- 2% are non-mechanical causes
 - most concerning when pain is worse at rest and does not change with position
 - surgical emergencies:
 - ♦ cauda equina syndrome (areflexia, lower extremity weakness, decreased anal tone, saddle anesthesia, fecal incontinence, urinary retention), AAA (pulsatile abdominal mass)
 - medical conditions
 - ♦ neoplastic (primary, metastatic, multiple myeloma)
 - ♦ infectious (osteomyelitis, TB)
 - ♦ metabolic (osteoporosis, osteomalacia, Paget's disease)
 - ♦ rheumatologic (ankylosing spondylitis, polymyalgia rheumatica)
 - ♦ referred pain (perforated ulcer, pancreatitis, pyelonephritis, ectopic pregnancy, herpes zoster)

Physical Exam

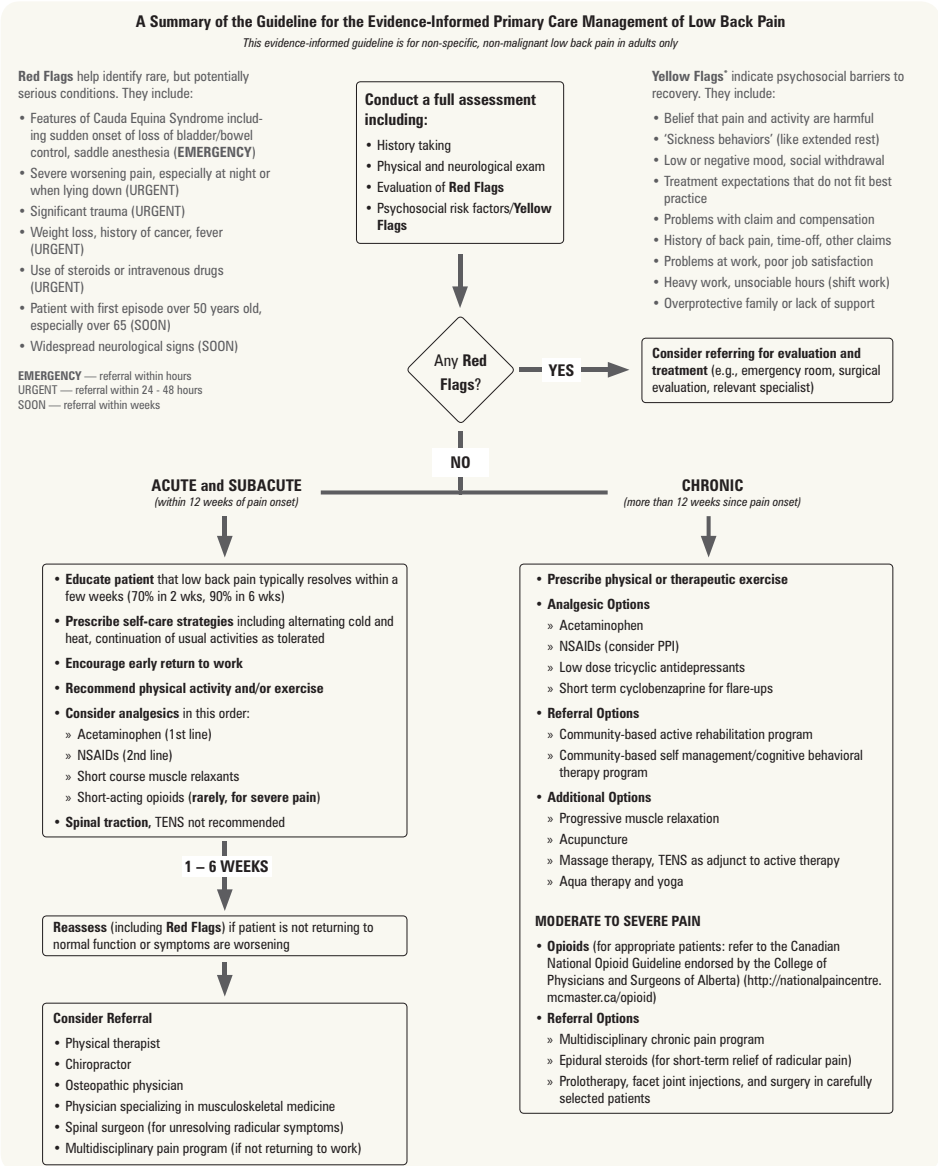

- inspection: curvature, posture, gait
- palpation: bony deformities/tenderness, paraspinal muscle bulk/tenderness, trigger points
 - percussion of spine to elicit pain due to fracture or infection
- ROM and peripheral pulses
- neurologic exam for L4/L5/S1 helps determine level of spinal involvement (power, reflexes, sensation)
- special tests
 - straight leg raise (positive if pain at <70 degrees and aggravated by ankle dorsiflexion), positive test is indicative of sciatica
 - crossed straight leg raise (raising of uninvolved leg elicits pain in leg with sciatica), more specific than straight leg raise
 - femoral stretch test (patient prone, knee flexed, examiner extends hip) to diagnose L4 radiculopathy

Investigations

- plain films not recommended in initial evaluation
- if infection/cancer suspected: CBC, ESR
- if neurologic deficits worsening or infection/cancer suspected: consider CT or MRI

**Indications for Lumbar Spine X-Ray**

- No improvement after 6 wk
- Fever >100.4°F
- Unexplained weight loss
- Prolonged corticosteroid use
- Significant trauma
- Progressive neurological deficit
- Suspicion of ankylosing spondylitis
- History of cancer (rule out metastases)
- Alcohol/drug abuse (increased risk of osteomyelitis, trauma, fracture)

Massage for Low Back Pain
Cochrane DB Syst Rev 2008;4:CD001929
This meta-analysis of 13 randomized trials assessed the use of massage therapy for non-specific low back pain compared to other active or sham treatments.
Conclusions: For some patients with subacute or chronic non-specific low back pain, massage may be beneficial, especially with education and exercises. Some evidence suggests that acupuncture massage may be more effective than classic massage but more studies are required to confirm these results.

Spinal Manipulative Therapy for Chronic Low-Back Pain
Cochrane DB Syst Rev 2011;2:CD008112
Methods: Systematic review of 39 RCTs that compared spinal manipulative therapy with other therapies for low back pain.
Findings: For acute and chronic low back pain, spinal manipulative therapy was superior only to sham therapy or therapies judged to be ineffective or even harmful. It had no statistical or clinical advantage over analgesics, physical therapy, exercises, back school, or physician care.
Conclusions: For acute and chronic low back pain, there is no evidence that spinal manipulative therapy is superior to other treatments.

Spinal Manipulative Therapy (SMT) for Acute Low-Back Pain
Cochrane DB Syst Rev 2012;9:CD008880
Conclusions: SMT is no more effective in participants with acute low-back pain than inert interventions, sham SMT, or when added to another intervention. SMT also appears to be no better than other recommended therapies.

Figure 8. Low back pain treatment
Reprinted with permission from: Kendall NAS, et al. Guide to Assessing Psycho-Social Yellow Flags in Acute Low Back Pain. ACC & NZGG, Wellington, NZ. (2004 ed.); Toward Optimized Practice. Guideline for the evidence-informed primary care management of low back pain. 2nd ed. 2007. Available from: www.topalbertadoctors.org

Table 26. Approach to Non-Traumatic Low Back Pain

	Back Dominant (Pain greatest above gluteal fold)		Leg Dominant (Pain greatest below gluteal fold)	
History	Pattern 1 Worse with flexion Constant/intermittent	Pattern 2 Worse with extension Never worse with flexion Always intermittent	Pattern 3 Pain changes with back movement/ position Currently/previously constant	Pattern 4 Worse with activity Improves with rest and posture change Intermittent/short duration
Physical Exam	Normal neuro exam <u>Fast responder</u> • Improves with extension <u>Slow responder</u> • No change or worsens with extension	Normal neuro exam ± improves with flexion Worse with extension	Leg pain can improve but not disappear Positive straight leg raise ± conduction loss <u>Fast responder</u> • Improves with specific back position <u>Slow responder</u> • Not better with position changes	No irritative findings ± conduction loss
Likely Pathology	Arising from intervertebral discs or adjacent ligaments	Posterior joint complex (associated ligaments and capsular structures)	Sciatica	Neurogenic claudication
Initial Management	Scheduled extension Lumbar roll Night lumbar roll Medication as required	Scheduled flexion Limited extension Night lumbar roll Medication as required	Prone extension Supine “Z” lie Lumbar roll Night lumbar roll Medication as required	Abdominal exercises Night lumbar roll Sustained flexion Pelvic tilt Medication as required

Menopause/Hormone Replacement Therapy

- see [Gynecology](#), GY31

Epidemiology

- mean age of menopause = 51.4 yr
- a woman will spend over 1/3 of her life in menopause

Clinical Features

- associated with estrogen deprivation
- urogenital tract: atrophy, vaginal dryness/itching, urinary frequency/urgency/incontinence, bleeding
- blood vessels and heart: vasomotor instability (e.g. hot flashes), increased risk of heart disease
- bones: bone loss, joint/muscle/back pain, fractures, loss of height
- brain: depression, irritability, mood swings, memory loss

Management

- encourage physical exercise, smoking cessation, and a balanced diet with adequate intake/supplementation of calcium (1,200-1,500 mg/d) and vitamin D (800-2,000 IU/d)
- hormone replacement therapy (HRT)
 - prescribe for moderate to severe symptoms for no longer than 5 yr; routine use is not recommended
 - regimens: cyclic estrogen-progestin, continuous estrogen-progestin, estrogen only (if no uterus), estrogen patch/gel/cream/ring/vaginal tablet
 - decreases risk of osteoporotic fractures, colorectal cancer
 - increases risk of breast cancer, coronary heart disease, stroke, DVT, and PE
 - initiation of HRT requires a thorough discussion of short- and long-term benefits and risks
- consider venlafaxine, SSRIs, or gabapentin to ease vasomotor instability

Osteoarthritis

- see [Rheumatology](#), RH5

Epidemiology

- most common form of arthritis seen in primary care
- prevalence is 10-12% and increases with age
- results in long-term disability in 2-3% of patients with OA
- almost everyone over the age of 65 shows signs of OA on x-ray, but only 33% of these individuals will be symptomatic

Clinical Features

- joint pain with activity, improved with rest, morning stiffness or gelling <30 min
- deformity, bony enlargement, crepitus, limitation of movement, periarticular muscle atrophy
- usually affects distal joints of hands, spine, hips, and knees

Investigations

- no laboratory tests for the diagnosis of OA
- hallmark radiographic features: joint space narrowing, subchondral sclerosis, subchondral cysts, osteophytes

Management

- goals: relieve pain, preserve joint motion and function, prevent further injury
- conservative
 - patient education, weight loss, low-impact exercise (OT/PT), assistive devices (e.g. canes, orthotics, raised toilet seats)
- pharmacological
 - consider comorbidities such as PUD, HTN, IHD, hepatic disease, and renal disease
 - medications do not alter natural course of OA
 - 1st line: acetaminophen up to 4 g/d (OA is not an inflammatory disorder)
 - 2nd line: NSAIDs in the lowest effective dose for the shortest duration of time, along with gastroprotection; COX-2 selective inhibitors (celecoxib/Celebrex®, Meloxicam/Mobicox®) are recommended if long-term treatment or if high risk for serious GI problems
 - combination analgesics (e.g. acetaminophen and codeine)
 - intra-articular hyaluronic acid injections
 - intra-articular corticosteroid injections (no more than 3-4x/yr) may be helpful in acute flares (benefits last 4-6 wk, can be up to 6 mo)
 - topical NSAID (diclofenac/Pennsaid®)
 - capsaicin cream (Zostrix®)
 - oral glucosamine
- surgery
 - consider if persistent significant pain and functional impairment despite optimal pharmacotherapy (e.g. debridement, osteotomy, total joint arthroplasty)

Figure 9. Common sites of involvement in OA

Glucosamine Therapy for Treating Osteoarthritis

Cochrane DB Syst Rev 2005;2:CD002946

This meta-analysis of 25 single- and double-blinded randomized controlled trials with 4,963 patients compared glucosamine treatment, administered by any route, against placebo or another treatment.

Conclusions: Glucosamine can decrease pain and functional impairment resulting from OA and is not associated with any side effects compared to placebo. Differences in the effectiveness of Rotta and non-Rotta preparations highlight variability between glucosamine preparations and patients should be made aware of this.

Osteoporosis

- see [Endocrinology, E42](#)
- for current guidelines and tools see National Osteoporosis Foundation: <http://nof.org/hcp/clinicians-guide>
- age-related disease characterized by decreased bone mass and increased susceptibility to fractures
- about 9.9. million Americans are affected by osteoporosis, while an additional 43.1 million have low bone density
- approximately 1 in 2 women and up to 1 in 4 men ≥ 50 yr will sustain fractures due to osteoporosis

Encourage basic bone health for all individuals over age 50, including regular active weight-bearing exercise, calcium (diet and supplements) 1,200 mg daily, vitamin D 800-2,000 IU (20-50 µg) daily and fall-prevention strategies

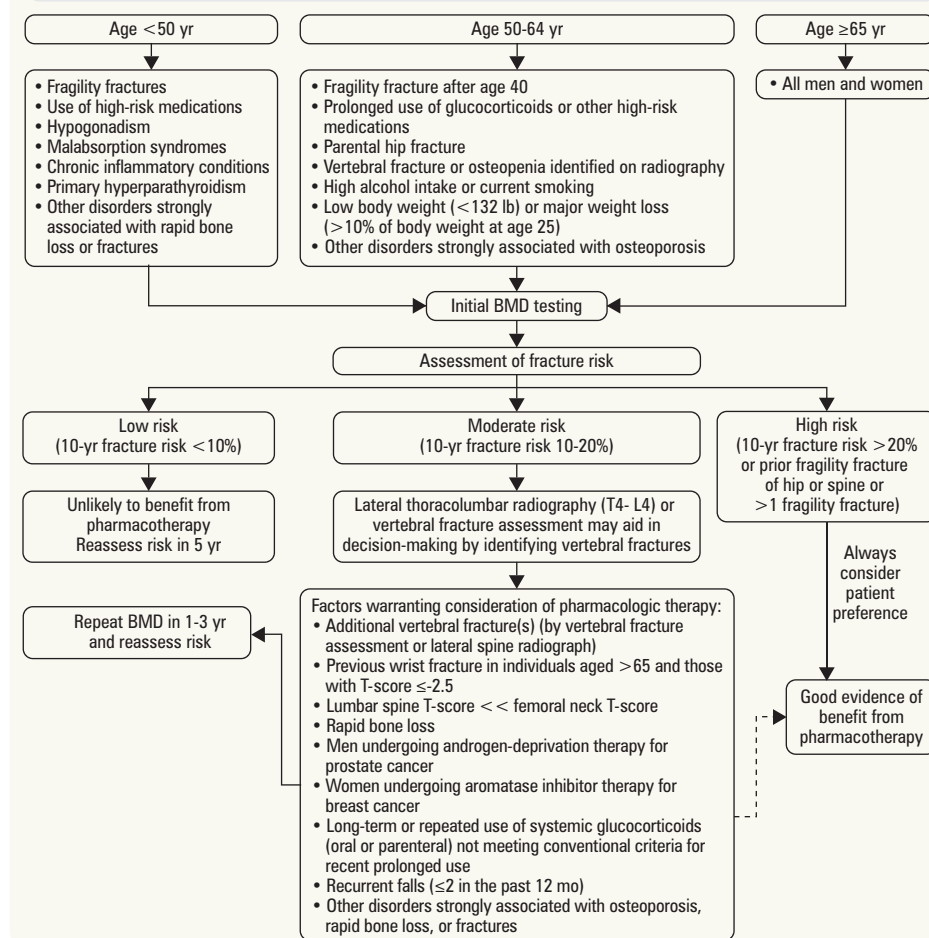

Figure 10. 2010 Clinical practice guidelines for the diagnosis and management of osteoporosis in Canada (integrated management model). Adapted from: *CMAJ* 2010;182:1864-1873

Management

- see [Endocrinology, E44](#)

Palliative and End-of-Life Care

- see [Geriatrics, GM12](#)

Disorders Strongly Associated with Osteoporosis include:

Primary hyperparathyroidism, type 1 DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (< 45 yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD, and chronic inflammatory conditions (e.g. IBD)

10 Yr Fracture Risk Assessment

FRAX (WHO Fracture Risk Assessment Tool) and CAROC (Canadian Association of Radiologists and Osteoporosis Canada) have been validated in the Canadian Population. FRAX and CAROC are available online from: <https://www.osteoporosis.ca/health-care-professionals/clinical-tools-and-resources/>

How much Calcium do we Need?

Age	
4-8	1,000 mg
9-18	1,300 mg
19-50	1,200 mg
> 50	1,200 mg
Pregnant and lactating women 19-50	1,000 mg

Calcium Content of Common Foods

- 1 cup milk = 300 mg
- $\frac{3}{4}$ cup yogurt = 332 mg
- $\frac{1}{2}$ can salmon with bones = 240 mg
- $\frac{1}{2}$ cup cooked broccoli = 33 mg
- 1 medium orange = 50 mg

Vitamin D Content in Food

- Milk fortified with vitamin D₃ contains 100 IUs per 250 mL glass
- Foods such as margarine, eggs, chicken livers, salmon, sardines, herring, mackerel, swordfish, and fish oils (halibut and cod liver oils) all contain small amounts; supplementation is necessary to obtain adequate levels as dietary intake has minimal impact
- Most multivitamins provide 400 IUs of vitamin D₃

Rash

- see [Dermatology, D5](#)

ATOPIC DERMATITIS

- clinical features
 - affects all ages but is more common in children
 - pruritus is the most common symptom; scratching worsens the rash creating a vicious cycle
- treatment
 - goals: limit itching, repair skin
 - moisturizers, emollients, topical corticosteroids; oral corticosteroids and topical calcineurin inhibitors may be used

SEBORRHEIC DERMATITIS

- clinical features
 - affects all ages but is most common in infants within the first 3 mo of life (e.g. pityriasis capitis or “cradle cap”) and adults age 30-60
 - affects the scalp, central face, and anterior chest; often presents as scalp scaling (dandruff) in adolescents and adults
 - may cause mild to marked erythema of the nasolabial fold, often with greasy scaling
- treatment
 - topical antifungals, topical low-potency steroids; topical calcineurin inhibitors may be used

ROSACEA

- clinical features
 - stages: (1) facial flushing, (2) erythema and/or edema and ocular symptoms, (3) papules and pustules, (4) rhinophyma
- treatment
 - topical or oral antibiotics, oral retinoids
 - laser treatment may be an option for progressive telangiectasis or rhinophyma
 - referral may be required to manage rhinophyma, ocular complications, or severe disease

ACNE VULGARIS

- clinical features
 - types: (I) comedonal, (II) papular, (III) pustular, (IV) nodulocystic
 - predilection for the face, neck, upper chest, and back
- treatment
 - mild acne: topical treatments (antibiotics, benzoyl peroxide, retinoids)
 - moderate acne: after topical treatments have failed, add oral antibiotics and consider hormonal therapy
 - severe acne: consider systemic retinoids

ONYCHOMYCOSIS (TINEA UNGUIUM)

- definition: fungal infection of the nail bed, matrix, or plate
- clinical features
 - occurs primarily in adults, most commonly after age 60
 - crumbling, distally dystrophic nails; yellowish, opaque with subungual hyperkeratotic debris
 - toenails are affected more often than fingernails
- investigations
 - microscopy of subungual scrapings under KOH preparation, culture
- treatment
 - oral antifungals (terbinafine/Lamisil®, itraconazole/Sporanox®), topical antifungals (ciclopirox/Loprox®)

Sexually Transmitted Diseases

- see [Gynecology, GY25](#)

Definition

- diverse group of infections caused by multiple microbial pathogens
- transmitted by either secretions or fluids from mucosal surfaces

Epidemiology

- high incidence rates worldwide
- American prevalence in clinical practice
 - common: chlamydia (most common), gonorrhea (2nd most common), HPV, genital herpes (increasing incidence of chlamydia and gonorrhea)
 - less common: hepatitis B, HIV, and syphilis (increasing in incidence), trichomoniasis
 - rare: chancroid, granuloma inguinale, lymphogranuloma venereum
- non-sexually transmitted genital tract infections: vulvovaginal candidiasis (VVC), bacterial vaginosis (BV)
- three most common infections associated with vaginal discharge in adult women are BV, VVC, and trichomoniasis

History

- sexual history
 - age of first intercourse, sexual orientation, sexual activity (oral, anal, and/or vaginal intercourse), sexual activity during travel
 - total number of partners in the past yr/mo/wk and duration of involvement with each
- STD history
 - STD awareness, contraception, previous STDs and testing (including Pap tests), partner communication regarding STDs
 - local symptoms such as burning, itching, discharge, sores, vesicles, testicular pain, dysuria, abdominal pain
 - systemic symptoms such as fever, lymphadenopathy, arthralgia

Investigations/Screening

- individuals at increased risk, even those who are asymptomatic, should be screened for chlamydia, gonorrhea, hepatitis B, HIV, and syphilis
- Pap test if none performed in the preceding 12 mo

Management

- primary prevention is vastly more effective than treating STDs and their sequelae
- offer hepatitis B vaccine if not immune, offer Gardasil® to women under age 26
- discuss STD risk factors (e.g. decreasing the number of sexual partners)
- direct advice to ALWAYS use condoms or to abstain from intercourse
- condoms are not 100% effective against HPV or HSV
- an STD patient is not considered treated until the management of his/her partner(s) is ensured (contact tracing by Public Health)
- patients diagnosed with bacterial STD or trichomonal infection should abstain from sexual activity until treatment completion and for 7 d after treatment for both partners, or until test of cure completed
- mandatory reporting: chlamydia, gonorrhea, hepatitis B, HIV, syphilis

STD Risk Factors

- Sexually active males and females <25 yr old
- Unprotected sex, sexual contact with a known case of STD, previous STD
- New sexual partner or >2 sexual partners in the past 12 mo
- Street involved, homeless, and/or substance abuse

When an STD is detected in a prepubertal child, evaluation for sexual abuse is mandatory

Sexual History

5 P's

Partners (numbers, gender)

Practices (vaginal, oral, anal insertive/receptive)

Protection

Pregnancy prevention

Prophylactic Vaccination Against Human Papillomavirus Infection and Disease in Women: A Systematic Review of Randomized Controlled Trials

CMAJ 2007;177:469-479

Purpose: To evaluate prophylactic HPV vaccination in preventing high- and low-grade cervical lesions, persistent HPV infection, external genital lesions, adverse events, and death using meta-analysis.

Studies: 9 reports from 6 different trials with 40,323 patients were included and all studies were of high methodologic quality. Three studies used the quadrivalent vaccine, two used the bivalent, and one used a monovalent. The longest mean duration of follow-up was 48 mo.

Results: Prophylactic HPV vaccination decreased the frequency of high-grade cervical lesions caused by vaccine-type HPV strains compared to the control group (OR 0.14; 95% CI 0.09-0.21). Vaccinations also prevented persistent HPV infection, low-grade lesions and genital warts, and the reported adverse events were mostly minor. Compared to placebo, there was no difference in serious adverse events or death.

Conclusion: Prophylactic HPV vaccination is highly efficacious in preventing infection and precancerous cervical disease in women aged 15-25 who have not previously been infected with vaccine-type HPV strains.

Table 27. Diagnosis and Treatment of Common STDs

	Signs and Symptoms	Investigations	Treatment	Complications
Gonococcal Urethritis/Cervicitis (<i>Neisseria gonorrhoeae</i>)	M: urethral discharge, unexplained pyuria, dysuria, irritation, testicular swelling, Sx of epididymitis F: mucopurulent endocervical discharge, vaginal bleeding, dysuria, pelvic pain, dyspareunia M and F: often asymptomatic, can involve rectal symptoms in cases of unprotected anal sex	M: urethral swab for Gram stain and culture F: urine PCR, endocervical swab for Gram stain and culture, vaginal swab for wet mount (to rule out trichomonas) M and F: urine PCR, rectal/pharyngeal swabs if indicated	Ceftriaxone 250 mg IM single dose* If risk factors for treatment failure (e.g. pregnancy, pharyngeal/rectal infection, potentially reduced susceptibility) → Test of cure: culture 4 d post-treatment (preferred) or urine PCR 2 wk post treatment (alternative) If no risk factors, rescreen 6-12 mo post treatment	M: urethral strictures, epididymitis, infertility F: PID, infertility, ectopic pregnancy, perinatal infection, chronic pelvic pain M and F: Arthritis, increased risk of acquiring and transmitting HIV
Non-Gonococcal Urethritis/Cervicitis (Usually <i>Chlamydia trachomatis</i>)	~70% asymptomatic If symptoms appear (usually 2-6 wk after infection) then similar to gonococcal symptoms (see above)	Same as above	Azithromycin 1 g PO single dose + gonococcal urethritis/cervicitis Rx* Same F/U as above	Same as above
Human Papillomavirus (genital warts, cervical dysplasia)	Most are asymptomatic M: cauliflower lesions (condylomata acuminata) on skin/mucosa of penile or anal area F: cauliflower lesions and/or pre-neoplastic/neoplastic lesions on cervix/vagina/vulva	None needed if simple condylomata Potential biopsy of suspicious lesions F: screening for cervical dysplasia through regular Pap smears	For condylomata: cryotherapy, electrocautery, laser excision, topical therapy (patient-applied or office-based) For cervical dysplasia: colposcopy and possible excision, dependent on grade of lesion	M and F: anal cancer MSM and F who have receptive anal sex: rectal cancer F: cervical/vaginal/vulvar cancer
Genital Herpes (HSV-1 and -2)	1° episode: painful vesiculoculcerative genital lesions ± fever, tender lymphadenopathy, protracted course Recurrent episodes: less extensive lesions, shorter course may have "trigger factors"	Swab of vesicular content for culture, type-specific serologic testing for HSV-1 vs. HSV-2 antibodies and to determine 1° vs. recurrent episode	1° episode: Acyclovir 200 mg PO 5x/d x 5-10 d or Famciclovir 250 mg PO tid x 5 d or Valacyclovir 1,000 mg PO bid x 10 d Recurrent Episode: Acyclovir 200 mg PO 5x/d x 5d or 800 mg PO tid x 2 d or Famciclovir 125 mg PO bid x 5 d or Valacyclovir 500 mg PO bid x 3 d or 1,000 mg PO OD x 3 d	Genital pain, urethritis, cervicitis, aseptic meningitis, increased risk of acquiring and transmitting HIV
Infectious Syphilis (<i>Treponema pallidum</i>)	1°: chancre (painless sore), regional lymphadenopathy 2°: rash and flu-like symptoms, meningitis, H/A, uveitis, retinitis, condyloma lata, mucus lesions, alopecia Latent Phase: asymptomatic 3°: neurologic, cardiovascular, and tissue complications	Specimen collection from 1° and 2° lesions, screen high risk individuals with serologic syphilis testing (VDRL), universal screening of pregnant women	Benzathine penicillin G IM (dose depends on stage and patient population) Notify partners (last 3-12 mo) Continuous F/U and testing until patients are seronegative	Chronic neurologic and cardiovascular sequelae, increased risk of acquiring and transmitting HIV

F = females; M = males

*N.B. if urethritis/cervicitis is suspected, always treat for both gonococcal and non-gonococcal types (i.e. ceftriaxone AND azithromycin)

Sinusitis

- see [Otolaryngology](#), OT25

Etiology

- viral etiology is more common
- viral: rhinovirus, influenza, parainfluenza
- bacterial: *S. pneumoniae*, *H. influenzae*, *M. catarrhalis*

Management of Acute Sinusitis

- may provide symptom relief: oral analgesics (acetaminophen, NSAIDs), nasal saline rinse, short-term use of topical or oral decongestants
- do not prescribe antihistamines
- intra-nasal corticosteroids if diagnosed with mild to moderate acute bacterial sinusitis
- antibiotics and intra-nasal corticosteroids if diagnosed with severe acute bacterial sinusitis
- ENT referral if: anatomic defect (e.g. deviated septum, polyp, adenoid hypertrophy), failure of second-line therapy, ≥4 episodes/yr, development of complications (e.g. mucocele, orbital extension, meningitis, intra-cranial abscess, venous sinus thrombosis)

Red Flags for Urgent Referral

- Altered mental status
- Headache
- Systemic toxicity
- Swelling of the orbit or change in visual acuity or EOM
- Hard neurological findings
- Signs of meningeal irritation
- Suspected intra-cranial complications (meningitis, intra-cranial abscess, cavernous sinus thrombosis)
- Involvement of associated structures (periocular cellulitis, Pott's puffy tumor)

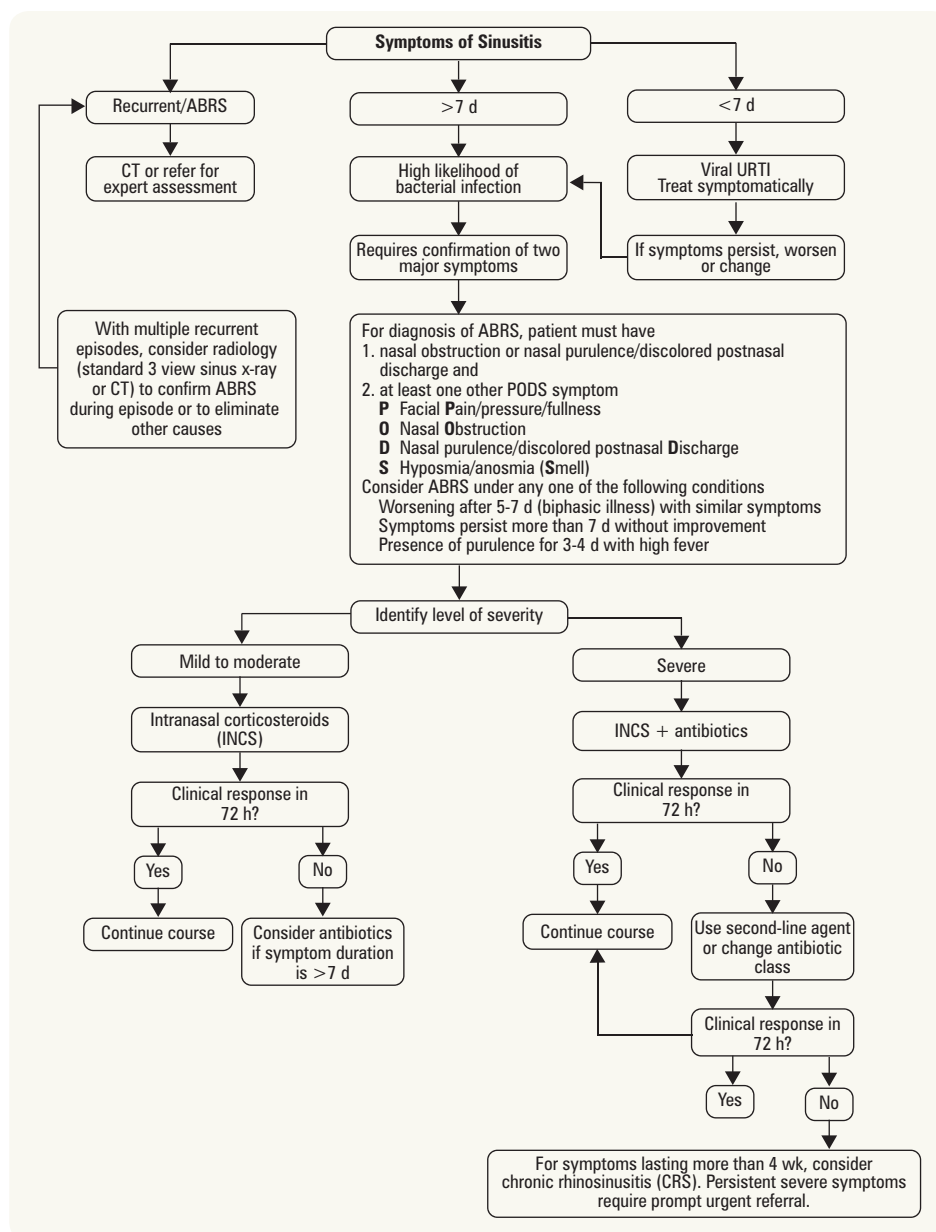

Figure 11. Diagnosis and management of sinusitis

ABRS = acute bacterial rhinosinusitis

Adapted from: Desrosiers M, et al. *Allergy Asthma Clin Immunol* 2011;7:doi:10.1186/1710-1492-7-2

Sleep Disorders

- see [Respirology](#), R31 and [Neurology](#), N45

Definition

- most often characterized by one of three complaints:
 - insomnia
 - ♦ difficulty falling asleep, difficulty maintaining sleep, early-morning waking, non-refreshing sleep
 - parasomnias
 - ♦ night terrors, nightmares, restless leg syndrome, somnambulism (performing complex behavior during sleep with eyes open but without memory of event)
 - excessive daytime sleepiness

Epidemiology

- 1/3 of patients in primary care setting have occasional sleep problems, 10% have chronic sleep problems

Etiology

- primary sleep disorders
 - primary insomnia, narcolepsy, obstructive sleep apnea, restless leg syndrome, periodic limb movements of sleep
- secondary causes
 - medical: COPD, asthma, CHF, hyperthyroidism, chronic pain, BPH, menopause, GERD, PUD, pregnancy, neurological disorders
 - drugs: alcohol, caffeine, nicotine, nicotine replacement therapy, β -agonists, antidepressants, steroids
 - psychiatric: mood and anxiety disorders
 - lifestyle factors: shift work, jet-lag

Investigations

- complete sleep diary every morning for 1-2 wk
 - record bedtime, sleep latency, total sleep time, awakenings, quality of sleep
- rule out specific medical problems (e.g. CBC and differential, TSH)
- refer for sleep study, nocturnal polysomnogram, or daytime multiple sleep latency test if suspicion of sleep apnea or periodic leg movements of sleep

Treatment of Specific Problems

- primary insomnia
 - majority of cases
 - person reacts to insomnia with fear or anxiety around bedtime or with a change in sleep hygiene, which can progress to a chronic disorder (psychophysiological insomnia)
 - treat any suspected medical or psychiatric cause
 - behavior based treatment
 - ♦ sleep hygiene: avoid alcohol, caffeine, nicotine; comfortable sleep environment; regular sleep schedule; no napping
 - ♦ exercise regularly, avoid heavy exercise within 3 h of bedtime
 - ♦ relaxation therapy: deep breathing, meditation, biofeedback
 - ♦ stimulus control therapy: re-association of bed/bedroom with sleep, re-establishment of a consistent sleep-wake schedule, reduce activities that cue staying awake
 - ♦ sleep restriction therapy: total time in bed should closely match the total sleep time of the patient (improves sleep efficacy)
 - ♦ CBT: address inappropriate beliefs and attitudes that perpetuate dysfunctional sleep
 - pharmacologic treatment
 - ♦ short-acting benzodiazepines (e.g. lorazepam, oxazepam, temazepam) at the lowest effective dose should be used <7 consecutive nights to break cycle of chronic insomnia or to manage an exacerbation of previously controlled primary insomnia
 - ♦ non-benzodiazepines: eszopiclone (Lunesta®), zolpidem (Ambien®), melatonin, low dose anti-depressants with sedating properties (amitriptyline, trazadone, mirtazapine)
 - ♦ follow-up every 2-4 wk initially (to reinforce behavioral interventions and renew/consider pharmacotherapy) then every 3 mo; if no progress or limited improvement, consider referral to sleep medicine program
- snoring
 - results from soft tissue vibration at the back of the nose and throat due to turbulent airflow through narrowed air passages
 - physical exam: obesity, nasal polyps, septal deviation, hypertrophy of the nasal turbinates, enlarged uvula and tonsils
 - investigations (only if severely symptomatic): nocturnal polysomnography and airway assessment (CT/MRI)
 - treatment
 - ♦ sleep on side (position therapy), weight loss
 - ♦ nasal dilators (noninvasive external dilator made with elastic adhesive backing applied over nasal bridge), tongue-retaining devices, mandibular advancement devices
 - at risk of developing obstructive sleep apnea
- obstructive sleep apnea (OSA)
 - apnea (no breathing for ≥ 10 s) resulting from upper airway obstruction due to collapse of the base of the tongue, soft palate with uvula, and epiglottis; respiratory effort is present
 - leads to a distinctive snorting, choking, awakening type pattern as the body rouses itself to open the airway (resuscitative breath)
 - apneic episodes can last from 20 s to 3 min and occur 100-600 episodes/night
 - diagnosis is based on nocturnal polysomnography: >15 apneic/hypopneic episodes per h of sleep with arousal recorded
 - consequences
 - ♦ daytime somnolence, non-restorative sleep
 - ♦ poor social and work performance
 - ♦ mood changes: anxiety, irritability, depression
 - ♦ sexual dysfunction: poor libido, impotence

Risk Factors for Obstructive Sleep Apnea

- 2% of women, 4% of men between ages 30-60
- Obesity (due to upper airway narrowing). BMI > 28 kg/m² present in 60-90% of cases
- Children (commonly due to large tonsils and adenoids)
- Aging (due to decreased muscle tone)
- Persistent URTIs, allergies, nasal tumors, hypothyroidism (due to macroglossia), neuromuscular disease
- Family history

- ♦ morning headache (due to hypercapnia)
- ♦ HTN (2x increased risk), CAD (3x increased risk), stroke (4x increased risk), arrhythmias
- ♦ pulmonary HTN, right ventricular dysfunction, cor pulmonale (due to chronic hypoxemia)
- ♦ memory loss, decreased concentration, confusion
- investigations
 - ♦ evaluate BP, inspect nose and oropharynx (enlarged adenoids or tonsils)
 - ♦ blood gas not helpful, TSH if clinically indicated
 - ♦ nocturnal polysomnography
- treatment
 - ♦ modifiable factors: avoid sleeping supine; weight loss; avoid alcohol, sedatives, opioids; inhaled steroids if nasal swelling present; dental appliances to modify mandibular position
 - ♦ primary treatment of OSA is CPAP: maintains patent airway in 95% of OSA cases
 - ♦ surgery: somnoplasty, uvulopalatopharyngoplasty (UPPP), tonsillectomy, and adenoidectomy (in children)
 - ♦ report patient to Ministry of Transportation if OSA is not controlled by CPAP

Sore Throat (Pharyngitis)

Definition

- inflammation of the oropharynx
- may be caused by a wide range of infectious organisms, most of which produce a self-limited infection with no significant sequelae

Etiology

- viral: adenovirus, rhinovirus, influenza virus, RSV, EBV, coxsackie virus, herpes simplex virus, CMV, HIV
- bacterial: group A β -hemolytic *Streptococcus* (GABHS), group C and group β -hemolytic *Streptococcus*, *Neisseria gonorrhoeae*, *Chlamydia pneumoniae*, *Mycoplasma pneumoniae*, *Corynebacterium diphtheriae*

Epidemiology

- viral
 - most common cause (90% in adults is viral), occurs year round
- bacterial
 - GABHS
 - ♦ most common bacterial cause
 - ♦ occurs most often in winter months
 - ♦ 5-15% of adult cases and up to 50% of all pediatric cases of acute pharyngitis
 - ♦ most prevalent between 5-17 yr old

Clinical Features

- viral
 - pharyngitis, conjunctivitis, rhinorrhea, hoarseness, cough
 - nonspecific flu-like symptoms such as fever, malaise, and myalgia
 - often mimics bacterial infection
 - EBV (infectious mononucleosis)
 - ♦ pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
 - coxsackie virus (hand, foot, and mouth disease)
 - ♦ primarily late summer, early fall
 - ♦ sudden onset of fever, pharyngitis, headache, abdominal pain, and vomiting
 - ♦ appearance of small vesicles that rupture and ulcerate on soft palate, tonsils, pharynx
 - ♦ ulcers are pale gray and several mm in diameter, have surrounding erythema, and may appear on hands and feet
 - herpes simplex virus
 - ♦ like coxsackie virus but ulcers are fewer and larger
 - ♦ pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
- bacterial
 - symptoms: pharyngitis, fever, malaise, headache, abdominal pain, absence of cough
 - signs: fever, tonsillar or pharyngeal erythema/exudate, swollen/tender anterior cervical nodes, halitosis
 - complications: rheumatic fever, glomerulonephritis, suppurative complications (abscess, sinusitis, otitis media, cervical adenitis, pneumonia), meningitis, impetigo

Red Flags in Patients with "Sore Throat"

- Persistence of symptoms longer than 1 wk without improvement
- Respiratory difficulty (particularly stridor, croup, etc.)
- Difficulty in handling secretions (peritonsillar abscess)
- Difficulty in swallowing (Ludwig's angina)
- Severe pain in the absence of erythema (supraglottitis/epiglottitis)
- Palpable mass (neoplasm)
- Blood in the pharynx or ear (trauma)

Investigations

- suspected GABHS
 - see Table below for approach to diagnosis and management of GABHS
 - gold standard for diagnosis is throat culture
 - rapid test for streptococcal antigen: high specificity (95%) but low sensitivity (50-90%)
 - suspected EBV (infectious mononucleosis)
 - ♦ peripheral blood smear, heterophile antibody test (i.e. the latex agglutination assay or “monospot”)

Table 28. Modified Centor Score: Approach to Diagnosis and Management of GABHS

POINTS					
Cough absent?	1				
History of fever >100.4°F?	1				
Tonsillar exudate?	1				
Swollen, tender anterior nodes?	1				
Age 3-14	1				
Age 15-44	0				
Age >45	-1				
In communities with moderate levels of strep infection (10-20% of sore throats):					
Score	0	1	2	3	4 or more
Chance patient has strep	1-2.5%	5-10%	11-17%	28-35%	51-53%
Suggested action	NO culture or antibiotic		Culture all, treat with antibiotics only if culture is positive		Culture all, treat with antibiotics on clinical grounds ¹ , discontinue antibiotics if culture comes back negative

¹Clinical grounds include a high fever or other indicators that the patient is clinically unwell and is presenting early in the course of the illness

Limitations: *This score is not applicable to patients less than 3 yr of age

*If an outbreak or epidemic of illness caused by GABHS is occurring in any community, the score is invalid and should not be used

Adapted from: Centor RM, et al. *Med Decis Making* 1981;1:239-46; McIsaac WJ, et al. *CMAJ* 1998;158:75-83

Management

- viral pharyngitis
 - antibiotics not indicated
 - symptomatic therapy: acetaminophen/NSAIDs for fever and muscle aches, decongestants
- GABHS
 - antibiotic treatment decreases severity and duration of symptoms, risk of transmission (after 24 h of treatment), and risk of rheumatic fever and suppurative complications
 - incidence of glomerulonephritis is not decreased with antibiotic treatment
 - no increased incidence of rheumatic fever with 48 h delay in antibiotic treatment; if possible, delay antibiotic treatment until culture confirms diagnosis
 - routine F/U and/or post-treatment throat cultures are not required for most patients
 - F/U throat culture only recommended for: patients with history of rheumatic fever, patients of family member(s) with history of acute rheumatic fever, suspected streptococcal carrier
- infectious mononucleosis (EBV)
 - self-limiting course; antibiotics are not indicated
 - symptomatic treatment: acetaminophen/NSAIDs for fever, pharyngitis, malaise
 - avoid heavy physical activity and contact sports for at least 1 mo or until splenomegaly resolves because of risk of splenic rupture
 - if acute airway obstruction, give corticosteroids and consult ENT

Complementary and Alternative Medicine

Epidemiology

- 50-75% of Americans report some use of CAM over their lifetime, and only half will disclose this use to their physician
- more likely to be used by younger patients and those with higher education and income
- examples: chiropractic, acupuncture, massage, naturopathy, homeopathy, traditional Chinese medicine, craniosacral therapy, osteopathy

Herbal Products

- over 50% of Americans use natural health products (NHPs)
- most commonly used include echinacea, ginseng, ginkgo, garlic, St. John's wort, and soy
- relatively few herbal products have been shown to be effective in clinical trials
- many patients believe herbal products are inherently safe and are unaware of potential side effects and interactions with conventional medicines
- all NHPs must be regulated under The Natural Health Products Regulations as of January 1, 2004, including herbal remedies, homeopathic medicines, vitamins, minerals, traditional medicines, probiotics, amino acids, and essential fatty acids (e.g. omega-3)
- always ask patients whether they are taking any herbal product, herbal supplement, or other natural remedy. Further questions may include:
 - Are you taking any prescription or non-prescription medications for the same purpose as the herbal product?
 - Are you allergic to any plant products?
 - Are you pregnant or breastfeeding?
- information resources: National Center for CAM (www.nccam.nih.gov)

Most Common Uses of CAM

- Back/neck problems
- Gynecological problems
- Anxiety
- Headaches
- Digestive problems
- Chronic fatigue syndromes

Table 29. Common Herbal Products

Common Name	Reported Uses	Possible Adverse Effects	Possible Drug Interactions
Black Cohosh	Menopausal symptoms, PMS, labor induction, arthritis	Hepatitis, liver failure, headaches, GI discomfort, heaviness in legs, weight problems	None reported
Chamomile	Mild sedative, anxiolytic, GI complaints, common cold	Allergic/contact dermatitis, anaphylaxis	Anxiolytics, sedatives
Echinacea	Common cold, flu, wound treatment, UTI, cancer	Hypersensitivity, hepatotoxicity with prolonged use, avoid use if immunosuppressed	Potentiates warfarin
Evening Primrose	Dysmenorrhea, menopausal sx, inflammation, allergies, eczema, arthritis, MS	Headache, restlessness, nausea, diarrhea, may decrease seizure threshold	Anticoagulants, antiplatelets
Feverfew	Migraine prevention, RA, anti-inflammatory	Anxiety, upset stomach, skin rash, miscarriage	Anticoagulants, antiplatelets
Flaxseed Oil	Laxative, menopausal symptoms, source of omega-3 fatty acids	Diarrhea	Do not take with other medications as fiber content can bind drugs
Garlic	Elevated lipids, HTN, hyperglycemia, antimicrobial	GI irritation, contact dermatitis, may increase post-operative bleeding	Anticoagulants, potentiates antihypertensives
Ginger	Nausea, motion sickness, dyspepsia, anti-inflammatory	Heartburn, not to be used for morning sickness	None known
Ginkgo Biloba	Increases peripheral circulation (AD, dementia, intermittent claudication), premenstrual syndrome, vertigo	Headache, cramping, bleeding, mild digestive problems; reports of intracranial hemorrhage	Anticoagulants, thiazide diuretics, MAO inhibitors
Ginseng	Energy enhancer, decreases stress, adjunct support for chemotherapy/radiation	HTN, nervousness, insomnia, breakthrough bleeding, palpitations	Stimulant medications, antihypertensives, hormonal therapies
Glucosamine (Chondroitin)	Osteoarthritis	GI distress, headache, drowsiness, palpitations	Caution if shellfish allergy
Saw Palmetto	BPH, adjunct to finasteride	Mild GI distress	α -adrenergics, finasteride
St. John's Wort	Mild to moderate depression	Photosensitivity, increased liver enzymes, drowsiness, dizziness, nausea, headache	CNS depressants, contraindicated with indinavir
Valerian Root	Sedative, anxiolytic, muscle relaxant, PMS	Drowsiness, headache, digestive problems, paradoxical insomnia	CNS depressants, antihistamines

Zink T, Chaffin J. Herbal "health" products: What family physicians need to know, *American Family Physician* 1998;58:1133-1140; NIH National Center for Complementary and Alternative Medicine website (<http://nccam.nih.gov>)

Antimicrobial Quick Reference

Condition	Microorganisms	Antimicrobial
RESPIRATORY/ENT		
Acute Rhinitis (common cold)	Rhinovirus, coronavirus, influenza, RSV, parainfluenza, adenovirus	None
Pharyngitis (sore throat)	Rhinovirus, adenovirus, influenza, parainfluenza, coxsackievirus, coronavirus	None
Strep Pharyngitis	Group A β -Hemolytic <i>Streptococcus</i>	<p>Children:</p> <p><u>1st line:</u> penicillin V 40 mg/kg/d PO div bid-tid (max 750 mg/d) x 10 d (use adult dose if >27 kg)</p> <p>amoxicillin 40 mg/kg/d PO div bid-tid x 10 d</p> <p><u>2nd line:</u> erythromycin estolate 40 mg/kg/d PO div bid-tid x 10 d</p> <p><u>3rd line:</u> cephalexin 25-50 mg/kg/d PO div qid x 10 d</p> <p>cefprozil 15 mg/kg/d PO div bid x 10 d</p> <p>Adults:</p> <p><u>1st line:</u> penicillin V 300 mg PO tid or 600 mg bid x 10 d</p> <p><u>2nd line:</u> erythromycin 250 mg PO qid x 10 d</p> <p><u>3rd line:</u> cephalexin 250 mg PO qid x 10 d</p> <p>cefadroxil 500 mg PO bid x 10 d</p>
Sinusitis	<i>S. pneumoniae</i> <i>H. influenzae</i> <i>M. catarrhalis</i> <i>S. aureus</i>	<p>Children:</p> <p><u>1st line:</u> amoxicillin 80 mg/kg/d PO div bid-tid x 5-10 d (max 3 g/d) x 10-14 d</p> <p><u>2nd line:</u> amoxicillin/clavulanate 40-80 mg/kg/d div bid (max 3 g/d) x 10-14 d</p> <p>cefprozil 30 mg/kg/d PO div bid x 10-14 d</p> <p><u>3rd line:</u> cefuroxime-AX 30-40 mg/kg/d PO div bid x 10-14 d</p> <p>clarithromycin 15 mg/kg/d PO div bid x 10-14 d</p> <p>Adults:</p> <p><u>1st line:</u> amoxicillin 500 mg PO tid x 5-10 d</p> <p><u>2nd line:</u> amoxicillin/clavulanate 500 or 875 mg PO bid x 5-10 d</p> <p>cefuroxime-AX 250-500 mg PO bid x 5-10 d</p> <p><u>3rd line:</u> levofloxacin 500 mg PO OD x 5-10 d</p> <p>moxifloxacin 400 mg PO OD x 5-10 d</p>
Acute Otitis Media	<i>S. pneumoniae</i> <i>H. influenzae</i> <i>M. catarrhalis</i> Group A <i>Strep</i> <i>S. aureus</i>	<p>Children:</p> <p>Treat if under age 6 mo</p> <p>If age 6-24 mo, watchful waiting appropriate if parents can observe child for 48-72 h with appropriate medical follow-up</p> <p>If age >24 mo, treat if worsens after 48-72 h</p> <p>10 d course if age <24 mo, 5 d course if age >24 mo</p> <p><u>1st line:</u> amoxicillin 80 mg/kg/d PO div bid-tid (max 3 g/d)</p> <p><u>2nd line:</u> amoxicillin/clavulanate 40-80 mg/kg/d PO div bid (max 3 g/d)</p> <p>cefprozil 30 mg/kg/d PO div bid</p> <p><u>3rd line:</u> cefuroxime-AX 30-40 mg/kg/d PO div bid</p> <p>clarithromycin 15 mg/kg/d PO div bid</p> <p>Chronic TM perforation or ventilation tubes: Ciprodex® otic suspension 4 drops bid x 5 d</p> <p>Adults:</p> <p><u>1st line:</u> amoxicillin 500 mg PO tid x 7-10 d</p> <p><u>2nd line:</u> amoxicillin/clavulanate 500 mg PO tid or 875 mg PO bid x 7-10 d</p> <p>cefprozil 250-500 mg PO bid x 7-10 d</p> <p>Chronic TM perforation or ventilation tubes: Ciprodex® otic suspension 4 drops bid x 5 d</p>
Otitis Externa	<i>P. aeruginosa</i> Coliforms <i>S. aureus</i>	<p><u>1st line:</u> Buro-sol® otic solution 2-3 drops tid or qid</p> <p><u>2nd line:</u> Cortisporin® otic solution 4 drops tid or qid (3 drops tid or qid for children)</p> <p>TM defect: Ciprodex® otic suspension 4 drops bid x 5 d</p> <p>Necrotizing (i.e. bone involvement): ciprofloxacin 750 mg PO bid x 4-8 wk</p>
Bronchitis	<i>H. influenzae</i> , parainfluenza, coronavirus, rhinovirus, RSV	None

Condition	Microorganisms	Antimicrobial
Community Acquired Pneumonia: Outpatient without Comorbidity	<i>S. pneumoniae</i> <i>M. pneumoniae</i> <i>C. pneumoniae</i>	<u>1st line:</u> amoxicillin 1,000 mg PO tid x 7-14 d (for patients over age 50 where mycoplasma infection is less likely) erythromycin 500 mg PO qid x 7-14 d clarithromycin 500 mg PO bid or 1,000 mg (ER) PO OD x 7-14 d azithromycin 500 mg PO on 1st d then 250 mg PO OD x 4 d or 500 mg PO OD x 3 d <u>2nd line:</u> doxycycline 100 mg PO on 1st d then 100 mg PO OD x 7-14 d
Community Acquired Pneumonia: Outpatient with Comorbidity	<i>S. pneumoniae</i> <i>M. pneumoniae</i> <i>C. pneumoniae</i> <i>H. influenzae</i>	ANY ONE of the β-lactam agents below: amoxicillin 1,000 mg PO tid x 7-14 d amoxicillin/clavulanate 500 mg PO tid or 875 mg PO bid x 7-14 d cefuroxime-AX 500 mg PO bid x 7-14 d cefprozil 500 mg PO bid x 7-14 d PLUS ONE of the following: clarithromycin 500 mg PO bid or 1,000 mg (ER) PO OD x 7-14 d azithromycin 500 mg PO OD on 1st d then 250 mg PO OD x 4 d doxycycline 100 mg PO bid on 1st d then 100 mg PO OD x 7-14 d OR ANY ONE of the following: levofloxacin 750 mg PO OD x 7-14 d moxifloxacin 400 mg PO OD x 7-14 d
Dental Infections/ Periapical and Periodontal Abscesses	Oral Flora	penicillin V potassium 500 mg PO qid x 7-10 d clindamycin 300 mg PO qid or 600 mg bid x 7-10 d
GASTROENTEROLOGY		
Diarrhea – Enteritis	Enterotoxigenic <i>E. coli</i> (ETEC) <i>Campylobacter</i> <i>Salmonella</i> <i>Shigella</i> Viruses Protozoa	<u>Mild to moderate</u> (i.e. <3 BM/d, no blood, no fever): OTC loperamide 4 mg PO STAT then 2 mg PO after each loose stool (max 8 doses/d) OTC bismuth subsalicylate (Pepto Bismol®) 2 tabs or 30 mL repeat q30min prn (max 8 doses/d) (prevention: 2 tabs or 30 mL qid with meals and in the evening) <u>Moderate to severe</u> (i.e. >3 BM/d, blood, fever): ofloxacin 400 mg PO single dose or 300 mg PO bid x 3 d (prevention: 300 mg PO OD) norfloxacin 800 mg PO single dose or 400 mg PO bid x 1-3 d (prevention: 400 mg PO OD) ciprofloxacin 750 mg PO single dose or 500 mg PO bid x 1-3 d (prevention: 500 mg PO OD) levofloxacin 500 mg PO OD x 1-3 d (prevention: 500 mg PO OD) azithromycin 1,000 mg PO single dose or 500 mg PO OD x 1-3 d (children: 10 mg/kg/d x 3 d) <i>Azithromycin:</i> Recommended primarily for Thailand, India, Nepal, and Indonesia where <i>Campylobacter</i> resistance to quinolones is high Considered drug of choice for children because of safety, tolerability, and ease of administration
Diarrhea – Post Abx (common with clindamycin)	<i>C. difficile</i>	<u>Mild to moderate</u> (WBC <5 x 10 ⁹ /L and Cr <1.5 x baseline): metronidazole 500 mg PO tid or 250 mg PO qid x 10 d (children: 15-30 mg/kg/d PO div tid-qid max 4 g/d) <u>Severe</u> (WBC ≥15 x 10 ⁹ /L and Cr ≥1.5 x baseline): vancomycin 125 mg PO qid x 10-14 d (children: 40 mg/kg/d PO div tid-qid x 10-14 d max 2 g/d)
Peptic Ulcer Disease (non-NSAID related)	<i>H. pylori</i>	<u>PPI:</u> lansoprazole 30 mg or omeprazole 20 mg or pantoprazole 40 mg or rabeprazole 20 mg <u>1st line:</u> (PPI PO bid + amoxicillin 1,000 mg PO bid + clarithromycin 500 mg PO bid x 7 d [e.g. HP-PAC: lansoprazole 30 mg PO bid + amoxicillin 1,000 mg PO bid + clarithromycin 500 mg PO bid x 7 d]) (PPI PO bid + metronidazole 500 mg PO bid + clarithromycin 500 mg or 250 mg PO bid x 7 d) <u>2nd line:</u> (PPI PO bid + metronidazole 500 mg PO bid + amoxicillin 1,000 mg PO bid x 7 d) (PPI PO bid + bismuth subsalicylate 2 tabs or 30 mL qid + metronidazole 250 mg PO qid + tetracycline 500 mg PO qid x 7-14 d)

Condition	Microorganisms	Antimicrobial
GENITOURINARY		
UTI/Cystitis	<i>Klebsiella</i> <i>E. coli</i> <i>Enterobacter</i> <i>Enterococci</i> <i>Proteus</i> <i>S. saprophyticus</i>	<u>1st line:</u> TMP/SMX 2 tabs bid or 1 DS tab bid x 3 d trimethoprim 100 mg PO bid or 200 mg PO OD x 3 d nitrofurantoin 50-100 mg PO qid or Macrobid® 100 mg bid x 5 d <u>2nd line:</u> amoxicillin 500 mg PO tid x 7 d norfloxacin 400 mg PO bid x 3 d ciprofloxacin 250 mg PO bid or 500 mg (ER) OD x 3 d NB: high rate of amoxicillin resistance in community <i>E. coli</i> , use only after lab susceptibility obtained <u>3rd line:</u> cephalexin 250-500 mg PO qid x 7 d levofloxacin 250 mg PO OD x 3 d <u>Pregnancy:</u> cephalexin 250-500 mg PO qid x 7 d nitrofurantoin 50-100 mg PO bid x 5 d amoxicillin 500 mg PO tid x 7 d NB: nitrofurantoin is contraindicated in pregnancy after 36 wk
Head and Pubic Lice (crabs)	<i>Pediculus humanus capitis</i> <i>Phthirus pubis</i>	permethrin cream 1%: apply as liquid onto washed hair for 10 min, then rinse; repeat in 1 wk
Vulvovaginal Candidiasis	<i>Candida</i>	Treat only if patient is symptomatic fluconazole 150 mg PO single dose miconazole 2% cream (Monistat 7®): one applicator (5 g) intravaginally qhs x 7 d multiple other OTC azole treatments
Bacterial Vaginosis	Overgrowth of: <i>G. vaginalis</i> <i>M. hominis</i> Anaerobes	If patient is asymptomatic, treatment is unnecessary unless high-risk pregnancy, prior IUD insertion, gynecologic surgery, induced abortion, or upper tract instrumentation <u>1st line:</u> metronidazole 500 mg PO bid x 7 d metronidazole 0.75% gel: one applicator (5 g) intravaginally qhs x 5 d clindamycin 2% cream: one applicator (5 g) intravaginally qhs x 7 d <u>2nd line:</u> metronidazole 2 g PO single dose clindamycin 300 mg PO bid x 7 d
Herpes	Herpes simplex virus	<u>1° episode:</u> acyclovir 400 mg PO tid x 5-7 d famciclovir 250 mg PO tid x 5-7 d valacyclovir 500-1,000 mg PO bid x 5-7 d <u>Recurrent Episode:</u> acyclovir 400 mg PO tid x 5 d or 800 mg PO bid x 5 d or 800 mg PO tid x 2 d famciclovir 125 mg PO bid x 5 d valacyclovir 500 mg PO bid x 3 d or 1,000 mg PO OD x 3 d <u>Pregnancy:</u> 1° episode: acyclovir 200 mg PO 5x/d x 5-10 d Prior infection within previous yr: acyclovir 200 mg PO qid at 36 wk valacyclovir 500 mg PO bid at 36 wk
Gonorrhea/Chlamydia	<i>N. gonorrhoeae</i> <i>C. trachomatis</i>	ceftriaxone 250 mg IM x 1 dose + azithromycin 1 g PO single dose or doxycycline 100 mg PO bid x 7 d
DERMATOLOGIC		
Mastitis	<i>S. aureus</i> <i>S. pyogenes</i>	cloxacillin 500 mg PO qid x 7 d cephalexin 500 mg PO qid x 7 d
Tinea Cruris/Pedis (jock itch/athlete's foot)	Trichophyton	clotrimazole 1% cream bid ketoconazole 2% cream bid
Uncomplicated Cellulitis	<i>S. aureus</i> Group A <i>Streptococcus</i>	<u>Children:</u> <u>1st line:</u> cephalexin 50-100 mg/kg/d div qid x 10-14 d <u>2nd line:</u> cloxacillin 50 mg/kg/d div qid x 10-14 d clindamycin 25 mg/kg/d x 10-14 d <u>Adults:</u> <u>1st line:</u> cephalexin 500 mg PO qid x 10-14 d <u>2nd line:</u> cloxacillin 500 mg PO qid x 10-14 d clindamycin 300 mg PO x 10-14 d

*All doses are adult doses unless otherwise specified

*This chart is not all-encompassing and is non-inclusive of special exceptions (i.e. pregnancy, poor renal clearance, etc.)

*Comorbidities include: COPD (received steroids within the last 3 mo), liver or renal disease, CHF, DM, malignancy, alcoholism, asplenia, immunosuppressing conditions, malnutrition, hospitalization in past 3 mo or nursing home

Overview of Gastrointestinal Tract

- the gastrointestinal tract runs from mouth to anus ("gum to bum")

Figure 1. Overview of gastrointestinal tract

Table 1. Summary of Gastrointestinal Tract Structure and Function

Organ	Function	Blood Supply	Innervation	Histology and Structural Features
Esophagus	<ul style="list-style-type: none">Muscular tube approximately 25 cm long with a diameter of 2 cmExtends from pharynx to the stomach	<ul style="list-style-type: none">Arterial: left gastric artery and left inferior phrenic arteryVenous:<ul style="list-style-type: none">Left gastric vein → portal venous systemEsophageal veins → azygos vein → IVC (systemic)	<ul style="list-style-type: none">Parasympathetic innervation via anterior and posterior gastric nerves (vagal trunks)Sympathetic innervation via thoracic trunks of the greater splanchnic nerves	<ul style="list-style-type: none">Mucosa: stratified squamous epitheliumSubmucosa: connective tissue, lymphocytes, plasma cells, nerve cellsMuscularis propria (muscularis externa): inner circular, outer longitudinal muscle<ul style="list-style-type: none">Upper 1/3: striated muscleMiddle 1/3: transition zoneLower 1/3: smooth muscle
Stomach	<ul style="list-style-type: none">Delivers food to intestine for digestion and absorptionSecretes acid, probably to reduce enteric infections/pneumonia; facilitate digestion of protein/iron/B₁₂Secretes intrinsic factor to facilitate B₁₂ absorptionMinor contribution to initial protein digestion via pepsin	<ul style="list-style-type: none">Lesser curvature:<ul style="list-style-type: none">Right and left gastric arteries (from celiac trunk)Greater curvature:<ul style="list-style-type: none">Right and left gastromental (gastroepiploic) arteries (from gastroduodenal and splenic a. respectively)Fundus: short and posterior gastric arteries (from the splenic artery)	<ul style="list-style-type: none">Parasympathetic innervation via vagus nerveSympathetic innervation via celiac plexus (from T6-T9)	<ul style="list-style-type: none">5 parts:<ul style="list-style-type: none">CardiaFundusBodyAntrumPylorus
Duodenum	<ul style="list-style-type: none">Modulates enteral pH via secretin → decreased gastric acid secretion, increased bicarbonate secretionSecretes CCK to stimulate bile secretionSite of iron absorption	<ul style="list-style-type: none">Branches of celiac artery and superior mesenteric artery	<ul style="list-style-type: none">Parasympathetic innervation via vagus nerveSympathetic innervation via greater and lesser splanchnic nerves	<ul style="list-style-type: none">4 parts<ul style="list-style-type: none">Superior (5 cm)Descending (7-10 cm)Horizontal (6-8 cm)Ascending (5 cm)1st part is intraperitoneal; rest is retroperitoneal

Acronyms

ALF	acute liver failure
BE	Barrett's esophagus
BT	biologic therapy
CCK	cholecystokinin
CD	Crohn's disease
DES	diffuse esophageal spasm
EIM	extraintestinal manifestation
ERCP	endoscopic retrograde cholangiopancreatography
EUS	endoscopic ultrasound
EVL	endoscopic variceal ligation
FAP	familial adenomatous polyposis
GE	gastroesophageal
GERD	gastroesophageal reflux disease
HAV	hepatitis A virus
HBV	hepatitis B virus
HCV	hepatitis C virus
HNPCC	hereditary non-polyposis colorectal cancer
HRS	hepatorenal syndrome
HVPG	hepatic venous pressure gradient
IBD	inflammatory bowel disease
IBS	irritable bowel syndrome
INH	isoniazid
LES	lower esophageal sphincter
MRCP	magnetic resonance cholangiopancreatography
NAC	N-acetylcysteine
NAFLD	non-alcoholic fatty liver disease
NERD	non-erosive reflux disease
NMS	neuroleptic malignant syndrome
OGD	oesophagogastroduodenoscopy
PBC	primary biliary cirrhosis
PPI	proton pump inhibitor
PSC	primary sclerosing cholangitis
PTC	percutaneous transhepatic cholangiography
PUD	peptic ulcer disease
SBP	spontaneous bacterial peritonitis
TIPS	transjugular intrahepatic portosystemic shunt
UC	ulcerative colitis

Table 1. Summary of Gastrointestinal Tract Structure and Function (continued)

Organ	Function	Blood Supply	Innervation	Histology and Structural Features
Jejunum	<ul style="list-style-type: none"> Absorption of sodium, water, and nutrients (protein, carbohydrates, fat, folic acid, and vit A, B, C, D, E, K) 	<ul style="list-style-type: none"> Superior mesenteric artery 	<ul style="list-style-type: none"> Parasympathetic innervation via fibers of the posterior vagal trunk Sympathetic innervation via fibers of T8-T10 	<ul style="list-style-type: none"> Deep red color 2-4 cm in thickness Thick and heavy wall Plicae circulares are large, tall and closely packed Has long vasa recta Scant fat in mesentery Scant Peyer's patches
Ileum	<ul style="list-style-type: none"> Absorption of sodium, water, nutrients, soluble vitamins (only site of vit B₁₂ absorption), and bile salt (entero-hepatic circulation) 	<ul style="list-style-type: none"> Superior mesenteric artery 	<ul style="list-style-type: none"> Same as jejunum 	When compared to jejunum: <ul style="list-style-type: none"> Paler pink color 2-3 cm in thickness Thin and light walls Plicae circulares are small and sparse Contains more mesenteric fat Many Peyer's patches
Large Bowel	<ul style="list-style-type: none"> Absorption of water (5-10% of total water) Bacteria: further digestion of chyme and metabolism of undigested CHO to short chain fatty acids Formation and storage of feces 	<ul style="list-style-type: none"> Branches of superior and inferior mesenteric arteries Rectal blood supply: sigmoid, right pudendal, and rectal arteries 	<ul style="list-style-type: none"> Parasympathetic innervation via vagus nerve Sympathetic innervation via greater and lesser splanchnic nerves 	<ul style="list-style-type: none"> Consists of cecum, colon (ascending, transverse, descending, and sigmoid), rectum and anal canal Features include teniae coli, haustra, and omental appendices
Liver	<ul style="list-style-type: none"> Glucose homeostasis Plasma protein synthesis Lipid and lipoprotein synthesis Bile acid synthesis and secretion Vitamin A, D, E, K, B₁₂ storage Biotransformation, detoxification Excretion of compounds 	<ul style="list-style-type: none"> 2 sources <ul style="list-style-type: none"> Portal vein (75-80%) Hepatic artery (20-25%) 	<ul style="list-style-type: none"> Sympathetic innervation via fibers of the celiac plexus Parasympathetic innervation via fibers of the anterior and posterior vagal trunks 	<ul style="list-style-type: none"> Largest internal organ Composed of 4 lobes (left, right, caudate, quadrate) and divided into 8 segments
Biliary Tract	<ul style="list-style-type: none"> Gallbladder functions to store and release bile that is produced in the liver Bile is used to emulsify fat and is composed of cholesterol, lecithin, bile acids, and bilirubin CCK stimulates gallbladder emptying while trypsin and chymotrypsin inhibit bile release 	<ul style="list-style-type: none"> Cystic artery 	<ul style="list-style-type: none"> Parasympathetic innervation via vagus nerve Sympathetic and visceral innervation via celiac nerve plexus Somatic afferent fibers via right phrenic nerve 	<ul style="list-style-type: none"> Consists of the hepatic ducts (intrahepatic, left, right and common), gallbladder, cystic duct, common bile duct, and ampulla of Vater
Pancreas	<ul style="list-style-type: none"> Endocrine function: islets of Langerhans produce glucagon, insulin, and somatostatin (from the α, β, and δ cells, respectively) Exocrine function: digestive enzymes are produced including amylase, lipase, trypsin, chymotrypsin, and carboxypeptidase 	<ul style="list-style-type: none"> Anterior superior pancreaticoduodenal artery (from the celiac trunk) Anterior inferior pancreaticoduodenal artery (from the superior mesenteric artery) Dorsal pancreatic artery (from the splenic artery) Pancreatic veins drain into the portal, splenic, and superior mesenteric veins 	<ul style="list-style-type: none"> Parasympathetic innervation via vagus nerve Sympathetic innervation via abdominopelvic splanchnic nerves 	<ul style="list-style-type: none"> 4 parts of pancreas: head (includes uncinate process), neck, body, and tail (Major) pancreatic duct connecting to common bile duct prior to ampulla of Vater Accessory pancreatic duct connected directly to duodenum

Visualizing the Gastrointestinal Tract

- see [Medical Imaging](#), MI10

Esophagus, Stomach, Duodenum

- OGD: best visualization of mucosa; also allows for therapeutic intervention (e.g. banding varices, thermal therapy/clipping/injecting bleeding ulcers, and dilatation e.g. esophageal strictures)
 - consider barium swallow first if dysphagia, decreased level of consciousness (increases risk of aspiration), inability to cooperate (increases risk of pharyngeal trauma during intubation)
 - endotracheal intubation first if massive upper GI bleed, acidemia, or inability to protect airway

Retroperitoneal Structures

SAD PUCKER

Suprarenal glands (adrenal glands)
 Aorta/IVC
 Duodenum (second to fourth segments)
 Pancreas (tail is intraperitoneal)
 Ureters
 Colon (only the ascending and descending branches)
 Kidneys
 Esophagus
 Rectum

Only the ileum (not jejunum) can absorb vitamin B₁₂ and bile acids

Small Bowel

- most difficult to visualize, especially if mucosal detail is needed
- CT enterography more accurate than small bowel follow through, but both have low sensitivity
- MRI enteroclysis increasingly available (use enteroclysis if dilation of the small bowel might improve sensitivity, such as diverticulosis, or if stricture suspected)
- "double balloon" enteroscopy (enteroscope with proximal and distal balloons to propel endoscope into jejunum from mouth or into jejunum/ileum or into ileus from anus) may be most sensitive but currently available only in selected centers; technically demanding
- wireless endoscopy capsule (26 x 11 mm capsule is swallowed, transmits images to a computer; contraindicated in bowel obstruction) is also accurate in diagnosis but unable to provide any therapeutic intervention

Colon and Terminal Ileum

- colonoscopy, with biopsy if required; contraindicated in perforation, acute diverticulitis, and severe colitis (increased risk of perforation)
- CT colonography ("virtual colonoscopy") more accurate in diagnosing diverticulosis, extrinsic pressure on colon (e.g. ovarian cancer compressing sigmoid colon), and fistulae; increasing evidence for use in colorectal cancer screening, especially for assessment of right side of colon in cases where colonoscopy is incomplete

Pancreatic/Biliary Duct

- MRCP almost as sensitive as ERCP in determining if bile duct obstruction present, but less accurate in determining cause of obstruction (tumor, stone, stricture)
- ERCP if endoscopic draining necessary, strong suspicion of stone, obstruction requiring stenting, or if tissue sampling required

Differential Diagnosis of Common Presenting Complaints

Table 2. Differential Diagnosis of Common Presenting Complaints

ACUTE ABDOMINAL PAIN	Upper/Mid-Abdomen		Lower Abdomen	
	Gastroenteritis Cholecystitis Perforated peptic ulcer Pancreatitis Small bowel obstruction Mesenteric ischemia Ruptured aortic aneurysm		Gastroenteritis Appendicitis Diverticulitis Crohn's disease Pelvic inflammatory disease Ectopic pregnancy	
CHRONIC/RECURRENT ABDOMINAL PAIN	Inflammatory	Neoplastic/Vascular	Toxin	Other
	PUD Biliary colic IBD Chronic pancreatitis	Recurrent bowel obstruction Mesenteric ischemia Sickle cell anemia	Lead poisoning	Mittelschmerz Endometriosis Porphyria IBS Radiculopathy Abdominal wall pain syndrome
ACUTE DIARRHEA	Inflammatory		Non-Inflammatory	
*Causes of bloody diarrhea	Bacterial <i>Shigella</i> * <i>Salmonella</i> * <i>Campylobacter</i> * <i>Yersinia</i> * <i>E. coli</i> (EHEC 0157:H7)* <i>C. difficile</i>	Protozoal <i>E. histolytica</i> * (amoebiasis) Strongyloides Others NSAIDs IBD* Ischemic*	Bacterial <i>S. aureus</i> <i>C. perfringens</i> <i>B. cereus</i> <i>E. coli</i> (ETEC, EPEC) <i>Salmonella enteritidis</i> <i>Vibrio cholera</i> Protozoal <i>Giardia lamblia</i>	Viral Rotavirus Norwalk CMV Drugs Antibiotics Colchicine Laxatives Antacids (magnesium)

Acute Upper Abdominal Pain

Remember to rule out thoracic sources, e.g. myocardial infarction, pneumonia, dissecting aneurysm

Obscure But Treatable Causes of Abdominal Pain

- Porphyria
- Angioedema
- Familial Mediterranean Fever
- Vasculitis (e.g. polyarteritis nodosa)

Rule out IBD when patient presents with bloody diarrhea

Table 2. Differential Diagnosis of Common Presenting Complaints (continued)

CHRONIC DIARRHEA	(A) Organic				(B) Functional
	Inflammatory	Secretory	Steatorrheic	Osmotic	
*Causes of bloody diarrhea	IBD Infectious (C. difficile, TB, CMV, HSV) Ischemic bowel Radiation colitis Neoplasia	Stimulant laxatives Post-ileal resection/cholecystectomy (bile salts) Bacterial toxins Vasculitis Neoplasia (Colon Ca, Carcinoid, VIPoma) Addison's disease Congenital syndromes	Giardia lamblia Celiac sprue Chronic pancreatitis Chronic cholestasis	Osmotic laxatives Lactose intolerance Chewing gum (sorbitol, mannitol)	IBS Constipation (overflow diarrhea) Anal sphincter dysfunction

CONSTIPATION: if no associated rectal bleeding/weight loss, etc., usually no cause found

	Colorectal cancer Stricture Extrinsic compression Anal disease Rectocele	Medications (narcotics, antidepressants, calcium channel blockers) Metabolic (DM, thyroid, hypercalcemia)	Neurologic (Parkinson's, MS, stroke) Collagen vascular disease (scleroderma, dermatomyositis)
--	--	--	--

NAUSEA/VOMITING	With Abdominal Pain		Without Abdominal Pain	
	Relieved by Vomiting	Not Relieved by Vomiting	Headache/Dizziness	No Other Symptoms
	Gastric outlet obstruction Small bowel obstruction GERD (regurgitation more common)	Gallbladder disease Pancreatitis Myocardial infarction Hepatitis Infectious Gastroenteritis	Cerebral tumor Migraine Vestibular disease Increased ICP	Drugs Uremia Pregnancy Metabolic (e.g. hypercalcemia) Gastroparesis (e.g. DM) Ketoacidosis

DYSPEPSIA	Common	Uncommon	Rare
	Functional dyspepsia Drug side effect Peptic ulcer GERD	Angina Crohn's disease Cancer Gallstones Aerophagia	Giardia lamblia Malabsorption (celiac sprue)

UPPER GI BLEED	Common	Uncommon	Rare
	Ulcers (H. pylori, ASA, NSAIDs) Esophageal varices Mallory-Weiss tears Erosive esophagitis Erosive gastritis	Tumors Arteriovenous malformation Dieulafoy's lesion (arterial) Gastric antral vascular ectasia (GAVE) Portal hypertensive gastropathy	Aorto-enteric fistulas Hemobilia

LOWER GI BLEED	Common	Uncommon	Rare
	Diverticulosis Ischemia Angiodysplasia (elderly) Infectious Anorectal (hemorrhoids, fissure, ulcer)	Upper GI bleed (brisk) Post-polypectomy Radiation colitis IBD	Intussusception Vasculitides Stercoral ulcer Coagulopathies

DYSPHAGIA	Mechanical (Solids)	Motility (Solids and Liquids)	Other
	Peptic stricture/cancer Eosinophilic esophagitis Extrinsic compression Schatzki ring/esophageal web Zenker's diverticulum	Achalasia Diffuse esophageal spasm Scleroderma	Foreign body Eosinophilic esophagitis

**Commonly Forgotten Causes of Vomiting**

- Drugs
- Uremia
- CNS Disease
- Pregnancy

**Differential Diagnosis of Abdominal Distention**

 - Feces
 - Fetus
 - Flatus
 - Fluid
 - Fatal Growth

Table 2. Differential Diagnosis of Common Presenting Complaints (continued)

ODYNOPHAGIA	Infection	Inflammation/ Ulceration	Drugs	Other
	Candida Herpes CMV (common in those who are immunosuppressed)	Caustic damage Eosinophilic esophagitis	Quinidine Iron Vitamin C Antibiotics (e.g. tetracycline) Bisphosphonates	Radiation

ABDOMINAL DISTENTION	Fluid (Ascites)		Flatulence	Feces	Other
	Portal HTN	Normal Portal Pressure			
	Cirrhosis Cardiac failure Hepatic vein thrombosis	Cancer (especially ovarian) Pancreatitis TB	Functional bowel disease (e.g. IBS) Fiber Lactose intolerance Chewing gum (e.g. sorbitol, mannitol)	Constipation Colonic obstruction Dysmotility	Pregnancy (fetus) Obesity (fat) Blood Large tumors (fatal growth)

JAUNDICE (UNCONJUGATED BILIRUBIN)	Overproduction	Decreased Hepatic Intake	Decreased Conjugation
	Hemolysis Ineffective erythropoiesis (e.g. megaloblastic anemias)	Gilbert's syndrome Drugs (e.g. rifampin)	Drug inhibition (e.g. chloramphenicol) Crigler-Najjar syndromes type I and II Gilbert's syndrome Neonatal jaundice

JAUNDICE (CONJUGATED BILIRUBIN)	Common	Uncommon
	Hepatocellular disease Drugs Cirrhosis (any cause) Inflammation (hepatitis, any cause) Infiltrative (e.g. hemochromatosis) Familial disorders (e.g. Rotor syndrome, Dubin-Johnson syndrome, cholestasis of pregnancy) PBC PSC Sepsis Post-operative/TPN	Intraductal obstruction Gallstones Biliary stricture Parasites Malignancy (cholangiocarcinoma) Sclerosing cholangitis Extraductal obstruction Malignancy (e.g. pancreatic cancer, lymphoma) Metastases in periportal nodes Inflammation (e.g. pancreatitis)

Esophagus

Gastroesophageal Reflux Disease

Definition

- condition in which the stomach contents (most characteristically acid) moves backwards from the stomach into the esophagus (the tube from the mouth to the stomach)

Etiology

- inappropriate transient relaxations of LES – most common cause
- low basal LES tone (especially in scleroderma)
- contributing factors include: delayed esophageal clearance, delayed gastric emptying, obesity, pregnancy
- acid hypersecretion (rare): Zollinger-Ellison syndrome (gastrin-secreting tumor)
- hiatus hernia worsens reflux, does not cause it (see [General Surgery, GS12](#))

Clinical Features

- "heartburn" (pyrosis) and acid regurgitation (together are 80% sensitive and specific for reflux) ± sour regurgitation, water brash, sensation of a lump in the throat (bolus sensation), and frequent belching
- non-esophageal symptoms (see [G7](#)) are increasingly recognized of being poor predictors of reflux

Epigastric discomfort = postprandial fullness, early satiety, epigastric pain, or burning

Foods/Substances that Aggravate GERD Symptoms

- EtOH
- Caffeine
- Tobacco
- Fatty/fried foods
- Chocolate
- Peppermint
- Spicy foods
- Citrus fruit juices

Figure 2. Signs and symptoms of GERD

Investigations

- usually a clinical diagnosis based on symptom history and relief following a trial of pharmacotherapy (PPI: symptom relief 80% sensitive for reflux)
- gastroscopy indications (*Ann Intern Med* 2012;157:808-816):
 - absolute indications:
 - heartburn accompanied by red-flags (bleeding, weight loss, etc.)
 - persistent reflux symptoms or prior severe erosive esophagitis after therapeutic trial of 4-8 wk of PPI 2x daily
 - history of esophageal stricture with persistent dysphagia
- repeat endoscopy indicated only if known Barrett's (or recurrence of symptoms) because future likelihood of Barrett's and esophagitis is minimal if the first endoscopy is normal
- esophageal manometry (study of esophageal motility)
 - may be done to diagnose abnormal peristalsis and/or decreased LES tone, but cannot detect presence of reflux; indicated before surgical fundoplication to intact esophageal functional
 - surgical fundoplication (wrapping of gastric fundus around the lower end of the esophagus) more likely to be successful if lower esophageal pressure is diminished; less likely to be successful if abnormal peristalsis
- 24 h pH monitoring: most accurate test, but not required or performed in most cases
 - most useful if PPIs do not improve symptoms

Management

- PPIs are the most effective therapy and usually need to be continued as maintenance therapy
- on-demand: antacids ($\text{Mg}(\text{OH})_2$, $\text{Al}(\text{OH})_3$, alginate), H_2 -blockers, or PPIs can be used for NERD
- diet helps symptoms, not the disease; avoid alcohol, coffee, spices, tomatoes, and citrus juices
- only beneficial lifestyle changes are weight loss (if obese) and elevating the head of bed (if nocturnal symptoms)
- dyspepsia may recur if therapy is discontinued

Complications

- esophageal stricture disease – scarring can lead to dysphagia (solids)
- ulcer
- bleeding
- Barrett's esophagus and esophageal adenocarcinoma – gastroscopy is recommended for patients with chronic GERD or symptoms suggestive of complicated disease (e.g. anorexia, weight loss, bleeding, dysphagia)

Barrett's Esophagus

Definition

- metaplasia of normal squamous esophageal epithelium to abnormal columnar epithelium containing-type intestinal mucosa (intestinal metaplasia)

Etiology

- thought to be acquired via long-standing GERD and consequent damage to squamous epithelium

Epidemiology

- in North America and Western Europe, 0.5-2.0% of adults are thought to have Barrett's esophagus
- up to 10% of GERD patients will have already developed BE by the time they seek medical attention
- more common in males, age >50, Caucasians, smokers, overweight, hiatus hernia, and long history of reflux symptoms

Pathophysiology

- endoscopy shows erythematous epithelium in distal esophagus; diagnosis of BE relies on biopsy demonstrating the presence of specialized intestinal epithelium of any length within the esophagus
- BE predisposes to premalignant changes in abnormal columnar epithelium, characterized as low- or high-grade dysplasia

Gastroesophageal Reflux Disease

Gastroscopy

Non-erosive reflux disease (NERD)	Esophagitis
Normal esophagus	Esophageal inflammation
Aim for symptom relief only; proton pump inhibitor PRN	Aim to heal inflammation; proton pump inhibitor indefinitely or surgical fundoplication

Figure 3. Classification and gastroscopic findings of GERD

Esophageal damage from reflux is most severe at first gastroscopy, therefore gastroscopy is necessary only once for patients with NERD

Up to 25% of patients with Barrett's esophagus do not report symptoms of GERD

Updated Guidelines 2008 for the Diagnosis, Surveillance, and Therapy of Barrett's Esophagus

Am J Gastroenterol 2008;103:788-797

- Screening** of the general population is not recommended and needs to be individualized based on risk factors. Role of esophageal capsule endoscopy for screening is currently under investigation.
- Surveillance** interval is based on grade of dysplasia. If no dysplasia confirmed on two endoscopies within the year, then q3yr. For low grade dysplasia (LGD), repeat endoscopy within 6 mo to ensure there is no high grade dysplasia (HGD) and if none, then q1y until no dysplasia on two consecutive endoscopies. If HGD, repeat endoscopy within 3 mo to ensure there is no adenocarcinoma and recommend intervention (endoscopic resection) or intensive surveillance (endoscopy q3mo).
- Diagnosis** using alternative imaging techniques (fiberoptic, chromoendoscopy) and biomarkers (DNA content abnormalities, loss of heterozygosity or methylation of specific genes) are being investigated but none are currently ready for routine clinical use.
- Treatment** of reflux symptoms with PPI decreases the development of dysplasia. Surgery (fundoplication) for patients without major comorbidities and whose reflux symptoms are controlled on PPI has a 20% failure rate at 5 yr and has not shown to decrease progression to adenocarcinoma.
- Prognosis:** 5 yr risk of esophageal adenocarcinoma in high grade dysplasia is >30%.
- Management** in high grade dysplasia, surveillance with intensive biopsy, endoscopic ablation, or esophagectomy produce similar outcomes and thus should be individualized to patient preference and local expertise.

Significance

- rate of malignant transformation is approximately 0.12% per yr for all BE patients prior to dysplasia
- risk of malignant transformation in high-grade dysplasia is significantly higher; studies have reported a 32-59% transformation rate over 5-8 yr of surveillance
- increased gastric acid secretion is more frequently associated with Barrett's esophagus as opposed to reflux alone

Management

- acid suppressive therapy with high-dose PPI indefinitely (or surgical fundoplication)
- endoscopy every 3 yr if no dysplasia
- high grade dysplasia: regular and frequent surveillance with intensive biopsy, endoscopic ablation/resection, or esophagectomy produce similar outcomes; however, evidence increasingly favoring endoscopic ablation with mucosal resection or radiofrequency ablation
- if low grade dysplasia, both surveillance and endoscopic ablation/resection are satisfactory options

Dysphagia

Definition

- difficulty swallowing, globus sensation

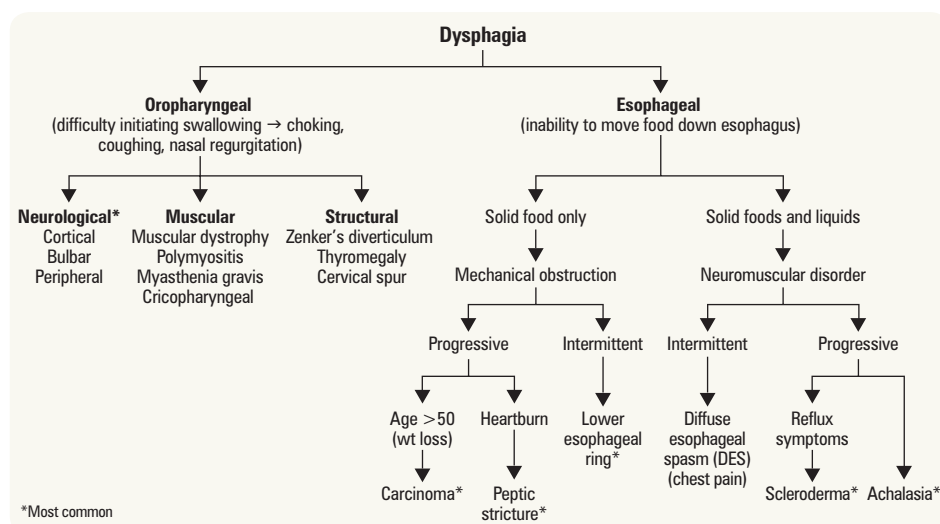

Figure 4. Approach to dysphagia (eosinophilic esophagitis omitted)

Esophageal Motor Disorders

Symptoms

- dysphagia with solids and liquids
- chest pain (in some disorders)

Diagnosis

- motility study (esophageal manometry)
- barium swallow sometimes helpful

Causes (Table 3)

- idiopathic
- achalasia (painless)
- scleroderma (painless)
- DM
- DES: rare and can be difficult to diagnose due to intermittent presentation

Key Questions in Dysphagia

- Difficulty in starting swallowing?
- Associated symptoms? (regurgitation, change in voice pitch, weight loss)
- Solids, liquids, or both?
- Intermittent or progressive?
- History of heartburn?
- Change in eating habits/diet?

Dysphagia = Difficulty in swallowing
Odynophagia = Pain on swallowing

Table 3. Esophageal Motor Disorders

Disorder	Achalasia	Scleroderma	Diffuse Esophageal Spasm
Definition	<ul style="list-style-type: none"> Failure of smooth muscle relaxation at LES Increased LES pressure Progressive loss of peristaltic function 	<ul style="list-style-type: none"> See Rheumatology, RH13 Systemic disease characterized by vasculopathy and tissue fibrosis (especially skin thickening) 	<ul style="list-style-type: none"> Normal peristalsis interspersed with frequent, repetitive, spontaneous, high pressure, non-peristaltic waves (tertiary peristalsis)
Etiology	<ul style="list-style-type: none"> Usually idiopathic 2° or pseudo-achalasia: e.g. malignancy, Chagas disease (<i>Trypanosoma cruzi</i>) 	<ul style="list-style-type: none"> Involves autoimmune, genetic, hormonal, and environmental factors Dysphagia: caused by reflux, dysmotility, or both 	<ul style="list-style-type: none"> Idiopathic
Pathophysiology	<ul style="list-style-type: none"> Inflammatory degeneration of Auerbach's plexus → increase in LES pressure, incomplete relaxation of LES with swallowing, aperistalsis 	<ul style="list-style-type: none"> Blood vessel damage → intramural neuronal dysfunction → distal esophageal muscle weakening → aperistalsis and loss of LES tone → reflux → stricture → dysphagia 	<ul style="list-style-type: none"> Potential mechanisms include impaired inhibitory innervation to esophageal body, malfunction in endogenous nitric oxide synthesis
Diagnosis 	<ul style="list-style-type: none"> CXR: no air in stomach, dilated esophagus Barium studies: esophagus terminates in narrowing at LES ("bird's beak") Endoscopy: rule out malignancy Manometry: definitive diagnosis (signs listed above) 	<ul style="list-style-type: none"> Clinical features of scleroderma Manometry: decreased pressure in LES, decreased peristalsis in body of esophagus 	<ul style="list-style-type: none"> Barium x-ray: "Corkscrew pattern" Manometry: >30% (but <100%) of esophageal contractions are aperistaltic
Treatment	<ul style="list-style-type: none"> Dilatation of LES with balloon, ± GERD prophylaxis, 50% good response, can repeat, risk of perforation (5%) Injection of botulinum toxin into LES (temporary) Surgery (myotomy) 	<ul style="list-style-type: none"> Medical: aggressive GERD therapy (PPIs bid) Surgery: anti-reflux surgery (gastroplasty, last resort) 	<ul style="list-style-type: none"> Reassurance not cardiac pain Medical: nitrates, calcium channel blockers, anticholinergics have variable benefit Surgical: long esophageal myotomy if unresponsive to above treatment (rarely helpful); balloon dilatation

Esophageal Diverticula

Definition

- outpouchings of one or more layers of the esophageal tract

Clinical Features

- commonly associated with motility disorders
- dysphagia, regurgitation, retrosternal pain, intermittent vomiting, may be asymptomatic

Classification

- classified according to location
 - pharyngoesophageal (Zenker's) diverticulum
 - most frequent form of esophageal diverticulum
 - posterior pharyngeal outpouching most often on the left side, above cricopharyngeal muscle and below the inferior pharyngeal constrictor muscle
 - symptoms: dysphagia, regurgitation of undigested food, halitosis
 - treatment: endoscopic or surgical myotomy of cricopharyngeal muscle ± surgical excision of sac
 - mid-esophageal diverticulum
 - secondary to mediastinal inflammation, motor disorders
 - usually asymptomatic; no treatment required
 - just proximal to LES (pulsatile type)
 - usually associated with motor disorders
 - usually asymptomatic; no treatment required

Peptic Stricture (from Esophagitis)

- presents as dysphagia alongside a long history of reflux symptoms, but reflux symptoms may disappear as stricture develops
- diagnosed with endoscopy or barium study if endoscopy contraindicated or unavailable

Treatment

- endoscopic dilatation and indefinite PPI
- anti-reflux surgery if above treatment unsuccessful

Esophageal Carcinoma

- see [General Surgery](#), GS14

Webs and Rings

- web = partial occlusion (upper esophagus)
- ring = circumferential narrowing (lower esophagus)

Clinical Features

- asymptomatic with lumen diameter >12 mm, provided peristalsis is normal
- dysphagia with large food boluses
- Schatzki ring
 - mucosal ring at squamo-columnar junction above a hiatus hernia
 - causes intermittent dysphagia with solids
 - treatment involves disrupting ring with endoscopic bougie

Plummer-Vinson Syndrome Triad

- Iron deficiency anemia
- Dysphagia
- Esophageal webs

Infectious Esophagitis

Definition

- severe mucosal inflammation and ulceration as a result of a viral or a fungal infection

Risk Factors

- DM
- chemotherapeutic agents
- immunocompromised states

Symptoms

- characteristically odynophagia, less often dysphagia
- diagnosis is via endoscopic visualization and biopsy

Appearance

- *Candida* (most common): whitish-yellow plaques without visible ulceration or inflammation
- Herpes (second most common), CMV: focal ulcers

Treatment

- *Candida*: nystatin swish and swallow, ketoconazole, fluconazole
- Herpes: often self-limiting; acyclovir, valacyclovir, famciclovir
- CMV: IV ganciclovir, famciclovir, or oral valganciclovir

Stomach and Duodenum

Dyspepsia

Definition

- intermittent epigastric discomfort, characteristically develops after eating

History and Physical

- history: most important are age, associated symptoms (such as weight loss and vomiting), and drugs (especially NSAIDs)
- physical exam: adenopathy, abdominal mass/organomegaly, Carnett's sign (if pain is due to abdominal wall muscle problem then the pain will increase during muscle contraction, such as during a sit-up)

Investigations

- laboratory: usual (CBC, liver enzymes, glucose, Cr, etc.) plus amylase, albumin
- consider trial of empiric anti-secretory drug therapy, non-invasive testing for *H. pylori* infection, endoscopy, barium radiography

Red Flags of Dyspepsia

- (raise suspicion of gastric malignancy):
- Unintended weight loss
 - Persistent vomiting
 - Progressive dysphagia
 - Odynophagia
 - Unexplained anemia or iron deficiency
 - Hematemesis
 - Jaundice
 - Palpable abdominal mass or lymphadenopathy
 - Family history of upper GI cancer
 - Previous gastric surgery

The most common cause of dyspepsia is functional (idiopathic) dyspepsia

Gastric Acid Secretion

Stomach

- primary function is mechanical grinding of food facilitating early enzymatic digestion into chyme and propulsion into duodenum

Table 4. Cells of the Gastric Mucosa

Cell Type	Secretory Product	Important Notes
Parietal cells	Gastric acid (HCl) Intrinsic factor	Stimulated by histamine, ACh, gastrin
Chief cells	Pepsinogen	Stimulated by vagal input and local acid
G-cells	Gastrin	Stimulates H ⁺ production from parietal cells
Superficial epithelial cells	Mucus, HCO ₃ ⁻	Protect gastric mucosa
Neuroendocrine cells	Multiple (e.g. somatostatin, inhibits cell secretion)	Involved in neural, hormonal, and paracrine pathways

Figure 5. Stimulation of H⁺ secretion from the parietal cell

Gastritis

Definition

- defined histologically: inflammation of the stomach mucosa

Etiology

- some causative agents may play a role in more than one type of gastritis and an individual patient may have histopathological evidence of more than one type of gastritis

Table 5. Updated Sydney Classification of Gastritis

Type	Common Etiology
Acute Gastritis	
Hemorrhagic/erosive gastritis	Alcohol*, Aspirin®/NSAID*, shock/physiological stress* (seen in ICU patients)
Helicobacter gastritis	<i>H. pylori</i> *
Chronic Gastritis	
Non-atrophic	<i>H. pylori</i> *
Atrophic	<i>H. pylori</i> *, dietary, environmental factors (multi-focal), autoimmunity
Chemical	NSAID*, bile
Radiation	Radiation injury
Lymphocytic	Celiac disease, drug
Eosinophilic	Food allergies
Non-infectious granulomatous	Crohn's disease, sarcoidosis
Other infectious gastritides	Bacteria, viruses, fungi, parasite, TB, syphilis

*Most common causes

Clinical Features

- non-erosive gastritis is asymptomatic (except in certain rare causes like Crohn's disease); difficult to diagnose clinically or endoscopically
- erosive gastritis can cause bleeding (pain only if progresses to ulcers – rare); can be seen endoscopically

Management

- determined by etiology (see *H. pylori*, G13, NSAID, G14 and *Stress-Induced Ulceration*, G14)
- non-pharmacological: avoidance of mucosal irritants such as alcohol, NSAIDs, and foods that trigger symptoms

Peptic Ulcer Disease

Definition

- focal defects in the mucosal that penetrate the muscularis mucosa layer results in scarring (defects superficial to the muscularis mucosa have erosions and no scarring)
- peptic ulcer disease includes defects located in the stomach (gastric ulcers) and duodenum (duodenal ulcers)

Etiology

Table 6. Etiology of Peptic Ulcer Disease

	Duodenal	Gastric
<i>H. pylori</i> infection	90%	60%
NSAIDs	7%	35%
Physiologic stress-induced	<3%	<5%
Zollinger-Ellison (ZE) syndrome	<1%	<1%
Idiopathic	15%	10%

- NSAID negative, *H. pylori* negative ulcers becoming more commonly recognized
- others: CMV, ischemic, idiopathic
- alcohol: damages gastric mucosa but rarely causes ulcers
- peptic ulcer associated with tobacco, cirrhosis of liver, COPD, and chronic renal failure

Clinical Features

- dyspepsia: most common presenting symptom
 - only 20% of patients with dyspepsia have ulcers, while most have functional disease
- may present with complications
 - bleeding 10% (severe if from gastroduodenal artery) (see *Bleeding Peptic Ulcer*, G13)
 - perforation 2% (usually anterior ulcers)
 - gastric outlet obstruction 2%
 - penetration (posterior) 2%; may also cause pancreatitis
- duodenal ulcers: 6 classical features, but history alone cannot distinguish from functional dyspepsia
 - epigastric pain; may localize to tip of xiphoid
 - burning
 - develops 1-3 h after meals
 - relieved by eating and antacids
 - interrupts sleep
 - periodicity (tends to occur in clusters over wk with subsequent periods of remission)
- gastric ulcers: more atypical symptoms; a biopsy is necessary to exclude malignancy

Investigations

- endoscopy (most accurate)
- upper GI series
- *H. pylori* tests (see Table 7)
- fasting serum gastrin measurement if Zollinger-Ellison (ZE) syndrome suspected

Treatment

- specific management depends on etiology (see *H. pylori*, G13, NSAID, G14 and *Stress-Induced Ulceration*, G14)
- eradicate *H. pylori* if present, chief advantage is to lower ulcer recurrence rate
- stop NSAIDs if possible
- start PPI: inhibits parietal cell $H^+/K^+-ATPase$ pump which secretes acid
 - heals most ulcers, even if NSAIDs are continued
- other meds (e.g. histamine H_2 -antagonists) less effective
- discontinue tobacco
- no diet modifications required but some people have fewer symptoms if they avoid caffeine, alcohol, and spices

Gastric vs. Duodenal Ulcers

Gastric ulcers must always be biopsied to rule out malignancies; duodenal ulcers are rarely malignant

Approach to PUD

- Stop NSAIDs
- Acid neutralization
- *H. pylori* eradication
- Quit smoking

Cigarette Smoking and PUD

- Increased risk of ulcer
- Increased risk of complications
- Increased chance of death from ulcer
- Impairs healing

Bleeding Peptic Ulcers: Risk Factors for Increased Mortality

- Co-existent illness
- Hemodynamic instability
- Age >60 yr
- Transfusion required

Management of Bleeding Peptic Ulcers

- OGD to explore upper GI tract
- establish risk of rebleeding/continuous bleed
 - clinical risk factors: increased age (>60), bleeding diathesis, history of PUD, comorbid disease, hemodynamically unstable
 - endoscopic signs of recurrent bleeding (active bleeding, visible vessel, clot, red spot) more predictive than clinical risk factors
 - ♦ if high risk, consider ICU admission

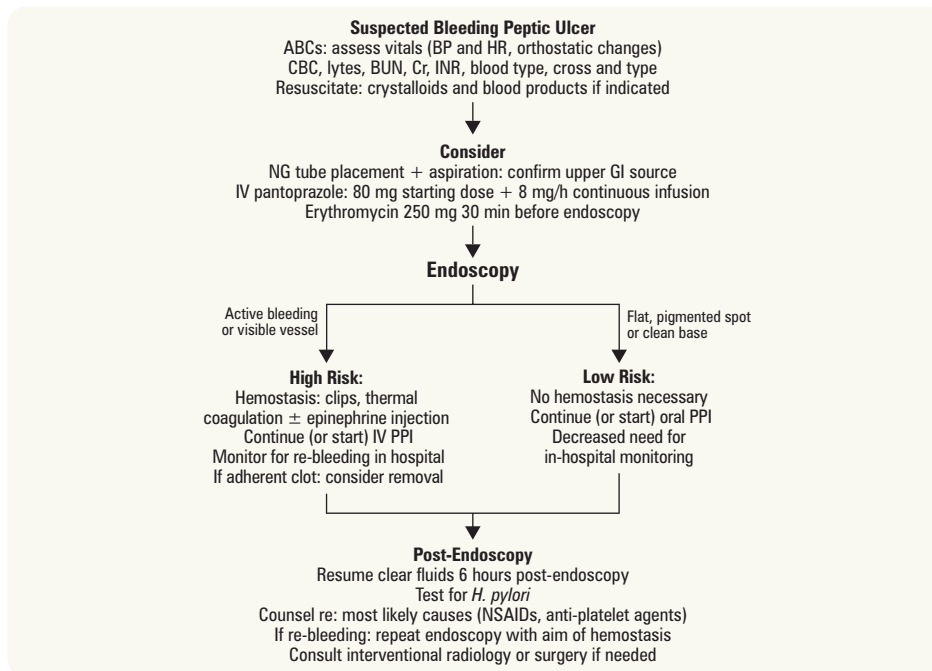

Figure 6. Approach to management of suspected bleeding peptic ulcer

Adapted from: Gralnek I, Barkun A, Bardou M. Management of acute bleeding from a peptic ulcer. *NEJM* 2008;359:928-937

Intragastric pH with Oral vs. Intravenous Bolus plus Infusion Proton-pump Inhibitor Therapy in Patients with Bleeding Ulcers

Gastroenterology 2008;134:1836-1841

Study: Randomized control trial.

Participants: Patients presenting with overt bleeding from an ulcer.

Intervention: Patients received either IV lansoprazole (90 mg bolus followed by 9 mg/h infusion; n=32) or oral lansoprazole (120 mg bolus followed by 30 mg every 3 h; n=34).

Primary Outcome: 24 h pH.

Results: Intragastric pH was >6 for >60% of the study period in 22 (68.8%) patients receiving IV and 22 (64.7%) patients receiving oral PPI. At 1 h, mean pHs for IV and oral were 5.3 and 3.3, respectively (difference 2.0; p=0.001). After 1.5 h, there were no differences in mean pH between the groups. Mean pH rose above 6 after 2-3 h of IV PPI and 3-4 h of oral PPI.

Conclusion: Frequent oral PPI may be able to replace the currently recommended IV bolus plus infusion PPI therapy in patients with bleeding ulcers. However, IV PPI has a more rapid increase in pH, reaching mean pH of 6 approximately 1 h sooner than oral PPI.

H. pylori-Induced Peptic Ulceration

Pathophysiology

- *H. pylori*: Gram-negative flagellated rod that resides on but does not invade the gastric mucosa
- acid secreted by parietal cells (stimulated by vagal acetylcholine, gastrin, histamine) necessary for most ulcers
- mucosal defenses moderated by PGE2 and blood flow, mucus, etc.
- theories of how *H. pylori* causes ulcers: none satisfactory, but pattern of colonization correlates with outcome
 - gastritis only in antrum (15% of patients), high gastric acid, associated with peptic ulcer, may progress to gastric metaplasia of duodenum where ulcer forms
 - gastritis throughout stomach ("pangastritis" – 85% of patients), low gastric acid, associated with cancer

Epidemiology

- *H. pylori* is found in about 30-40% of all Americans, with rates higher in African-American and Hispanic populations
 - highest prevalence in those raised during 1930s
- infection most commonly acquired in childhood, presumably by fecal-oral route
- high prevalence in developing countries, low socioeconomic status (poor sanitation and overcrowding)

Outcome

- gastritis (non-erosive) in 100% of patients but asymptomatic
- peptic ulcer in 15% of patients
- gastric malignancy (gastric carcinoma and mucosal associated lymphomatous tissue [MALT] lymphoma in 0.5% of patients)
- most are asymptomatic but still worthwhile eradicating to lower future risk of peptic ulcer/ gastric malignancy and prevent spread to others (mostly children <5 yr of age)

Investigations

Table 7. Diagnosis of *H. pylori* Infection

Test	Sensitivity	Specificity	Comments
Non-invasive Tests			
Urea breath test	90-100%	89-100%	Affected by PPI therapy (false negatives)
Serology	88-99%	89-95%	Can remain positive after treatment
Stool antigen test	95-97%	94-98%	Useful for diagnosing acute infection
Invasive Tests (require endoscopy)			
Histology	93-99%	95-99%	Gold standard; affected by PPI therapy (false negatives)
Rapid urease test (on biopsy)	89-98%	93-100%	Rapid
Microbiology culture	98%	95-100%	Research only

Treatment: *H. pylori* Eradication

- triple therapy for 7-14 d (Hp-Pac®): PPI bid (e.g. lansoprazole 30 mg bid) + amoxicillin 1 g bid + clarithromycin 500 mg bid
 - 80% success rate
- quadruple therapy for 10-14 d: PPI bid + bismuth 525 mg qid + tetracycline 500 mg qid + metronidazole 250 mg qid
 - only recommended as first line therapy if resistance to clarithromycin or metronidazole is high, or in patients with recent or repeated exposure to these drugs
 - levofloxacin can replace metronidazole or tetracycline
- sequential therapy
 - days 1-5: PPI bid + amoxicillin 1 g bid
 - days 6-10: PPI bid + clarithromycin 500 mg bid + tinidazole 500 mg bid
- 5-15% of cases are resistant to all known therapies

NSAID-Induced Ulceration

- NSAID use causes gastric mucosal petechiae in virtually all, erosions in most, ulcers in some (25%)
 - erosions bleed, but usually only ulcers cause significant clinical problems
- most NSAID ulcers are clinically silent: dyspepsia is as common in patients with ulcers as in patients without ulcers; NSAID-induced ulcers characteristically present with complications (bleeding, perforation, obstruction)
- NSAIDs more commonly cause gastric ulcers than duodenal ulcers
- may exacerbate underlying duodenal ulcer disease

Pathophysiology

- direct: erosions/petechiae – are due to local (direct) effect of drug on gastric mucosa
- indirect: systemic NSAID effect (intravenous NSAID causes ulcers, but not erosions), inhibits mucosal cyclooxygenase, leading to decreased synthesis of protective prostaglandins, thus leading to ulcers

Risk Factors For NSAID Causing Peptic Ulcer

- previous peptic ulcers/UGIB
- age
- high dose of NSAID/multiple NSAIDs being taken
- concomitant corticosteroid use
- concomitant cardiovascular disease/other significant diseases

Treatment

- prophylactic cytoprotective therapy with a PPI is recommended if any of the above risk factors exist concomitantly with ASA/NSAID use
- lower NSAID dose or stop all together and replace with acetaminophen
- combine NSAID with PPI or misoprostol
- enteric coating of Aspirin® (ECASA) provides minor benefit since this decreases incidence of erosion, not incidence of ulceration

Stress-Induced Ulceration

Definition

- ulceration or erosion in the upper GI tract of ill patients, usually in ICU
- lesions most commonly in fundus of stomach

Pathophysiology

- unclear: likely involves ischemia; may be caused by CNS disease, acid hypersecretion, Cushing ulcers
- physiological stress (e.g. fever, severe illness, complex post-operative course) causes ulcers and erosions

If at high risk for development of ulcers, prophylaxis with PPI indicated

The David Y Graham Lecture: Use of Nonsteroidal Anti-Inflammatory Drugs (NSAID) in a COX-2 Restricted Environment

Am J Gastroenterol 2008;103:221-227

This short article reviews the current understanding of NSAID risks, emphasizing (1) with the possible exception of naproxen, all NSAIDs increase cardiovascular/cerebrovascular risk, especially the COX-2 specific inhibitors (2) low-dose Aspirin®, now used widely to decrease these risks, increases the likelihood of upper GI tract bleeding and may not abrogate the cardiovascular risk of NSAIDs (3) clopidogrel is no safer than Aspirin® in patients with high risk of upper GI tract bleeding (4) add a PPI to NSAID if there is an increased risk of upper GI events.

Risk Factors

- mechanical ventilation
- anti-coagulation
- multi-organ failure
- septicemia
- severe surgery/trauma
- CNS injury ("Cushing's ulcers")
- burns involving more than 35% of body surface

Clinical Features

- UGIB (see *Upper Gastrointestinal Bleeding, G25*)
- painless

Treatment

- prophylaxis with gastric acid suppressants (H_2 -blockers or PPI) decreases risk of UGIB, but may increase risk of pneumonia
- treatment same as for bleeding peptic ulcer but often less successful

Gastric Carcinoma

- see *General Surgery, GS18*

**Small and Large Bowel****Classification of Diarrhea****Definition**

- clinically: diarrhea defined as stools that are looser and/or more frequent than normal; physiologically: 24 h stool weight >200 g (less useful clinically)

Classification

- acute vs. chronic
- small volume (tablespoons of stool; typical of colonic diseases) vs. large volume (>1/2 cup stool; typical of small bowel diseases)
- watery (bowel disease) vs. steatorrhea
- secretory (diarrhea persists with fasting) vs. osmotic (diarrhea stops with fasting)

Acute Diarrhea**Definition**

- passage of frequent unformed stools for <14 d

Etiology

- most commonly due to infections
- most infections are self-limiting and resolve within 7 d

Risk Factors

- food (seafood, chicken, turkey, eggs, beef)
- medications: antibiotics, laxatives
- others: high risk sexual activity, infectious outbreaks, family history (IBD)

Classification

- broadly divided and classified into inflammatory and non-inflammatory diarrhea
- mechanisms
 - stimulation of intestinal water secretion and inhibition of water absorption (i.e. secretory problem)
 - in inflammatory diarrhea, organisms and cytotoxins invade mucosa, killing mucosal cells and further perpetuating the diarrhea

Table 8. Classification of Acute Diarrhea

	Inflammatory	Non-Inflammatory
Definition	Disruption of intestinal mucosa	Intestinal mucosa intact
Site	Usually colon	Usually small intestine
Sigmoidoscopy	Usually abnormal mucosa seen	Usually normal
Symptoms	Bloody (not always) Small volume, high frequency Often lower abdominal cramping with urgency \pm tenesmus May have fever \pm shock	Watery, little or no blood Large volume Upper/periumbilical pain/cramp \pm shock
Investigations	Fecal WBC and RBC positive	Fecal WBC negative

**Useful Questions in Acute Diarrhea****Those Fads Wilt**

Travel
Homosexual contacts
Outbreaks
Seafood
Extra-intestinal signs of IBD
Family history
Antibiotics
Diet
Steatorrhea
Weight loss
Immunosuppressed
Laxatives
Tumor history

**Infectious Causes of Inflammatory Diarrhea****Your Stool Smells Extremely Crappy**

Yersinia
Shigella
Salmonella
E. coli (EHEC 0157:H7), *E. histolytica*
Campylobacter, *C. difficile*

Table 8. Classification of Acute Diarrhea (continued)

	Inflammatory	Non-Inflammatory
Etiology	See <i>Differential Diagnosis of Common Presenting Complaints, G4</i>	See <i>Differential Diagnosis of Common Presenting Complaints, G4</i>
Differential Diagnosis	Acute presentation of idiopathic inflammatory bowel disease	Acute presentation of non-inflammatory chronic diarrhea (e.g. celiac disease)
Significance	Higher yield with stool C&S Can progress to life-threatening megacolon, perforation, hemorrhage Antibiotics may benefit	Lower yield with stool C&S Chief life-threatening problem is electrolyte disturbances/ fluid depletion Antibiotics unlikely to be helpful

Investigations

- stool cultures/microscopy (C&S/O&P) are required only if diarrhea is inflammatory, severe, or for epidemiological purposes (day care worker, nursing home resident, community outbreaks (e.g. Walkerton), etc.)
 - C&S only tests *Campylobacter*, *Salmonella*, *Shigella*, *E. coli*
 - ♦ other organisms must be ordered separately
- flexible sigmoidoscopy: useful if inflammatory diarrhea suspected
 - biopsies are the most useful method of distinguishing idiopathic IBD (Crohn's disease and ulcerative colitis) from infectious colitis or acute self-limited colitis
- *C. difficile* toxin: indicated when recent/remote antibiotic use, hospitalization, nursing home, or recent chemotherapy

Treatment

- fluid and electrolyte replacement orally in most cases, intravenous if severe extremes of age/coma
- anti-diarrheals
 - antimitility agents: diphenoxylate, loperamide (Imodium®); contraindicated in mucosal inflammation
 - ♦ side effects: abdominal cramps, toxic megacolon
 - absorbants: kaolin/pectin (Kaopectate®), methylcellulose, activated attapulgate
 - ♦ act by absorbing intestinal toxins/micro-organisms, or by coating intestinal mucosa
 - ♦ much less effective than antimitility agents
 - modifiers of fluid transport: bismuth subsalicylate (Pepto-Bismol®) may be helpful
- antibiotics: rarely indicated
 - risks
 - ♦ prolonged excretion of enteric pathogen (especially *Salmonella*)
 - ♦ drug side effects (including *C. difficile* infection)
 - ♦ development of resistant strains
 - ♦ renal failure/hemolysis (enterohemorrhagic *E. coli* O157:H7)
 - indications for antimicrobial agents in acute diarrhea
 - ♦ septicemia
 - ♦ prolonged fever with fecal blood or leukocytes
 - ♦ clearly indicated: *Shigella*, *V. cholerae*, *C. difficile*, traveler's diarrhea (enterotoxigenic *E. coli* [ETEC]), *Giardia*, *Entamoeba histolytica*, *Cyclospora*
 - ♦ situational: *Salmonella*, *Campylobacter*, *Yersinia*, non-enterotoxigenic *E. coli*
 - ♦ *Salmonella*: always treat *Salmonella typhi* (typhoid or enteric fever); treat other *Salmonella* only if there is underlying immunodeficiency, hemolytic anemia, extremes of age, aneurysms, prosthetic valve grafts/joints, sickle cell disease

**Stool Osmotic Gap**

Stool osmolality is normally about 290 mOsm/kg and can be approximated by the calculated stool osmolality ($2 \times [\text{Na}^+]_{\text{stool}} + [\text{K}^+]_{\text{stool}}$). In osmotic diarrhea, measured stool osmolality > calculated stool osmolality. In secretory diarrhea measured stool osmolality = calculated stool osmolality.

S. typhi has a rose spot rash (transient maculopapular rash on anterior thorax, upper abdomen), and a prodrome of high fever, bradycardia, headache, and abdominal pain; diarrhea is not the initial presentation.

Traveler's Diarrhea

- see [Infectious Diseases, ID14](#)

Chronic Diarrhea

Definition

- passage of frequent unformed stool for >14 d
- approach is similar to that of acute diarrhea except that the majority of cases are non-infectious

Etiology/Classification

- see *Differential Diagnosis of Common Presenting Complaints, G4*

Investigations

- guided by history
- stool analysis for: *C. difficile* toxin, C&S, O&P ± fecal fat, WBC
- blood for: CBC, electrolytes, CRP, TSH, celiac serology (IgA anti-tTG; ask for serum protein electrophoresis or immunoglobulin quantitation to rule out IgA deficiency which has an increased frequency in celiac disease)
- colonoscopy and ileoscopy with biopsy
- upper GI endoscopy with duodenal biopsy
- wireless small bowel endoscopy capsule (low yield)
- trial of lactose free diet
 - caveat: may delay diagnosis of IBD and celiac disease

Maldigestion and Malabsorption

Definition

- **maldigestion:** inability to break down large molecules in the lumen of the intestine into their component small molecules
- **malabsorption:** inability to transport molecules across the intestinal mucosa into circulation
- **malassimilation:** encompasses both maldigestion and malabsorption

Etiology

- **maldigestion**
 - inadequate mixing of food with enzymes (e.g. post-gastrectomy)
 - pancreatic exocrine deficiency
 - primary diseases of the pancreas (e.g. cystic fibrosis, pancreatitis, cancer)
 - bile salt deficiency
 - ♦ terminal ileal disease (impaired recycling), bacterial overgrowth (deconjugation of bile salts), rarely liver disease (cholestatic)
 - specific enzyme deficiencies (e.g. lactase)
- **malabsorption**
 - inadequate absorptive surface
 - ♦ infections/infestations (e.g. Whipple's disease, Giardia)
 - ♦ immunologic or allergic injury (e.g. celiac disease)
 - ♦ infiltration (e.g. lymphoma, amyloidosis)
 - ♦ fibrosis (e.g. systemic sclerosis, radiation enteritis)
 - ♦ bowel resection (length, site, and location are important)
 - ♦ extensive Crohn's disease
 - drug-induced
 - ♦ cholestyramine, ethanol, neomycin, tetracycline, and other antibiotics
 - endocrine
 - ♦ DM (complex pathogenesis)

Clinical Features

- symptoms usually vague unless disease is severe
- weight loss, diarrhea, steatorrhea, weakness, fatigue
- manifestations of malabsorption/deficiency

Fat Soluble Vitamins: **ADEK**
vitamin A, vitamin D, vitamin E, vitamin K

Table 9. Absorption of Nutrients and Fat Soluble Vitamins

Deficiency	Absorption	Clinical Disease and/or Features	Investigations
Iron	Duodenum, upper jejunum	Hypochromic, microcytic anemia, glossitis, koilonychia (spoon nails), pica	↓ Hb, ↓ serum Fe, ↓ serum ferritin
Calcium	Duodenum, upper jejunum (binds to Ca^{2+} binding-protein in cells; levels increased by Vit D)	Metabolic bone disease, may get tetany and paresthesias if serum calcium falls (see Endocrinology, E40)	↓ serum Ca^{2+} , ↓ serum Mg^{2+} , and ↑ ALP Evaluate for ↓ bone mineralization radiographically (DEXA)
Folic Acid	Jejunum	Megaloblastic anemia, glossitis, ↓ red cell folate (may see ↑ folic acid with bacterial overgrowth)	↓ serum folic acid
Vitamin B₁₂	B ₁₂ ingested and bound to R proteins mainly from salivary glands; stomach secretes intrinsic factor (IF) in acidic medium; in basic medium, proteases from the pancreas cleave R protein and B ₁₂ -IF complex forms, protecting B ₁₂ from further protease attack; B ₁₂ absorbed in ileum and binds to transcobalamin (TC)	Subacute combined degeneration of the spinal cord, peripheral/optic neuropathy, dementia, megaloblastic anemia, glossitis	Differentiate causes by nuclear Schilling test (when available) Positive anti-intrinsic factor antibodies and atrophic gastritis point toward pernicious anemia (see Hematology, H24)
Carbohydrate	Complex polysaccharides hydrolyzed to oligosaccharides and disaccharides by salivary and pancreatic enzymes Monosaccharides absorbed in duodenum/jejunum	Generalized malnutrition, weight loss, flatus, and diarrhea	Hydrogen breath test Trial of carbohydrate-restricted diet D-xylose test
Protein	Digestion at stomach, brush border, and inside cell Absorption occurs primarily in the jejunum	General malnutrition and weight loss, amenorrhea and ↓ libido if severe	↓ serum albumin (low sensitivity)
Fat	Lipase, colipase, phospholipase A (pancreatic enzymes), and bile salts needed for digestion Products of lipolysis form micelles which solubilize fat, and aid in absorption Fatty acids diffuse into cell cytoplasm	Generalized malnutrition, weight loss, and diarrhea Foul-smelling feces + gas Steatorrhea	Small bowel biopsy MRCP, ERCP, pancreatic function tests Quantitative stool fat test (72 h) May start with qualitative stool fat test (Sudan stain of stool) (C-triolein breath test)
Vitamin A	Dietary sources (e.g. milk, eggs, liver, carrots, sweet potatoes)	Night blindness Dry skin Keratomalacia	
Vitamin D	Skin (via UV light) or diet (e.g. eggs, fish oil, fortified milk)	Osteomalacia in adults Rickets in children	
Vitamin E	Dietary sources (e.g. vegetable oils, nuts, leafy green vegetables)	Retinopathy, neurological problems	
Vitamin K	Synthesized by intestinal flora ↑ risk of deficiency after prolonged use of broad spectrum antibiotics and/or starvation	Prolonged INR causes bleeding	

* Calcium malabsorption more commonly causes decreased bone density rather than hypocalcemia because serum calcium levels are protected by leaching calcium from the bone

Investigations

- transglutaminase serology/protein electrophoresis and abdominal imaging are most useful because celiac disease and chronic pancreatitis are the two most common causes of steatorrhea
- 72 h stool collection (weight, fat content) documents steatorrhea (gold standard)
- serum carotene, folate, Ca^{2+} , Mg^{2+} , vitamin B_{12} , albumin, ferritin, serum iron solution, INR/PTT
- stool fat globules on fecal smear stained with Sudan (rarely used)
- other tests specific for etiology (e.g. CT scan/MRI to visualize pancreas)
- trial of therapy with pancreatic enzymes

Treatment

- dependent on underlying etiology

Celiac Disease (Gluten Enteropathy/Sprue)

Definition

- abnormal small intestine mucosa due to intestinal reaction to gliadin, a component of gluten found in cereal grains

Etiology

- only autoimmune disease in which antigen (a peptide in α -gliadin) is recognized
- associated with other autoimmune diseases, especially thyroid disease
- gluten, a protein in cereal grains, broken down to gliadin, is toxic factor
- HLA-DQ2 (chromosome 6) found in 80-90% of patients compared with 20% in general population; also associated with HLA-DQ8

Epidemiology

- more common in women
- family history: 15% of first-degree relatives
- may present any time from infancy (when cereals introduced) to elderly
- peak presentation in infancy

Clinical Features

- classically: diarrhea, weight loss, anemia, symptoms of vitamin/mineral deficiency, failure to thrive; now more commonly bloating, gas, iron deficiency
- improves with gluten-free diet, deteriorates when gluten reintroduced
- disease is usually most severe in proximal bowel
 - thus iron, calcium, and folic acid deficiency more common than vitamin B_{12} deficiency
- gluten enteropathy may be associated with dermatitis herpetiformis skin eruption, epilepsy, myopathy, depression, paranoia, infertility, bone fractures/metabolic bone disease

Investigations

- small bowel mucosal biopsy (usually duodenum) is diagnostic with:
 - villous atrophy and crypt hyperplasia
 - increased number of plasma cells and lymphocytes in lamina propria
 - increased intraepithelial lymphocytes
 - villous atrophy also seen in small bowel overgrowth, Crohn's, lymphoma, *Giardia*, HIV
- consider CT enterography to visualize small bowel to rule out lymphoma
- evidence of malabsorption (localized or generalized)
 - steatorrhea
 - low levels of ferritin/iron saturation, Ca^{2+} , Fe, albumin, cholesterol, carotene, B_{12} absorption
- improvement with a gluten-free diet; should not be started before anti-tTG and biopsy
- serological tests
 - serum anti-tTG antibody, IgA, is 90-98% sensitive, 94-97% specific
 - IgA deficient patients have false-negative anti-tTG
 - ♦ thus measure serum IgA concomitantly (via serum protein electrophoresis)
- fecal fat >7%

Treatment

- dietary counseling
 - gluten free diet: avoid barley, rye, wheat
 - ♦ oats allowed if not contaminated by other grains
 - rice and corn flour are acceptable
 - iron, folate supplementation (with supplementation of other vitamins as needed)
- if poor response to diet change, consider
 - alternate diagnosis
 - non-adherence to gluten-free diet
 - concurrent disease (e.g. microscopic colitis, pancreatic insufficiency)

**Gluten found in BROW**

Barley
Rye
Oats (controversial)
Wheat

- development of intestinal (enteropathy-associated T-cell) lymphoma (abdominal pain, weight loss, palpable mass)
- development of diffuse intestinal ulceration, characterized by aberrant intraepithelial T-cell population (precursor to lymphoma)

Prognosis

- associated with increased risk of lymphoma, carcinoma (e.g. small bowel and colon)
- risk of malignancy may be lowered by dietary gluten restriction

Inflammatory Bowel Disease

Definition

- Crohn's disease (CD), ulcerative colitis (UC), indeterminate colitis or IBD-unclassified (IBDU)

Pathophysiology

- poorly understood
- sustained response of the immune system, perhaps to enteric flora in a genetically predisposed individual
- current hypothesis: lack of appropriate down-regulation of immune responsiveness

Genetics

- increased risk of both UC and CD in relatives of patients with either disease, especially siblings, early onset disease
 - familial risk greater if proband has CD rather than UC
- likely polygenomic pattern: 9 gene loci are associated
- CARD15/NOD2 gene mutation associated with CD (relative risk in heterozygote is 3, in homozygote is 40), especially Ashkenazi Jews, early onset disease, ileal involvement, fistulizing and stenotic disease
 - CARD15 gene product modulates NFκB, which is required for the innate immune response to microbial pathogens, best expressed in monocytes-macrophages

Clinical Features

Table 10. Clinical Differentiation of Ulcerative Colitis from Crohn's Disease

	Crohn's Disease	Ulcerative Colitis
Location	Any part of GI tract <ul style="list-style-type: none"> • Small bowel + colon: 50% • Small bowel only: 30% • Colon only: 20% 	Isolated to large bowel Always involves rectum, may progress proximally
Rectal Bleeding	Uncommon	Very common (90%)
Diarrhea	Less prevalent	Frequent small stools
Abdominal Pain	Post-prandial/colicky	Less common
Fever	Common	Uncommon
Urgency/Tenesmus	Uncommon (unless rectum involved)	Common
Palpable Mass	Frequent (25%), RLQ	Rare (if present, cecum full of stool)
Recurrence After Surgery	Common	None post-colectomy
Endoscopic Features	Ulcers (aphthous, stellate, linear), patchy lesions, pseudopolyps, cobblestoning	Continuous diffuse inflammation, erythema, friability, loss of normal vascular pattern, pseudopolyps
Histologic Features	Transmural distribution with skip lesions Focal inflammation ± noncaseating granulomas, deep fissuring + aphthous ulcerations, strictures Glands intact	Mucosal distribution, continuous disease (no skip lesions) Granulomas absent Gland destruction, crypt abscess
Radiologic Features	Cobblestone mucosa Frequent strictures and fistulae AXR: bowel wall thickening "string sign"	Lack of haustra Strictures rare; need to rule out complicating cancer
Complications	Strictures, fistulae, perianal disease	Toxic megacolon
Colon Cancer Risk	Increased if >30% of colon involved	Increased except in proctitis

Table 11. Extraintestinal Manifestations (EIM) of IBD

System	Crohn's Disease	Ulcerative Colitis
Dermatologic		
Erythema nodosum	15%	10%
Pyoderma gangrenosum	10%	Less common
Perianal skin tags	75-80%	Rare
Oral mucosal lesions	Common	Rare
Psoriasis	Statistically associated in 5-10% of those with IBD but not an EIM	
Rheumatologic		
Peripheral arthritis	15-20% of those with IBD (CD>UC)	
Ankylosing spondylitis	10% of those with IBD (CD>UC)	
Sacroiliitis	Occurs equally in CD and UC	
Ocular (~10% of IBD)		
Uveitis (vision threatening)	3-4% of IBD patients (CD>UC)	
Episcleritis (benign)		
Hepatobiliary		
Cholelithiasis	15-35% of patients with ileal Crohn's	
PSC	1-5% of IBD cases involving colon	
Fatty liver		
Urologic		
Calculi	Most common in CD, especially following ileal resection	
Ureteric obstruction		
Fistulae	Characteristic of Crohn's	
Others		
Thromboembolism		
Vasculitis		
Osteoporosis		
Vitamin deficiencies (B ₁₂ , Vit ADEK)		
Cardiopulmonary disorders		
Pancreatitis (rare)		

Crohn's Disease

Definition

- chronic transmural inflammatory disorder potentially affecting the entire gut from mouth to perianal region ("gum to bum")

Epidemiology

- incidence 1-6/100,000; prevalence 10-100/100,000
- bimodal: onset before 30 yr, second smaller peak age 60; M=F
- incidence of Crohn's increasing (relative to UC) especially in young females
- more common in Caucasians, Ashkenazi Jews
 - risk in Asians increases with move to Western countries
- smoking incidence in Crohn's patients is higher than general population

Pathology

- most common location: ileum + ascending colon
- linear ulcers leading to mucosal islands and "cobblestone" appearance
- granulomas are found in 50% of surgical specimens, 15% of mucosal biopsies

Clinical Features

- natural history unpredictable; young age, perianal disease, and need for corticosteroids have been associated with poor prognosis, but associations are not strong enough to guide clinical decisions
- most often presents as recurrent episodes of abdominal cramps, diarrhea, and weight loss
- ileitis may present with post-prandial pain, vomiting, RLQ mass; mimics acute appendicitis
- extra-intestinal manifestations are more common with colonic involvement
- fistulae, fissures, abscesses are common
- deep fissures with risk of perforation into contiguous viscera (leads to fistulae and abscesses)
- enteric fistulae may communicate with skin, bladder, vagina, and other parts of bowel

Investigations

- colonoscopy with biopsy to visualize (less often gastroscopy)
- CT/MR enterography to visualize small bowel
- CRP elevated in most new cases, useful to monitor treatment response
- bacterial cultures, O&P, *C. difficile* toxin to exclude other causes of inflammatory diarrhea

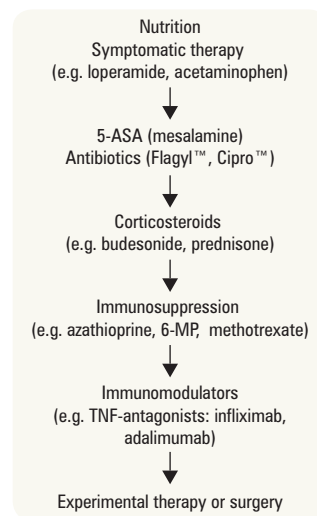

Figure 7. Traditional graded approach to induction therapy in Crohn's disease

Note: Starting with immunosuppressives plus immunomodulators ("bottom-up approach") increasingly being used (*Lancet* 2008;371:660-667). Combination of azathioprine and infliximab has the highest remission rate yet described with medical treatment (*NEJM* 2010;362:1383-1395).

Management (see Figure 7)**Table 12. Management of Crohn's Disease**

Management	Notes
Lifestyle/Diet	Smoking cessation Fluids only during acute exacerbation Enteral diets may aid in remission No evidence for any non-enteral diet changing the natural history of Crohn's disease, but may affect symptoms Those with extensive small bowel involvement or extensive resection require electrolyte, mineral, and vitamin supplements (vit D, Ca ²⁺ , Mg ²⁺ , zinc, Fe, B ₁₂)
Antidiarrheal Agents*	Loperamide (Imodium®) > diphenoxylate (Lomotil®) > codeine (cheap but addictive) All work by decreasing small bowel motility CAUTION if colitis is severe (risk of precipitating toxic megacolon), therefore avoid during flare-ups
5-ASA	Efficacy controversial: most evidence for mild colonic disease Sulfasalazine (Salazopyrin®): 5-ASA bound to sulfapyridine Hydrolysis by intestinal bacteria releases 5-ASA (active component) Dose-dependent efficacy Mesalamine (Pentasa®): coated 5-ASA releases 5-ASA in the ileum and colon
Antibiotics	e.g. metronidazole (20 mg/kg/d, bid or tid dosing) or ciprofloxacin Best described for perianal Crohn's, although characteristically relapse when discontinued
Corticosteroids	Prednisone: starting dose 40 mg OD for acute exacerbations; IV methylprednisolone if severe No proven role for steroids in maintaining remissions; masks intra-abdominal sepsis
Immunosuppressives	6-mercaptopurine (6-MP), azathioprine (Imuran®); methotrexate (used less often) More often used to maintain remission than to treat active inflammation Most commonly used as steroid-sparing agents i.e. to lower risk of relapse as corticosteroids are withdrawn May require >3 mo to have beneficial effect; usually continued for several years May help to heal fistulae, decrease disease activity Side effects: vomiting, pancreatitis, bone marrow suppression, increased risk of malignancy
Biologics	Infliximab IV (Remicade®) or adalimumab SC (Humira®): both = antibody to TNF-α Proven effective for treatment of fistulae and patients with medically refractory CD First-line immunosuppressive therapy with infliximab + azathioprine more effective than using either alone
Surgical/Experimental	Surgical treatment (see General Surgery, GS30) Surgery generally reserved for complications such as fistulae, obstruction, abscess, perforation, bleeding, and for medically refractory disease If <50% or <200 cm of functional small intestine, risk of short bowel syndrome At least 50% clinical recurrence within 5 yr; 85% within 15 yr; endoscopic recurrence rate even higher 40% likelihood of second bowel resection, 30% likelihood of third bowel resection Complications of ileal resection: <100 cm resected → watery diarrhea or cholorrhea (impaired bile salt absorption) Treatment: cholestyramine or anti-diarrheals e.g. loperamide >100 cm resected → steatorrhea (reduced mucosal surface area, bile salt deficiency) Treatment: fat restriction, medium chain triglycerides

*Cholestyramine: a bile-salt binding resin; for watery diarrhea with <100 cm of terminal ileum diseased or resected; however, non-specific anti-diarrheals are more convenient and often more potent

Prognosis

- highly variable course
- 10% disabled by the disease eventually, spontaneous remission also described
- increased mortality, especially with more proximal disease, greatest in the first 4-5 yr
- complications include:
 - intestinal obstruction/perforation
 - fistula formation
 - malignancy (lower risk compared to UC)
- surveillance colonoscopy same as ulcerative colitis (see [Ulcerative Colitis, G22](#)) if more than 1/3 of colon involved

Characteristically more than 1 yr between onset of symptoms and diagnosis of Crohn's disease

**Traditional Medical Management of Crohn's**

	Induction of Remission	Maintenance
5-ASA	?	?
Steroids	+	
Immunosuppressive	+	+
Antibiotics	+	
MTX	+	+
Infliximab	+	+

**Biological Therapies for Inflammatory Bowel Diseases**

Gastroenterology 2009;136:1182-1197

Although the etiology of inflammatory bowel diseases (IBD) is unknown, biological therapies (BT) that target key molecules in innate and adaptive immune pathways have been designed.

Anti-TNF Agents (infliximab, adalimumab, certolizumab): Effective in CD, less effective for UC. Increase mucosal healing, decrease need for hospitalizations and surgeries, and can induce steroid-free remission. At least 10% of patients annually develop intolerance and/or a loss of response.

Selective Anti-Adhesion Molecules

(natalizumab): Increases response and remission rates, circulating leukocytes, and steroid-sparing capacity in CD. Progressive multifocal leukoencephalopathy is a rare adverse event.

Promising New BT: Anti-Interleukin-12/Interleukin-23 p40 target factors more often associated with CD, while anti-IFN-antibodies may treat CD and UC.

BT Without Established Efficacy: Recombinant human cytokines, blockade of T-cell activation (daclizumab and basiliximab) and stimulators of the innate immune system.

Conclusion: Anti-TNF agents are effective treatments for IBD. There is a need to develop salvage biologic therapies for patients who do not respond to a first biological drug. BT's have a safety risk, so their place in treatment algorithms must be defined carefully.

Ulcerative Colitis

Definition

- inflammatory disease affecting colonic mucosa anywhere from rectum (always involved) to cecum

Epidemiology

- incidence 2-10/100,000; prevalence 35-100/100,000 (more common than Crohn's)
- 2/3 onset by age 30 (with second peak after 50); M=F
- small hereditary contribution (15% of cases have 1st degree relative with disease)
- risk is less in smokers
- inflammation limited to rectum or left colon is more common than pancolitis

Pathology

- disease can involve any portion of lower bowel ranging from rectum only (proctitis) to entire colon (pancolitis)
- inflammation is diffuse, continuous and confined to mucosa

Clinical Features

- rectal bleeding is the hallmark feature, however diarrhea may be present if more than the rectum is involved
 - can also have abdominal cramps/pain, especially with defecation
- severity of colonic inflammation correlates with symptoms (stool volume, amount of blood in stool)
- tenesmus, urgency, incontinence
- systemic symptoms: fever, anorexia, weight loss, fatigue in severe cases
- extra-intestinal manifestations (see Table 11)
- characteristic exacerbations and remissions; 5% of cases are fulminant

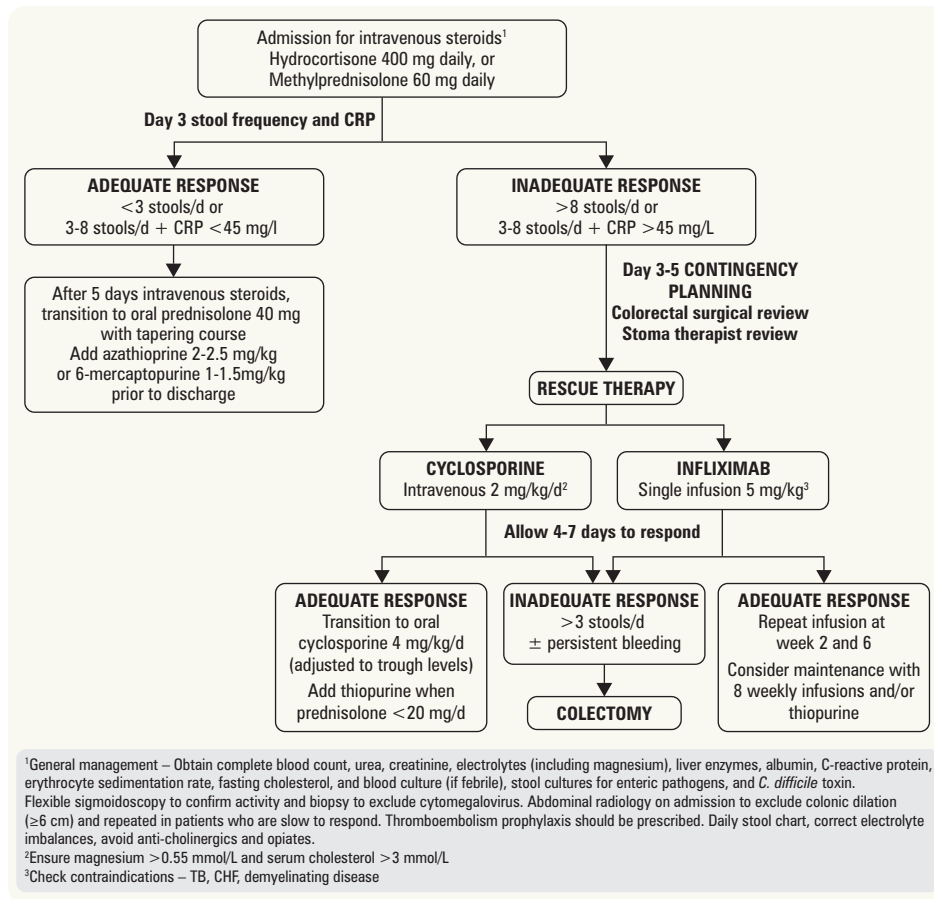

In UC, non-bloody diarrhea is frequently the initial presentation; eventually progressing to bloody diarrhea

Investigations

- sigmoidoscopy with mucosal biopsy (to exclude self-limited colitis) without bowel prep often sufficient for diagnosis
- colonoscopy helpful to determine extent of disease; contraindicated in severe exacerbation
- CT colonography (formerly barium enema) if colonoscopy cannot be done; contraindicated in severe disease
- stool culture, microscopy, *C. difficile* toxin assay necessary to exclude infection
- no single confirmatory test

Management

- mainstays of treatment: 5-ASA (mesalamine) derivatives and corticosteroids, with azathioprine used in steroid-dependent or resistant cases
- diet of little value in decreasing inflammation but may alleviate symptoms
- antidiarrheal medications generally not indicated in UC
- 5-ASA
 - topical (suppository or enema): very effective for distal disease (distal to splenic flexure), preferable to corticosteroids
 - oral: effective for mild to moderate, but not severe colitis (4 g/d)
 - e.g. sulfasalazine 3-4 g/d, mesalamine 4 g/d
 - commonly used in maintaining remission (decreases yearly relapse rate from 60% to 15%)
 - may decrease rate of colorectal cancer
- corticosteroids
 - to remit acute disease, especially if severe or first attack; may need maximum dose IV steroids initially (e.g. methylprednisolone 30 mg IV q12h)
 - limited role as maintenance therapy
 - use suppositories for proctitis, enemas for proctosigmoiditis
 - topical steroids (e.g. hydrocortisone foam, budesonide enemas) for inflammation distal to splenic flexure
- immunosuppressants (steroid-sparing)
 - if severe UC is refractory to steroid therapy, consider adding IV cyclosporine or IV infliximab within 3-5 d of recognition of need for salvage – rapidly effective, but helpful only in a minority of patients
 - azathioprine: too slow to rapidly resolve acute relapse
 - most commonly used to induce and maintain remission as corticosteroids withdrawn
- surgical treatment
 - early in severe UC, especially fulminant cases and toxic megacolon – consider operation if no response after 3-5 d of corticosteroids, or after 4-7 d of immunosuppressive medical therapy
 - aim for cure with colectomy; bowel continuity can be restored with ileal pouch-anal anastomosis (IPAA)
 - indications: failure of adequate medical therapy, toxic megacolon, uncontrollable bleeding, pre-cancerous changes detected either by endoscopy or endoscopic biopsies (dysplasia), inability to taper corticosteroids, overt malignancy

**Medical Management of Ulcerative Colitis**

	Induction of Remission	Maintenance
5-ASA	+	+
Steroids	+	
Immunosuppressive	±	+

**When Considering Complications of IBD, Think: ULCERATIVE COLITIS**

Urinary calculi
Liver problems
Cholelithiasis
Epithelial problems
Retardation of growth/sexual maturation
Arthralgias
Thrombophlebitis
Iatrogenic complications
Vitamin deficiencies
Eyes
Colorectal cancer
Obstruction
Leakage (perforation)
Iron deficiency
Toxic megacolon
Inanition (wasting)
Strictures

Figure 8. Medical management of severe ulcerative colitis

Gastroenterology 2011;140:1827-1837

Complications

- similar to CD, except
 - more liver problems (especially PSC in men)
 - greater risk of colorectal cancer
 - ♦ risk increases with duration and extent of disease (5% at 10 yr, 15% at 20 yr for pancolitis; overall relative risk is 8%)
 - ♦ risk also increases with active mucosal inflammation and sclerosing cholangitis
 - ♦ thus, regular colonoscopy and biopsy in pancolitis of ≥ 8 yr is indicated
 - toxic megacolon (transverse colon diameter >6 cm on abdominal x-ray) with immediate danger of perforation (see [General Surgery, GS26](#))

Prognosis

- chronic relapsing pattern in most patients
- 10-15% chronic continuous pattern
- >1 attack in almost all patients
- more colonic involvement in the 1st yr correlates with increased severity of attacks and increased colectomy rate
 - colectomy rate = 1% for all patients after the 1st yr; 20-25% eventually undergo colectomy
- normal life expectancy
- if proctitis only, usually benign course

**Irritable Bowel Syndrome****Definition**

- a form of functional bowel disease, more than just a label for GI symptoms unexplained after investigations

Epidemiology

- 20% of North Americans
- onset of symptoms usually in young adulthood
- F>M

Pathophysiology

- associated with either abnormal perception of intestinal activity or abnormal intestinal motility
- abnormal motility: multiple abnormalities described; unclear if associations or if causative
- psychological: stress may increase IBS symptoms but does not cause IBS

Diagnosis

Table 13. Rome III Criteria for Diagnosing Irritable Bowel Syndrome

IBS Rome III Criteria	
<ul style="list-style-type: none"> • ≥ 12 wk in the past 12 mo of abdominal discomfort or pain that has 2 out of 3 features: <ul style="list-style-type: none"> • Relieved with defecation • Associated with a change in frequency of stool • Associated with a change in consistency of stool • The following are supportive, but not essential to the diagnosis: <ul style="list-style-type: none"> • Abnormal stool frequency ($>3/d$ or $<3/wk$) • Abnormal stool form (lumpy/hard/loose/watery) $>1/4$ of defecations • Abnormal stool passage (straining, urgency, feeling of incomplete evacuation) $>1/4$ of defecations • Passage of mucus $>1/4$ of defecations • Bloating 	
Diagnosis of IBS Less Likely in Presence of "Red Flag" Features	
<ul style="list-style-type: none"> • Weight loss • Fever • Nocturnal defecation 	<ul style="list-style-type: none"> • Anemia • Blood or pus in stool • Abnormal gross findings on flexible sigmoidoscopy
Normal Physical Exam	

Investigations

- if history consistent with Rome III criteria, no alarm symptoms, and no family history of IBD or colorectal cancer, limited investigations required
- aim is to rule out diseases which mimic IBS
- CBC, TSH, albumin, CRP, tTG serology with protein electrophoresis
- stool for C&S, O&P, fecal fat if diarrhea present
- consider sigmoidoscopy

Management

- reassurance, explanation, support, aim for realistic goals
- relaxation therapy, biofeedback, hypnosis, stress reduction
- no therapeutic agent consistently effective, pain most difficult to control
- symptom-guided treatment
 - pain predominant
 - ♦ antispasmodic medication before meals (e.g. hyoscine, pinaverium, trimebutine)
 - ♦ increase dietary fiber (bran or psyllium)
 - ♦ tricyclic antidepressants (TCA), selective serotonin reuptake inhibitors (SSRI)
 - diarrhea predominant (IBS-D)
 - ♦ increase dietary fiber (bran or psyllium) to increase stool consistency
 - ♦ loperamide (Imodium®)
 - ♦ diphenoxylate (Lomotil®)
 - ♦ cholestyramine 4 g QID
 - constipation predominant (IBS-C)
 - ♦ exercise and increase fiber in diet
 - ♦ osmotic or other laxatives
 - mixed (alternating constipation and diarrhea) (IBS-M)

Prognosis

- 80% improve over time
- most have intermittent episodes
- normal life expectancy

Rifaximin Therapy for Patients with Irritable Bowel Syndrome without Constipation

NEJM 2011;364:22-32

Purpose: Previous evidence suggests that gut flora may play an important role in the pathophysiology of irritable bowel syndrome (IBS). This study evaluated rifaximin, a minimally absorbed antibiotic, in treating IBS without constipation.

Methods: Two phase 3, double-blind, placebo-controlled trials (TARGET 1 and TARGET 2). 1,260 patients who had IBS without constipation were randomly assigned to rifaximin (550 mg dose) or placebo, 3 times daily for 2 wk, with a follow-up of 10 wk. The primary endpoint was adequate self-reported relief of global IBS symptoms.

Results: Significantly more patients in the rifaximin group had adequate self-reported relief of global IBS symptoms compared to the placebo group during the first 4 wk after treatment (40.8% vs. 31.2% respectively). Also, more patients in the rifaximin group had adequate relief of bloating compared to the placebo group (39.5% vs. 28.7% respectively).

Conclusions: Rifaximin therapy for 2 wk provided significant relief of symptoms, bloating, abdominal pain, and stool consistency associated with IBS without constipation.

IBS Mimickers

- Enteric infections e.g. *Giardia*
- Lactose intolerance/other disaccharidase deficiency
- Crohn's disease
- Celiac sprue
- Drug-induced diarrhea
- Diet-induced (excess tea, coffee, colas)

Constipation

Definition

- passage of infrequent or hard stools with straining (stool water <50 mL/d); bowel frequency <3 times/wk

Epidemiology

- increasing prevalence with age; F>M
- rare in Africa and India where stool weight is 3-4x greater than in Western countries

Etiology

- if constipation is the only presenting symptom, underlying disease is only rarely found. Only test indicated in this situation is a complete blood count (2013 recommendation of American Gastroenterology Association), but consider TSH, calcium, and glucose
- most common: idiopathic attributed to colon dysmotility but this is difficult to measure
- organic causes
 - medication side effects (narcotics, antidepressants) are the most common
 - intestinal obstruction, left sided colon cancer (consider in older patients), and fecal impaction
 - metabolic
 - ♦ DM
 - ♦ hypothyroidism
 - ♦ hypercalcemia, hypokalemia, uremia
 - neurological
 - ♦ intestinal pseudo-obstruction
 - ♦ Parkinson's disease
 - ♦ MS
 - collagen vascular disease (e.g. scleroderma)
 - painful anal conditions (e.g. fissures)

Clinical Presentation

- overlaps with irritable bowel syndrome
- stool firm, difficult to expel, passed with straining, abdominal pain relieved by defecation, flatulence, overflow diarrhea, tenesmus, abdominal distension, infrequent BMs (<3/wk)

Investigations

- colon visualization if concomitant symptoms such as rectal bleeding, weight loss, or anemia (colonoscopy, CT colonography)
- if refractory to treatment, consider classification based on colon transit time; can measure colonic transit time with radioopaque markers that are ingested and followed with a series of plain film abdominal x-rays (normal: 70 h)
 - (1) normal = misperception of normal defecation (IBS)
 - (2) prolonged throughout = "colonic inertia" (infrequent bowel movements with gas/bloating, tends to occur in youth)
 - (3) outlet obstruction = inability to coordinate pelvic floor muscles to empty rectum, straining, stool in rectum on digital exam, tends to occur in old age
- combination of (2) and (3) common

Treatment (in order of increasing potency)

- dietary fiber
 - useful if mild or moderate constipation, but not if severe
 - aim for 30 g daily, increase dose slowly
- surface-acting (soften and lubricate)
 - docusate salts, mineral oils
- osmotic agents (effective in 2-3 d)
 - lactulose, sorbitol, magnesium salts (e.g. magnesium hydroxide, i.e. milk of magnesia), lactitol, polyethylene glycol 3350
- cathartics/stimulants (effective in 24 h)
 - castor oil, senna (avoid prolonged use to prevent melanosis coli), bisacodyl
- enemas and suppositories (e.g. saline enema, phosphate enema, glycerin suppository, bisacodyl suppository)
- prokinetic agents (prucalopride)

Causes of Constipation

DOPED

Drugs

Obstruction

Pain

Endocrine dysfunction

Depression

Upper Gastrointestinal Bleeding

Definition

- bleeding proximal to the ligament of Treitz (75% of GI bleeds)
 - ligament of Treitz: suspensory ligament where fourth portion of the duodenum transitions to jejunum

Etiology

- above the GE junction
 - epistaxis
 - esophageal varices (10-30%)
 - esophagitis
 - esophageal cancer
 - Mallory-Weiss tear (10%)
- stomach
 - gastric ulcer (20%) (see *Peptic Ulcer Disease, G12*)
 - gastritis (e.g. from alcohol or post-surgery) (20%)
 - gastric cancer
 - gastric antral vascular ectasia (rare, associated with cirrhosis and CTD)
 - Dieulafoy's lesion (very rare)

Aortoenteric Fistula is a rare and lethal cause of GI bleed, most common in patients with a history of aortic graft surgery. Therefore, perform emergency endoscopy if suspected, emergency surgery if diagnosed

Note: The window of opportunity is narrow. Suspect if history of aortic graft, abdominal pain associated with bleeding

- duodenum
 - ulcer in bulb (25%)
 - aortoenteric fistula: usually only if previous aortic graft (see sidebar, G25)
- coagulopathy (drugs, renal disease, liver disease)
- vascular malformation (Dieulafoy's lesion, AVM)

Clinical Features

- in order of decreasing severity of the bleed: hematochezia > hematemesis > coffee ground emesis > melena > occult blood in stool

Management (initial)

- stabilize patient (1-2 large bore IVs, IV fluids, monitor)
- send blood for CBC, cross and type, platelets, PT, PTT, electrolytes, BUN, Cr, LFTs
- keep NPO
- consider NG tube to determine upper vs. lower GI bleeding in some cases
- endoscopy (OGD): establish bleeding site + treat lesion
 - if bleeding peptic ulcer: most commonly used method of controlling bleeding is injection of epinephrine around bleeding point + thermal hemostasis (bipolar electrocoagulation or heater probe); less often thermal hemostasis may be used alone, but injection alone not recommended
 - endoclips
- IV PPI: decrease risk of rebleed if endoscopic predictors of rebleeding seen (see prognosis section)
 - given to stabilize clot, not to accelerate ulcer healing
 - if given before endoscopy, decreases need for endoscopic therapeutic intervention
- for variceal bleeds, octreotide 50 µg loading dose followed by constant infusion of 50 µg/h
- consider IV erythromycin (or metoclopramide) to accelerate gastric emptying prior to gastroscopy to remove clots from stomach

Prognosis

- 80% stop spontaneously
- peptic ulcer bleeding: low mortality (2%) unless rebleeding occurs (25% of patients, 10% mortality)
- endoscopic predictors of rebleeding: spurt or ooze, visible vessel, fibrin clot
- can send home if clinically stable, bleed is minor, no comorbidities, endoscopy shows clean ulcer with no predictors of rebleeding
- H₂-antagonists have little impact on rebleeding rates and need for surgery
- esophageal varices have a high rebleeding rate (55%) and mortality (29%)

Always ask about NSAID/Aspirin® or anticoagulant therapy in GI bleed

Forrest Classification of Bleeding Peptic Ulcers

Forrest Class	Type of Lesion	Risk of Rebleed (%)
I	Arterial bleeding (oozing/spurting)	55-100
Ila	Visible vessel	43
Ilb	Sentinel clot	22
Ilc	Hematin covered flat spot	10
III	No stigmata of hemorrhage	5

Lancet 1974;2:394-397

Transfusion Strategies for Acute Upper Gastrointestinal Bleeding

NEJM 2013;368:11-21

Study: Prospective, unblinded, RCT, follow-up up to 45 d.

Populations: 921 patients with hematemesis, bloody nasogastric aspirate, melena, or both. Exclusion criteria included massive bleed, ACS, stroke/TIA or transfusion within previous 90 d; recent trauma/surgery; lower GI bleed.

Intervention: Patients randomized to restrictive (<7.0 g/dL) or liberal (<9.0 g/dL) transfusion. Outcome: Mortality, further bleeding, adverse events.

Results: Fewer patients in the restrictive group required transfusion (51% vs. 15%; $p < 0.001$). The hazard ratio for death for restrictive compared to liberal transfusion was 0.55; 95% CI, 0.33 to 0.92; $p = 0.02$. Further bleeding occurred in 10% vs. 16% ($p = 0.01$) of patients, while adverse effects occurred in 40% vs. 48% ($p = 0.02$) of patients in the restrictive and liberal strategies, respectively. The restrictive strategy had a better survival rate in patients with bleeding associated with cirrhosis Child-Pugh class A or B (HR: 0.30; 95% CI, 0.11 to 0.85), but not in cirrhosis Child-Pugh class C (HR: 1.04; 95% CI, 0.45 to 2.37) or a peptic ulcer (HR: 0.70; 95% CI, 0.26 to 1.25).

Conclusions: Transfusing patients with an acute upper GI bleed at hemoglobin of <7.0 g/dL rather than 9.0 g/dL is associated with fewer transfusions, better survival, and fewer adverse events.

Review Article: Improved Survival with Patients with Variceal Bleeds

Int J Hepatol 2011;doi=10.461/2011/356919

General Measures: Resuscitation to achieve hemodynamic stability (Hb >7.0-8.0 g/dL) but avoid fluid overload as it can precipitate or worsen ascites.

Antibiotic Prophylaxis: IV ceftriaxone or postendoscopic norfloxacin reduces bacterial infection, rebleeding rates, length of hospitalization, and all-cause mortality.

Splanchnic Vasoconstriction: Somatostatin, Octreotide, Terlipressin.

Therapeutic Endoscopy: Band ligation is superior to injection sclerotherapy in initial control of bleeding, incidence of rebleeding, side effects, time, and survival.

Recommendations: Combination therapy with vasoactive drug plus endoscopic band ligation is recommended for Child's A and if combined therapy fails (HVPG >20 mmHg within 24 h after start of bleed is the best predictor failure); TIPS is then recommended for patients with Child's B or C, early TIPS is recommended over combined therapy.

Approach to Iron Deficiency Anemia

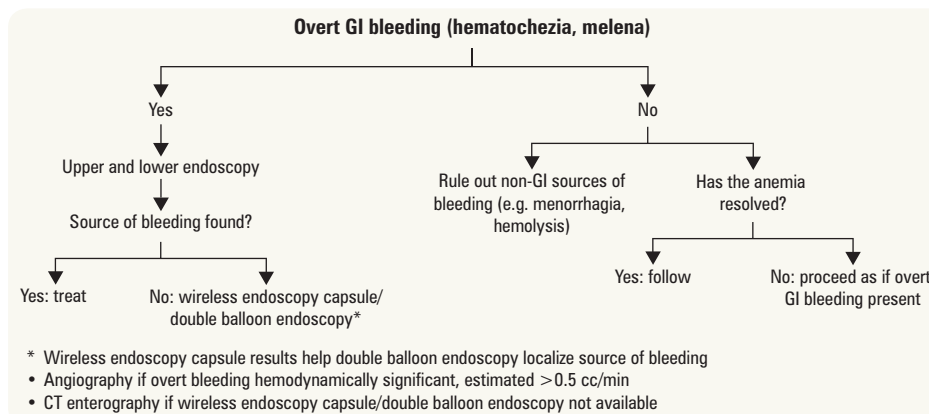

Figure 9. Approach to iron deficiency anemia

Esophageal Varices

Etiology

- almost always due to portal HTN
- often accompanied by varices in stomach

Clinical Features

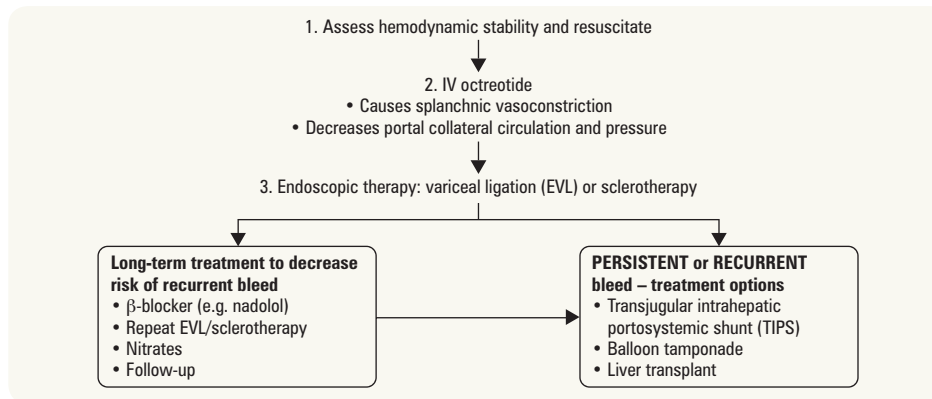

- characteristically massive upper GI bleeding

Prognosis

- risk of bleeding: 30% in 1st yr
- risk of rebleeding: 50-70% (20% mortality at 6 wk)

Investigations

- endoscopy

Management**Figure 10. Management of bleeding esophageal varices**

Not depicted: Intravenous ceftriaxone (lowers risk of sepsis, especially spontaneous bacterial peritonitis)

If varices isolated to stomach, think of splenic vein thrombosis

Gastric varices best treated by endoscopic injection of cyanoacetate ("crazy glue")

In a prospective study of upper GI tract bleeding, mortality, recurrent bleeding, and adverse events were lower when transfusions were given only when the hemoglobin concentration fell below 7.0 g/dL compared to transfusions given when the hemoglobin fell below 9.0 g/dL. The benefit was most marked in variceal bleeding with Childs-Pugh Class A or B cirrhosis (see below under cirrhosis), but also seen in peptic ulcer. Exclusion criteria included exsanguinating bleeding, acute coronary syndrome, and stroke. *NEMJ* 2013;368:11-21

Mallory-Weiss Tear

Definition

- longitudinal laceration in gastric mucosa on lesser curvature near GE junction (20% straddle junction, 5% in distal esophagus)

Etiology

- due to rapid increases in gastric pressure from retching/vomiting against a closed glottis
- hiatus hernia usually present

Clinical Features

- hematemesis \pm melena, classically following an episode of retching without blood
- can lead to fatal hematemesis

Management

- 90% stop spontaneously
- if persistent: endoscopy with epinephrine injection \pm clips or surgical repair

Lower Gastrointestinal Bleeding

Definition

- bleed distal to ligament of Treitz

Etiology

- if blood per rectum with hemodynamic instability, rule out upper GI source
- diverticular (60% from right colon)
- vascular
 - angiodysplasia
 - anorectal (hemorrhoids, fissures)
- neoplasm
 - cancer
 - polyps
- inflammation
 - colitis (ulcerative, infectious, radiation, ischemic)
- post-polypectomy

Clinical Features

- hematochezia (see Figure 11)
- anemia
- occult blood in stool
- rarely melena

Management

- treat underlying cause

Always exclude upper GI lesion before localizing the site of the bleeding to the lower GI tract

**Lower GI Bleed****CHAND**

Colitis (radiation, infectious, ischemic, IBD [UC > CD])

Hemorrhoids/fissure

Angiodysplasia

Neoplastic

Diverticular disease

Liver

Investigations of Hepatobiliary Disease

A. TEST OF LIVER FUNCTION

Prothrombin Time (PT or INR)

- a marker of hepatic protein synthesis
- increased by
 - impaired hepatic protein synthesis (>80%) (including all coagulation factors except VIII) i.e. hepatocellular dysfunction
 - vitamin K deficiency
 - vitamin K administration promptly corrects PT in vitamin K deficiency (malnutrition, malabsorption, etc.) but not in hepatocellular dysfunction; thus in the absence of vitamin K deficiency, INR/PT is a reliable index of hepatocellular dysfunction

Serum Albumin Level

- a marker of hepatic protein synthesis; must exclude malnutrition, renal or GI losses, and significant inflammatory or malignant illness of any organ system

Serum Bilirubin

- marker of hepatic excretion: transport from hepatocyte to bile
- canaliculus breakdown product of hemoglobin; metabolized in the reticuloendothelial system of liver; transported through biliary system, excreted via gut
- direct bilirubin = conjugated; indirect = unconjugated bilirubin
- liver dysfunction causes hyperbilirubinemia (elevated direct bilirubin) since conjugation preserved even in end stage liver failure

All clotting factors except factor VIII and von Willebrand factor are exclusively synthesized in the liver

Serum transaminases >1000 due to

- Viral hepatitis
- Drugs
- Autoimmune hepatitis
- Hepatic ischemia
- Less often, common bile duct stone

ALT > AST = most causes of hepatitis
AST > ALT = alcoholic liver disease or other causes of hepatitis that have progressed to advanced cirrhosis

Table 14. Test of Liver Function

Test	What do levels correlate with?	Increased by	How to Interpret
Prothrombin Time (PT or INR)	Hepatic protein synthesis All coagulation factors except VIII	Hepatocellular dysfunction Vitamin K deficiency	PT/INR will promptly correct if vitamin K is administered, so increased PT/INR in absence of vitamin K deficiency is a reliable marker of hepatocellular dysfunction
Serum Albumin	Hepatic protein synthesis	Hepatocellular dysfunction Malnutrition Renal or GI losses Significant inflammation Malignancy	Rule out other potential causes
Serum Direct Bilirubin	Hepatic excretion from hepatocyte to biliary system	Liver dysfunction	Conjugation is preserved even in end stage liver failure, thus increased direct bilirubin indicates liver dysfunction

B. TESTS OF LIVER INJURY

- disproportionately increased AST or ALT = hepatocellular damage
 - ALT more specific to liver; AST from multiple sources (especially muscle)
 - elevation of both highly suggestive of liver injury
 - most common cause of elevated ALT is fatty liver
- disproportionately increased ALP and GGT = cholestasis
 - if ALP is elevated alone, rule out bone disease by fractionating ALP and/or checking GGT
 - if ALP elevation out of proportion to ALT/AST elevation, consider:
 - obstruction of common bile duct (extraluminal = pancreatic Ca, lymphoma; intraluminal = stones, cholangiocarcinoma, sclerosing cholangitis, helminths)
 - destruction of microscopic ducts (e.g. PBC)
 - bile acid transporter defects (drugs, intrahepatic cholestasis of pregnancy)
 - infiltration of the liver (liver metastases, lymphoma, granulomas, amyloid)

Alcoholic hepatitis: history of recent alcohol, RUQ abdominal pain, AST/ALT > 2, AST usually < 300, low grade fever, mildly elevated WBC

Major Sources of ALP

- Hepatobiliary tree
- Bone
- Placenta

DDx for Hepatomegaly

- Congestive (right heart failure, Budd-Chiari syndrome)
- Infiltrative
 - Malignant (primary, secondary, lymphoproliferative, leukemia)
 - Benign (fatty liver, cysts, hemochromatosis, extramedullary hematopoiesis, amyloid)
- Proliferative
 - Infectious (viral, tuberculosis, abscess, echinococcus)
 - Inflammatory (granulomas [sarcoid], histiocytosis X)

DDx for Hepatitis

- Viral infection
- Alcohol
- Drugs
- Immune-mediated
- Toxins

Causes of Elevated Serum Transaminases in Chronic Hepatitis B

- Ongoing immune-mediated liver injury without immune control of HBV
- Reactivation from prior immune control due to lack of adequate immune control
- Seroconversion (HBeAg converting to anti-HBe; spontaneously or with Rx)
- Hepatitis D
- Other liver insult (fatty liver, alcohol, drugs, hepatitis A)

Acute Viral Hepatitis (General)

Definition

- viral hepatitis lasting < 6 mo

Clinical Features

- most are subclinical
- flu-like prodrome may precede jaundice by 1-2 wk
 - N/V, anorexia, taste/smell disturbance, headaches, fatigue, myalgia, low-grade fever
 - arthralgia and urticaria (especially HBV)
- only some progress to icteric (clinical jaundice) phase, lasting days to weeks
 - pale stools and dark urine 1-5 d prior to icteric phase
 - hepatomegaly and RUQ pain
 - splenomegaly and cervical lymphadenopathy (10-20% of cases)

Investigations

- AST and ALT (>10-20x normal in hepatocellular necrosis)
- ALP minimally elevated
- viral serology, particularly the IgM antibody directed to the virus

Treatment

- supportive (hydration, diet)
- indications for hospitalization: encephalopathy, coagulopathy, severe vomiting, hypoglycemia

Prognosis

- poor prognostic indicators: comorbidities, persistently high bilirubin 20 mg/dL, increased INR, decreased albumin, hypoglycemia
- cholestasis (most commonly with HAV infection)

Complications

- hepatocellular necrosis: AST, ALT >10-20x normal, ALP and bilirubin minimally increased, increased cholestasis

Hepatitis A Virus

- RNA virus
- fecal-oral transmission; incubation period 4-6 wk
- diagnosed by elevated transaminases, positive anti-HAV IgM
- in children: characteristically asymptomatic
- in adults: fatigue, nausea, arthralgia, fever, jaundice

- can cause acute liver failure and subsequent death (<1-5%)
- can relapse, but never becomes chronic

Hepatitis B Virus

Table 15. Hepatitis B Serology

	HBsAg	Anti-HBs	HBeAg	Anti-HBe	Anti-HBc	Liver Enzymes
Acute HBV	+	–	+	–	IgM	
Chronic (e-Ag positive) HBV (generally high HBV DNA)	+	–	+	–	IgG	ALT, AST elevated
Chronic (e-Ag negative) HBV (generally low HBV DNA)	+	–	–	+	IgG	ALT, AST normal
Resolved infection	–	±	–	±	IgG	
Immunization	–	+	–	–	–	

Figure 12. Time course of acute hepatitis B infection

Risk of hepatocellular carcinoma in HBV increases with increasing age, which is likely a surrogate for increasing liver fibrosis/cirrhosis

Risk of hepatocellular carcinoma in HCV increases only after cirrhosis develops

Epidemiology

- 4 phases of chronic hepatitis B: not all will go through all 4 phases, but all will have positive HBsAg
 1. **immune tolerance:** extremely high HBV-DNA (>20,000 IU/mL), HBeAg positive, but normal ALT/AST; due to little immune control and minimal immune-mediated liver damage; characteristic of perinatal infection (or 'incubation period' in adult with newly acquired HBV)
 2. **immune clearance** (or immunoactive): falling but still elevated HBV-DNA levels (>20,000 IU/mL), HBeAg positive; due to immune attack on the virus and immune-mediated liver damage; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment
 3. **immune control:** lower HBV-DNA (<20,000 IU/mL), HBeAg negative, anti-HBe positive, ALT/AST normal; due to immune control without immune-mediated liver damage; risk of reactivation to phase 2 (clinically resembles acute hepatitis B), especially with immunosuppression e.g. corticosteroids or chemotherapy
 4. **immune escape** ("core or precore mutant"): elevated HBV-DNA (>2,000 IU/mL), HBeAg negative because of pre-core or core promoter gene mutation, anti-HBe positive, ALT/AST high; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment

Management

- counseling: 40% of men and 10% of women with perinatal infection will die from HBV-related complications
- prolonged immune-mediated damage leads to higher risk of liver fibrosis
- hepatocellular carcinoma screening with ultrasound q6mo, especially if high serum HBV-DNA levels, cirrhosis, men, (age >40 in Asian men, >50 in Asian women, and >20 in African descent)
- consider pharmacological therapy if
 1. HBeAg positive + HBV-DNA >20,000 IU/mL + elevated ALT; or
 2. HBeAg negative + HBV-DNA >2,000 IU/mL + elevated ALT ± stage ≥2 fibrosis on liver biopsy
 3. treat to *prevent* flare when placed on immunosuppressive therapy such as prednisone
- treatment goal: reduce serum HBV-DNA to undetectable level

Without treatment, 8-20% of those with ongoing immunoactive chronic hepatitis can develop cirrhosis within 5 yr. In contrast, those in the immune tolerant phase (with extremely high HBV-DNA levels) are at minimal risk for liver fibrosis as they do not have immune-mediated liver injury.

In acute hepatitis B, HDV co-infection increases severity of hepatitis but does not increase risk of progression to chronic hepatitis. However in the context of chronic hepatitis B, superinfection with HDV increases progression to cirrhosis.

- treatment options: interferon, tenofovir, entacavir, lamivudine, adefovir
- vaccinate against HAV if serology negative (to prevent further liver damage)
- follow blood and sexual precautions

Hepatitis D

- defective RNA virus requiring HBsAg for entry into hepatocyte, therefore infects only patients with hepatitis B; causes more aggressive disease than hepatitis B virus alone
- co-infection: acquire HDV and HBV at the same time
 - better prognosis than superinfection (acute HDV infection on pre-existing HBV infection)
- HDV can present as ALF and/or accelerate progression to cirrhosis
- management: low-dose interferon (20% response) and liver transplant for end-stage disease

Hepatitis C Virus

- RNA virus
- blood-borne transmission; sexual transmission is "inefficient"
- major risk factor: injection drug use
- other risk factors: blood transfusion received before 1992 (or received in developing world), tattoos, intranasal cocaine use
- clinical manifestation develops 6-8 wk after exposure
 - symptoms mild and vague (fatigue, malaise, nausea) therefore not commonly diagnosed in acute stage

Diagnosis

- suspected on basis of elevated ALT/AST and positive serum anti-HCV
- diagnosis established by detectable HCV-RNA in serum
- virus genotype correlates with response to treatment but not prognosis
 - serum HCV-RNA inversely correlates with response to treatment
- normal transaminases can have underlying cirrhosis on biopsy, but otherwise excellent prognosis

Management

- blood-borne precautions; vaccinate for hepatitis A and B if serology negative; avoid alcohol
- clearest indication for treatment is in subgroup likely to develop clinically significant liver disease
 - persistently elevated transaminases, liver biopsy shows fibrosis/cirrhosis and at least moderately severe necrosis/inflammation
- indicators of poor response to treatment: cirrhosis, genotype 1, high HCV-RNA, co-infection with HIV, African-American race
- pegylated interferon- α + ribavirin aims to clear HCV infection, but only 50-80% success rate and side effects common (therefore not all patients are treated)
 - sustained virologic response (SVR) = undetectable HCV-RNA 3-6 mo off treatment (which generally means that HCV has been successfully eradicated) = "cure"
 - pegylated interferon- α SC injection weekly and ribavirin PO bid and add proteinase inhibitor PO (bocepravir or telapravir) for genotype 1
- length of treatment often determined by rapidity and degree of fall in HCV RNA level
- adverse effects: depression/fatigue, hemolysis, bone marrow suppression (monitor CBC regularly), fevers/myalgia, precipitates autoimmune diseases (rare), skin rashes
- recently introduced proteinase inhibitors for genotype 1 (most common, least amenable to treatment) have significantly increased sustained remission rate to up to 70%
- interferon-free regimens using combinations (>2) of oral anti-viral drugs have shown high efficacy and will likely be the mainstay of treatment in future years

HCV treatment lowers the risk of hepatocellular carcinoma

Prognosis

- 80% of acute hepatitis C become chronic (of these 20% evolve to cirrhosis)
- risk of hepatocellular carcinoma increases if cirrhotic
- can cause cryoglobulinemia; associated with membranoproliferative glomerulonephritis, lymphoma

Risk Factors for Progression

- EtOH
- HIV co-infection
- Old age at diagnosis

Table 16. Characteristics of the Viral Hepatitis

	HAV	HBV	HCV	HDV	HEV	CMV	EBV	Yellow Fever
Virus Family	<i>Picornaviridae</i>	<i>Hepadnaviridae</i>	<i>Flaviviridae</i>	<i>Deltaviridae</i>	<i>Caliciviridae</i>	<i>Herpesviridae</i>	<i>Herpesviridae</i>	<i>Flavivirus</i>

Management	General hygiene Treat close contacts (anti-HAV Ig) Prophylaxis for high-risk groups (HAV vaccine \pm HAV Ig) unless immune	Prevention: HBV vaccine and/or hepatitis B Ig (HBIG) for needlestick, sexual contact, infants of infected mothers unless already immune Rx: oral antivirals vs. interferon if indications met	Prevention: no vaccine Rx: IFN + ribavirin + protease inhibitor; possibility of interferon-free regimens in near future	Prevention: HBV vaccine	Prevention: general hygiene, no vaccine	In high risk transplant patients: CMV IG and anti-virals (ganciclovir, valganciclovir)	Supportive treatment post infection	Prevention Supportive treatment post infection
Acute Mortality	0.1-0.3%	0.5-2%	1%	2-20% coinfection with HBV, 30% superinfection Predisposes HBV carriers to more severe hepatitis and faster progression to cirrhosis	1-2% overall, 10-20% in pregnancy	Rare in immunocompetent adults	Rare	20-60% in developing countries
Oncogenicity	No	Yes	Yes	?	No	No	Yes	No
Complications	Can cause acute liver failure and subsequent death ($<$ 1-5%)	Hepatocellular carcinoma secondary to cirrhosis, serum sickness-like syndrome, glomerulonephritis, cryoglobulinemia, polyarteritis nodosa, porphyria cutanea tarda	Hepatocellular carcinoma in 2-5% of cirrhosis per yr, cryoglobulinemia, B-cell non-Hodgkin lymphoma	Leukocytoclastic vasculitis, membranous glomerulonephropathy	Mild, except in third trimester (10-20% fulminant liver failure)	5% of newborns with multiple handicaps Immunocompromised patients at risk of CMV-induced hepatitis, retinitis, colitis, esophagitis, pneumonitis	Associated with Burkitt's lymphoma and nasopharyngeal carcinoma (rare in Western world)	Can cause a recurrent toxic phase with liver damage, GI bleeding, and high mortality rates

Autoimmune Chronic Active Hepatitis

- diagnosis of exclusion: rule out viruses, drugs, metabolic, or genetic causes
- can be severe: 40% mortality at 6 mo without treatment
- extrahepatic manifestations
 - sicca, Raynaud's, thyroiditis, Sjögren's, arthralgias
 - hypergammaglobulinemia
 - ♦ anti-smooth muscle antibody elevation is most characteristic; also elevations in
 - ♦ anti-LKM (liver kidney microsome, especially in children)
 - less specific: elevated ANA, RF
 - ♦ can have false positive viral serology (especially anti-HCV)
 - ♦ biopsy – periportal (zone 1) and interface inflammation and necrosis

- management: corticosteroids (80% respond) \pm azathioprine (without this, most will relapse as corticosteroids are withdrawn)

Drug-Induced Liver Disease

Table 17. Classification of Hepatotoxins

	Direct	Indirect
Example	Acetaminophen, CCl ₄	Phenytoin, INH
Dose-Dependence	Usual	Unusual
Latent Period	Hours-days	Weeks-months
Host Factors	Not important	Very important
Predictable	Yes	No (idiosyncratic)

Hy's Law: drug-induced hepatocellular jaundice indicates a mortality of at least 10%

Specific Drugs

- acetaminophen
 - metabolized by hepatic cytochrome P450 system
 - can cause ALF (transaminases >1,000 U/L followed by jaundice and encephalopathy)
 - requires 10-15 g in healthy, 4-6 g in alcoholics/anticonvulsant users
 - mechanism: high acetaminophen dose saturates glucuronidation and sulfation elimination pathways \rightarrow reactive metabolite is formed \rightarrow covalently binds to hepatocyte membrane
 - presentation
 - first 24 h: N/V (usually within 4-12 h of overdose)
 - 24-48 h: asymptomatic, but ongoing hepatic necrosis resulting in increased transaminases
 - >48 h: continued hepatic necrosis possibly complicated with ALF or resolution
 - note: potential delay in presentation in sustained-release products
 - blood levels of acetaminophen correlate with the severity of hepatic injury, particularly if time of ingestion known
 - therapy
 - gastric lavage/emesis (if <2 h after ingestion)
 - oral activated charcoal
 - N-acetylcysteine (NAC, Mucomyst®) can be given PO or IV (most effective within 8-10 h of ingestion, but should be given no matter when time of ingestion)
 - promotes hepatic glutathione regeneration
 - no recorded fatal outcomes if NAC given before increase in transaminases
- chlorpromazine: cholestasis in 1% after 4 wk; often with fever, rash, jaundice, pruritus, and eosinophilia
- INH (isoniazid)
 - 20% develop elevated transaminases but <1% develop clinically significant disease
 - susceptibility to injury increases with age
- methotrexate
 - causes fibrosis/cirrhosis; increased risk in the presence of obesity, DM, alcoholism (i.e. with underlying risk for pre-existing fatty liver)
 - scarring develops without symptoms or changes in liver enzymes, therefore biopsy may be needed in long-term treatment
- amiodarone: can cause same histology and clinical outcome as alcoholic hepatitis
- others: azoles, statins, methyl dopa, phenytoin, propylthiouracil (PTU), rifampin, sulfonamides, tetracyclines
- herbs: chaparral, Chinese herbs (e.g. germander, comfrey, bush tea)

Wilson's Disease

Definition

- autosomal recessive defect in copper metabolism (gene ATP7B)

Pathology

- decreased biliary excretion of copper plus decreased incorporation of copper into ceruloplasmin

Clinical Manifestations

- liver: acute hepatitis, acute liver failure, chronic active hepatitis, cirrhosis, low risk of hepatocellular carcinoma
- eyes: Kayser-Fleischer rings (copper deposits in Descemet's membrane); more common in patients with CNS involvement, present in 50% if only liver involvement
- CNS: basal ganglia (wing flapping tremor, Parkinsonism), cerebellum (dysarthria, dysphagia, incoordination, ataxia), cerebrum (psychosis, affective disorder)
- kidneys: Fanconi's syndrome (proximal tubule transport defects) and stones

Clinical Manifestations of Wilson's Disease

ABCD

Asterixis

Basal ganglia degeneration: suspect if parkinsonian features in the young

Ceruloplasmin \downarrow

Cirrhosis

Corneal deposits (Kayser-Fleischer ring)

Copper

Dementia

- blood: intravascular hemolysis; may be initial presentation in fulminant hepatitis
- joints: arthritis, bone demineralization, calcifications

Investigations

- suspect if increased liver enzymes with clinical manifestations at young age (<30); especially combination of liver disease with dystonia, psychiatric symptoms
- screening tests
 1. reduced serum ceruloplasmin (<50% of normal)
 2. Kayser-Fleischer rings (usually require slit-lamp examination)
 3. increased urinary copper excretion
- gold standard
 1. increased copper on liver biopsy by quantitative assay
 2. genetic analysis imperfect as many mutations in ATP7B are possible

Treatment

- 4 drugs available
 1. penicillamine chelates copper, poorly tolerated
 2. trientine chelates copper
 3. zinc impairs copper excretion in stool/decreases copper absorption from gut
 4. tetrathiomolybdate preferred if neurological involvement
- screen relatives
- liver transplant in severe cases

Hemochromatosis

Definition

- excessive iron storage causing multiorgan system dysfunction (liver, in particular) with total body stores of iron increased to 20-40 g (normal 1 g)

Pathology

- primary hemochromatosis
 - primarily due to common recessive gene (HFE, 5%); 1/400 patients are homozygotes
 - results in ongoing gut absorption of iron despite adequate iron stores
- secondary hemochromatosis
 - parenteral iron overload (e.g. transfusions)
 - chronic hemolytic anemia: thalassemia, pyruvate kinase deficiency
 - excessive iron intake

Gene mutation not 100% penetrant, so not all with homozygous gene defect have clinically significant iron overload

Clinical Manifestations

- usually presents with trivial elevation in serum transaminases
- liver: cirrhosis (30%), HCC (200x increased risk) – most common cause of death (1/3 of patients)
- pancreas: DM, chronic pancreatitis
- skin: bronze or gray (due to melanin, not iron)
- heart: dilated cardiomyopathy
- pituitary: hypogonadotropic hypogonadism (impotence, decreased libido, amenorrhea)
- joints: arthralgia (any joint, but especially MCP joints), chondrocalcinosis

Investigations

- screening for individuals with clinical features and/or family history (1/4 chance of sibling having the disease)
 - transferrin saturation (free Fe²⁺/TIBC) >45%
 - serum ferritin >400 ng/mL
 - HFE gene analysis: 90% of primary hemochromatosis involves C282Y allele, while H63D and S65C alleles also commonly involved and screened
- liver biopsy (generally used to detect cirrhosis or if potential for other causes of liver disease)
 - markers of advanced fibrosis: if any of the following are present at the time of diagnosis → age >40, elevated liver enzymes, or ferritin >1000
 - considered if compound heterozygote and potential other cause of liver injury (e.g. fatty liver, etc.)
 - if C282Y/C282Y and no markers of advanced fibrosis, then biopsy generally not needed
- HCC screening if cirrhosis

Treatment

- phlebotomy: weekly or q2wk then lifelong maintenance phlebotomies q2-6mo
- deferoxamine if phlebotomy contraindicated (e.g. cardiomyopathy, anemia)
- primary hemochromatosis responds well to phlebotomy
- secondary hemochromatosis usually requires chelation therapy (administration of agents that bind and sequester iron, and then excreted)

Ferritin may never normalize if other causes of high ferritin present (e.g. fatty liver from metabolic syndrome or alcohol)

Prognosis

- normal life expectancy if treated before the development of cirrhosis or DM

Alcoholic Liver Disease

Definition

- fatty liver (all alcoholics): always reversible if alcohol stopped
- alcoholic hepatitis (35% of alcoholics): usually reversible if alcohol stopped
- cirrhosis (10-15% of alcoholics): potentially irreversible

Pathology

- several mechanisms, poorly understood
- ethanol oxidation to acetaldehyde
 - reduces NAD^+ to NADH; increased NADH decreases ATP supply to liver, impairing lipolysis so fatty acids and triglycerides accumulate in liver
 - binds to hepatocytes evoking an immune reaction
- ethanol increases gut permeability leading to increased bacterial translocation
- alcohol metabolism causes
 - relative hypoxia in liver zone III > zone I
 - necrosis and hepatic vein sclerosis
- histology of alcoholic hepatitis
 - ballooned (swollen) hepatocytes often containing Mallory bodies, characteristically surrounded by neutrophils
 - large fat globules
 - fibrosis: space of Disse and perivenular

Clinical Manifestation

- >2-3 standard drinks/d in females and >3-6 standard drinks/d in men for >10 yr leads to cirrhosis, but only in about 10 to 20% of those who consume this amount daily on a continuous basis; cirrhosis risk increases with amount of alcohol consumed above threshold
- clinical findings do not accurately predict type of liver involvement
- fatty liver
 - mildly tender hepatomegaly; jaundice rare
 - mildly increased transaminases <5x normal
- alcoholic hepatitis
 - variable severity: mild to fatal liver failure
 - mild: stops drinking because feels unwell, resumes when feeling better (if assessed, findings of hepatitis, potentially mild jaundice and mildly elevated INR)
 - severe: stops drinking but feels unwell, low grade fever, RUQ discomfort, increased white blood cell count – mimics RLL pneumonia and cholecystitis

Investigations

- blood tests are non-specific, but in general:
 - AST:ALT >2:1 (usually <300)
 - increased GGT
 - CBC: increased MCV (mean corpuscular volume), increased WBC

Treatment

- alcohol cessation (see [Psychiatry, PS19](#))
 - Alcoholics Anonymous, disulfiram, naltrexone, acamprosate
- multivitamin supplements (especially thiamine)
- caution with drugs metabolized by the liver
- prednisone 40 mg OD x 28 d (taper over 2-4 wk) in subgroup with elevated bilirubin and INR, or if encephalopathy; but contraindicated in GI bleeding, renal failure, infection, pancreatitis
 - response (and subsequent decision to continue treatment) predicted by day 7 bilirubin (Lille score)
- pentoxifylline decreases TNF, shown in one trial to reduce death, albeit only from renal failure; favorable side-effect profile

Prognosis

- prognosis: Maddrey's discriminant function (based on PT and bilirubin) predicts mortality
- fatty liver: complete resolution with cessation of alcohol intake
- alcoholic hepatitis mortality
 - immediate: 30%-60% in the first 6 mo if severe
 - with continued alcohol: 70% in 5 yr
 - with cessation: 30% in 5 yr

**Standard Drink Equivalent**

1 standard drink = 14 g EtOH
 = 12 oz beer (5% alcohol)
 = 5 oz wine (12-17%)
 = 3 oz fortified wine (17-22%)
 = 1.5 oz liquor (40%)

Tip: percentage alcohol multiplied by oz roughly equals 60

**Biopsy + Histology of Alcoholic Hepatitis (triad)**

- Hepatocyte necrosis with surrounding inflammation in zone III
- Mallory bodies (intracellular eosinophilic aggregates of cytokeratins)
- Chicken-wire fibrosis (network of intralobular connective tissue surrounding cells and venules)

**GI Complications of Alcohol Abuse**

- **Esophagus**
 - Mallory-Weiss tear
 - Esophageal varices (secondary to portal HTN)
- **Stomach**
 - Alcoholic gastritis
- **Pancreas**
 - Acute pancreatitis
 - Chronic pancreatitis
- **Liver**
 - Alcoholic hepatitis
 - Fatty liver
 - Cirrhosis
 - Hepatic encephalopathy
 - Portal HTN (secondary to cirrhosis)
 - Ascites (secondary to cirrhosis)
 - HCC (secondary to cirrhosis)

Non-Alcoholic Fatty Liver Disease

Definition

- spectrum of disorders characterized by macrovesicular hepatic steatosis
- most common cause of liver disease in North America

Pathology

- pathogenesis not well elucidated; insulin resistance implicated as key mechanism, leading to hepatic steatosis
- changes indistinguishable from those of alcoholic hepatitis despite negligible history of alcohol consumption

Risk Factors

- likely a component of the metabolic syndrome along with type 2 DM, HTN, hypertriglyceridemia
- rapid weight loss or weight gain

Clinical Manifestations

- often asymptomatic
- may present with fatigue, malaise, and vague RUQ discomfort
- elevated serum triglyceride/cholesterol levels and insulin resistance

Investigations

- elevated serum AST, ALT \pm ALP; AST/ALT <1
- presents as echogenic liver texture on ultrasound
- liver biopsy diagnostic, but often necessary only for prognosis

Treatment

- no proven effective therapy other than gradual weight loss
- some evidence for vitamin E (800 U daily) in select groups
 - pioglitazone can be considered if DM concomitantly present, but results in weight gain
- modification of risk factors is generally recommended, especially gradual weight reduction
- optimization of therapy for DM, hyperlipidemia, HTN

Prognosis

- most die from cardiovascular or cerebrovascular disease
- better prognosis than alcoholic hepatitis
 - $<25\%$ progress to cirrhosis over a 7-10 yr period
- risk of progression increases if inflammation or scarring occurs alongside fat infiltration (non-alcoholic steatohepatitis)
- other clinical indicators of unfavorable prognosis: DM, age, metabolic syndrome

Acute Liver Failure (formerly Fulminant Hepatic Failure)

Definition

- severe decline in liver function characterized by coagulation abnormality (INR >1.5) and encephalopathy
- in setting of previously normal liver
- rapid (<26 wk duration)

Pathology

- drugs (especially acetaminophen), hepatitis B (measure IgM anti-HBc because sometimes HBV-DNA and even HBsAg rapidly becomes negative), hepatitis A, hepatitis C (rare), ischemic, idiopathic

Treatment

- correct hypoglycemia, monitor level of consciousness, prevent GI bleeding with PPI, monitor for infection and multiorgan failure (usually requires ICU)
- consider liver biopsy before INR becomes too high
- chief value is to exclude chronic disease, less helpful for prognosis
- liver transplant (King's College criteria can be used as prognostic indicator): consider early, especially if time from jaundice to encephalopathy >7 d (e.g. not extremely rapid), age <10 or >40 , cause is drug or unknown, bilirubin >17.5 mg/dL, INR >3.5 , creatinine >2.6 mg/dL

Cirrhosis

Definition

- liver damage characterized by diffuse distortion of the basic architecture and replacement with scar tissue and formation of regenerative nodules
- Stage 1 cirrhosis is compensated and asymptomatic, can last for 10-20 yr with almost normal life expectancy
- Stage 2 cirrhosis is the onset of first decompensation, typically development of ascites (most common), variceal bleeding, encephalopathy

Pathology

- fatty liver (alcohol, non-alcoholic fatty liver disease)
- chronic viral hepatitis (B, B+D, C; not A or E)
- autoimmune hepatitis
- hemochromatosis
- primary biliary cirrhosis
- chronic hepatic congestion
 - cardiac cirrhosis (chronic right heart failure, constrictive pericarditis)
 - hepatic vein thrombosis (Budd-Chiari)
- cryptogenic (i.e. no identifiable cause, although many of these patients may represent "burnt-out NASH")
- rare: Wilson's disease, Gaucher's disease, α 1-antitrypsin deficiency

Investigations

- definitive diagnosis is histologic (liver biopsy)
- other tests may be suggestive:
 - blood work: fall in platelet count <150 is the earliest finding, followed many yr later with rise in INR, fall in albumin, rise in bilirubin, fall in glucose level (pre-terminal event; see Figure 13)
 - FibroTest: combination of various clinical and biochemical markers that can predict degree of fibrosis
 - imaging
 - ♦ U/S is the primary imaging modality but only finds advanced cirrhosis
 - ♦ CT to look for varices, nodular liver texture, splenomegaly, ascites
 - ♦ FibroScan: non-invasive tool using elastography (variable availability)
 - gastroscopy: varices or portal gastropathy

Treatment

- treat underlying disorder
- decrease insults (e.g. alcohol cessation, hepatotoxic drugs, immunize for Hep A and B if non-immune)
- follow patient for complications (esophageal varices, ascites, HCC defines stage 2 cirrhosis)
- prognosis: Child-Pugh Score and MELD score
- liver transplantation for end-stage disease if no alcohol for >6 mo; use MELD score

Table 18. Child-Pugh Score and Interpretation

Classification	1	2	3
Serum bilirubin (mg/dL)	<2	2-3	>3
Serum albumin (g/dL)	>3.5	2.8-3.5	<2.8
INR	<1.7	1.7-2.3	>2.3
Presence of ascites	Absent	Controllable	Refractory
Encephalopathy	Absent	Minimal	Severe
Interpretation			
Points	Class	Life Expectancy	Perioperative Mortality
5-6	A	15-50 yr	10%
7-9	B	Candidate for transplant	30%
10-15	C	1-3 mo	82%
Score: 5-6 (Child's A), 7-9 (Child's B), 10-15 (Child's C)			

*Note: Child's classification is rarely used for shunting, but is still useful to quantitate the severity of cirrhosis

Fibrosis may regress and disappear if cause of liver injury is treated or resolves

Usual causes of death in cirrhosis: renal failure (hepatorenal syndrome), sepsis, GI bleed, or HCC

Figure 13. Progression of liver dysfunction based on liver function tests – the "W"

MELD (Model for End Stage Liver Disease)

- Predicts 3-mo survival and used to stratify patients on transplant list
- Based on creatinine, INR, and total bilirubin

Complications

- hematologic changes in cirrhosis
 - pancytopenia from hypersplenism: platelets first, then WBC, then hemoglobin
 - decreased clotting factors resulting in elevated INR
 - relationship of INR to bleeding tendency is controversial; some patients may be hypocoagulable, others may be hypercoagulable
- variceal bleeds
 - half of patients with cirrhosis have gastroesophageal varices and one-third of these develop hemorrhage with an overall mortality of >30%
 - hepatic venous pressure gradient (HVPG) ≥ 10 mmHg is the strongest predictor of variceal development
 - management: resuscitation, antibiotic prophylaxis, vasoactive drugs (e.g. octreotide IV) combined with endoscopic band ligation or sclerotherapy, TIPS
- renal failure in cirrhosis
 - classifications
 - ♦ pre-renal (usually due to over-diuresis)
 - ♦ acute tubular necrosis (ATN)
 - ♦ hepatorenal syndrome (HRS)
 - Type I: sudden and acute renal failure (rapid doubling of creatinine over 2 wk)
 - Type II: gradual increase in creatinine with worsening liver function (creatinine doubling over years)
 - ♦ HRS can occur at any time in severe liver disease, especially after:
 - overdiuresis or dehydration, such as diarrhea, vomiting, etc.
 - GI bleed
 - sepsis
 - ♦ treatment for hepatorenal syndrome (generally unsuccessful at improving long-term survival)
 - for type I HRS: octreotide + midodrine + albumin (increases renal blood flow by increasing systemic vascular resistance)
 - definitive treatment is liver transplant
- hepatopulmonary syndrome
 - majority of cases due to cirrhosis, though can be due to other chronic liver diseases, such as non-cirrhotic portal HTN
 - thought to arise from ventilation-perfusion mismatch, intrapulmonary shunting and limitation of oxygen diffusion, failure of damaged liver to clear circulating pulmonary vasodilators vs. production of a vasodilating substance by the liver
 - clinical features
 - ♦ hyperdynamic circulation with cardiac output >7 L/min at rest and decreased pulmonary + systemic resistance (intrapulmonary shunting)
 - ♦ dyspnea, platypnea (increase in dyspnea in upright position, improved by recumbency) and orthodeoxia (desaturation in the upright position, improved by recumbency),
 - ♦ diagnosis via contrast-enhanced echocardiography: inject air bubbles into peripheral vein; air bubbles appear in left ventricle after third heartbeat (normal = no air bubbles; in ventricular septal defect, air bubbles seen <3 heart beats)
 - ♦ only proven treatment is liver transplantation

Cirrhosis Complications

VARICES

Varices
Anemia
Renal failure
Infection
Coagulopathy
Encephalopathy
Sepsis

Hepatorenal Syndrome vs. Pre-renal Failure – difficult to differentiate:

- Similar blood and urine findings, (see [Nephrology](#), NP33)
- Urine sodium: very low in hepatorenal; low in pre-renal
- Intravenous fluid challenge: giving volume expanders improves pre-renal failure, but not hepatorenal syndrome

Hepatopulmonary Syndrome

Clinical triad:

- Liver disease
- Increased alveolar-arterial gradient while breathing room air
- Evidence for intrapulmonary vascular abnormalities

© Jason Sharpe 2003

Figure 14. Clinical features of liver disease

Hepatocellular Carcinoma

- see [General Surgery](#), GS43

Liver Transplantation

- see [General Surgery](#), GS44

Portal Hypertension

Definition

- pressure gradient between hepatic vein pressure and wedged hepatic vein pressure (corrected sinusoidal pressure) >5 mmHg

Pathophysiology

- 3 sites of increased resistance (remember pressure = flow x resistance)
 - pre-sinusoidal (e.g. portal vein thrombosis, schistosomiasis, sarcoidosis)
 - sinusoidal (e.g. cirrhosis, alcoholic hepatitis)
 - post-sinusoidal (e.g. right-sided heart failure, hepatic vein thrombosis, veno-occlusive disease, constrictive pericarditis)

Complications

- GI bleeding from varices in esophagus, less commonly in stomach, even less frequently from portal hypertensive gastropathy
- ascites
- hepatic encephalopathy
- thrombocytopenia
- renal dysfunction
- sepsis
- arterial hypoxemia

Management

- non-selective β -blockers (propranolol, nadolol) decrease risk of bleeding from varices
- TIPS: to decrease portal venous pressure
 - shunt between portal and hepatic vein via transjugular vein catheterization and percutaneous puncture of portal vein
 - can be used to stop acute bleeding or prevent rebleeding or treat ascites
 - shunt usually remains open for <1 yr
 - complications: hepatic encephalopathy, deterioration of hepatic function
 - contraindicated with severe liver dysfunction
 - most commonly used as a "bridge" to liver transplant
- other surgically created shunts (rare): portacaval, distal spleno-renal (Warren shunt)

Portal Hypertension

Signs

- Esophageal varices
- Melena
- Splenomegaly
- Ascites
- Hemorrhoids

Management

- β -blockers
- Nitrates
- Shunts (e.g. TIPS)

Hepatic Encephalopathy

Definition

- spectrum of potentially reversible neuropsychiatric syndromes secondary to liver disease diagnosed after ruling out other causes for symptoms (e.g. structural/metabolic)

Pathophysiology

- portosystemic shunt around hepatocytes and decreased hepatocellular function increase level of systemic toxins (believed to be ammonia from gut, mercaptans, fatty acids, amino acids) which go to the brain

Precipitating Factors

- nitrogen load (GI bleed, protein load from food intake, renal failure, constipation)
- drugs (narcotics, CNS depressants)
- electrolyte disturbance (hypokalemia, alkalosis, hypoxia, hypovolemia)
- infection (spontaneous bacterial peritonitis)
- deterioration in hepatic function or superimposed liver disease

Stages

- I: apathy, restlessness, reversal of sleep-wake cycle, slowed intellect, impaired computational abilities, impaired handwriting
- II: asterixis, lethargy, drowsiness, disorientation
- III: stupor (rousable), hyperactive reflexes, extensor plantar responses
- IV: coma (response to painful stimuli only)

Investigations

- clinical diagnosis: supported by laboratory findings and exclusion of other neuropsychiatric diseases
- rule out
 - non-liver-related neuropsychiatric disease in a patient with liver problems (e.g. alcohol withdrawal or intoxication, sedatives, subdural hematoma, metabolic encephalopathy)
 - causes of metabolic encephalopathy (e.g. renal failure, respiratory failure, severe hyponatremia, hypoglycemia)
- characteristic EEG findings: diffuse (non-focal), slow, high amplitude waves

Precipitating Factors for Hepatic Encephalopathy

HEPATICS

- Hemorrhage in GI tract/Hypokalemia
- Excess dietary protein
- Paracentesis
- Alkalosis/Anemia
- Trauma
- Infection
- Colon surgery
- Sedatives

Treatment

- treat underlying precipitating factors
- decrease generation of nitrogenous compounds
 - decrease dietary protein to 50 g/d; vegetable protein is better tolerated than animal protein
 - lactulose: titrated to achieve 2 to 3 soft stools per day
 - ♦ prevents diffusion of NH_3 (ammonia) from the colon into blood by lowering pH and forming non-diffusible NH_4 (ammonium)
 - ♦ serves as a substrate for incorporation of ammonia by bacteria, promotes growth in bowel lumen of bacteria which produce minimal ammonia
 - ♦ also acts as a laxative to eliminate nitrogen-producing bacteria from colon
- if inadequate response with lactulose may try antibiotics
 - broad-spectrum antibiotics (metronidazole, rifaximin) eliminate ammonia producing bacteria from bowel lumen
 - non-absorbable antibiotic rifaximin probably most effective treatment
- best acute treatment in comatose patient is lactulose enemas

Ascites

Definition

- accumulation of excess fluid in the peritoneal cavity

Etiology

Table 19. Serum-Ascites Albumin Gradient as an Indicator of the Causes of Ascites

Serum [Alb] – Ascitic [Alb] >11 g/L (1.1 g/dL) Portal Hypertension Related	Serum [Alb] – Ascitic [Alb] <11 g/L (1.1 g/dL) Non-portal Hypertension Related
Cirrhosis/severe hepatitis	Peritoneal carcinomatosis
Chronic hepatic congestion (right heart failure, Budd-Chiari)	TB
Massive liver metastases	Pancreatic disease
Myxedema	Serositis
	Nephrotic syndrome*

* In nephrotic syndrome: decreased serum [Alb] to begin with therefore gradient not helpful

Pathogenesis

- key factor in pathogenesis is increased sodium (and water) retention by the kidney for reasons not fully understood. Theories include:
 - underfill hypothesis: first step in ascites formation is increased portal pressure and low oncotic pressure (e.g. low serum albumin) driving water out of the splanchnic portal circulation into abdominal cavity; the resulting decreased circulating volume causes secondary sodium retention by the kidney
 - overfill hypothesis: cirrhosis directly causes increased sodium retention by the kidney in the absence of hypovolemia and ascites arises secondarily
 - peripheral arterial vasodilation theory (most popular): as portal HTN develops in cirrhosis, production of local mediators such as nitric oxide lead to splanchnic arterial vasodilation which ultimately results in reduction of effective arterial volume and compensatory sodium and fluid retention by the kidneys (i.e. circulation volume is increased, as per overflow hypothesis, but relatively underfilled, as per underfill hypothesis)

Diagnosis

- abdominal ultrasound
- physical exam (clinically detectable when >500 mL)
 - bulging flanks, shifting dullness, fluid-wave test positive
 - most sensitive symptom: ankle swelling

Investigations

- diagnostic paracentesis
 - 1st aliquot: cells and differential
 - 2nd aliquot: chemistry (especially albumin, but also total protein; amylase if pancreatitis; TG and chylomicrons if turbid and suspect chylous ascites)
 - 3rd aliquot: C&S, Gram stain
 - 4th aliquot: cytology (usually positive in peritoneal carcinomatosis)

Treatment

- non-refractory ascites
 - Na^+ restriction (daily sodium intake <2 g)
 - diuretics: spironolactone, furosemide
 - aim for weight loss 0.5-1 kg/d, more if concomitant peripheral edema (which is mobilized quicker than ascitic fluid); overly rapid weight loss increases risk of renal failure
 - double diuretic dose every 2-4 wk to achieve weight loss target
- refractory ascites (treatment with diuretics are inadequate or not tolerated):

Secondary bacterial peritonitis (as opposed to primary bacterial peritonitis) usually results from a perforated viscus or surgical manipulation

Serum Ascites Albumin Gradient (SAAG)

- >1.1 g/dL portal HTN
- <1.1 g/dL unrelated to portal HTN

Primary Prophylaxis of Spontaneous Bacterial Peritonitis Delays Hepatorenal Syndrome and Improves Survival in Cirrhosis

Gastroenterology 2007;133:818-824

Study: RCT, double-blinded study with 1 yr follow-up.

Population: 68 patients with cirrhosis, ascites, ascitic fluid protein <1.5 g/dL, and impaired renal function or severe liver failure.

Intervention: General, regional, or combined anesthesia to patients undergoing a surgical procedure.

Main Outcome: Norfloxacin vs. placebo.

Results: There was a significant reduction of patients developing spontaneous bacterial peritonitis (SBP) (6% vs. 30%, $p=0.02$) and spontaneous bacteremia (0% vs. 12%, $p=0.05$) with norfloxacin therapy. There were significantly fewer patients who developed all-cause renal failure (7 vs. 16, $p=0.03$) and hepatorenal syndrome (HRS) with norfloxacin therapy. Probability of survival at 3 mo (94% vs. 62%, $p=0.02$) and 1 yr (60% vs. 48%, $p=0.003$) were high in patients treated with norfloxacin.

Conclusion: Primary prophylaxis with norfloxacin in patients with advanced cirrhosis reduced SBP, HRS, and improved 1 yr survival.

- therapeutic/palliative paracentesis indicated
- IV albumin (not indicated if <5 L removed by paracentesis)
- TIPS in an appropriate patient (no contraindications) with potential transplant-free survival advantage
- liver transplantation should be considered in every case, since development of ascites in patients with cirrhosis are associated with 50% 2 yr mortality

Complication: Primary/Spontaneous Bacterial Peritonitis

- primary/spontaneous bacterial peritonitis (SBP)
 - complicates ascites, but does not cause it (occurs in 10% of cirrhotic ascites); higher risk in patients with GI bleed
 - 1/3 of patients are asymptomatic, thus do not hesitate to do a diagnostic paracentesis in ascites even if no clinical indication of infection
 - fever, chills, abdominal pain, ileus, hypotension, worsening encephalopathy, acute kidney injury
 - Gram-negatives compose 70% of pathogens: *E. coli* (most common), *Streptococcus*, *Klebsiella*
- diagnosis
 - absolute neutrophil count in peritoneal fluid $>0.25 \times 10^9$ cells/L (250 cells/mm³)
 - Gram stain positive in only 10-50% of patients
 - culture positive in <80% of patients (not needed for diagnosis)
- prophylaxis: consider in patients with
 - cirrhosis or GI bleed: ceftriaxone IV daily or norfloxacin bid x 7 d
 - previous episode of SBP: long-term prophylaxis with daily norfloxacin or TMP-SMX
- treatment
 - IV antibiotics (cefotaxime 2 g IV q8h or ceftriaxone 2 g IV daily is the treatment of choice for 5 d; modify if response inadequate or culture shows resistant organisms)
 - IV albumin (1.5 g/kg at time of diagnosis and 1 g/kg on day 3) decreases mortality by lowering risk of acute renal failure

Biliary Tract

Jaundice

- see Table 2, G6 and Figures 15 and 16, G42

Signs and Symptoms

- dark urine, pale stools: suggests that bilirubin elevation is from direct fraction
- pruritus: suggests chronic disease, cholestasis
- abdominal pain: suggests biliary tract obstruction from stone or pancreatic tumor (obstructive jaundice)
- painless jaundice in the elderly: think of pancreatic cancer
- kernicterus: rarely seen in adults due to maturation of blood brain barrier

Investigations

- blood work: CBC, bilirubin (direct and total), liver enzymes (AST, ALT, ALP, GGT), liver function tests (INR/PT, PTT, albumin), amylase
- U/S or CT for evidence of bile duct obstruction (e.g. bile duct dilation)
- direct bile duct visualization
 - magnetic resonance cholangiopancreatography (MRCP): non-invasive
 - endoscopic ultrasound (EUS): sensitive for stones and pancreatic tumors
 - endoscopic retrograde cholangiopancreatography (ERCP): invasive, most accurate, allows for therapeutic intervention
 - percutaneous transhepatic cholangiography (PTC): if ERCP fails, if obstruction is in liver

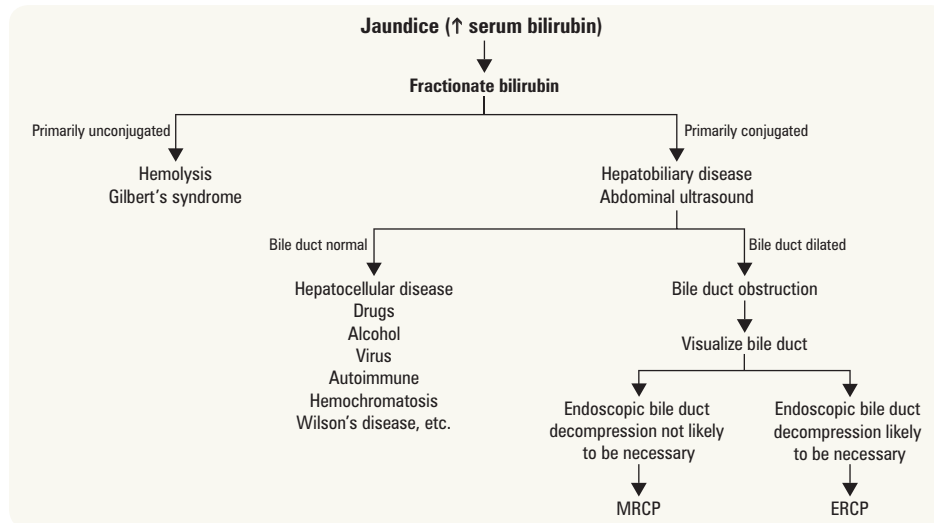

Figure 16. Approach to jaundice

Gilbert's Syndrome

Definition

- mild decrease in glucuronyltransferase activity leading to defective conjugation of bilirubin

Etiology/Epidemiology

- some patients have decreased hepatobiliary uptake
- affects 7% of population, especially males
- autosomal dominant, 70% due to a mutation in the UGT gene

Signs and Symptoms

- presents in teens-20s, often an incidental finding
- only manifestation is intermittent jaundice with increased serum unconjugated bilirubin developing most characteristically while fasting, or at times of acute illness; no other clinical implications

Treatment

- none indicated (entirely benign)

Sclerosing Cholangitis

Definition

- inflammation of biliary tree (intra and/or extrahepatic bile ducts) leading to scarring and lumen obliteration

Etiology

- primary/idiopathic (most common)
 - associated with IBD, more commonly UC, in up to 70% of patients (usually male)
 - one of the most common indications for transplant
- secondary (less common)
 - long-term choledocholithiasis
 - cholangiocarcinoma
 - surgical/traumatic injury (iatrogenic)
 - contiguous inflammatory process
 - post-ERCP
 - associated with HIV/AIDS ("HIV cholangiopathy")
 - IgG4-related disease

Signs and Symptoms

- often insidious, may present with fatigue and pruritus
- may present with signs of episodic bacterial cholangitis secondary to biliary obstruction

Diagnosis

- increased ALP (hallmark), less often increased bilirubin
- mildly increased AST, usually <300 U/L
- p-ANCA (30-80%), elevated IgM (40-50%)

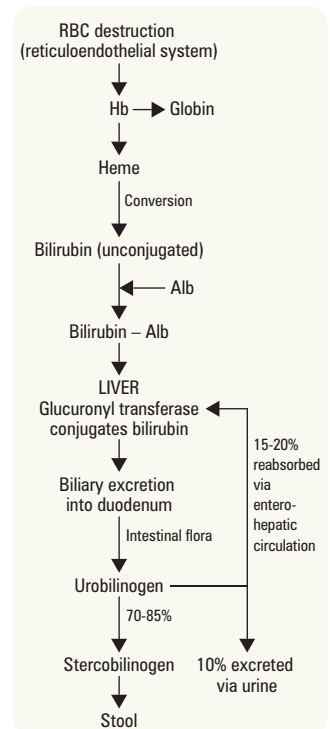

Figure 15. Production and excretion of bilirubin

Gilbert's Syndrome vs. Crigler-Najjar Syndrome

Gilbert's Syndrome: mild decrease in glucuronyltransferase activity

Crigler-Najjar Syndrome: complete deficiency of glucuronyltransferase

ERCP

- Absence of narrowing in PBC
- Narrowing of intra and extrahepatic ducts in PSC

- ERCP shows narrowing and dilatations of bile ducts that may result in "beading", both intrahepatic and extrahepatic bile ducts
 - if intrahepatic narrowing only, do anti-mitochondrial antibody to rule out PBC

Complications

- repeated bouts of cholangitis may lead to complete biliary obstruction with resultant secondary biliary cirrhosis and hepatic failure
- increased incidence of cholangiocarcinoma (10-15%): difficult to diagnose and treat

Management

- image bile duct (MRCP) at least annually for early detection of cholangiocarcinoma (controversial)
- endoscopic sphincterotomy, biliary stent in selected cases of dominant CBD stricture
- antibiotics for cholangitis
- suppurative cholangitis requires emergency drainage of pus in CBD
- liver transplantation appears the best treatment for advanced sclerosing cholangitis (nearly 90% 1 yr survival; mean follow-up from time of diagnosis to need for transplant is 10 yr)
- ursodiol: previously recommended, but studies suggest that at least in high doses it increases mortality

Prognosis

- unfavorable regardless of treatment
- mean survival after diagnosis remains 4-10 yr

Primary Biliary Cirrhosis

Definition

- chronic inflammation and fibrous obliteration of intrahepatic bile ductules

Etiology/Epidemiology

- likely autoimmune (associated with Sjögren's syndrome, scleroderma, CREST syndrome, RA, thyroiditis)
- affects mainly middle-aged women (M:F = 1:9)

Signs and Symptoms

- often asymptomatic
- initial symptoms: pruritus, fatigue
- chronic: jaundice and melanosis (darkening skin) and other signs of cholestasis
- end-stage: hepatocellular failure, portal HTN, ascites
- high incidence of osteoporosis

Investigations

- increased ALP, GGT; bilirubin rises in later stage
- positive anti-mitochondrial antibodies (AMA; 95% specificity and sensitivity)
- increased serum cholesterol (mild increase in LDL, larger increase in HDL)
 - may have: xanthelasmas, xanthomas
- liver biopsy confirms diagnosis and stages severity
- normal bile duct on MRCP rules out bile duct obstruction which can mimic PBC
- recently described "overlap" syndromes with autoimmune cholangitis, autoimmune hepatitis, sclerosing cholangitis

Clinical Course

- can be fatal, although not all asymptomatic patients show progression

Treatment

- treat with ursodiol (less frequently colchicine, methotrexate)
- cholestyramine (for pruritus and hypercholesterolemia)
- calcium and vitamin D for low bone density; bisphosphonates if osteoporosis severe
- monitor for thyroid disease
- liver transplant if disease severe, progressive

Table 20. Primary Sclerosing Cholangitis vs. Primary Biliary Cirrhosis

	Primary Sclerosing Cholangitis	Primary Biliary Cirrhosis
Predominant Gender	Male	Female
Associated Comorbidities	IBD, especially UC	Other autoimmune disorders (Sjögren's, CREST, RA)
Affected Ducts	Both intra- and extra-hepatic	Intrahepatic only
Investigations	ERCP/MRCP (narrowing and dilatations of ducts visualized)	Anti-mitochondrial antibodies, IgM, increased lipids, liver biopsy (absence of duct narrowing on ERCP)

Secondary Biliary Cirrhosis

Definition

- cirrhosis from prolonged partial or total obstruction of major bile ducts

Etiology

- acquired: post-operative strictures, chronic pancreatitis, sclerosing cholangitis, stone in bile duct
- congenital: CF, congenital biliary atresia, choledochal cysts

Diagnosis

- cholangiography and liver biopsy

Treatment

- treat obstruction, give antibiotics for cholangitis prophylaxis

Biliary Colic, Cholecystitis

- see [General Surgery](#), GS46

Ascending Cholangitis

- see [General Surgery](#), GS48

Definition

- infection of the biliary tree

Etiology

- stasis in the biliary tract due to obstruction or stricture (usually from previous cholecystectomy)
- infection originates in the duodenum or spreads hematogenously from the portal vein
- bacteria
 - *E. coli*, *Klebsiella*, *Enterobacter*, *Enterococcus*
 - co-infection with *Bacteroides* and *Clostridia* can occur

Signs and Symptoms

- Charcot's triad: fever, RUQ pain, jaundice (50-70%)
- Reynold's Pentad in patients with suppurative cholangitis: fever, RUQ pain, jaundice, hypotension, altered mental status

Diagnosis

- increased WBC
- usually increased ALP and bilirubin, ALT variably elevated
- blood culture
- abdominal U/S: CBD dilation, stones

Treatment

- most important is drainage, ideally via ERCP, but if necessary by percutaneous biliary or surgical routes
- antibiotic therapy: broad spectrum to cover Gram-negatives, *Enterococcus*, and anaerobes (especially if CBD manipulation); no clear consensus on antibiotic choice but consider:
 - ampicillin + sulbactam or piperacillin/tazobactam
 - metronidazole + 3rd generation cephalosporin (e.g. ceftriaxone) or fluoroquinolone (e.g. ciprofloxacin or levofloxacin)
 - carbapenem monotherapy (e.g. imipenem or meropenem)

Prognosis

- good with effective drainage and antibiotics in mild to moderate cases
- high mortality (~50%) in patients with Reynold's Pentad

Charcot's Triad

- RUQ pain
- Fever
- Jaundice

Reynold's Pentad

- Charcot's triad
- Hypotension
- Altered mental status

Pancreas

Pancreatic Enzyme Abnormalities

Causes of Increased Serum Amylase

- pancreatic disease
 - pancreatitis, pancreatic duct obstruction (e.g. ampullary cancer), pseudocyst, abscess, ascites, trauma, cancer
- non-pancreatic abdominal disease
 - biliary tract disease, bowel obstruction/ischemia, perforated or penetrating ulcer, ruptured ectopic pregnancy, aneurysm, chronic liver disease, peritonitis
- non-abdominal disease
 - cancer (lung, ovary, esophagus, etc.), salivary gland lesions, bulimia, renal transplant/insufficiency, burns, ketoacidosis
 - macroamylasemia

Causes of Increased Serum Lipase

- pancreatic disease: same as above
- non-pancreatic abdominal disease (mild elevations only): same as above
- non-abdominal disease
 - macrolipasemia
 - renal failure

Pancreatic Enzymes

TALC

Trypsin

Amylase

Lipase

Chymotrypsin

When serum amylase >5x normal, the cause is almost always pancreatitis or renal disease

Acute Pancreatitis

Etiology

Idiopathic: thought to be hypertensive sphincter or microlithiasis

Gallstones (45%)

Ethanol (35%)

Tumors: pancreas, ampulla, choledochocoele

Scorpion stings

Microbiological

- bacterial: *Mycoplasma*, *Campylobacter*, TB, *M. avium intracellulare*, *Legionella*, leptospirosis
- viral: mumps, rubella, varicella, viral hepatitis, CMV, EBV, HIV, Coxsackie virus, echovirus, adenovirus
- parasites: ascariasis, clonorchiasis, echinococcosis

Autoimmune: SLE, polyarteritis nodosa (PAN), Crohn's disease

Surgery/trauma

- manipulation of sphincter of Oddi (e.g. ERCP), post-cardiac surgery, blunt trauma to abdomen, penetrating peptic ulcer

Hyperlipidemia (TG >11.3 mmol/L; >1000 mg/dL), Hypercalcemia, Hypothermia

Emboli or ischemia

Drugs/toxins

- azathioprine, mercaptopurine, furosemide, estrogens, methyldopa, H₂-blockers, valproic acid, antibiotics, acetaminophen, salicylates, methanol, organophosphates, steroids (controversial)

Pathogenesis

- activation of proteolytic enzymes within pancreatic cells, starting with trypsin, leading to local and systemic inflammatory response
- in gallstone pancreatitis, this is due to mechanical obstruction of the pancreatic duct by stones
- in ethanol-related pancreatitis, pathogenesis is unknown
- in rare genetic diseases, mutations prevent the physiological breakdown of trypsin required normally to stop proteolysis (e.g. mutant trypsin in hereditary pancreatitis or mutation in SPINK 1 gene which normally inhibits activated trypsin); may be model for ethanol-related pancreatitis

Pathology

- mild (interstitial)
 - peri-pancreatic fat necrosis
 - interstitial edema
- severe (necrotic)
 - extensive peri-pancreatic and intra-pancreatic fat necrosis
 - parenchymal necrosis and hemorrhage → infection in 60%
 - release of toxic factors into systemic circulation and peritoneal space (causes multi-organ failure)
- severity of clinical features may not always correlate with pathology

When thinking about the causes of acute pancreatitis remember: **I GET SMASHED**, but vast majority due to gallstones or ethanol

- 3 phases
 - local inflammation + necrosis → hypovolemia
 - systemic inflammation in multiple organs, especially in lungs, usually after IV fluids given → pulmonary edema
 - local complications 2 wk after presentation → pancreatic sepsis/abscess

Signs and Symptoms

- pain: epigastric, noncolicky, constant
- can radiate to back
- may improve when leaning forward (Inglefinger's sign)
- tender rigid abdomen; guarding
- N/V
- abdominal distention from paralytic ileus
- fever: chemical, not due to infection
- jaundice: compression or obstruction of bile duct
- Cullen's/Gray-Turner's signs
- tetany: transient hypocalcemia
- hypovolemic shock: can lead to renal failure
- acute respiratory distress syndrome
- coma

Investigations

- increased serum pancreatic enzymes: amylase, lipase (more specific)
- ALT >150 specific for biliary cause
- increased WBC, glucose, low calcium
- imaging: CT most useful for diagnosis and prognosis
 - x-ray: "sentinel loop" (dilated proximal jejunum), calcification, and "colon cut-off sign" (colonic spasm)
 - U/S: useful for evaluating biliary tree (67% sensitivity, 100% specificity)
 - CT scan with IV contrast: useful for diagnosis and prognosis because contrast seen only in viable pancreatic tissue, non-viable areas can be biopsied percutaneously to differentiate sterile from infected necrosis
 - ERCP or MRCP if cause uncertain, assess for duct stone, pancreatic or ampullary tumor, pancreas divisum

Prognosis

- usually a benign, self-limiting course, single or recurrent
- occasionally severe leading to
 - shock
 - pulmonary edema
 - multi-organ dysfunction syndrome
 - GI ulceration due to stress
 - death
- mortality according to Ranson's criteria (see sidebar)
 - ≤2 criteria = <5% mortality
 - 3-4 criteria = 15-20%
 - 5-6 criteria = 40%
 - ≥7 criteria = >99%
 - multiple other prognostic indices available, more accurate than Ranson but difficult to remember (e.g. APACHE)

Treatment

- goals (only supportive therapy available)
 - (1) hemodynamic stability
 - (2) analgesia
 - (3) oxygen
 - (4) stop progression of damage (difficult)
 - (5) treat local and systemic complications
- antibiotics controversial except in documented infection (use cephalosporins, imipenem)
- aspirate necrotic areas of pancreas to diagnose infection; drain if infected
- IV fluids (crystalloid or colloid)
 - beware third spacing of fluid, monitor urine output carefully
- NG suction (rests pancreas) if vomiting, stomach very dilated
- endoscopic sphincterotomy if severe gallstone pancreatitis (i.e. cholangitis or ongoing obstruction)
- nutritional support: nasojejunal feeding tube or TPN if cannot tolerate enteric feeds
 - recent evidence supports nasogastric enteral (or oral if feasible) feeds
- no benefit: glucagon, atropine, aprotinin, H₂-blockers, peritoneal lavage
- follow clinically and CT/ultrasound to exclude complications
- chief role of surgery is to drain fluid or excise necrotic tissue (necrosectomy) in the case of infected pancreatic necrosis (try to delay for >2 wk to allow demarcation between viable and necrotic tissue)

Cullen's Sign

Periumbilical ecchymosis

Gray-Turner's Sign

Flank ecchymosis

Increased Amylase

- Sensitive, not specific

Increased Lipase

- Higher sensitivity and specificity
- Stays elevated longer

Ranson's Criteria: Prognostic Indicator of Mortality in Pancreatitis not due to Gallstones

At Admission

G: Blood Glucose >11 mmol/L (>200 mg/dL) (with no history of hyperglycemia)

A: Age >55

L: Serum LDH >350 IU/L

A: AST >250 IU/L

W: WBC >16 x 10⁹/L (16,000/mm³)

During First 48 h

C: Serum Calcium <2 mmol/L (<8 mg/dL)

H: Hematocrit drop >10%

O: Arterial PO₂ <60 mmHg

B: Base deficit >4 mmol/L (>4 mEq/L)

B: BUN rise >1.8 mmol/L (>5 mg/dL)

S: Estimated fluid Sequestration >6 L

- Difficult course if 2 criteria present
- High mortality if ≥3 criteria present

Prophylactic Antibiotics Cannot Reduce Infected Pancreatic Necrosis and Mortality in Acute Necrotizing Pancreatitis: Evidence from a Meta-analysis of Randomized Controlled Trials

Am J Gastroenterol 2008;103:104-110

Purpose: To review the effectiveness of IV antibiotics on pancreatic necrosis.

Study Selection: RCTs comparing antibiotics with placebo or no treatment.

Results: Seven trials (n=467) were included.

Antibiotics were not statistically superior to controls in reduction of infected necrosis and mortality.

Conclusion: Prophylactic antibiotics cannot reduce infected pancreatic necrosis and mortality in patients with acute necrotizing pancreatitis.

Note: In practice the temptation to give antibiotics for pancreatitis is mainly in the setting of a sick patient with fever and suggestive pancreatic necrosis on CT scan. It is difficult to determine whether pancreatic necrosis has become infected without aspiration biopsy (see *Curr Gastroenterol Rep* 2009;11:104-110).

Late Complications

- pseudocysts: follow if asymptomatic, drain if symptomatic or growing
 - drain: choice of endoscopic, percutaneous under radiological guidance, or surgical
- infected necrosis/abscesses: antibiotics + percutaneous drainage, endoscopic vs. surgical
- bleeding: (1) gastric varices if splenic vein thrombosis, (2) pseudoaneurysm of vessels in areas of necrosis, especially splenic artery, (3) duodenal ulcer related to compression of duodenum by enlarged pancreas
- splenic and portal vein thrombosis: no effective therapy described, anticoagulation not proven, hazardous
- rare: DM, pancreatic duct damage

Chronic Pancreatitis**Definition**

- irreversible damage to pancreas characterized by:
 - (1) pancreatic cell loss (from necrosis)
 - (2) inflammation
 - (3) fibrosis

Etiology/Pathophysiology

- alcohol (most common)
 - causes a larger proportion (>90%) of chronic pancreatitis than acute pancreatitis
 - changes composition of pancreatic juice (e.g. increases viscosity)
 - decreases pancreatic secretion of pancreatic stone protein (lithostathine) which normally solubilizes calcium salts
 - ♦ precipitation of calcium within pancreatic duct results in duct and gland destruction
 - toxic effect on acinar and duct cells – directly or via increasing free radicals
 - acinar cell injury leads to cytokine release, which stimulates pancreatic stellate cells to form collagen (leading to fibrosis)
 - varying degrees of ductular dilatation, strictures, protein plugs, calcification
 - no satisfactory theory to explain why only a minority of alcoholics develop pancreatitis
- unusual causes
 - CF
 - severe protein-calorie malnutrition
 - hereditary
 - idiopathic

Signs and Symptoms

- early stages
 - recurrent attacks of severe abdominal pain (upper abdomen and back)
 - chronic painless pancreatitis: 10%
- late stages: occurs in 15% of patients
 - malabsorption syndrome when >90% of function is lost, steatorrhea
 - DM, calcification, jaundice, weight loss, pseudocyst, ascites, GI bleed

Investigations

- laboratory
 - increase in serum glucose
 - increase in serum ALP, less commonly bilirubin (jaundice)
 - serum amylase and lipase usually normal
- AXR: pancreatic calcifications
- U/S or CT: calcification, dilated pancreatic ducts, pseudocyst
- MRCP or ERCP: abnormalities of pancreatic ducts-narrowing and dilatation
- EUS: abnormalities of pancreatic parenchyma and pancreatic ducts
- 72 h fecal fat test: measures exocrine function
- secretin test: gold standard, measures exocrine function but difficult to perform, unpleasant for patient, expensive
- fecal pancreatic enzyme measurement (elastase-1, chymotrypsin): available only in selected centers

Management

- most common problem is pain, difficult to control
- general management
 - total abstinence from alcohol
 - enzyme replacement may help pain by resting pancreas via negative feedback
 - analgesics
 - celiac ganglion blocks
 - time: pain decreases with time as pancreas "burns out"
- endoscopy: sphincterotomy, stent if duct dilated, remove stones from pancreatic duct

Gallstones only cause acute pancreatitis (not chronic pancreatitis)

**Symptoms of Chronic Pancreatitis**

- Abdominal pain
- Diabetes
- Steatorrhea

Etiology = Almost Always Alcohol

Treatment

- Alcohol abstinence
- Pancreatic enzyme replacement
- Analgesics
- Pancreatic resection if ductular blockage

- surgery: drain pancreatic duct (pancreaticojejunostomy) if duct dilated (more effective than endoscopy); resect pancreas if duct contracted
- steatorrhea
 - pancreatic enzyme replacement
 - restrict fat, increase carbohydrate and protein (may also decrease pain)
 - neither endoscopy nor surgery can improve pancreatic function

Autoimmune Pancreatitis

- most commonly presents as a mimicker of pancreatic cancer (pancreatic mass detected because of jaundice ± abdominal pain)

Investigations

- histology: lymphocyte and plasma cell infiltration of pancreas
- imaging: focal or diffuse enlargement of pancreas on CT or MRI, sausage shaped, low density rim around pancreas
- serology: increased serum IgG4
- other organs involvement: sialadenitis, retroperitoneal fibrosis, biliary duct narrowing, nephritis

Treatment

- responds to prednisone

Clinical Nutrition

Determination of Nutritional Status

- corrected weight loss (expressed as body mass index [kg/m^2]) is most important parameter in assessing need for nutritional support

Investigations

- plasma proteins: albumin, pre-albumin (shorter half life than albumin), transferrin
 - decrease may indicate decreased nutritional status or disease state
- thyroid-binding globulin, retinol-binding protein (may be too sensitive)
- anthropometry (e.g. triceps skinfold thickness), grip strength less often used

Table 21. Areas of Absorption of Nutrients

	Fe	CHO	Proteins, Lipids Na ⁺ , H ₂ O	Bile Acids	Vit B ₁₂
Duodenum	+++	+++	+++	+	
Jejunum	+	+	++	+	+
Ileum	+	+	++	+++	+++

Hypomagnesemia may be an initial sign of short bowel syndrome in patients who have undergone surgical bowel resection

Most Common Indications for Artificial Nutrition Support:

- Preexisting nutritional deprivation
- Anticipated or actual inadequate energy intake by mouth
- Significant multiorgan system disease

Enteral Nutrition

Definition

- enteral nutrition (tube feeding) is a way of providing food through a tube placed in the stomach or the small intestine
- choice of tubes: nasogastric (NG), nasojejunal (NJ), percutaneous endoscopic gastrostomy (G-tube), percutaneous endoscopic jejunostomy (J-tube) or tubes can be placed radiologically, surgically

Indications

- oral feeding inadequate or contraindicated

Feeds

- polymeric feeds contain whole protein, carbohydrate, fat as a liquid, with or without fiber
- elemental feeds contain protein as amino acids, carbohydrate as simple sugars, fat content low (therefore high osmolarity)
- specific diets: low carbohydrate/high fat solution for ventilated patients (carbohydrate has a high respiratory quotient so minimizes carbon dioxide production), high energy, low electrolyte solutions for dialysis patients

Relative Contraindications

- non-functioning gut (e.g. intestinal obstruction, enteroenteral or enterocutaneous fistulae)
- uncontrolled diarrhea
- GI bleeding

Complications

- aspiration
- diarrhea
- refeeding syndrome (rare): carbohydrate can stimulate excessive insulin release, leading to cellular uptake and low serum levels of phosphate, magnesium, potassium
- overfeeding syndrome (rare): hypertonic dehydration, hyperglycemia, hypercapnea, azotemia (from excess protein)

Enteral Nutrition Advantages over Parenteral Nutrition

- far fewer serious complications (especially sepsis)
- nutritional requirements for enterally administered nutrition better understood
- can supply gut-specific fuels such as glutamine and short chain fatty acids
- nutrients in the intestinal lumen prevent atrophy of the gut and pancreas
- prevents gallstones by stimulating gallbladder motility
- much less expensive

Enteral vs. Parenteral Nutrition for Acute Pancreatitis

Cochrane DB of Syst Rev 2010;1:CD002837

Purpose: Compare EN vs. TPN on mortality, morbidity, and hospital stay in patients with pancreatitis.

Study Selection: RCTs of TPN vs. EN in pancreatitis.

Results: Eight trials (n=348) were included. Enteral nutrition decreases RR of death (0.50), multiple organ failure (0.55), infection (0.39), and other local complications (0.70). It also decreased hospital stay by 2.37 d.

Conclusion: EN reduces mortality, organ failure, infections, and length of hospital stay in patients with pancreatitis.

Parenteral Nutrition

Definition

- parenteral nutrition is the practice of feeding a person intravenously, bypassing the usual process of eating and digestion

Indications

- short-term (<1 mo)
 - whenever GI tract not functioning
 - only situations where PN has been well shown to increase survival are after bone marrow transplant and in short bowel syndrome, some evidence for benefit in gastric cancer, but often used in ICU, perioperatively, and in difficult to control sepsis
 - pre-operative: only useful in severely malnourished (e.g. loss of >15% of pre-morbid weight, serum albumin <28 g/L or <2.8 g/dL), and only if given for ≥2 wk
 - renal failure: PN shown to increase rate of recovery; no increase in survival
 - liver disease: branched chain amino acids may shorten duration of encephalopathy; no increase in survival
 - IBD: PN closes fistulae and heals acute exacerbations of mucosal inflammation, but effect is transient (EN is equally effective)
 - some evidence for efficacy, but convincing data not available for:
 - ♦ radiation/chemotherapy-induced enteritis
 - ♦ AIDS with wasting diarrhea
 - ♦ severe acute pancreatitis
- long-term (>1 mo): can be given at home
 - severe untreatable small bowel disease (e.g. radiation enteritis, extensive CD, high output fistulae)
 - following surgical resection of >70% of bowel (e.g. bowel infarction)
 - severe motility diseases (e.g. scleroderma affecting bowel)

Relative Contraindications

- functional GI tract for enteral nutrition
- active infection; at least until appropriate antibiotic coverage
- inadequate venous access; triple-lumen central venous lines usually prevent this problem
- unreliable patient or clinical setting

Complications of PN

- sepsis: most serious of the common complications
- mechanical pneumothorax from insertion of central line, catheter migration and thrombosis, air embolus
- metabolic: CHF, hyperglycemia, gallstones, cholestasis

Whenever possible, enteral nutrition is ALWAYS preferable over parenteral nutrition

Common Medications

Table 22. Common Drugs Prescribed in Gastroenterology

Class	Generic Drug Name	Trade Name	Dosing	Mechanism of Action	Indications	Contraindications	Side Effects
Proton Pump Inhibitors (H ⁺ /K ⁺ -ATPase inhibitors)	omeprazole	Losec®/Prilosec®	20 mg PO OD	Inhibits gastric enzymes H ⁺ /K ⁺ -ATPase (proton pump)	Duodenal ulcer, gastric ulcer, NSAID-associated gastric and duodenal ulcers, reflux esophagitis, symptomatic GERD, dyspepsia, Zollinger-Ellison syndrome, eradication of <i>H. pylori</i> (combined with antibiotics)	Hypersensitivity to drug	Dizziness, headache, flatulence, abdominal pain, nausea, rash, increased risk of osteoporotic fracture (secondary to impaired calcium absorption)
	lansoprazole or dexlansoprazole	Prevacid® Dexilant®	Oral therapy: 15-30 mg OD (before breakfast) IV therapy: 30 mg OD	Same as above	Same as above	Same as above	Same as above
	pantoprazole	Pantoloc® Protonix®	40 mg PO OD for UGIB: 80 mg IV bolus then 8 mg/h infusion	Same as above	Same as above and UGIB	Same as above	Same as above
	rabeprazole	Pariet®/Aciphex®	40 mg PO OD	Same as above	Same as above	Same as above	Same as above
	esomeprazole	Nexium®	20-40 mg PO OD	Same as above	Same as above	Same as above	Same as above
Histamine H₂-Receptor Antagonists	ranitidine	Zantac®	300 mg PO OD or 150 mg bid IV therapy: 50 mg q8h (but tachyphylaxis a problem)	Inhibits gastric histamine H ₂ -receptors	Duodenal ulcer, gastric ulcer, NSAID-associated gastric and duodenal ulcers, ulcer prophylaxis, reflux esophagitis, symptomatic GERD, Zollinger-Ellison syndrome	Hypersensitivity to drug	Confusion, dizziness, headache, arrhythmias, constipation, nausea, agranulocytosis, pancytopenia, depression
	famotidine	Pepcid®	Oral therapy: duodenal/gastric ulcers: 40 mg qhs GERD: 20 mg bid IV therapy: 20 mg bid	Same as above	Same as above	Same as above	Same as above
Stool Softener	docusate sodium	Colace®	100-400 mg PO OD, divided in 1-4 doses	Promotes incorporation of water into stool	Relief of constipation	Presence of abdominal pain, fever, N/V	Throat irritation, abdominal cramps, rashes
Osmotic Laxatives	lactulose	Lactulose/ Constulose®	Constipation: 15-30 mL PO OD to bid Encephalopathy: 15-30 mL bid to qid	Poorly absorbed in GI tract and is broken down by colonic bacteria into lactic acid into colon, increases osmotic colonic contents, increases stool volume	Chronic constipation, prevention and treatment of portal-systemic encephalopathy	Patients who require a low galactose diet	Flatulence, intestinal cramps, nausea, diarrhea if excessive dosage
	PEG3350	Lax-a-day®/ Golytely®	Constipation: 17 g powder dissolved in 4-8 oz liquid PO OD	Osmotic agent causes water retention in stool and promotes frequency of stool	Relief of constipation Colonoscopy prep	Hypersensitivity to drug	Abdominal distension, pain, anal pain, thirst, nausea, rigor, tonic-clonic seizures (rare)
Prokinetic Laxatives	senna	Senokot®	Tablets: 1-4 PO qhs Syrup: 10-15 mL PO qhs	Induce peristalsis in lower colon	Constipation	Patients with acute abdomen	Abdominal cramps, discoloration of breast milk, urine, feces, melanosis coli and atonic colon from prolonged use (controversial)
	bisacodyl	Bisacodyl®	5-30 mg PO OD (start at 10 mg for bowel preparation)	Enteric nerve stimulation and local contact-induced secretory effects. Colonic movements	Constipation Preparation of bowel for procedure	GI obstruction Gastroenteritis	Abdominal colic, abdominal discomfort, proctitis (with suppository use), diarrhea
	metoclopramide	Maxolon®	See anti-emetics	See anti-emetics	See anti-emetics	See anti-emetics	See anti-emetics
Bulk Laxatives	psyllium	Metamucil®	2-6 tabs (1 tab = 0.52 g) PO qd-tid pm	Increases stool bulk → water retention in stool	Constipation	Hypersensitivity to drug GI obstruction	GI obstruction, diarrhea, constipation, abdominal cramps

Table 22. Common Drugs Prescribed in Gastroenterology (continued)

Class	Generic Drug Name	Trade Name	Dosing	Mechanism of Action	Indications	Contraindications	Side Effects
Antidiarrheal Agents	loperamide	Imodium®	Acute diarrhea: 4 mg PO initially, followed by 2 mg after each unformed stool	Acts as antidiarrheal via cholinergic, oncholingeric, opiate, and nonopiate receptor-mediated mechanisms; decreases activity of myenteric plexus	Adjunctive therapy for acute non-specific diarrhea, chronic diarrhea associated with IBD and for reducing the volume of discharge for ileostomies, colostomies, and other intestinal resections	Children <2 yr, known hypersensitivity to drug, acute dysentery characterized by blood in stools and fever, acute ulcerative colitis or pseudomembranous colitis associated with broad-spectrum antibiotics	Abdominal pain or discomfort, drowsiness or dizziness, tiredness, dry mouth, N/V, hypersensitivity reaction
	diphenoxylate/atropine	Lomotil®	5 mg PO tid to qid	Inhibits GI propulsion via direct action on smooth muscle, resulting in a decrease in peristaltic action and increase in transit time	Adjunctive therapy for diarrhea, as above	Hypersensitivity to diphenoxylate or atropine, jaundice, pseudomembranous enterocolitis, diarrhea caused by enterotoxin producing bacteria	Dizziness, drowsiness, insomnia, headache, N/V, cramps, allergic reaction
Anti-Emetics	dimenhydrinate		25-50 mg PO/IV/IM q4-6h prn	Competitive H ₁ receptor antagonist in GI tract, blood vessels, and respiratory tract. Blocks chemoreceptor trigger zone. Diminishes vestibular stimulation and disrupts labyrinthine function through central anticholinergic action	Motion sickness, radiation sickness, postoperative vomiting, and drug-induced N/V	Hypersensitivity to drug	Xerostomia, sedation
	prochlorperazine	Compazine®	5-10 mg PO/IV/IM bid- tid prn	D ₁ , D ₂ receptor antagonist in chemoreceptor trigger zone and α adrenergic and anticholinergic effects. Depresses RAS affecting emesis	Post operative N/V, antipsychotic, anxiety	Hypersensitivity to drug	Dystonia, EPS, seizure, neuroleptic malignant syndrome (NMS) (rarely)
	metoclopramide	Maxolon®	10 mg IV/IM q2-3h prn, 10-15 mg PO qid (30 min before meals and qhs)	Dopamine and HT receptor antagonist in chemoreceptor trigger zone. Enhances response to ACh in upper GI tract, enhancing motility and gastric emptying. Increases LES tone	GER, diabetic gastroparesis, post operative and chemotherapy induced N/V, migraines, constipation	Hypersensitivity to drug, GI obstruction, perforation, hemorrhage, pheochromocytoma, seizures, and EPS	Restlessness, drowsiness, dizziness, fatigue, EPS, some rare serious side effects include NMS, agranulocytosis
	ondansetron	Zofran®	Depends on procedure, generally 8-16 mg PO	Selective 5HT ₃ receptor antagonist in central chemoreceptor trigger zone and peripherally on vagus nerve	N/V caused by cancer chemotherapy and radiation therapy; multiple off label uses, including gastroenteritis N/V	Morphine, hypersensitivity to drug	Constipation, diarrhea, increased liver enzymes, headache, fatigue, malaise, cardiac dysrhythmia
	granisetron	Kytril®	1 mg PO bid (for nausea from chemotherapy/radiation)	Same as above	N/V caused by cancer chemotherapy and radiation therapy	Same as above	Constipation, prolonged QT interval (rarely)
IBD Agents	mesalamine	Pentasa® Asacol®	CD: 1 g tid/qid Active UC: 1 g PO qid Maintenance UC: 1.6 g divided doses daily also as suppositories and enemas	5-ASA: Blocks arachidonic acid metabolism to prostaglandins and leukotrienes	IBD	Hypersensitivity to mesalamine salicylates	Abdominal pain, constipation, arthralgia, headache
	sulfasalazine	Azulfidine®	3-4 g/d PO in divided doses	Compound composed of 5-ASA bound to sulfapyridine, hydrolysis by intestinal bacteria releases 5-ASA, the active component	Colonic disease	Hypersensitivity to sulfasalazine, sulfa drugs, salicylates; intestinal or urinary obstruction, porphyria	Rash, loss of appetite, N/V, headache, oligospermia (reversible)
	prednisone		20-40 mg PO OD for acute exacerbation	Anti-inflammatory	Mod-severe CD and UC		Complications of steroid therapy
Immunosuppressive Agents	6-mercaptopurine (6-MP)	Purinethol®	CD: 1.5 mg/kg/d PO	Immunosuppressive	IBD: active inflammation and to maintain remission	Hypersensitivity to mercaptopurine, prior resistance to mercaptopurine or thioguanine, history of treatment with alkylating agents, hypersensitivity to azathioprine, pregnancy	Pancreatitis, bone marrow suppression, increased risk of cancer
	azathioprine	Azasan® Imuran®	IBD: 2-3 mg/kg/d PO	Same as above	Same as above	Same as above	Same as above
Immunomodulators	infliximab	Remicade®	5-10 mg/kg IV over 2 h	Antibody to TNFα	Medically refractory CD	Heart failure, moderate to severe, doses >5 mg/kg	Reported cases of reactivated TB, PCP, lymphoma, other infections

Landmark Gastroenterology Trials

Trial	Reference	Results
ALF	<i>Gastroenterology</i> 2009;137:856-64	IV NAC was shown to improve transplant-free survival in patients with early non-acetaminophen related acute liver failure Later stage disease did not improve with IV NAC
BISAP	<i>Am J Gastro</i> 2009; 104:966	Five point scoring system for patients with acute pancreatitis to identify those at increased risk for mortality
Early combined vs. conventional management in Crohn's disease	<i>Lancet</i> 2008; 371:660-7	Initiation of more intensive therapy early in Crohn's disease may be more likely to result in corticosteroid-free remission than conventional therapy
FAMOUS	<i>Lancet</i> 2009; 374:119-25	Famotidine was effective in preventing gastric and duodenal ulcers, and erosive esophagitis in patients receiving low-dose ASA therapy
Glucocorticoids and NAC in Alcoholic Hepatitis	<i>NEJM</i> 2011; 365:1781-9	Combination therapy improved 1 mo survival, but not 6 mo survival compared to prednisolone monotherapy
MELD	<i>Gastroenterology</i> 2003;124:91-6	MELD score can be applied for allocation of donor livers as it accurately predicts 3 mo mortality in patients with chronic liver failure
SONIC	<i>NEJM</i> 2010; 362:1383-95	In moderate-severe Crohn's disease, infliximab + azathioprine was more likely to result in corticosteroid-free remission than infliximab monotherapy. Infliximab monotherapy was more effective than azathioprine monotherapy

Basic Anatomy Review

Figure 1. Abdominal incisions

Lateral Abdominal Wall Layers and their Continuous Spermatic and Scrotal Structures (superficial to deep)

1. skin (epidermis, dermis, subcutaneous fat)
2. superficial fascia
 - Camper's fascia (fatty) → Dartos fascia
 - Scarpa's fascia (membranous) → Colles' superficial perineal fascia
3. muscle (see Figure 2 and Figure 3)
 - external oblique → inguinal ligament → external spermatic fascia and fascia lata
 - internal oblique → cremasteric muscle/fascia
 - transversus abdominis → posterior inguinal wall
4. transversalis fascia → internal spermatic fascia
5. preperitoneal fat
6. peritoneum → tunica vaginalis

Midline Abdominal Wall Layers (superficial to deep)

1. skin
2. superficial fascia
3. rectus abdominis muscle: in rectus sheath, divided by linea alba
 - above arcuate line (midway between symphysis pubis and umbilicus)
 - ♦ anterior rectus sheath = external oblique aponeurosis and anterior leaf of internal oblique aponeurosis
 - ♦ posterior rectus sheath = posterior leaf of internal oblique aponeurosis and transversus abdominis aponeurosis
 - below arcuate line
 - ♦ aponeuroses of external oblique, internal oblique, transversus abdominis all pass in front of rectus abdominis
4. arteries: superior epigastric (branch of internal thoracic), inferior epigastric (branch of external iliac); both arteries anastomose and lie behind the rectus muscle (superficial to posterior rectus sheath above arcuate line)
5. transversalis fascia

Figure 2. Continuity of the abdominal wall with layers of the scrotum and spermatic cord

Acronyms

5-FU	5-fluorouracil
AAA	abdominal aortic aneurysm

IPAH	idiopathic pulmonary arterial hypertension
IPF	idiopathic pulmonary fibrosis
LAR	low anterior resection
LBO	large bowel obstruction
LCIS	lobular carcinoma <i>in situ</i>
LES	lower esophageal sphincter
LGIB	lower gastrointestinal bleed
LVRs	lung volume reduction surgery
MALT	mucosa-associated lymphoid tissue
MEN	multiple endocrine neoplasia
MIBG	metaiodobenzylguanidine
MIS	minimally invasive surgery
MRCp	magnetic resonance cholangiopancreatography
NGT	nasogastric tube
OGD	oesophagogastroduodenoscopy
POD	post-operative day
PPI	proton pump inhibitor
PTC	percutaneous transhepatic cholangiography
PUD	peptic ulcer disease
SBO	small bowel obstruction
SCC	squamous cell carcinoma
SIADH	syndrome of inappropriate anti-diuretic hormone
SMA	superior mesenteric artery
SMV	superior mesenteric vein
TED	thromboembolic deterrent
TEE	transesophageal echocardiogram
TTE	transthoracic echocardiogram
UGIB	upper gastrointestinal bleed
VATS	video-assisted thorascopic surgery
VIP	vasoactive intestinal peptide

Figure 3. Midline cross-section of abdominal wall

Figure 4. Blood supply to the GI tract

Venous Flow

Figure 5. Venous drainage of the GI tract

Organ	Arteries
Liver	Left and right hepatic (branches of hepatic proper)
Spleen	Splenic
Gallbladder	Cystic (branch of right hepatic artery)
Stomach	1. Lesser curvature: right and left gastric 2. Greater curvature: right (branch of gastroduodenal) and left (branch of splenic) gastroepiploic 3. Fundus: short gastrics (branch of splenic)
Duodenum	1. Gastroduodenal 2. Pancreaticoduodenals (superior branch of gastroduodenal, inferior branch of superior mesenteric)
Pancreas	1. Pancreatic branches of splenic 2. Pancreaticoduodenals
Small intestine	1. Superior mesenteric branches: jejunal, ileal, ileocolic
Large intestine	1. Superior mesenteric branches: right colic, middle colic 2. Inferior mesenteric branches: left colic, sigmoid, superior rectal

Differential Diagnoses of Common Presentations

Acute Abdominal Pain

- acute abdomen = severe abdominal pain of acute onset and requires urgent medical attention
- in patients with acute abdominal pain, the first diagnoses that you should consider are those requiring potential urgent surgical intervention
- two main patterns constituting urgent general surgery referrals are peritonitis and obstruction

Table 1. Differential Diagnosis of Acute Abdominal Pain

RUQ	EPIGASTRIC	LUQ
Hepatobiliary Biliary colic Cholecystitis Cholangitis CBD obstruction (stone, tumor) Hepatitis Budd-Chiari Hepatic abscess/mass Right subphrenic abscess Gastrointestinal Pancreatitis Presentation of gastric, duodenal, or pancreatic pathology Hepatic flexure pathology (CRC, subcostal incisional hernia) Genitourinary Nephrolithiasis Pyelonephritis Renal: mass, ischemia, trauma Cardiopulmonary RLL pneumonia Effusion/empyema CHF (causing hepatic congestion and R pleural effusion) MI Pericarditis Pleuritis Miscellaneous Herpes zoster Trauma Costochondritis	Cardiac Aortic dissection/ruptured AAA MI Pericarditis Gastrointestinal Gastritis GERD/esophagitis PUD Pancreatitis Mallory-Weiss tear DIFFUSE Gastrointestinal Peritonitis Early appendicitis, perforated appendicitis Mesenteric ischemia Gastroenteritis/colitis Constipation Bowel obstruction Pancreatitis Inflammatory bowel disease Irritable bowel syndrome Ogilvie's syndrome Cardiovascular/Hematological Aortic dissection/ruptured AAA Sickle cell crisis Genitourinary/Gynecological Perforated ectopic pregnancy PID Acute urinary retention Endocrinological Carcinoid syndrome Diabetic ketoacidosis Addisonian crisis Hypercalcemia Other Lead poisoning Tertiary syphilis	Pancreatic Pancreatitis (acute vs. chronic) Pancreatic pseudocyst Pancreatic tumors Gastrointestinal Gastritis PUD Splenic flexure pathology (e.g. CRC, ischemia) Splenic Splenic infarct/abscess Splenomegaly Splenic rupture Splenic aneurysm Cardiopulmonary (see RUQ and Epigastric) Genitourinary (see RUQ) LLQ Gastrointestinal Diverticulitis Diverticulosis Colon/sigmoid/rectal cancer Fecal impaction Proctitis (ulcerative colitis, infectious; i.e. gonococcus or chlamydia) Sigmoid volvulus Hernia Gynecological See 'suprapubic' Genitourinary See 'suprapubic' Extraperitoneal Abdominal wall hematoma/abscess Psoas abscess See Gynecology, Urology, and Respirology chapters for further details regarding respective RLQ and suprapubic pain
RLQ	SUPRAPUBIC	
Gastrointestinal Appendicitis Crohn's disease Tuberculosis of the ileocecal junction Cecal tumor Intussusception Mesenteric lymphadenitis (<i>Yersinia</i>) Cecal diverticulitis Cecal volvulus Hernia: femoral, spigelian, inguinal obstruction, Amyand's (and resulting cecal distention) Gynecological See 'suprapubic' Genitourinary See 'suprapubic' Extraperitoneal Abdominal wall hematoma/abscess Psoas abscess	Gastrointestinal (see RLQ/LLQ) Acute appendicitis IBD Gynecological Ectopic pregnancy PID Endometriosis Threatened/incomplete abortion Hydrosalpinx/salpingitis Ovarian torsion Hemorrhagic fibroid Tubo-ovarian abscess Gynecological tumors Genitourinary Cystitis (infectious, hemorrhagic) Hydroureter/urinary colic Epididymitis Testicular torsion Acute urinary retention Extraperitoneal Rectus sheath hematoma	

In all patients presenting with an acute abdomen, order the following:

KEY TESTS FOR SPECIFIC DIAGNOSIS

- Liver function tests (LFTs) including ALP, ALT, AST, bilirubin
- Amylase/lipase
- Urinalysis
- β -hCG (in women of childbearing age)
- Troponins
- Lactate

KEY TESTS FOR OR PREPARATION

- CBC, electrolytes, BUN, creatinine, glucose
- CXR + ECG
- PT/INR and PTT

Pancreatitis can look like a surgical abdomen, but is rarely an indication for immediate laparotomy

Localization of Pain

Most digestive tract pain is perceived in the midline because of bilaterally symmetric innervation. Kidney, ureter, ovary, or somatically innervated structures are more likely to cause lateralized pain

Referred Pain

- Biliary colic: to right shoulder or scapula
- Renal colic: to groin
- Appendicitis: periumbilical to right lower quadrant (RLQ)
- Pancreatitis: to back
- Ruptured aortic aneurysm: to back or flank
- Perforated ulcer: to RLQ (via right paracolic gutter)
- Hip pain: to groin

Most Common Presentations of Surgical Pain

- Sudden onset with rigid abdomen = perforated viscus
- Pain out of proportion to physical findings = mesenteric ischemia or ischemic bowel
- Vague pain that subsequently localizes = appendicitis or other intra-abdominal process that irritates the parietal peritoneum
- Waves of colicky pain = bowel obstruction

Types of Peritonitis

- Primary peritonitis: spontaneous without clear etiology
- Secondary peritonitis: due to a perforated viscus
- Tertiary peritonitis: recurrent secondary peritonitis more often with resistant organisms

Abdominal Mass

Table 2. Differential Diagnosis of Abdominal Mass

Right Upper Quadrant (RUQ)	Upper Midline	Left Upper Quadrant (LUQ)
Gallbladder: cholecystitis, cholangiocarcinoma, peri-ampullary malignancy, cholelithiasis	Pancreas: pancreatic adenocarcinoma, other pancreatic neoplasm, pseudocyst	Spleen: splenomegaly, tumor, abscess, subcapsular splenic hemorrhage, can also present as RLQ mass if extreme splenomegaly
Biliary tract: Klatskin tumor, choledochal cyst	Abdominal aorta: AAA (pulsatile)	Stomach: tumor
Liver: hepatomegaly, hepatitis, abscess, tumor (hepatocellular carcinoma, metastatic tumor, etc.)	Gastric tumor (adenocarcinoma, gastrointestinal stromal tumor, carcinoid tumor), MALT lymphoma	Colon: tumor, constipation
Colon: tumor, constipation		
Right Lower Quadrant (RLQ)	Lower Midline	Left Lower Quadrant (LLQ)
Intestine: stool, tumor (CRC), mesenteric adenitis, appendicitis, appendiceal phlegmon or other abscess, typhilitis, intussusception, Crohn's inflammation	Uterus: pregnancy, leiomyoma (fibroid), uterine cancer, pyometra, hematometra	Intestine: stool, tumor, abscess (see RLQ)
Ovary: ectopic pregnancy, cyst (physiological vs. pathological), tumor (serous, mucinous, struma ovarii, germ cell, Krukenberg)	GU: bladder distention, tumor	Ovary: see RLQ
Fallopian tube: ectopic pregnancy, tubo-ovarian abscess, hydrosalpinx, tumor		Fallopian tube: see RLQ

Indications for Urgent Operation

IHOP

Ischemia
Hemorrhage
Obstruction
Perforation

Gastrointestinal Bleeding

- see [Gastroenterology](#), G25

Indications for Surgery

- failure of medical management
- exsanguinating hemorrhage: hemodynamic instability despite vigorous resuscitation
- recurrent hemorrhage after initial stabilization procedures (up to two attempts of endoscopic control)
- hypovolemic shock
- prolonged bleeding with transfusion requirement >4 units
- bleeding at rate >1 unit/8 h

Surgical Management of GI Bleeding

- UGIB
 - bleeding from a source proximal to the ligament of Treitz
 - often presents with hematemesis and melena unless very brisk (then can present with hematochezia, hypotension, tachycardia)
 - initial management with endoscopy; if fails, then consider surgery
 - note: PUD accounts for approximately 55% of severe UGIB
- LGIB
 - bleeding from a source distal to the ligament of Treitz
 - often presents with BRBPR unless proximal to transverse colon
 - may occasionally present with melena
 - initial management with colonoscopy to detect and potentially stop source of bleeding
 - 75% of patients will spontaneously stop bleeding, however if bleeding continues barium enema should NOT be performed
 - angiography, RBC scan to determine source as indicated
 - surgery indicated if bleeding is persistent - aimed at removing underlying cause of bleeding
 - obscure bleed may require blind total colectomy if the source is not found

Overt bleeding: obvious hematochezia or melena per rectum visible to naked eye

Occult bleeding: bleeding per rectum is not obvious to naked eye (e.g. positive guaiac test)

Obscure bleeding: overt bleeding with no identifiable source after colonoscopy and endoscopy

Transfusion Strategies for Acute Upper Gastrointestinal Bleeding

NEJM 2013;368:11-21

Recent study by Villanueva et al., demonstrates that a restrictive transfusion strategy (transfusion with hemoglobin below 70 g/L) significantly improves outcomes in patients with acute UGIB, compared to a liberal transfusion strategy (transfusion with hemoglobin below 90 g/L). Refer to study for details.

Table 3. Differential Diagnosis of GI Bleeding

Anatomical Source	Etiology	
Hematological	Excess anticoagulation (coumadin, heparin, etc.) Excess antiplatelet (clopidogrel, ASA)	DIC Congenital bleeding disorders
Nose	Epistaxis	
Esophagus	Esophageal varices Mallory-Weiss tear Esophagitis	Aorto-esophageal fistula (generally post endovascular aortic repair)* Esophageal cancer
Stomach	Gastritis Gastric varices Dieulafoy's lesion	Gastric ulcer Gastric cancer*
Duodenum	Duodenal ulcer Perforated duodenal ulcer*	Duodenal cancer*
Jejunum	Tumors* Polyps Ulcers	

Table 3. Differential Diagnosis of GI Bleeding (continued)

Anatomical Source	Etiology	
Ileum and Ileocecal Junction	Meckel's diverticulum (rare surgical management) Small bowel obstruction	Crohn's disease* Tuberculosis of ileocecal junction
Large Intestine	Colorectal cancer* Mesenteric thrombosis/ischemic bowel* Ulcerative colitis* (subtotal colectomy if failure of medical management) Angiodysplasia Diverticulosis (*if bleeding is persistent)	Crohn's disease (less frequently presents with bleeding)* Pancolitis (infectious, chemotherapy, or radiation induced) Suture or staple line of a post-gastrointestinal anastomosis
Sigmoid	Diverticulosis (*if bleeding is persistent) Sigmoid cancer* Bleeding post-polypectomy	Polyps (*if not amenable to colonoscopic polypectomy) Inflammatory bowel disease (IBD)
Rectum and Anus	Hemorrhoids (internal > external) Fissures Rectal cancer* Anal varices	Polyps (*if not amenable to colonoscopic polypectomy) Crohn's or ulcerative colitis* Solitary rectal ulcer syndrome

*Managed surgically in most cases

**Biochemical Signs for Differentiating Jaundice**

Hepatocellular: Elevated bilirubin + elevated ALT/AST
Cholestatic: Elevated bilirubin + elevated ALP/GGT ± duct dilatation upon biliary U/S
Hemolysis: ↓ haptoglobin ↑ LDH

Note: cholestatic jaundice is usually surgical

Jaundice

- see [Gastroenterology](#), G41

Pre-Operative Preparations

Considerations

- informed consent (see [Ethical, Legal, and Organizational Medicine](#), ELOAM5)
- screening questionnaire to assess important potential risk factors such as age, exercise capacity, medication use, and allergies
- consults: anesthesia, medicine, as indicated
- NPO for ≥6 h prior; activity as tolerated (AAT), vital signs routine (VSR)
- IV – balanced crystalloid at maintenance rate (4:2:1 rule → roughly 100-125 cc/h): normal saline or Ringer's lactate; bolus to catch up on estimated losses including losses from bowel prep
 - appropriate use of fluids perioperatively decreases risk of cardiorespiratory complications
- review patient's regular medications including prednisone: consider pre-operative stress dose if prednisone with β-blocker used in past year
- prophylactic antibiotics depending on wound class (within 1 h prior to incision): usually cefazolin (Ancef®) ± metronidazole (Flagyl®)
- consider bowel prep: cleans out bowel and decreases bacterial population
 - oral cathartic (e.g. fleet Phosphosoda®) starting previous day
 - use in selected cases; current evidence does not support routine use
- consider DVT prophylaxis for all inpatient surgery (heparin)
- do not hold heparin prior to surgery unless epidural is expected
- hold clopidogrel and coumadin 5 to 7 days pre-operative; consider holding ASA (surgeon dependent)
- smoking cessation x 8 wk or more pre-operative can significantly decrease post-operative complications
- remote infection: delay elective surgery until infection controlled

Investigations

- routine pre-operative laboratory investigations for **elective** procedures should be **selective**
 - only ASA class and surgical risk have been found to independently predict post-operative adverse effects
- blood components: group and screen or cross and type depending on procedure
- CBC, electrolytes, BUN, creatinine
- INR/PT, PTT
- ABGs and/or PFTs if predisposed to respiratory insufficiency
- CXR (PA and lateral) if >50 yr old or previously abnormal within past 6 mo
- ECG if >50 yr old or as indicated by history
- β-hCG testing in all women of reproductive age

Drains

- NGT
 - indications: gastric decompression, analysis of gastric contents, irrigation/dilution of gastric contents, to test anastomosis for leak, feeding (only if necessary due to risk of aspiration → naso-jejunal tube preferable)

**Bilirubin Levels**

	Prehepatic	Intrahepatic	Posthepatic
Serum Bilirubin			
Indirect	↑	↑	N
Direct	N	↑	↑
Urine			
Urobilinogen	↑	↑	–
Bilirubin	–	+	+
Fecal			
Urobilinogen	↑	↑	–

In patients with liver disease and an acute abdomen, spontaneous bacterial peritonitis must be ruled out

**Best Practice in General Surgery (BPIGS)**

<http://www.bpigs.ca/>
 BPIGS is a University of Toronto initiative with the goal of standardizing care in general surgery. This link contains EBM based guidelines which have been implemented by consensus within all Toronto teaching hospitals. This is a highly recommended source for the most up-to-date pre-operative and general treatment guidelines

**Surgical Emergencies: Take an AMPLE History****AMPLE****Allergies****Medications**

Past medical/surgical history (including anesthesia and bleeding disorders)

Last meal

Events (HPI and FHx of bleeding disorders/anesthesia complications)

- contraindications: suspected basal skull fracture, obstruction of nasal passages due to trauma
- Foley catheter with urometer
 - indications: to accurately monitor urine output, decompression of bladder, relieve obstruction, rapidly expanding suprapubic mass
 - contraindications: suspected urethral injury, difficult insertion of catheter

Approach to the Critically Ill Surgical/Trauma Patient

ABC, I'M FINE ABC

IV: 2 large bore IVs with NS, wide open
Monitors: O₂ sat, ECG, BP
Foley catheter to measure urine output
Investigations: blood work
NGT if indicated
"Ex" rays (abdomen 3 views, CXR), other imaging – only when stable

Pre and Post-Operative Orders

ADDAVIDS

Admit to ward X under Dr. Y

Diagnosis

Diet

Activity

Vitals (q4h from ED and post-operative is standard)

IV, Investigations, Ins and Outs

Drugs, Dressings, Drains

Special procedures

Drugs – 7 As

Analgesia

Anti-emetic

Anticoagulation

Antibiotics

Anxiolytics

Anticonstipation

All other patient meds (home meds, stress dose steroids, and β -blockers)

5 Ws of Post-Operative Fever

Wind POD #1-2 (pulmonary – atelectasis, pneumonia)

Water POD #3-5 (urine – UTI)

Wound POD #5-8 (if earlier think streptococcal or clostridial infection)

Walk POD #8+ (thrombosis – DVT/PE)

Wonder drugs POD #1+ (drug)

Drain Size

Measured by the unit French
French = diameter (mm) x 3

Surgical Complications

- general principles in preventing complications during the post-operative period include:
 - frequent examination of the patient (daily or more) and their wound
 - removal of surgical tubes as soon as possible
 - early ambulation
 - monitor fluid balance and electrolytes
 - analgesia - enough to adequately address pain, but not excessive
 - skillful nursing care

Post-Operative Fever

- fever does not necessarily imply infection particularly in the first 24-48 h post-operative
- fever may not be present or is blunted if patient is receiving chemotherapy, glucocorticoids, or immunosuppression
- timing of fever may help identify cause
 - hours after surgery – POD #1 (immediate)
 - ♦ inflammatory reaction in response to trauma from surgery
 - ♦ reaction to blood products received during surgery
 - ♦ malignant hyperthermia
 - POD #1-2 (acute)
 - ♦ atelectasis (most common cause of fever in first 48 h after surgery)
 - ♦ early wound infection (especially *Clostridium*, Group A *Streptococcus* – feel for crepitus and look for “dishwater” drainage)
 - ♦ aspiration pneumonitis
 - ♦ other: Addisonian crisis, thyroid storm, transfusion reaction
 - POD #3-7 (subacute): infections more likely
 - ♦ UTI, surgical site infection, IV site/line infection, septic thrombophlebitis, leakage at bowel anastomosis (tachycardia, hypotension, oliguria, abdominal pain)
 - POD #8+ (delayed)
 - ♦ intra-abdominal abscess, DVT/PE (can be anytime post-operative, most commonly POD #8-10), drug fever
 - ♦ other: cholecystitis, peri-rectal abscess, URTI, infected seroma/biloma/hematoma, parotitis, *C. difficile* colitis, endocarditis, sinusitis (from nasogastric tube)

Treatment

- treat primary cause
- antipyrexia (e.g. acetaminophen)

Wound/Incisional Complications

WOUND CARE (see [Plastic Surgery, PL8](#))

- can shower POD #2-3 (epithelialization of wound occurs within 48 h)
- dressings can generally be removed POD #2 and left uncovered if dry (check with attending to be sure)
- examine wound if wet dressing, signs of infection (fever, tachycardia, pain)
- skin sutures and staples can be removed POD #7-10
 - exceptions: incision crosses crease (groin), closed under tension, in extremities (hand) or patient factors (elderly, corticosteroid use, immunosuppressed) removed POD #14, earlier if signs of infection
- negative pressure dressings consist of foam and suction, promote granulation
 - ideal for large (grafted sites) or non-healing wounds (irradiated skin, ulcer)

DRAINS

- sometimes placed intraoperatively to prevent fluid accumulation (blood, pus, serum, bile, urine)
 - can be used to assess quantity of third space fluid accumulation post-operatively
- potential route of infection, bring out through separate incision (vs. operative wound) to decrease risk of wound infection and remove as soon as possible

- types of drains
 - open (e.g. Penrose), higher risk of infection
 - closed: 1) Gravity drainage (e.g. Foley catheter); 2) Underwater-seal drainage system (e.g. chest tube); 3) Suction drainage (e.g. Jackson-Pratt)
 - sump (e.g. NGT)
- monitor drain outputs daily
- drains should be removed once drainage is minimal (<30-50 cc/24 h)
- evidence does not support routine post-operative drainage of abdominal cavity
- drains do not guarantee that the patient will not form a collection of fluid
- ridged drains can erode through internal structures, and excessive suction can cause necrosis

SURGICAL SITE INFECTION

Etiology

- S. aureus*, *E. coli*, *Enterococcus*, *Streptococcus* spp., *Clostridium* spp.

Risk Factors

Table 4. Procedures and Their Impact on Surgical Site Infection

Classification	Clean	Clean-Contaminated	Contaminated	Dirty/Infected
Definition	Incision under sterile conditions; nontraumatic; no entrance of hollow organ	Incision under sterile conditions; ENTRANCE of hollow viscus; no evidence of active infection; minimal contamination	Incision under sterile conditions; MAJOR contamination of wound during procedure (i.e. gross spillage of stool, infection in biliary, respiratory, or GU systems)	Established infection present before wound is made in skin
Example	Wound created to repair hernia	Routine cholecystectomy; colon resection	Bowel obstruction with enterotomy and spillage of contents; necrotic bowel resection; fresh traumatic wounds	Appendiceal abscess; traumatic wound with contaminated devitalized tissue; perforated viscus
Infection Rate	<2%	3-4%	7-10%	30-40%
Wound Closure	Primary closure	Primary closure	Often secondary closure	Secondary closure

- patient characteristics
 - age, DM, steroids, immunosuppression, obesity, burn, malnutrition, patient with other infections, traumatic wound, radiation, chemotherapy
- other factors
 - prolonged pre-operative hospitalization, reduced blood flow, break in sterile technique, multiple antibiotics, hematoma, seroma, foreign bodies (drains, sutures, grafts), skin preparation, hypoxemia, hypothermia

Clinical Presentation

- typically fever POD #5-8 (*Streptococcus* and *Clostridium* can present in 24 h)
- pain, blanchable wound erythema, induration, purulent discharge, warmth
- complications: fistula, sinus tracts, sepsis, abscess, suppressed wound healing, superinfection, spreading infection to myonecrosis or fascial necrosis (necrotizing fasciitis), wound dehiscence, evisceration, hernia

Prophylaxis

- used to reduce the chance of surgical site infections
 - pre-operative antibiotics for most surgeries (cefazolin ± metronidazole or if β-lactam allergy, clindamycin ± gentamycin)
 - within 1 h pre-incision; can re-dose at 1-2 half-lives (~q4-8h) in the OR
 - not required for low risk elective cholecystectomy, hemorrhoidectomy, fistulotomy, sphincterotomy for fissure
- generally no need to continue prophylactic antibiotics post-operatively
 - reserve post-operative antibiotics for treatment of suspected or documented intra-abdominal infection
- normothermia (maintain patient temperature 96.8-100.4°F during OR)
- hyperoxygenation (consider FiO₂ of 80% in OR)
- chlorhexidine-alcohol wash of surgical site
- hair removal should not be performed unless necessary; if so, clipping superior to shaving
- protect skin edges (moistened lap pads); consider delayed primary closure of incision for contaminated wounds

Treatment

- examination of the wound: inspect, compress adjacent areas, swab drainage for C&S and Gram stain
- re-open affected part of incision, drain, pack, heal by secondary intention in most cases
- for deeper infections, debride necrotic and non-viable tissue
- antibiotics and demarcation of erythema only if cellulitis or immunodeficiency

Systemic Prophylactic Antibiotics Recommendations

Updated Recommendations for Control of Surgical Site Infections

Ann Surg 2011;253:1082-93

- Choice of routine prophylactic antibiotic depends on the pathogen and patient allergies.
- Vancomycin and fluorquinolones should be administered 1-2 h prior to incision; all other antibiotics should be administered 30 min prior to incision.
- Short-acting antibiotics should be redosed ~3 h after incision.
- Antibiotic administration >24 h after surgery does not appear to add benefits.
- Antibiotics should no longer be routinely administered in three doses.
- The majority of antibiotics are renally excreted hence renal function must be considered in antibiotic administration.
- Obese patients need higher antibiotic doses to achieve therapeutic concentrations.
- Drug half-life and length of operation need to be considered in antibiotic administration.

WOUND HEMORRHAGE/HEMATOMA

- secondary to inadequate surgical control of hemostasis

Risk Factors

- anticoagulant therapy, coagulopathies, thrombocytopenia, DIC, severe liver disease, myeloproliferative disorders, severe arterial HTN, severe cough
- more common with transverse incisions through muscle

Clinical Features

- pain, swelling, discoloration of wound edges, leakage
- rapidly expanding neck hematoma can compromise airway and is a surgical emergency (consider opening wound at bedside)

Treatment

- pressure dressing
- open drainage \pm wound packing (large hematoma only)
- if significant bleeding, may need to re-operate to find source (often do not find a discrete vessel)

SEROMA

- fluid collection other than pus or blood
- secondary to transection of lymph vessels
- delays healing
- increased infection risk

Treatment

- pressure dressing \pm needle drainage
- if significant may need to re-operate

WOUND DEHISCENCE

- disruption of fascial layer, abdominal contents contained by skin only
- 95% caused by intact suture tearing through fascia

Clinical Features

- typically POD #1-3; most common presentation sign is serosanguinous or salmon-colored drainage from wound \pm evisceration
- palpation of wound edge: should normally feel a "healing ridge" from abdominal wall closure (raised area of tissue under incision)

Risk Factors

- local: technical failure of closure, increased intra-abdominal pressure (e.g. COPD, ileus, bowel obstruction), hematoma, infection, poor blood supply, radiation, patient not fully paralyzed while closing, transverse incision
- systemic: smoking, malnutrition (hypoalbuminemia, vitamin C deficiency), connective tissue diseases, immunosuppression, pulmonary disease, ascites, poor nutrition, steroids, chemotherapy, obesity, other (e.g. age, sepsis, uremia)
- DM alone is not a risk factor

Treatment

- place moist dressing over wound with binder around abdomen and transfer to OR
- may consider conservative management with debridement of fascial and/or skin margins

EVISCEATION

- protrusion of abdominal viscera through the abdominal wall
- also known as 'burst abdomen', is a surgical emergency (mortality rates as high as 45%)

Treatment

- take patient for operative closure, use slowly absorbable suture \pm retention sutures

**Pre-Operative Skin Antiseptics for Preventing Surgical Wound Infections After Clean Surgery**
Cochrane DB Syst Rev 2013;3:CD003949

Purpose: To determine if pre-operative skin antiseptics prior to clean surgery prevents surgical-site infection (SSI) and which antiseptic is most effective.

Methods: Systematic review and meta-analysis of randomized-controlled trials (RCTs). Main outcome was SSI. Secondary outcomes included quality of life, mortality, and length of hospital stay.

Results: 13 RCTs (n=2,623 patients) were included that made 11 total comparisons between skin antiseptics. A single study found a statistically significant difference between two antiseptics: 0.5% chlorhexidine solution in methylated spirits prevented SSIs after clean surgery better than alcohol-based povidone-iodine paint. No other statistically significant differences were found.

Conclusions: Insufficient evidence that one antiseptic is better than another. Alcohol-based solutions are probably more effective than aqueous-based solutions.

**Systemic Review and Meta-Analysis of Randomized Clinical Trials Comparing Primary vs. Delayed Primary Skin Closure in Contaminated and Dirty Abdominal Incisions**
JAMA Surg 2013;148:779-786

Purpose: To compare rates of surgical site infection (SSI) with delayed primary closure (DPC) vs. primary skin closure (PC).

Results/Conclusions: 8 RCTs with 623 patients. Most common diagnosis was appendicitis (77.4%).

Although there was significant heterogeneity between studies, DPC (2-5 d time to first review) was found to significantly reduce the chance of SSI (OR 0.65, 95% CI 0.40-0.93). Although current trials are poorly designed, DPC may be a simple and cost-effective way of reducing the rates of SSIs following abdominal surgery with contaminated or dirty wounds.

Urinary and Renal Complications

URINARY RETENTION

- may occur after any operation with general anesthesia or spinal anesthesia
- more likely in older males with history of benign prostatic hyperplasia, patients on anticholinergics

Clinical Presentation

- abdominal discomfort, palpable bladder, overflow incontinence, post-void residual urine volume >100 mL

Treatment

- Foley catheter to rest bladder, then trial of voiding

OLIGURIA/ANURIA (see [Nephrology](#), NP33)**Etiology**

- prerenal vs. renal vs. postrenal
 - most common post-operative cause is prerenal ± ischemic ATN
 - ♦ external fluid loss: hemorrhage, dehydration, diarrhea
 - ♦ internal fluid loss: third-spacing due to bowel obstruction, pancreatitis

Clinical Presentation

- urine output <0.5 cc/kg/h, increasing Cr, increasing BUN

Treatment

- according to underlying cause; fluid deficit is treated with crystalloid (NS or RL)

Post-Operative Dyspnea

- see *Respiratory Complications* below and *Cardiac Complications*, GS11

Etiology

- respiratory: atelectasis, pneumonia, pulmonary embolus (PE), ARDS, asthma, pleural effusion
- cardiac: MI, arrhythmia, CHF
- inadequate pain control

Respiratory Complications

ATELECTASIS

- comprises 90% of post-operative pulmonary complications

Clinical Features

- low-grade fever on POD #1, tachycardia, crackles, decreased breath sounds, bronchial breathing, tachypnea

Risk Factors

- COPD, smoking, obesity, elderly persons
- upper abdominal/thoracic surgery, oversedation, significant post-operative pain, poor inspiratory effort

Treatment

- pre-operative prophylaxis
 - smoking cessation (best if >8 wk pre-operative)
 - provide incentive spirometer and instruct how to use
- post-operative prophylaxis
 - incentive spirometry, deep breathing exercise, chest physiotherapy, intermittent positive-pressure breathing
 - selective NGT decompression after abdominal surgery
 - short-acting neuromuscular blocking agents
 - minimize use of respiratory depressive drug, good pain control, early ambulation

PNEUMONIA/PNEUMONITIS

- may be secondary to aspiration of gastric contents during anesthetic induction or extubation, causing a chemical pneumonitis

Risk Factors

- aspiration: general anesthetic, decreased LOC, GERD, full stomach, bowel/gastric outlet obstruction + non-functioning NGT, pregnancy, seizure disorder
- non-aspiration: atelectasis, immobility, pre-existing respiratory disease

Clinical Features

- productive cough, fever
- tachycardia, cyanosis, respiratory failure, decreased LOC
- CXR: pulmonary infiltrate

Treatment

- prophylaxis: see atelectasis prophylaxis, pre-operative NPO/NGT, rapid sequence anesthetic induction
- immediate removal of debris and fluid from airway
- consider endotracheal intubation and flexible bronchoscopic aspiration
- IV antibiotics to cover oral nosocomial aerobes and anaerobes (e.g. ceftriaxone, metronidazole)

PULMONARY EMBOLUS (see [Respirology, R18](#))**Clinical Features**

- unilateral leg swelling and pain (DVT as a source of PE), sudden onset shortness of breath, tachycardia, fever
- most commonly POD #8-10, but can occur anytime post-operatively

Treatment

- IV heparin, long-term warfarin (INR = 2-3) for 3 mo
- Greenfield (IVC) filter if contraindications to anticoagulation or develops a complication while on anticoagulation
- prophylaxis: subcutaneous heparin (5,000 U bid) or LMWH, compression stockings (TED™ Hose)

PULMONARY EDEMA**Etiology**

- cardiogenic vs. noncardiogenic
- circulatory overload: excess volume replacement, LV failure, shift of fluid from peripheral to pulmonary vascular bed, negative airway pressure, alveolar injury due to toxins (e.g. ARDS)
 - more common with pre-existing cardiac disease
- negative pressure pulmonary edema due to inspiratory efforts against a closed glottis upon awakening from general anesthesia

New onset "asthma" and wheezing in the elderly is cardiogenic until proven otherwise

Clinical Features

- shortness of breath, crackles at lung bases, CXR abnormal

Treatment (LMNOP)

- Lasix
- Morphine (decreases symptoms of dyspnea, venodilator and afterload reduction)
- Nitrates (venodilator)
- Oxygen + non-invasive ventilation
- Position (sit patient up)

RESPIRATORY FAILURE**Clinical Features**

- dyspnea, cyanosis, evidence of obstructive lung disease
- earliest manifestations – tachypnea and hypoxemia (RR >25, pO₂ <60)
- pulmonary edema, unexplained decrease in SaO₂

Treatment

- ABCs, O₂, ± intubation
- bronchodilators, diuretics to treat CHF
- adequate blood pressure to maintain pulmonary perfusion
- if these measures fail to keep PaO₂ >60, consider ARDS

Cardiac Complications

- abnormal ECGs common in post-operative period (compare to pre-operative ECG)
- common arrhythmias: supraventricular tachycardia, atrial fibrillation (secondary to fluid overload, PE, MI)

MYOCARDIAL INFARCTION

- see [Cardiology and Cardiac Surgery, C27](#)
- surgery increases risk of MI
- incidence
 - 0.5% in previously asymptomatic men >50 yr old
 - 40-fold increase in men >50 yr old with previous MI

**Risk Factors**

- pre-operative HTN, CHF
- previous MI (highest risk ≤6 mo, but risk never returns to baseline)
- increased age
- intraoperative hypotension
- operations >3 h
- angina

Clinical Features

- majority of cases on day of operation or POD #3-4 (shifting of third space fluid back into intravascular compartment)
- often silent without chest pain, may only present with new-onset CHF (dyspnea), arrhythmias, hypotension

Intra-Abdominal Abscess

Definition

- collection of pus walled-off from rest of peritoneal cavity by inflammatory adhesions and viscera

Etiology

- usually polymicrobial: Gram-negative bacteria, anaerobes
 - consider Gram-positives if coexisting cellulitis

Risk Factors

- emergency, contaminated OR
- GI surgery with anastomoses
- risk factors for poor healing (DM, poor nutrition, etc.)
- may occur POD #3 after laparotomy when third space fluid re-distribution occurs

Clinical Features

- persistent spiking fever, dull pain, weight loss
- mass difficult to palpate
- peritoneal signs if abscess perforation and secondary peritonitis
- leukocytosis or leukopenia (immunocompromised, elderly)
- co-existing effusion (pleural effusion with subphrenic abscess)
- common sites: pelvis, Morrison's pouch (space between kidney and liver), subphrenic, paracolic gutters, lesser sac, peri-appendiceal, post-surgical anastomosis, diverticular, psoas

Investigations

- CBC, blood cultures x2
- CT \pm water-soluble contrast
- DRE (pelvic abscess)

Treatment

- eradication (preferred), laparoscopy, open drainage
- subsequent antibiotic coverage, ciprofloxacin (Cipro®) + metronidazole (Flagyl®)

Paralytic Ileus

- see *Bowel Obstruction*, GS24

Delirium

- see *Psychiatry*, PS16 and *Neurology*, N19

Thoracic Surgery

Hiatus Hernia

Figure 6. Types of hiatus hernia

SLIDING HIATUS HERNIA (Type I)

- see Figure 6
- herniation of both the stomach and the gastroesophageal (GE) junction into thorax
- 90% of esophageal hernias

Risk Factors

- age
- increased intra-abdominal pressure (e.g. obesity, pregnancy, coughing, heavy lifting)
- smoking

Clinical Features

- majority are asymptomatic
- larger hernias frequently associated with GERD (60-80%) due to decreased competence of the LES

Complications

- most common complication is GERD
- other complications are rare and are related to reflux
 - esophagitis (dysphagia, heartburn)
 - consequences of esophagitis (peptic stricture, Barrett's esophagus, esophageal carcinoma)
 - extra-esophageal complications (pneumonitis/pneumonia, asthma, cough, laryngitis)

Investigations

- CXR, barium swallow, endoscopy, or esophageal manometry (technique for measuring LES pressure)
- 24-48 h esophageal pH monitoring to quantify reflux
- gastroscopy with biopsy to document type and extent of tissue damage and rule out esophagitis, Barrett's esophagus, and cancer

Treatment

- lifestyle modification
 - stop smoking, weight loss, elevate head of bed, no meals <3 h prior to sleeping, smaller and more frequent meals, avoid alcohol, coffee, mint, and fat
- medical
 - antacid, H₂-antagonist, PPI, prokinetic agent
- surgical (<15%)
 - if failure of medical therapy, esophageal stricture, severe nocturnal aspiration, Barrett's esophagus
 - anti-reflux procedure (usually laparoscopic) e.g. Nissen fundoplication
 - ♦ fundus of stomach is wrapped around the lower esophagus and sutured in place
 - ♦ 90% success rate at experienced centers

PARAESOPHAGEAL HIATUS HERNIA (Type II)

- see Figure 6
- herniation of all or part of the stomach through the esophageal hiatus into the thorax with an undisplaced GE junction
- least common esophageal hernia (<10%)

Clinical Features

- usually asymptomatic due to normal GE junction
- pressure sensation in lower chest, dysphagia

Complications

- hemorrhage, incarceration, strangulation (gastric volvulus), obstruction, gastric stasis ulcer (Cameron lesions – causes Fe-deficiency anemia)

Treatment

- surgery to prevent severe complications
 - reduce hernia and excise hernia sac, repair defect at hiatus, and anti-reflux procedure (e.g. Nissen fundoplication)
 - may consider suturing stomach to anterior abdominal wall (gastropexy)
 - in very elderly patients at high surgical risk consider PEG (percutaneous endoscopic gastrostomy)

MIXED HIATUS HERNIA (Type III)

- see Figure 6
- combination of Types I and II

TYPE IV HERNIA

- herniation of other abdominal organs into thorax: colon, spleen, small bowel

**Differential Diagnosis of Hiatus Hernia**

GI Causes	Non-GI Causes
<ul style="list-style-type: none"> • Cholelithiasis • Diverticulitis • Peptic ulcer • Achalasia • Pancreatitis • GERD • Gastritis 	<ul style="list-style-type: none"> • MI • Angina • Pericarditis

Esophageal Perforation

Etiology

- iatrogenic (most common)
 - endoscopic, dilatation, biopsy, intubation, operative, NGT placement
- barogenic
 - trauma
 - repeated, forceful vomiting (Boerhaave's syndrome)
 - other: convulsions, defecation, labor (rare)
- ingestion injury
 - foreign body, corrosive substance
- carcinoma

Clinical Features

- neck or chest pain
- fever, tachycardia, hypotension, dyspnea, respiratory compromise
- subcutaneous emphysema, pneumothorax, hematemesis

Investigations

- CXR: pneumothorax, pneumomediastinum, pleural effusion, subdiaphragmatic air
- CT chest: widened mediastinum, pneumomediastinum
- contrast swallow (water-soluble then thin barium): contrast extravasation

Treatment

- supportive if rupture is contained
 - NPO, vigorous fluid resuscitation, broad-spectrum antibiotics, possible percutaneous drainage
- surgical
 - <24 h
 - ♦ primary closure of a healthy esophagus or resection of diseased esophagus
 - >24 h or non-viable wound edges
 - ♦ diversion and exclusion followed by delayed reconstruction (i.e. cervical esophagostomy ("spit fistula") proximally, close esophagus distally; gastrostomy/jejunostomy tube for decompression/feeding)

Complications

- sepsis, abscess, fistula, empyema, mediastinitis, death
- post-operative esophageal leak
- mortality 10-50% dependent on timing of diagnosis

Boerhaave's Syndrome: transmural esophageal perforation

Mallory-Weiss Tear: non-transmural esophageal tear (partial thickness tear)

Both are associated with forceful emesis

6Ss of SCC

Smoking
Spirits (alcohol)
Seeds (betel nut)
Scalding (hot liquid)
Strictures
Sack (diverticula)

Perioperative Chemo(radio)therapy vs. Primary Surgery for Resectable Adenocarcinoma of the Stomach, Gastroesophageal Junction, and Lower Esophagus

Cochrane DB Syst Rev 2013;5:CD008107

Study: Review of RCTs to examine the effect of perioperative chemotherapy for gastroesophageal adenocarcinoma on survival and other clinically relevant outcomes.

Results/Conclusions: 14 RCTs, 2,422 participants.

1. Perioperative chemotherapy was associated with a significantly longer overall survival (HR 0.81, 95% CI 0.73-0.89), a relative survival increase of 19% and an absolute increase of 9%.
2. Tumors of the GE junction showed a more pronounced response to perioperative chemotherapy compared to other sites.
3. Combined chemoradiotherapy was more effective for tumors of the esophagus and GE junction compared to chemotherapy alone.
4. Perioperative chemotherapy was more effective in younger patients and is associated with longer disease-free survival, higher rates of R0 resection, and a more favorable tumor stage upon resection.
5. Resection with negative margins is a strong predictor of survival.

Esophageal Carcinoma

Epidemiology

- M:F = 3:1
- onset 50-60 yr of age
- upper (20-33%), middle (33%), lower (33-50%)
- main types:
 - most common worldwide: SCC in upper 2/3 of esophagus
 - most common in Western countries: adenocarcinoma in distal 1/3 of esophagus

Risk Factors

- geographic variation in incidence
- SCC
 - underlying esophageal disease such as strictures, diverticula, achalasia
 - smoking, alcohol, hot liquids, pickled foods (high in nitrosamines)
 - more common in patients from Asia
- adenocarcinoma
 - Barrett's esophagus (most important), smoking, obesity (increased reflux), GERD

Clinical Features

- frequently asymptomatic: late presentation
- progressive dysphagia (mechanical): first solids then liquids
- odynophagia then constant pain
- constitutional symptoms
- regurgitation and aspiration (aspiration pneumonia)
- hematemesis, anemia
- tracheoesophageal or bronchoesophageal fistula
- direct, hematogenous, or lymphatic spread
 - trachea (coughing), recurrent laryngeal nerves (hoarseness, vocal paralysis), aorta, pericardium, liver, lung, bone, celiac, and mediastinal nodes

Investigations

- barium swallow: shows narrowing – suggestive but not diagnostic
- esophagoscopy: biopsy and assess resectability
- endoscopic ultrasound (EUS)
 - visualize local disease
 - regional nodal involvement (most accurate way to stage the cancer) ± FNA
- bronchoscopy ± thoracoscopy
 - rule out airway invasion in tumors of the upper and mid esophagus
- full metastatic workup (CT head, CT chest/abdomen/pelvis, LFTs, etc.)

Treatment

- if present with distant metastatic disease
 - treat with systemic therapy and palliate symptoms (esophageal stent)
- if locally advanced (locally invasive disease or nodal disease on CT or EUS)
 - multimodal therapy
 - ♦ concurrent external beam radiation and chemotherapy (cisplatin and 5-FU)
 - ♦ possibility of curative esophagectomy after chemoradiation if disease responds well
 - if unable to tolerate multimodal therapy or if highly advanced disease, consider palliative resection, brachytherapy, or endoscopic dilatation/stenting/laser ablation for palliation
- if early stage (non-transmural and without evidence of nodal disease)
 - esophagectomy (transthoracic or trans-hiatal approach) and lymphadenectomy
 - ♦ anastomosis in chest or neck
 - ♦ stomach most often used for reconstruction; may also use colon
 - neoadjuvant chemotherapy and radiation are controversial
 - adjuvant chemotherapy ± radiation usually recommended for post-operative node-positive disease
- more advanced stages
 - neoadjuvant chemotherapy ± radiation followed by esophagectomy

Prognosis

- prognosis usually poor because presentation is usually at advanced stage (5 yr survival for all stages is only 17%)

OTHER DISORDERS

- esophageal varices (see [Gastroenterology, G26](#))
- Mallory-Weiss tear (see [Gastroenterology, G27](#))

Pleura, Lung, and Mediastinum

- see [Respirology, R22](#)

Tube Thoracostomy

Indications

- to drain abnormal large-volume air or fluid collections in the pleural space
 - pleural effusion, hemothorax, chylothorax, empyema
 - pneumothorax, if
 - ♦ large or progressive
 - ♦ patient is on mechanical ventilation
 - ♦ bronchopleural fistula
 - ♦ tension pneumothorax
- to treat symptomatic and/or recurrent pleural effusion
 - see [Respirology, R24](#)
 - for long-term drainage of malignant effusions
 - via facilitation of pleurodesis (obliteration of the pleural space by instilling talc or doxycycline to cause fibrosis and adherence of parietal and visceral pleura)

Complications

- overall complications are rare (1-3%)
- malposition (most common complication), especially by inexperienced operators:
 - tubes may dissect along the external chest wall, or may be placed below the diaphragm
- bleeding (anticoagulation is a relative contraindication)
- local infection, empyema
- perforation of lung parenchyma
- risk of re-expansion pulmonary edema when large volumes of air or fluid are drawn off quickly (>1.0-1.5 L)

Figure 7. Typical thoracic surgery incisions

Figure 8. Tube thoracostomy

Tube thoracostomy can be completed under ultrasound guidance by an interventional radiologist or surgeon

Lung Transplantation

Conditions Leading to Transplantation

- chronic acquired lung disease: COPD
- genetic: CF, emphysema due to α -1 antitrypsin deficiency
- idiopathic interstitial pneumonias: IPF, nonspecific interstitial pneumonitis
- HTN-related: IPAHA, secondary pulmonary HTN, Eisenmenger's syndrome
- other: sarcoidosis, lymphangioleiomyomatosis, pulmonary Langerhans cell histiocytosis

Clinical Indications

- transplantation should be considered for patients with advanced lung disease refractory to maximal medical or surgical therapy
- patients who are symptomatic during activities of daily living and limited expected survival over the next 2 yr

Criteria for Transplantation

- lung allocation score based on: 1) post-transplant survival measure, and 2) waiting list urgency measure
- transplant benefit = post-transplant survival (days) – waitlist survival (days)

Contraindications

- uncontrolled or untreatable pulmonary or extrapulmonary infection
- malignancy in the last 2 yr
- advanced cardiopulmonary disease
- significant chest wall/spinal deformity
- active cigarette smoking
- HIV infection, ongoing HBV or HCV infections

Post-Operative Complications

- primary graft dysfunction: main cause is ischemia-reperfusion injury, graded by $\text{PaO}_2/\text{FiO}_2$ ratio and CXR findings
- airway anastomotic complications (focal infection, bronchial necrosis and dehiscence, excess granulation tissue, tracheobronchomalacia, stenosis, fistula)
- chronic graft dysfunction: bronchiolitis obliterans syndrome
- infectious complications (bacterial, fungal, CMV, community-acquired respiratory viruses, mycobacteria)
- malignancy (non-melanoma skin cancer, post-transplant lymphoproliferative disease, colon, breast, Kaposi's sarcoma, bladder)

Prognosis

- median survival for all adult recipients: 5.4 yr
- 1 yr survival: COPD > IPF > IPAHA
- 10 yr survival: CF, α -1 antitrypsin deficiency > IPAHA > COPD, IPF

Chronic Obstructive Pulmonary Disease

- see [Respirology](#), R9

Treatment

- indications for surgical management
 - dyspnea despite maximal medical therapy and pulmonary rehabilitation
 - CT showing hyperinflation and heterogeneously distributed emphysema predominant in the upper lung zone
 - may be used as a bridging procedure to lung transplantation
- contraindications
 - age >75, cigarette smoking within the prior 6 mo, higher risk of surgical mortality
 - homogeneously distributed emphysematous changes without areas of preserved lung tissue
 - diffusing capacity of lung for carbon monoxide <20% of predicted, PaCO_2 >60 mmHg, PaO_2 <45 mmHg
- surgical procedures
 - lung volume reduction surgery: wedge excision of emphysematous tissue
 - bilateral or unilateral, thoracotomy or VATS

Complications of Treatment

- air leak: may require reintubation and mechanical ventilation
- arrhythmias, pneumonia

Prognosis

- total mortality at 2 yr same as with maximal medical therapy, but better exercise capacity and quality of life with LVRS

Long-Term Survival Analysis of the Canadian Lung Volume Reduction Surgery Trial

Ann Thorac Surg 2013;96:1217-1222

Study: Retrospective observational study assessing the long-term survival of patients enrolled in the CLVRS at 8-10 yr follow-up.

Results/Conclusions: 62 patients total. 52 patients had a median survival time of 4.11 yr. Compared with the best medical care group, patients in the LVRS group showed a 16 mo survival advantage and a 20% reduction in mortality. LVRS may provide long-term benefits in the treatment of end-stage emphysema, however, the results were not statistically significant.

Stomach and Duodenum

Peptic Ulcer Disease

GASTRIC ULCERS

- see [Gastroenterology, G12](#)

Indications for Surgery

- unresponsive to medical treatment (intractability)
 - always operate if fails to heal completely, even if biopsy negative: could be primary gastric lymphoma or adenocarcinoma
- dysplasia or carcinoma
 - always biopsy ulcer for malignancy
- hemorrhage: 3x greater risk of bleeding compared to duodenal ulcers
- complications: obstruction, perforation, bleeding
- surgical treatment is increasingly rare due to *H. pylori* eradication and medical treatment

Procedures

- distal gastrectomy with ulcer excision: Billroth I or Billroth II
- vagotomy and pyloroplasty only if acid hypersecretion (rare)
- wedge resection if possible or biopsy with primary repair

DUODENAL ULCERS

- see [Gastroenterology, Bleeding Peptic Ulcer, G13](#), and [Peptic Ulcer Disease, G12](#)
- most within 2 cm of pylorus (duodenal bulb)

Indications for Surgery

- hemorrhage, rebleed in hospital, perforation, gastric outlet obstruction
 - decision to operate based on amount of blood loss (usually >8 units), rate of bleeding, and hemodynamic stability
- intractable despite medical management (endoscopy)

Procedures

- Graham patch of perforated ulcer-plication of ulcer and omental patch
- oversewing of bleeding ulcer ± pyloroplasty
- pyloroplasty, gastroduodenostomy, or gastrojejunostomy (improved drainage)
- antrectomy (eliminate hormonal stimulation from the antrum)
- gastric resection (decrease the number of parietal cells)
- vagotomy
 - rarely done now due to *H. pylori* eradication and PPI

Complications of Surgery

- retained antrum
- fistula (gastrocolic/gastrojejunal)
- dumping syndrome, postvagotomy diarrhea, afferent loop syndrome (see [Complications of Gastric Surgery, GS20](#))

Kissing Ulcer: combination of perforation and bleeding

Figure 9. Billroth I and Billroth II with Roux-en-Y reconstruction (gastrojejunostomy)

Table 5. Complications of Duodenal Ulceration

Complication	Clinical Features	Management
Perforated Ulcer (typically on anterior surface)	Sudden onset of pain (possibly in RLQ due to track down right paracolic gutter) Acute abdomen: rigid, diffuse guarding Ileus Initial chemical peritonitis followed by bacterial peritonitis	Investigation: CXR – free air under diaphragm (70% of patients) Treatment: Oversew ulcer (plication) and omental (Graham) patch – most common treatment
Posterior Penetration	Elevated amylase/lipase if penetration into pancreas Constant mid-epigastric pain burrowing into back, unrelated to meals	
Hemorrhage (typically on posterior surface)	Gastroduodenal artery involvement	Resuscitation initially with crystalloids; blood transfusion if necessary Diagnostic and/or therapeutic endoscopy (laser, cautery, or injection); if recurs, may have second scope Consider interventional radiology: angiography with embolization/coiling Surgery if severe or recurrent bleeding, hemodynamically unstable, or failure of endoscopy and IR: oversewing of ulcer, pyloroplasty
Gastric Outlet Obstruction	Ulcer can lead to edema, fibrosis of pyloric channel, neoplasm N/V (undigested food, non-bilious), dilated stomach, crampy abdominal pain Succussion splash (splashing noise heard with stethoscope over the stomach when patient is shaken) Auscultate gas and fluid movement in obstructed organ	NGT decompression and correction of hypochloremic, hypokalemic metabolic alkalosis Medical management initially: high dose PPI therapy Surgical resection if obstruction does not resolve: either Billroth I, pyloroplasty, or gastrojejunostomy

Gastric Carcinoma

Epidemiology

- M:F = 3:2
- incidence of adenocarcinoma <10 (US) vs. 60 (Japan, Korea) per 100,000 (incidence highest in Asia and Latin America)
- most common age group = 50-59 yr
- incidence has decreased by 2/3 in past 50 yr

Risk Factors

- *H. pylori*, causing chronic atrophic gastritis
- hereditary nonpolyposis colorectal cancer (HNPCC), hereditary diffuse gastric carcinoma (HDGC)
- smoking, alcohol, smoked food, nitrosamines
- pernicious anemia associated with achlorhydria and chronic atrophic gastritis
- gastric adenomatous polyps
- previous partial gastrectomy (>10 yr post-gastrectomy)
- hypertrophic gastropathy
- blood type A

Clinical Features

- clinical suspicion
 - ulcer fails to heal
 - lesion on greater curvature of stomach or cardia
- asymptomatic, insidious, or late onset of symptoms
 - postprandial abdominal fullness, vague epigastric pain
 - anorexia, weight loss
 - burping, N/V, dyspepsia, dysphagia
 - hepatomegaly, epigastric mass (25%)
 - hematemeses, fecal occult blood, melena, iron-deficiency anemia
- metastasis:
 - peritoneum, liver, lung, brain

Investigations

- OGD and biopsy; EUS to assess pre-operative T-stage and N-stage
- CT chest/abdomen/pelvis CT (for metastatic workup see Table 7)

Signs of Metastatic Gastric Carcinoma

Virchow's Node: left supraclavicular node

Blumer's Shelf: mass in pouch of Douglas

Krukenberg Tumor: metastases to ovary

Sister Mary Joseph Node: umbilical metastases

Irish's Node: left axillary nodes

Table 6. TNM Classification System for Staging of Gastric Carcinoma (AJCC/IUCC 2010)

Primary Tumor (T)		Regional Lymph Nodes (N)		Distant Metastasis (M)	
T0	No evidence of primary tumor	NX	Cannot be assessed	M0	No distant metastasis
Tis	Carcinoma <i>in situ</i>	N0	No regional node metastasis	M1	Distant metastasis
T1a	Invasion into lamina propria or muscularis mucosae	N1	Metastasis in 1-2 regional nodes		
T1b	Invasion into submucosa	N2	Metastasis in 3-6 regional nodes		
T2	Invasion into muscularis propria	N3a	Metastasis in 7-15 regional nodes		
T3	Penetration of subserosal connective tissue without tissue invasion of visceral peritoneum or adjacent structures	N3b	Metastasis in ≥16 regional nodes		
T4a	Invasion into serosa				
T4b	Invasion into adjacent structures				

Treatment

- adenocarcinoma
 - proximal lesions
 - ♦ total gastrectomy and Roux-en-Y esophagojejunostomy
 - distal lesions
 - ♦ distal gastrectomy or subtotal gastrectomy: wide (5-6 cm) margins, en bloc removal of omentum and lymph nodes
 - palliation
 - ♦ gastric resection to decrease bleeding and relieve obstruction, enables the patient to eat
 - ♦ radiation therapy
 - ♦ studies are showing larger role for chemotherapy
- lymphoma
 - *H. pylori* eradication, chemotherapy ± radiation, surgery in limited cases (perforation, bleeding, obstruction)

**Staging and 5 Yr Survival Rates for Gastric Cancer**

Stage	TNM	5 Year Survival
IA	T1N0M0	71%
IB	T2N0M0 T1N1M0	57%
IIA	T3N0M0 T2N1M0 T1T2M0	45%
IIB	T4aN0M0 T3N1M0 T2N2M0 T1N3M0	33%
IIIA	T4aN1M0 T3T2M0 T2N3M0	20%
IIIB	T4bN0M0 T4bN1M0 T4aN2M0 T3N3M0	14%
IIIC	T4bN2M0 T4bN3M0 T4aN3M0	9%
IV	TxNxM1	4%

Gastrointestinal Stromal Tumor

Epidemiology

- most common mesenchymal neoplasm of GI tract
- derived from interstitial cells of Cajal (cells associated with Auerbach's plexus that have autonomous pacemaker function which coordinate peristalsis throughout the GI tract)
- 75-80% associated with tyrosine kinase (c-KIT) mutations
- most common in stomach (50%) and proximal small intestine (25%), but can occur anywhere along GI tract
- typically present with vague abdominal mass, feeling of abdominal fullness, or with secondary symptoms of bleeding and anemia
- often discovered incidentally on CT, laparotomy, or endoscopy

Risk Factors

- Carney's triad: GISTs, paraganglioma, and pulmonary chondroma
- Type IA neurofibromatosis

Investigations

- EUS is helpful
- pre-operative biopsy: controversial, but useful for indeterminate lesions:
 - not recommended if index of suspicion for GIST is high
 - percutaneous biopsy is NOT recommended due to high friability and risk of peritoneal spread

Treatment

- surgical resection if >2 cm; follow with serial endoscopy if <2 cm and resect if growing or symptomatic
- localized GIST
 - surgical resection with preservation of intact pseudocapsule
 - lymphadenectomy NOT recommended, as GISTs rarely metastasize to lymph nodes
 - consider imatinib post-operative for high-risk GIST (large, >4 cm with significant mitotic activity)
- advanced disease (i.e. metastases to liver and/or peritoneal cavity)
 - chemotherapy with imatinib

Bariatric (Weight Loss) Surgery for Obesity is Considered when Other Treatments have Failed
Cochrane DB Syst Rev 2009;2:CD003641
Benefits

- Greater weight loss in patients with BMI >30 at 2 yr.
- Reduction in comorbidities (type 2 DM, HTN, and medication use).
- Improvement in quality of life at 2 yr (physical function, physical role, general health, vitality, and emotional role).

Risks

- Complications: leaks, hernias, infection, pulmonary embolism, post-operative mortality.
- Side effects specific to type of procedure (i.e. vomiting, dumping syndrome, food intolerance).
- Cholecystitis occurs as a result of rapid weight loss.

Prognosis

- risk of metastatic potential depends on
 - tumor size (worse if >10 cm)
 - mitotic activity (worse if >5 mitotic figures or 50/hpf)
 - degree of nuclear pleomorphism
 - location: with identical sizes, extra-gastric location has a higher risk of progression than GISTs in the stomach
- metastases to liver, omentum, peritoneum; nodal metastases rare

Bariatric Surgery

- weight reduction surgery for morbid obesity
- indications: BMI >40 or BMI >35 with related comorbidity (e.g. DM, CAD, sleep apnea, HTN, severe joint disease)
- requires multidisciplinary evaluation and follow-up

Surgical Options

- malabsorptive/restrictive
 - laparoscopic Roux-en-Y gastric bypass (most common – see Figure 9)
 - staple off small gastric pouch (restrictive) with Roux-en-Y limb to pouch (malabsorptive) with dumping syndrome physiology
 - most effective, higher complication rates
- restrictive
 - laparoscopic adjustable gastric banding
 - ♦ silicone band around fundus creates pouch, adjustable through port under skin
 - laparoscopic sleeve gastrectomy
 - ♦ resects most of the greater curvature (about 75% of the stomach); becoming popular weight-loss procedure
- malabsorptive
 - biliopancreatic diversion with duodenal switch
 - gastrectomy, enteroenterostomy, duodenal division closure and duodenoenterostomy

Complications

- perioperative mortality ~1% (anastomotic leak with peritoneal signs, PE)
- obstruction at enteroenterostomy (see *Complications of Gastric Surgery, below*)
- staple line dehiscence
- internal hernias
- dumping syndrome
- cholelithiasis due to rapid weight loss (20-30%)
- band abscess (if long-term)

Complications of Gastric Surgery

- most resolve within 1 yr

Alkaline Reflux Gastritis (see Figure 10A)

- duodenal contents (bilious) reflux into stomach causing gastritis ± esophagitis
- treatment
 - medical: H₂-blocker, metoclopramide, cholestyramine (bile acid sequestrant)
 - surgical: conversion of Billroth I or II to Roux-en-Y

Afferent Loop Syndrome (see Figure 10B)

- accumulation of bile and pancreatic secretions causes intermittent mechanical obstruction and distention of afferent limb
- clinical features
 - early postprandial distention, RUQ pain, nausea, bilious vomiting, anemia
- treatment: surgery (conversion to Roux-en-Y increases afferent loop drainage)

Dumping Syndrome (see Figure 10C)

- early – 15 min post-prandial
 - etiology
 - ♦ hyperosmotic chyme released into small bowel (fluid accumulation and jejunal distention)
 - clinical features
 - ♦ post-prandial symptoms
 - ♦ epigastric fullness or pain, emesis, nausea, diarrhea, palpitations, dizziness, tachycardia, diaphoresis

Figure 10. Complications of gastric surgery

- treatment
 - ♦ small multiple low carbohydrate, low fat, and high protein meals and avoidance of liquids with meals
 - ♦ last resort is interposition of antiperistaltic jejunal loop between stomach and small bowel to delay gastric emptying
- late – 3 h post-prandial
 - etiology: large glucose load leads to large insulin release and hypoglycemia
 - treatment: small snack 2 h after meals

Keep/maintain a very low threshold for laparoscopy in patients with abdominal pain after gastric bypass

Blind-Loop Syndrome (see Figure 10D)

- bacterial overgrowth of colonic Gram-negative bacteria in afferent limb
- clinical features
 - anemia/weakness, diarrhea, malnutrition, abdominal pain, and hypocalcemia
- treatment: broad-spectrum antibiotics, surgery (conversion to Billroth I)

Postvagotomy Diarrhea (see Figure 10E)

- up to 25%
- bile salts in colon inhibit water resorption
- treatment: medical (cholestyramine), surgical (reversed interposition jejunal segment)

Small Intestine

Tumors of Small Intestine

BENIGN TUMORS

- 10x more common than malignant
- usually asymptomatic until large
- most common sites: terminal ileum, proximal jejunum
- polyps
 - adenomas
 - hamartomas
 - FAP (see *Familial Colon Cancer Syndromes*, GS33)
 - juvenile polyps
- other: leiomyomas, lipomas, hemangiomas

Malignant Tumors – ACLS

Adenocarcinoma Most common
 Carcinoid
 Lymphoma
 Sarcoma ↓
 Least common

Carcinoid Syndrome Symptoms – FDR

Flushing
 Diarrhea
 Right-sided heart failure

Table 7. Malignant Tumors of the Small Intestine

	Adenocarcinoma	Carcinoid	Lymphoma	Metastatic
Epidemiology	Usually 50-70 yr M>F	Increased incidence 50-60 yr	Highest incidence in 70s M>F Usually non-Hodgkin's lymphoma	Most common site of GI metastases in patients with metastatic melanoma
Risk Factors	Crohn's, FAP, history of CRC, HNPCC		Crohn's, celiac disease, autoimmune disease, immunosuppression, radiation therapy, nodular lymphoid hyperplasia	Melanoma, breast, lung, ovary, colon, cervical cancer
Clinical Features	Early metastasis to lymph nodes 80% metastatic at time of operation Abdominal pain (common)	N/V, anemia, GI bleeding, jaundice, weight loss (less common) Often slow-growing Usually asymptomatic, incidental finding Obstruction, bleeding, crampy abdominal pain, intussusception Carcinoid syndrome (<10%) <ul style="list-style-type: none"> • Hot flashes, hypotension, diarrhea, bronchoconstriction, right heart failure • Requires liver involvement: lesion secretes serotonin, kinins, and vasoactive peptides directly to systemic circulation (normally inactivated by liver) 	Fatigue, weight loss, fever malabsorption, abdominal pain, anorexia, vomiting, constipation, mass Rarely – perforation, obstruction, bleeding, intussusception	Obstruction and bleeding
Investigations	CT abdomen/pelvis Endoscopy	Most found incidentally at surgery for obstruction or appendectomy Chest thorax/abdomen/pelvis Consider small bowel enteroclysis to look for primary Elevated 5-HIAA (breakdown product of serotonin) in urine or increased 5-HT in blood Radiolabelled octreotide or MIBG scans to locate tumor	CT abdomen/pelvis	CT abdomen/pelvis

Table 7. Malignant Tumors of the Small Intestine (continued)

	Adenocarcinoma	Carcinoid	Lymphoma	Metastatic
Treatment	Surgical resection ± chemotherapy	Surgical resection Carcinoid syndrome treated with steroids, histamine, octreotide Metastatic risk 2% if size <1 cm, 90% if >2 cm	Low grade: chemotherapy with cyclophosphamide High grade: surgical resection, radiation Palliative: somatostatin, doxorubicin	Palliation
Prognosis	5 yr survival 25% (if node positive)	5 yr survival 70%; 20% with liver metastases	5 yr survival 40%	Poor
Origin/Location	Usually in proximal small bowel, incidence decreases distally	Classified based on embryological origin (foregut, midgut, hindgut) Originate from gut enterochromaffin cell Appendix 46%, distal ileum 28%, rectum 17%	Usually distal ileum Proximal jejunum in patients with celiac disease	Hematogenous spread from breast, lung, kidney Direct extension from cervix, ovaries, colon
Staging System	TNM	TNM	Ann Arbor	

Abdominal Hernia

- see *Hiatus Hernia*, GS13

Definition

- defect in abdominal wall causing abnormal protrusion of intra-abdominal contents

Epidemiology

- M:F = 9:1
- lifetime risk of developing a hernia: males 20-25%, females 2%
- frequency of occurrence: 50% indirect inguinal, 25% direct inguinal, 8-10% incisional (ventral), 5% femoral, 3-8% umbilical
- most common surgical disease of males

Risk Factors

- activities which increase intra-abdominal pressure
 - obesity, chronic cough, asthma, COPD, pregnancy, constipation, bladder outlet obstruction, ascites, heavy lifting
- congenital abnormality (e.g. patent processus vaginalis, indirect inguinal hernia)
- previous hernia repair, especially if complicated by wound infection
- loss of tissue strength and elasticity (e.g. hiatus hernia, aging, repetitive stress)

Clinical Features

- mass of variable size
- tenderness worse at end of day, relieved with supine position or with reduction
- abdominal fullness, vomiting, constipation
- transmits palpable impulse with coughing or straining

Investigations

- physical examination usually sufficient
- ultrasound ± CT (CT required for obturator hernias, internal abdominal hernias and Spigelian and/or femoral hernias in obese patients)

Classification

- complete: hernia sac and contents protrude through defect
- incomplete: partial protrusion through the defect
- internal hernia: sac herniating into or involving intra-abdominal structure
- external hernia: sac protrudes completely through abdominal wall
- strangulated hernia: vascular supply of protruded viscus is compromised (ischemia)
 - requires **emergency** repair
- incarcerated hernia: irreducible hernia, not necessarily strangulated
- Richter's hernia: only part of bowel circumference (usually anti-mesenteric border) is incarcerated or strangulated so may not be obstructed
 - a strangulated Richter's hernia may self-reduce and thus be overlooked, leaving a gangrenous segment at risk of perforation in the absence of obstructive symptoms
- sliding hernia: part of wall of hernia sac formed by retroperitoneal structure (usually colon)

Anatomical Types

- groin
 - indirect and direct inguinal, femoral (see [Figure 13](#))
 - pantaloon: combined direct and indirect hernias, peritoneum draped over inferior epigastric vessels
- epigastric: defect in linea alba above umbilicus
- incisional: ventral hernia at site of wound closure, may be secondary to wound infection
- other: Littre's (involving Meckel's), Amyand's (containing appendix), lumbar, obturator, peristomal, umbilical, Spigelian (ventral hernia through linea semilunaris), Grynfeltt-Lesshaft hernia (superior lumbar hernia), Petit's hernia (inferior lumbar triangle)

Figure 11. Normal inguinal anatomy

Borders of Hesselbach's Triangle

- Lateral: inferior epigastric artery
- Inferior: inguinal ligament
- Medial: lateral margin of rectus sheath

Figure 12. Richter's hernia

Inguinal canal walls = MALT x 2

- | | |
|-----------------------|---|
| 2M Roof | 2 muscles (internal oblique, transversus abdominis) |
| 2A Ant. wall | 2 aponeuroses (external and internal oblique) |
| 2L Floor | 2 ligaments (inguinal and lacunar) |
| 2Ts Post. wall | 2T (transversalis fascia, conjoint tendon) |

Complications

- incarceration
- strangulation
 - small, new hernias more likely to strangulate
 - femoral >> indirect inguinal > direct inguinal
 - intense pain followed by tenderness
 - intestinal obstruction, gangrenous bowel, sepsis
 - surgical emergency
 - **DO NOT** attempt to manually reduce hernia if septic or if contents of hernial sac gangrenous
 - ♦ will cause closed loop SBO – and EMERGENCY

Treatment

- surgical treatment (herniorrhaphy) is only to prevent strangulation and evisceration, for symptomatic relief, for cosmesis; if asymptomatic can delay surgery
- repair may be done open or laparoscopic and may use mesh for tension-free closure
- most repairs are now done using tension-free techniques – a plug in the hernial defect and a patch over it or patch alone
- observation is acceptable for small asymptomatic inguinal hernias

Post-Operative Complications

- recurrence (15-20%)
 - risk factors: recurrent hernia, age >50, smoking, BMI >25, poor pre-operative functional status (ASA ≥3 – see [Anesthesia, A3](#)), associated medical conditions: type 2 DM, hyperlipidemia, immunosuppression, any comorbid conditions increasing intra-abdominal pressure
 - less common with mesh/"tension-free" repair
- scrotal hematoma (3%)
 - painful scrotal swelling from compromised venous return of testes
 - deep bleeding: may enter retroperitoneal space and not be initially apparent
 - difficulty voiding
- nerve entrapment
 - ilioinguinal (causes numbness of inner thigh or lateral scrotum)
 - genital branch of genitofemoral (in spermatic cord)
- stenosis/occlusion of femoral vein
 - acute leg swelling
- ischemic colitis

Watchful Waiting vs. Repair of Inguinal Hernia in Minimally Symptomatic Men: A Randomized Clinical Trial

JAMA 2006;295:285-292

Purpose: To compare pain and the physical component score (PCS) of the Short-Form-36 Version 2 survey at 2 yr in men with minimally symptomatic inguinal hernias treated with watchful waiting or surgical repair.

Methods: RCT of 720 men (n=364 watchful waiting, n=356 surgical repair) followed up for 2-4.5 yr. Watchful-waiting patients were followed up at 6 mo and annually and watched for hernia symptoms; repair patients received standard open tension-free repair and were followed up at 3 and 6 mo and annually. The main outcome was pain and discomfort interfering with usual activities at 2 yr and change in PCS from baseline to 2 yr. Secondary outcomes were complications, patient-reported pain, functional status, activity levels, and satisfaction with care.

Results: Primary intention-to-treat outcomes were similar at 2 yr for watchful waiting vs. surgical repair: pain limiting activities (5.1% vs. 2.2%, respectively; p=0.06 [corrected]); PCS (improvement over baseline, 0.29 points vs. 0.13 points; p=0.79). Twenty-three percent of patients assigned to watchful waiting crossed over to receive surgical repair (increase in hernia-related pain was the most common reason offered); 17% assigned to receive repair crossed over to watchful waiting. Self-reported pain in watchful-waiting patients crossing over improved after repair. Occurrence of post-operative hernia-related complications was similar in patients who received repair as assigned and in watchful-waiting patients who crossed over. One watchful-waiting patient (0.3%) experienced acute hernia incarceration without strangulation within 2 yr; a second had acute incarceration with bowel obstruction at 4 yr, with a frequency of 1.8/1,000 patient/yr inclusive of patients followed up for as long as 4.5 yr.

Conclusion: Watchful waiting is an acceptable option for men with minimally symptomatic inguinal hernias. Delaying surgical repair until symptoms increase is safe because acute hernia incarcerations occur rarely.

Inguinal Hernias – MD's don't LLe

MD: Medial to the inferior epigastric a.

= Direct inguinal hernia

Ll: Lateral to the inferior epigastric a.

= Indirect inguinal hernia

Indirect Inguinal Hernias: Rule of 5s

5% lifetime incidence in males

5x more common than direct inguinal hernias

5-10x more common in males than females

Generally occur by 5th decade of life

Cooper's Ligament, which runs on the pectineal line of the pubic bone, is often exploited in hernia repair

Contents of Spermatic Cord

vas deferens, testicular artery/veins, genital branch of genitofemoral nerve, lymphatics, cremaster muscle, ± hernia sac

Groin Hernias

Table 8. Groin Hernias

	Direct Inguinal	Indirect Inguinal	Femoral
Epidemiology	1% of all men	Most common hernia in men and women M>F	Affects mostly females
Etiology	Acquired weakness of transversalis fascia "Wear and tear" Increased intra-abdominal pressure	Congenital persistence of processus vaginalis in 20% of adults	Pregnancy – weakness of pelvic floor musculature Increased intra-abdominal pressure
Anatomy	Through Hesselbach's triangle Medial to inferior epigastric artery Usually does not descend into scrotal sac	Originates in deep inguinal ring Lateral to inferior epigastric artery Often descends into scrotal sac (or labia majora)	Into femoral canal, below inguinal ligament but may override it Medial to femoral vein within femoral canal
Treatment	Surgical repair	Surgical repair	Surgical repair
Prognosis	3-4% risk of recurrence	<1% risk of recurrence	

Table 9. Superficial Inguinal Ring vs. Deep Inguinal Ring*

Superficial Inguinal Ring	Deep Inguinal Ring
Opening in external abdominal aponeurosis; palpable superior and lateral to pubic tubercle	Opening in transversalis fascia: palpable superior to mid-inguinal ligament
Medial border: medial crus of external abdominal aponeurosis	Medial border: inferior epigastric vessels
Lateral border: lateral crus of external oblique aponeurosis	Superior-lateral border: internal oblique and transversus abdominis muscles
Roof: intercrural fibers	Inferior border: inguinal ligament

*see *Basic Anatomy Review*, Figure 2, GS2

Bowel Obstruction

Definition

- partial or complete blockage of the bowel resulting in failure of intestinal contents to pass through lumen

Pathogenesis

- disruption of the normal flow of intestinal contents leading to proximal dilatation and distal decompression
- may take 12-24 h to decompress, therefore passage of feces and flatus may occur after the onset of obstruction
- bowel ischemia may occur if blood supply is strangulated or if bowel wall inflammation leads to venous congestion
- bowel wall edema and disruption of normal bowel absorptive function can lead to increased intraluminal fluid and transudative fluid loss into peritoneal cavity, electrolyte disturbances

Risk Factors

- prior abdominal or pelvic surgery, abdominal wall or groin hernia, history of malignancy, prior radiation

Differential Diagnosis

- SBO, ILBO, pseudo-obstruction

Clinical Features

- must differentiate between obstruction and ileus, and characterize obstruction as small vs. large bowel, acute vs. chronic, partial vs. complete (constipation vs. obstipation), strangulating vs. non-strangulating, and with vs. without perforation
- differentiation between small and large bowel obstruction is key as LBO is a surgical emergency and often requires early surgery to avoid perforation

Table 10. Bowel Obstruction vs. Paralytic Ileus

	SBO	LBO	Paralytic Ileus
Nausea, Vomiting	Early, may be bilious	Late, may be feculent	Present
Abdominal Pain	Colicky	Colicky	Minimal or absent
Abdominal Distention	+ (prox SBO), ++ (distal SBO)	++	+
Constipation	+	+	+
Bowel Sounds	Normal, increased Absent if secondary ileus (delayed presentation)	Normal, increased (borborygmi) Absent if secondary ileus (delayed presentation)	Decreased, absent
AXR Findings	Air-fluid levels "Ladder" pattern (plicae circularis) Proximal distention (>3 cm) + no colonic gas	Air-fluid levels "Picture frame" appearance Proximal distention + distal decompression No small bowel air if competent ileocecal valve Coffee bean sign (sigmoid volvulus)	Air throughout small bowel and colon

Complications (of total obstruction)

- strangulating obstruction (10% of bowel obstructions) = **surgical emergency**
 - cramping pain turns to continuous ache, hematemesis, melena (if infarction)
 - fever, leukocytosis, tachycardia
 - peritoneal signs, early shock
 - see *Intestinal Ischemia*, GS28
- other
 - perforation: secondary to ischemia and luminal distention
 - septicemia
 - hypovolemia (due to third spacing)

Investigations

- radiological
 - upright CXR or left lateral decubitus to rule out free air, usually seen under the right hemidiaphragm
 - abdominal x-ray (3 views) to determine SBO vs. LBO vs. ileus
 - ♦ if ischemic bowel look for: free air, pneumatosis, thickened bowel wall, air in portal vein, dilated small and large bowels, thickened or hose-like haustra (normally finger-like projections)

Figure 13. Schematic of inguinal (direct and indirect) and femoral hernias

- other
 - ♦ most used: CT provides information on level of obstruction, severity, cause
 - important to rule out closed loop obstruction, especially in the elderly
 - ♦ less used: upper GI series/small bowel series for SBO (if no cause apparent, i.e. no hernias, no previous surgeries)
 - ♦ if suspect LBO, consider a rectal water-soluble (Gastrografin® for PO/PR; Hypaque® for IV) enema rather than barium enema (can thicken and cause complete obstruction)
 - ♦ may consider ultrasound or MRI in pregnant patients
- laboratory
 - may be normal early in disease course
 - BUN, creatinine, hematocrit to assess degree of dehydration
 - fluid, electrolyte abnormalities
 - amylase elevated
 - metabolic alkalosis due to frequent emesis
 - if strangulation: leukocytosis with left shift, lactic acidosis, elevated LDH (late signs)

Treatment

- stabilize vitals, fluid and electrolyte resuscitation
- NGT to relieve vomiting, prevent aspiration, and decompress small bowel by prevention of further distention by swallowed air
- Foley catheter to monitor ins/outs

MUST DO

Rule out CRC in constipated patient
Send for TURP in patient with BPH (treat intra-abdominal HTN)

Increased Risk of Perforation with Distention as seen on Abdomen Imaging

- Small bowel ≥ 3 cm
- Distal colon ≥ 6 cm
- Proximal colon ≥ 9 cm
- Cecum ≥ 12 cm

Patients presenting with a SBO in setting of “virgin” abdomen should have surgery ASAP – EXCEPTION: malignant obstruction from history and imaging

In a non-virgin abdomen – adhesional SBOs resolve spontaneously with NGT decompression 70% of time

Top 3 Causes of SBO (in order)

ABC

Adhesions
Bulge (hernias)
Cancer (neoplasms)

Causes of SBO

SHAVING

Stricture
Hernia
Adhesions
Volvulus
Intussusception/IBD
Neoplasm
Gallstones

Small Bowel Obstruction

Etiology

Table 11. Common Causes of SBO

Intraluminal	Intramural	Extramural
Intussusception Gallstones	Crohn's Radiation stricture Adenocarcinoma	Adhesions Incarcerated hernia Peritoneal carcinomatosis

Treatment

- consider whether complete or partial obstruction, ongoing or impending strangulation, location and cause
 - SBO with history of abdomen/pelvic surgery → conservative management (NGT decompression, GI rest, serial abdominal exams) → surgery if no resolution in 48-72 h or complications
 - complete SBO, strangulation → urgent surgery after stabilizing patient with fluid resuscitation
 - SBO with no previous surgery and no evidence of carcinomatosis → operate
 - trial of medical management may be indicated in Crohn's, recurrent SBO, carcinomatosis
 - special case: early post-operative SBO (within 30 d of abdominal surgery) – prolonged trial of conservative therapy may be appropriate, surgery is reserved for complications such as strangulation

Prognosis

- mortality: non-strangulating <1%, strangulating 8% (25% if >36 h), ischemic = up to 50%

Large Bowel Obstruction

Etiology

Table 12. Common Causes of LBO

Intraluminal	Intramural	Extramural
Constipation	Adenocarcinoma Diverticulitis IBD stricture Radiation stricture	Volvulus Adhesions

Clinical Features (unique to LBO)

- open loop (10-20%)
 - incompetent ileocecal valve allows relief of colonic pressure as contents reflux into ileum, therefore clinical presentation similar to SBO
- closed loop (80-90%) (dangerous)
 - competent ileocecal valve, resulting in proximal and distal occlusions
 - massive colonic distention → increased pressure in cecum → bowel wall ischemia → necrosis → perforation

**Top 3 Causes of LBO (in order)**

- Cancer
- Diverticulitis
- Volvulus

Treatment

- surgical correction of obstruction (usually requires resection + temporary diverting colostomy)
- volvulus requires sigmoidoscopic or endoscopic decompression followed by operative reduction if unsuccessful
 - if successful, consider sigmoid resection on same admission
- cecal volvulus can be a true volvulus or a cecal 'bascule' (cecum folds anteriorly to the ascending colon producing a flap valve occlusion to cecal emptying) – both need surgical treatment

In a patient with clinical LBO consider impending perforation when:

- Cecum ≥ 5 in in diameter
- Tenderness present over cecum

Prognosis

- overall mortality: 10%
- cecal perforation + feculent peritonitis: 20% mortality

Colonic Pseudo-Obstruction

Definition

- condition with symptoms of intestinal blockage without any physical signs of blockage
- paralytic ileus of large bowel

Differential Diagnosis

- acute: toxic megacolon, trauma, post-operative (especially post orthopedic procedures with prolonged immobilization), neurologic disease, retroperitoneal disease, medications (narcotics, psychiatric)
- chronic: neurologic disease (enteric, central, peripheral nervous system), scleroderma

Toxic Megacolon

**Pathogenesis**

- extension of inflammation into smooth muscle layer causing paralysis
- damage to myenteric plexus and electrolyte abnormalities are not consistently found

Etiology

- inflammatory bowel disease (ulcerative colitis > Crohn's disease)
- infectious colitis: bacterial (*C. difficile*, *Salmonella*, *Shigella*, *Campylobacter*), viral (cytomegalovirus), parasitic (*E. histolytica*)

Clinical Features

- infectious colitis usually present for >1 wk before colonic dilatation
- diarrhea \pm blood (but improvement of diarrhea may portend onset of megacolon)
- abdominal distention, tenderness, \pm local/general peritoneal signs (suggest perforation)
- triggers: hypokalemia, constipating agents (opioids, antidepressants, loperamide, anticholinergics), barium enema, colonoscopy

Colon is MEGA and patient is TOXIC

Diagnostic Criteria

- must have both colitis and systemic manifestations for diagnosis
- radiologic evidence of dilated colon
- **three of:** fever, HR >120, WBC >10.5, anemia
- **one of:** fluid and electrolyte disturbances, hypotension, altered LOC

Investigations

- CBC (leukocytosis with left shift, anemia from bloody diarrhea), electrolytes, elevated CRP, ESR
- metabolic alkalosis (volume contraction and hypokalemia) and hypoalbuminemia are late findings
- AXR: dilated colon >6 cm (right > transverse > left), loss of haustra
- CT: useful to assess underlying disease

Treatment

- NPO, NGT, stop constipating agents, correct fluid and electrolyte abnormalities, transfusion
- serial AXRs
- broad-spectrum antibiotics (reduce sepsis, anticipate perforation)
- aggressive treatment of underlying disease (e.g. steroids in IBD, metronidazole for *C. difficile*)
- indications for surgery (50% improve on medical management)
 - worsening or persisting toxicity or dilation after 48-72 h
 - severe hemorrhage, perforation
 - high lactate and WBC especially for *C. difficile*
- procedure: subtotal colectomy + end ileostomy (may be temporary, with second operation for re-anastomosis later)

Use caution when giving antidiarrheals, especially with bloody diarrhea

Prognosis

- average 25-30% mortality

Paralytic Ileus

Pathogenesis

- temporary paralysis of the myenteric plexus

Associations

- post-operative, intra-abdominal sepsis, medications (opiates, anesthetics, psychotropics), electrolyte disturbances (Na^+ , K^+ , Ca^{2+}), *C. difficile*, inactivity

Treatment

- NGT decompression, NPO, fluid resuscitation, correct causative abnormalities (e.g. sepsis, medications, electrolytes), consider TPN for prolonged ileus
- post-operative: gastric and small bowel motility returns by 24-48 h, colonic motility by 3-5 d
- current interest in novel therapies such as gum chewing and pharmacologic therapy (opioid antagonists)

Ogilvie's Syndrome

- acute pseudo-obstruction
- distention of colon without mechanical obstruction in distal colon
- arises in bedridden patients with serious extraintestinal illness or trauma
- exact mechanism unknown, likely autonomic motor dysregulation → possibly sympathetic deprivation to colon, unopposed parasympathetic tone, and interruption of sacral parasympathetic tone to distal bowel
- first presents with abdominal distention (>90%) ± tenderness
- later symptoms mimic true obstruction

Associations

- most common: trauma, infection, cardiac (MI, CHF)
- disability (long-term debilitation, chronic disease, bed-bound nursing home patients, paraplegia), drugs (narcotic use, laxative abuse, polypharmacy), other (recent orthopedic or neurosurgery, post-partum, electrolyte abnormalities including hypokalemia, retroperitoneal hematoma, diffuse carcinomatosis)

Investigations

- AXR: cecal dilatation – if diameter ≥ 12 cm, increased risk of perforation

Treatment

- treat underlying cause
- NPO, NGT
- decompression: rectal tube, colonoscopy, neostigmine (cholinergic drug), surgical decompression (ostomy/resection) uncommon
- surgery (extremely rare): if perforation, ischemia, or failure of conservative management

Prognosis

- most resolve with conservative management

Intestinal Ischemia

Etiology

- acute
 - arterio-occlusive mesenteric ischemia (AOMI)
 - ♦ thrombotic, embolic, extrinsic compression (e.g. strangulating hernia)
 - non-occlusive mesenteric ischemia (NOMI)
 - ♦ mesenteric vasoconstriction secondary to systemic hypoperfusion (preserves supply to vital organs)
 - mesenteric venous thrombosis (MVT)
 - ♦ consider hypercoagulable state (i.e. rule out malignancy), DVT (prevents venous outflow)
- chronic: usually due to atherosclerotic disease – look for CVD risk factors

Clinical Features

- acute: severe abdominal pain out of proportion to physical findings, vomiting, bloody diarrhea, bloating, minimal peritoneal signs early in course, hypotension, shock, sepsis
- chronic: postprandial pain, fear of eating, weight loss
- common sites: SMA supplied territory, “watershed” areas of colon – splenic flexure, left colon, sigmoid colon

Investigations

- laboratory: leukocytosis (non-specific), lactic acidosis (late finding)
 - amylase, LDH, CK, ALP can be used to observe progress
 - hypercoagulability workup if suspect venous thrombosis
- AXR: portal venous gas, intestinal pneumatosis, free air if perforation
- contrast CT: thickened bowel wall, luminal dilatation, SMA or SMV thrombus, mesenteric/portal venous gas, pneumatosis
- CT angiography is the gold standard for acute arterial ischemia

Treatment

- fluid resuscitation, correct metabolic acidosis, NPO, NGT decompression of stomach, prophylactic broad-spectrum antibiotics, avoid vasoconstrictors and digitalis
- exploratory laparotomy
- angiogram, embolectomy/thrombectomy, bypass/graft, mesenteric endarterectomy, anticoagulation therapy, percutaneous transluminal angioplasty ± stent
- segmental resection of necrotic intestine
 - assess extent of viability; if extent of bowel viability is uncertain, a second look laparotomy 12-24 h later is mandatory

Pain “out of keeping with physical findings” is the hallmark of early intestinal ischemia

An acute abdomen + metabolic acidosis is bowel ischemia until proven otherwise

Figure 14. Appendix anatomy

Appendix

Appendicitis

Epidemiology

- 6% of population, M>F
- 80% between 5-35 yr of age

Pathogenesis

- luminal obstruction → bacterial overgrowth → inflammation/swelling → increased pressure → localized ischemia → gangrene/perforation → localized abscess (walled off by omentum) or peritonitis
- etiology
 - children or young adult: hyperplasia of lymphoid follicles, initiated by infection
 - adult: fibrosis/stricture, fecolith, obstructing neoplasm
 - other causes: parasites, foreign body

Clinical Features

- most reliable feature is progression of signs and symptoms
- low grade fever (38°C), rises if perforation
- abdominal pain then anorexia, N/V
- classic pattern: pain initially periumbilical; constant, dull, poorly localized, then well localized pain over McBurney's point
 - due to progression of disease from visceral irritation (causing referred pain from structures of the embryonic midgut, including the appendix) to irritation of parietal structures
 - McBurney's sign

McBurney's Sign

Tenderness 1/3 the distance from the ASIS to the umbilicus on the right side

Laparoscopic vs. Open Appendectomy

Cochrane DB Syst Rev 2010;10:CD001546

Laparoscopic Surgery

- Wound infection less likely
- Intra-abdominal abscesses 2x more likely
- Reduced pain on POD #1
- Reduced hospital stay by 1.1 d
- Sooner return to normal activity, work, and sport
- Costs outside hospital are reduced

Open Surgery

- Shorter duration of surgery
- Lower operation costs

Overview

Diagnostic laparoscopy and laparoscopic appendectomy appear to be advantageous over open appendectomy, particularly for young female patients and obese patients.

- signs
 - inferior appendix: McBurney's sign (see sidebar GS28), Rovsing's sign (palpation pressure to left abdomen causes McBurney's point tenderness). McBurney's sign is present whenever the opening of the appendix at the cecum is directly under McBurney's point; therefore McBurney's sign is present even when the appendix is in different locations
 - retrocecal appendix: psoas sign (pain on flexion of hip against resistance or passive hyperextension of hip)
 - pelvic appendix: obturator sign (flexion then external or internal rotation about right hip causes pain)
- complications
 - perforation (especially if >24 h duration)
 - abscess, phlegmon

Investigations

- laboratory
 - mild leukocytosis with left shift (may have normal WBC counts)
 - higher leukocyte count with perforation
 - β -hCG to rule out ectopic pregnancy
 - urinalysis
- imaging
 - ultrasound: may visualize appendix, but also helps rule out gynecological causes – overall accuracy 90-94%, can rule in but cannot rule out appendicitis (if >0.2 in, SENS/SPEC/NPV/PPV 98%)
 - upright CXR, AXR: usually nonspecific – free air if perforated (rarely), calcified fecolith, loss of psoas shadow, RLQ ileus
 - CT scan: thick wall, appendicolith, inflammatory changes – overall accuracy 94-100%, optimal investigation

Treatment

- hydrate, correct electrolyte abnormalities
- surgery (gold standard, 20% mortality with perforation especially in elderly) + antibiotic coverage
- if localized abscess (palpable mass or large phlegmon on imaging and often pain >4-5 d), consider radiologic drainage + antibiotics x 14 d \pm interval appendectomy in 6 wk (controversial)
- appendectomy
 - laparoscopic vs. open (see sidebar)
 - complications: spillage of bowel contents, pelvic abscess, enterocutaneous fistula
 - perioperative antibiotics:
 - ♦ cefazolin + metronidazole (no post-operative antibiotic unless perforated)
 - ♦ other choices: 2nd/3rd generation cephalosporin for aerobic gut organisms
- colonoscopy in the elderly to rule out other etiology (neoplasm)

Prognosis

- mortality rate: 0.08% (non-perforated), 0.5% (perforated appendicitis)

Effect of Delay to Operation on Outcomes in Adults with Acute Appendicitis

Arch Surg 2010;145:886-892

Purpose: To examine the effect of delay to appendectomy on morbidity and mortality among adults with appendicitis.

Method: Retrospective cohort study with the main exposure being time to operation, and main outcomes being 30-d overall morbidity and serious morbidity/mortality.

Results: Of 32,782 patients in the study, 75.2%, 15.1%, and 9.8% underwent surgeries within 6 h, 6-12 h, and >12 h of admission, respectively. Differences in operative duration and length of post-operative stay were statistically significant but not clinically meaningful. No significant differences were observed in adjusted overall morbidity or serious morbidity/mortality. Duration from surgical admission to anesthesia induction was not predictive in regression models for either outcomes.

Conclusions: Delay of appendectomy for acute appendicitis among adults does not adversely affect outcomes.

Antibiotics vs. Placebo for Prevention of Post-Operative Infection After Appendectomy

Cochrane DB Syst Rev 2005;3:CD001439

Purpose: To determine the effectiveness of antibiotics against post-operative infections after appendectomy.

Method: Meta-analysis of randomized controlled trials (RCTs) and controlled clinical trials (CCTs), on both adults and children, in which any antibiotic regime was compared to placebo in patients undergoing appendectomy for suspected appendicitis. The main outcomes of interest were wound infection, intra-abdominal abscess, length of hospital stay, and mortality.

Results: 45 studies (n=9,576) were included. Treatment with antibiotics decreased wound infection and abscess rates.

Conclusion: Various prophylactic antibiotic regimens are effective in preventing post-operative complications after appendectomy.

Tumors of the Appendix

CARCINOID TUMORS (most common type)

- see *Tumors of Small Intestine: Carcinoid*, GS21

ADENOCARCINOMA

- 50% present as acute appendicitis
- spreads rapidly to lymph nodes, ovaries, and peritoneal surfaces
- treatment: right hemicolectomy

Inflammatory Bowel Disease

- see *Gastroenterology*, G19

Principles of Surgical Management

- can alleviate symptoms, address complications, improve quality of life
- conserve bowel: resect as little as possible to avoid short gut syndrome
- perioperative management
 - optimize medical status: may require TPN (especially if >7 d NPO) and bowel rest
 - hold immunosuppressive therapy pre-operative, provide pre-operative stress dose of corticosteroid if patient had recent steroid therapy, taper steroids post-operative
 - DVT prophylaxis: heparin (IBD patients at increased risk of thromboembolic events)

Crohn's Disease

- see [Gastroenterology, G20](#)

Treatment

- surgery is NOT curative, but over lifetime ~70% of Crohn's patients will have surgery
- indications for surgical management
 - failure of medical management
 - SBO (due to stricture/inflammation): indication in 50% of surgical cases
 - abscess, fistula (enterocolic, vesicular, vaginal, cutaneous abscess), quality of life, perforation, hemorrhage, chronic disability, failure to thrive (children), perianal disease
- surgical procedures
 - resection and anastomosis/stoma if active or subacute inflammation, perforation, fistula
 - ♦ resection margin only has to be free of gross disease (microscopic disease irrelevant to prognosis)
 - stricturoplasty – widens lumen in chronically scarred bowel: relieves obstruction without resecting bowel (contraindicated in acute inflammation)

Complications of Treatment

- short gut syndrome (diarrhea, steatorrhea, malnutrition)
- fistulas
- gallstones (if terminal ileum resected, decreased bile salt resorption → increased cholesterol precipitation)
- kidney stones (loss of calcium in diarrhea → increased oxalate absorption and hyperoxaluria → stones)

Prognosis

- recurrence rate at 10 yr: ileocolic (25-50%), small bowel (50%), colonic (40-50%)
- re-operation at 5 yr: primary resection (20%), bypass (50%), stricturoplasty (10% at 1 yr)
- 80-85% of patients who need surgery lead normal lives
- mortality: 15% at 30 yr

Crohn's 3 Major Patterns

- Ileocecal 40% (RLQ pain, fever, weight loss)
- Small intestine 30% (especially terminal ileum)
- Colon 25% (diarrhea)

Findings in Crohn's

- "Cobblestoning" on mucosal surface due to edema and linear ulcerations
- "Skip lesions": normal mucosa in between
- "Creeping fat": mesentery infiltrated by fat
- Granulomas: 25-30%

Findings in Ulcerative Colitis

- Patients usually present with diarrhea (± blood in their stool)
- Associated symptoms include colicky abdominal pain, urgency, tenesmus, and incontinence
- Presence of extraintestinal manifestations
- Endoscopically, there is loss of vascular markings, erythema, granularity of mucosa, petechiae, exudates, edema, erosions, and spontaneous bleeding
- Biopsy features included crypt abscesses, crypt branching, shortening and disarray, and crypt atrophy
- Inflammation is continuous and usually involves rectum
- Barium enema: "lead-pipe appearance"

Ulcerative Colitis

- see [Gastroenterology, G22](#)

Treatment

- indications for surgical management
 - failure of medical management (including inability to taper steroids)
 - complications: hemorrhage, obstruction, perforation, toxic megacolon (emergency), failure to thrive (children)
 - reduce cancer risk (1-2% risk per year after 10 yr of disease)
- surgical procedures
 - proctocolectomy and ileal pouch-anal anastomosis (IPAA) ± rectal mucosectomy (operation of choice)
 - proctocolectomy with permanent end ileostomy (if not a candidate for ileoanal procedures)
 - colectomy and IPAA ± rectal mucosectomy
 - in emergency: total colectomy and ileostomy with Hartmann closure of the rectum, rectal preservation

Complications of Treatment

- early: bowel obstruction, transient urinary dysfunction, dehydration (high stoma output), anastomotic leak
- late: stricture, anal fistula/abscess, pouchitis, poor anorectal function, reduced fertility

Prognosis

- mortality: 5% over 10 yr
- total proctocolectomy will completely eliminate risk of cancer
- perforation of the colon is the leading cause of death from ulcerative colitis

Diverticular Disease

Definitions

- diverticulum: abnormal sac-like protrusion from the wall of a hollow organ
- diverticulosis: presence of multiple diverticula
- diverticulitis: inflammation of diverticula
- true (congenital) diverticuli: contain all layers of colonic wall, often right-sided
- false (acquired) diverticuli: contain mucosa and submucosa, often left-sided

Figure 15. Diverticular disease – cross-sections of true and false diverticuli

Diverticulosis

Epidemiology

- 5-50% of Western population, lower incidence in non-Western countries, M=F
- prevalence is age dependent: <5% by age 40, 30% by age 60, 65% by age 85
- 95% involve sigmoid colon (site of highest pressure)

Pathogenesis

- risk factors
 - lifestyle: low-fiber diet (predispose to motility abnormalities and higher intraluminal pressure) inactivity, obesity
 - muscle wall weakness from aging and illness (e.g. Ehler-Danlos, Marfan's)
- high intraluminal pressures cause outpouching to occur at point of greatest weakness, most commonly where vasa recta penetrate the circular muscle layer, therefore increased risk of hemorrhage

Clinical Features

- uncomplicated diverticulosis: asymptomatic (70-80%)
- episodic abdominal pain (often LLQ), bloating, flatulence, constipation, diarrhea
- absence of fever/leukocytosis
- no physical exam findings or poorly localized LLQ tenderness
- complications
 - diverticulitis (15-25%): 25% of which are complicated (i.e. abscess, obstruction, perforation, fistula)
 - bleeding (5-15%): PAINLESS rectal bleeding, 30-50% of massive LGIB
 - diverticular colitis (rare): diarrhea, hematochezia, tenesmus, abdominal pain

Treatment

- uncomplicated diverticulosis: high fiber, education
- diverticular bleed
 - initially workup and treat as any LGIB
 - if hemorrhage does not stop, resect involved region

Diverticulitis

Epidemiology

- 95% left-sided in patients of Western countries, 75% right-sided in Asian populations

Pathogenesis

- erosion of the wall by increased intraluminal pressure or inspissated food particles → inflammation and focal necrosis → micro or macroscopic perforation
- usually mild inflammation with perforation walled off by pericolic fat and mesentery; abscess, fistula, or obstruction can ensue
- poor containment results in free perforation and peritonitis

Diverticulosis vs. Diverticulitis

Diverticulosis represents the presence of diverticuli (bulging pouches) within the colonic wall, whereas diverticulitis is the inflammation of one or more diverticuli

Clinical Features

- depend on severity of inflammation and whether or not complications are present; hence ranges from asymptomatic to generalized peritonitis
- LLQ pain/tenderness (2/3 of patients) often for several days before admission
- constipation, diarrhea, N/V, urinary symptoms (with adjacent inflammation)
- complications (25% of cases)
 - abscess: palpable tender abdominal mass
 - fistula: colovesical (most common), coloenteric, colovaginal, colocutaneous
 - colonic obstruction: due to scarring from repeated inflammation
 - perforation: generalized peritonitis (feculent vs. purulent)
 - ♦ recurrent attacks rarely lead to peritonitis
- low-grade fever, mild leukocytosis common, occult or gross blood in stool rarely coexist with acute diverticulitis

Investigations

- AXR, upright CXR
 - localized diverticulitis (ileus, thickened wall, SBO, partial colonic obstruction)
 - free air may be seen in 30% with perforation and generalized peritonitis
- CT scan (test of choice): very useful for assessment of severity and prognosis; this is usually done with rectal contrast
 - 97% sensitive, 99% specific
 - increased soft tissue density within pericolic fat secondary to inflammation, diverticula secondary to inflammation, bowel wall thickening, soft tissue mass (pericolic fluid, abscesses), fistula
 - 10% of diverticulitis cannot be distinguished from carcinoma
- elective evaluations: establish extent of disease and rule out other diagnoses (polyps, malignancy) after resolution of acute episode
 - colonoscopy or barium enema and flexible sigmoidoscopy

Treatment

- uncomplicated: conservative management
- outpatient: clear fluids only until improvement and antibiotics (e.g. ciprofloxacin and metronidazole) 7-10 d to cover gram negative rods and anaerobes (e.g. *B. fragilis*)
- hospitalize: if severe presentation, inability to tolerate oral intake, significant comorbidities, fail to improve outpatient management
- treat with NPO, IVF, IV antibiotics (e.g. IV ceftriaxone + metronidazole, ampicillin, gentamicin)
- indications for surgery
 - unstable patient with peritonitis
 - Hinchey stage 3-4
 - after 1 attack if immunosuppressed
 - consider after 2 or more attacks, recent trend is toward conservative management of recurrent mild/moderate attacks
 - complications: generalized peritonitis, free air, abscess, fistula, obstruction, hemorrhage, inability to rule out colon cancer on endoscopy, or failure of medical management
- surgical procedures
 - for emergency or complex cases: Hartmann procedure: colon resection + colostomy and rectal stump → colostomy reversal in 3-6 mo
 - elective cases or minimal contamination of the abdominal cavity: consider colon resection + primary anastomosis

Prognosis

- mortality rates: 6% for purulent peritonitis, 35% for fecal peritonitis
- recurrence rates: 13-30% after first attack, 30-50% after second attack

Table 13. Hinchey Staging and Treatment for Diverticulitis

Hinchey Stage	Description	Acute treatment
1	Phlegmon/small pericolic abscess	Medical
2	Large abscess/fistula	Abscess drainage, resection ± primary anastomosis
3	Purulent peritonitis (ruptured abscess)	Hartmann procedure
4	Feculent peritonitis	Hartmann procedure

Figure 16. Hartmann procedure

Colorectal Neoplasms

Colorectal Polyps

Definition

- polyp: protuberance into the lumen of normally flat colonic mucosa
- sessile (flat) or pedunculated (on a stalk)

Epidemiology

- 30% of the population have polyps by age 50, 40% by age 60, 50% by age 70

Clinical Features

- 50% in the rectosigmoid region, 50% are multiple
- usually asymptomatic, do not typically bleed, tenesmus, intestinal obstruction, mucus
- usually detected during routine endoscopy or familial/high risk screening

Pathology

- non-neoplastic
 - hyperplastic: most common non-neoplastic polyp
 - mucosal polyps: small <0.2 in, no clinical significance
 - inflammatory pseudopolyps: associated with IBD, no malignant potential
 - submucosal polyps: lymphoid aggregates, lipomas, leiomyomas, carcinoids
- neoplastic
 - hamartomas: juvenile polyps (large bowel), Peutz-Jegher syndrome (small bowel)
 - ♦ malignant risk due to associated adenomas (large bowel)
 - ♦ low malignant potential → most spontaneously regress or autoamputate
 - adenomas: premalignant, often carcinoma *in situ*:
 - ♦ some may contain invasive carcinoma ("malignant polyp" – 3-9%): invasion into muscularis
 - ♦ malignant potential: villous > tubulovillous > tubular

Figure 17. Sessile and pedunculated polyps

Table 14. Characteristics of Tubular vs. Villous Polyps

	Tubular	Villous
Incidence	Common (60-80%)	Less common (10%)
Size	Small (<2 cm)	Large (usually >2 cm)
Attachment	Pedunculated	Sessile
Malignant Potential	Lower	Higher
Distribution	Even	Left-sided predominance

Investigations

- colonoscopy is the gold standard for diagnosis and treatment of colonic polyps
- CT colonography: increasing in availability; patients still require bowel prep and will require colonoscopy if polyps are identified
- other: flexible sigmoidoscopy if polyps are detected, proceed to colonoscopy for examination of entire bowel and biopsy

Treatment

- indications: symptoms, malignancy or risk of malignancy (i.e. adenomatous polyps)
- endoscopic removal of entire growth
- surgical resection for those invading into muscularis (high risk of malignancy) and those too large to remove endoscopy
- follow-up endoscopy 1 yr later, then every 3-5 yr

Familial Colon Cancer Syndromes

FAMILIAL ADENOMATOUS POLYPOSIS

Pathogenesis

- autosomal dominant inheritance, mutation in adenomatous polyposis coli (APC) gene on chromosome 5q21

Clinical Features

- hundreds to thousands of colorectal adenomas usually by age 20 (by 40s in attenuated FAP)
- extracolonic manifestations
 - carcinoma of small bowel (i.e. polyps in colon), bile duct, pancreas, stomach, thyroid, adrenal, small bowel
 - congenital hypertrophy of retinal pigment epithelium presents early in life in 2/3 of patients; 97% sensitivity
 - virtually 100% lifetime risk of colon cancer (because of number of polyps)

- variants
 - Gardner's syndrome: FAP + extraintestinal lesions (sebaceous cysts, osteomas, desmoid tumors)
 - Turcot syndrome: FAP + CNS tumors (childhood cerebellar medulloblastoma)

Investigations

- genetic testing (80-95% sensitive, 99-100% specific)
- if no polyposis found: annual flexible sigmoidoscopy from puberty to age 50, then routine screening
- if polyposis or APC gene mutation found: annual colonoscopy and consider surgery (see Figure 16); consider upper endoscopy to evaluate for periampullary tumors

Treatment

- surgery indicated by age 17-20
- total proctocolectomy with ileostomy or total colectomy with ileorectal anastomosis
- doxorubicin-based chemotherapy
- NSAIDs for intra-abdominal desmoids

HEREDITARY NON-POLYPOSIS COLORECTAL CANCER – LYNCH SYNDROME

Pathogenesis

- autosomal dominant inheritance, mutation in a DNA mismatch repair gene (MSH2, MSH6, MLH1) resulting in microsatellite genomic instability and subsequent mutations
- microsatellite instability account for approximately 15% of all colorectal cancers

Clinical Features

- early age of onset, right > left colon, synchronous and metachronous lesions
- mean age of cancer presentation is 44 yr, lifetime risk 70-80% (M>F)
 - HNPCC I: hereditary site-specific colon cancer
 - HNPCC II: cancer family syndrome – high rates of extracolonic tumors (endometrial, ovarian, hepatobiliary, small bowel)

Diagnosis

- Amsterdam Criteria
 - 3 or more relatives with verified Lynch syndrome associated cancers, and 1 must be 1st degree relative of the other 2
 - 2 or more generations involved
 - 1 case must be diagnosed before 50 yr old
 - FAP is excluded
- genetic testing (80% sensitive) – colonoscopy mandatory even if negative
 - refer for genetic screening individuals who fulfill EITHER the Amsterdam Criteria (as above) OR the revised Bethesda Criteria (see sidebar)
- colonoscopy (starting age 20) annually
- surveillance for extracolonic lesions

Treatment

- total colectomy and ileorectal anastomosis with annual proctoscopy

Colorectal Carcinoma

Epidemiology

- 4th most common cancer (after lung, prostate, and breast), 2nd most common cause of cancer death

Risk Factors

- most patients have no specific risk factors
- age >50 (dominant risk factor in sporadic cases), mean age is 70
- genetic: FAP, HNPCC, family history of CRC
- colonic conditions
 - adenomatous polyps (especially if >1 cm, villous, multiple)
 - IBD (especially UC: risk is 1-2%/yr if UC >10 yr)
 - previous colorectal cancer (also gonadal or breast)
- diet (increased fat, red meat, decreased fiber) and smoking
- DM and acromegaly (insulin and IGF-1 are growth factors for colonic mucosal cells)

Pathogenesis

- adenoma-carcinoma sequence; rarely arise *de novo*

Referral Criteria for Genetic Screening for APC

- To confirm the diagnosis of FAP (in patients with ≥100 colorectal adenomas)
- To provide pre-symptomatic testing for individuals at risk for FAP (1st degree relatives who are ≥10 yr old)
- To confirm the diagnosis of attenuated FAP (in patients with ≥20 colorectal adenomas)

Revised Bethesda Criteria for HNPCC and Microsatellite Instability (MSI)

Tumors from individuals should be tested for MSI in the following situations

- Colorectal cancer diagnosed in a patient who is <50 yr
- Presence of synchronous, metachronous colorectal, or other HNPCC-associated tumors, regardless of age
- Colorectal cancer with the MSI-H histology diagnosed in a patient who is <60 yr
- Colorectal cancer diagnosed in one or more first-degree relatives with an HNPCC-related tumor, with one of the cancers being diagnosed <50 yr
- Colorectal cancer diagnosed in two or more first- or second-degree relatives with HNPCC-related tumors, regardless of age

Elderly persons who present with iron-deficiency anemia should be investigated for colon cancer

Staging for CRC

- I T1,2 N0 M0
- II T3,4 N0 M0
- III TxN+ M0
- IV TxNxM1

5-yr Survival Rates for CRC

Stage	Colon	Rectum
I	74%	74%
IIA	67%	64%
IIB	59%	52%
IIC	37%	32%
IIIA	73%	74%
IIIB	46%	45%
IIIC	28%	33%
IV	6%	6%

Clinical Features

- often asymptomatic
- hematochezia/melena, abdominal pain, change in bowel habits
- others: weakness, anemia, weight loss, palpable mass, obstruction
- 20% patients have distant metastatic disease at time of presentation
- spread
 - direct extension, lymphatic, hematogenous (liver most common, lung, bone, brain; tumor of distal rectum → IVC → lungs)
 - peritoneal seeding: ovary, Blumer's shelf (pelvic cul-de-sac)

Table 15. Clinical Presentation of CRC

	Right Colon	Left Colon	Rectum
Frequency	25%	35%	30%
Pathology	Exophytic lesions with occult bleeding	Annular, invasive lesions	Ulcerating
Symptoms	Weight loss, weakness, rarely obstruction	Constipation ± overflow (alternating bowel patterns), abdominal pain, decreased stool caliber, rectal bleeding	Obstruction, tenesmus, rectal bleeding
Signs	Fe-deficiency anemia, RLQ mass (10%)	BRBPR, LBO	Palpable mass on DRE, BRBPR

Investigations

- colonoscopy (best), look for synchronous lesions (3-5% of patients); alternative: air contrast barium enema ("apple core" lesion) + sigmoidoscopy
- if a patient is FOBT +ve, or has microcytic anemia or has a change in bowel habits, do colonoscopy
- laboratory: CBC, urinalysis, liver enzymes, liver function tests, carcinogenic embryonic antigen (CEA) (pre-operative for baseline, >5 ng/mL have worse prognosis)
- staging (see Table 16 and sidebar GS34): CT chest/abdomen/pelvis; bone scan, CT head only if lesions suspected
- rectal cancer: pelvic MRI or endorectal ultrasound to determine T and N stage

Table 16. TNM Classification System for Staging of Colorectal Carcinoma (AJCC/IUCC 2010)

Primary Tumor (T)	Regional Lymph Nodes (N)	Distant Metastasis (M)
T0 No primary tumor found	N0 No regional node involvement	M0 No distant metastasis
Tis Carcinoma <i>in situ</i>	N1 Metastasis in 1-3 regional nodes	M1 Distant metastasis
T1 Invasion into submucosa	N2 Metastasis in 4 or more regional nodes	
T2 Invasion into muscularis propria		
T3 Invasion through muscularis propria and into serosa		
T4 Invasion into adjacent structures or organs		

Treatment

- **colon cancer**
 - wide surgical resection of lesion and regional lymphatic drainage; usually colectomy with primary anastomosis
 - ♦ curative: wide resection of lesion (2 in margins) with nodes and mesentery
 - ♦ palliative: if distant spread, local control for hemorrhage or obstruction
 - ♦ care is taken to not spread tumor by unnecessary palpation
 - ♦ cancer-bearing portion of colon is removed according to vascular distribution of segment
 - adjuvant chemotherapy (5-FU or oral capecitabine with oxaliplatin) can be considered for stages II or III
- **rectal cancer**
 - choice of operation depends on individual case; types of operations (see Figure 18)
 - ♦ low anterior resection of rectum (LAR): curative procedure of choice if adequate distal margins; uses technique of total mesorectal excision
 - ♦ abdominoperineal resection of rectum (APR): if adequate distal margins cannot be obtained; involves the removal of distal sigmoid colon, rectum, and anus – permanent end colostomy required
 - ♦ local excision: for select T1 lesions only
 - ♦ palliative procedures: electrocoagulation or laser photocoagulation for unresectable cancers for symptom relief
 - adjuvant therapy
 - ♦ combined neoadjuvant chemoradiation therapy followed by post-operative adjuvant chemotherapy for stages II and III

Follow-Up

- currently there are no data suggesting optimal follow-up
- combination of periodic CT chest/abdomen/pelvis, CEA, and colonoscopy is recommended
- CEA to monitor for initial response to treatment, and to assess for recurrence q3mo (not a screening test)
- intensive follow-up improves overall survival in low-risk patients

Figure 18. APR vs. LAR

APR removes distal sigmoid colon, rectum, and anus; permanent end colostomy required

LAR removes distal sigmoid and rectum with anastomosis of distal colon to anus

Pre-Operative vs. Post-Operative Chemoradiotherapy for Locally Advanced Rectal Cancer: Results of the German CAO/ARO/AIO-94 Randomized Phase III Trial after a Median Follow-Up of 11 Years

J Clin Oncol 2012;30:1926-1933

Background: The CAO/ARO/AIO-94 trial (published 2004) recommended pre-operative chemoradiotherapy (CRT) as standard treatment for locally advanced rectal cancer. However, no survival benefit was shown after median follow-up of 46 mo, and this study reports long-term effects. **Methods:** Patients with stage II to III rectal cancer (n=799) were randomly assigned to pre-operative (n=404) or post-operative CRT (n=395) with fluorouracil (FU), radiation, and adjuvant FU chemotherapy, in addition to total mesorectal excision surgery. Follow-up was designed to assess long-term overall survival as the primary end point; and cumulative incidence of local and distant relapses and disease-free survival as secondary end points.

Results: 10 yr incidence of local relapse was significantly lower in the pre-operative CRT group than in the post-operative group (7.1% vs. 10.1%, p=0.048). Overall survival at 10 yr was similar at ~60% for patients treated with pre-operative or post-operative CRT (p=0.85). Disease-free survival rates at 10 yr was similar at ~68% for patients treated with pre-operative or post-operative CRT (p=0.54). No significant difference was detected for 10 yr incidence of distant metastases (pre-operative CRT 29.8% vs. post-operative CRT 29.6%, p=0.9).

Conclusion: There is long-term reduction in local recurrence of stage II to III rectal cancer with pre-operative chemotherapy, but no improvement in overall survival or distant recurrence of disease.

Other Conditions of the Large Intestine

Angiodysplasia

Definition

- vascular anomaly: focal submucosal venous dilatation and tortuosity

Clinical Features

- most frequently in right colon of patients >60 yr old
- bleeding typically intermittent, rarely massive, not usually hypotensive (melena, anemia, guaiac positive stools)

Investigations

- colonoscopy: cherry red spots, branching pattern from central vessel
- angiography: early-filling vein, vascular tuft, delayed emptying vein; rarely active bleeding
- RBC technetium-99 scan
- barium enema is contraindicated (obscures other x-rays, i.e. angiogram)

Treatment

- none if asymptomatic
- cautery, right hemicolectomy, embolization, vasopressin infusion, sclerotherapy, band ligation, laser, octreotide, and rarely segmental resection if other treatments fail

Volvulus

Definition

- rotation of segment of bowel about its mesenteric axis
- sigmoid (65%), cecum (30%), transverse colon (3%), splenic flexure (2%)
- 5-10% of large bowel obstruction; 25% of intestinal obstruction during pregnancy

Risk Factors

- age (50% of patients >70 yr: stretching/elongation of bowel with age is a predisposing factor)
- high fiber diet (can cause elongated/redundant colon), chronic constipation, laxative abuse, pregnancy, bedridden, institutionalization (less frequent evacuation of bowels)
- congenital hypermobile cecum

Clinical Features

- symptoms due to bowel obstruction (see *Bowel Obstruction*, GS24) or intestinal ischemia (see *Intestinal Ischemia*, GS28)
- colicky abdominal pain, persistence of pain between spasms, abdominal distention, vomiting

Investigations

- AXR (classic findings): "omega", "bent inner-tube", "coffee-bean" signs
- barium/Gastrografin® enema: "ace of spades" (or "bird's beak") appearance due to funnel-like luminal tapering of lower segment towards volvulus
- sigmoidoscopy or colonoscopy as appropriate
- CT

Treatment

- initial supportive management (same as initial management for bowel obstruction (see *Bowel Obstruction*, GS24))
- cecum
 - nonsurgical
 - ♦ may attempt colonoscopic detorsion and decompression
 - surgical
 - ♦ right colectomy + ileotransverse colonic anastomosis
- sigmoid
 - nonsurgical
 - ♦ decompression by flexible sigmoidoscopy and insertion of rectal tube past obstruction
 - ♦ subsequent elective surgery recommended (50-70% recurrence)
 - surgical: Hartmann procedure (if urgent)
 - ♦ indications: strangulation, perforation, or unsuccessful endoscopic decompression

Cecal Volvulus

AXR: Central cleft of "coffee bean" sign points to RLQ

Sigmoid Volvulus

AXR: Central cleft of "coffee bean" sign points to LLQ

Barium enema: "ace of spades" or "bird's beak" sign

Fistula

Definition

- abnormal communication between two epithelialized surfaces (e.g. enterocutaneous, colovesical, aortoenteric, entero-enteric)

Etiology

- foreign object erosion (e.g. gallstone, graft)
- inflammatory states (e.g. infection, IBD [especially Crohn's], diverticular disease)
- iatrogenic/surgery (e.g. post-operative anastomotic leak, radiation)
- congenital, trauma
- neoplastic

Investigations

- U/S, CT scan, fistulogram
- measure amount of drainage from fistula

Treatment

- decrease secretion: octreotide/somatostatin/omeprazole
- surgical intervention: dependent upon etiology (for non-closing fistulas); uncertainty of diagnosis

Why Fistulae Stay Open

FRIENDO

Foreign body

Radiation

Infection

Epithelialization

Neoplasm

Distal obstruction (most common)

Others: increased flow; steroids (may inhibit closure, usually will not maintain fistula)

Stomas

Definition

- an opening of the GI tract onto the surface of the abdomen wall

Ileostomy

- usually positioned in RLQ; ileum is brought through rectus abdominus muscles
- indications: after colectomy for ulcerative colitis, in some cases of Crohn's disease or familial polyposis
- conventional ileostomy: discharges small quantities of liquid material continuously, appliance (plastic bag attached to a sheet of protective material) required at all times
- continent ileostomy: reservoir is constructed from distal ileum, emptied by inserting catheter into stoma several times a day; rarely used, has mostly been replaced by ileal pouch anal anastomosis

Colostomy

- indications: to decompress an obstructed colon, to protect a distal anastomosis after resection, or to evacuate stool after distal colon or rectum is removed
- colostomies can be done by making an opening in a loop of colon (loop colostomy) or by dividing the colon and bringing out one end (end colostomy)
- most common permanent colostomy is a sigmoid colostomy – expels stool once per day, no appliance required
- chronic paracolostomy hernia is a common complication

Complications (10%)

- obstruction: herniation, stenosis (skin and abdominal wall), adhesive bands, volvulus
- peri-ileostomy abscess and fistula
- skin irritation
- prolapse or retraction
- diarrhea (excessive output)

Figure 19. Ostomies

Colostomy/Ileostomy

- Connection of proximal limb of colon or ileum to abdominal wall skin

Mucous Fistula

- Connection of distal limb of colon to abdominal wall skin

Ileal Conduit

- Connection of bowel to ureter proximally and abdominal wall distally to drain urine

Figure 20. End vs. loop colostomy

Anorectum

Hemorrhoids

Etiology

- vascular and connective tissue complexes form a plexus of dilated veins (cushion)
 - internal: superior hemorrhoidal veins, above dentate line, portal circulation
 - external: inferior hemorrhoidal veins, below dentate line, systemic circulation

Risk Factors

- increased intra-abdominal pressure: chronic constipation, pregnancy, obesity, portal HTN, heavy lifting

Clinical Features and Treatment

- internal hemorrhoids
 - engorged vascular cushions usually at 3, 7, 11 o'clock positions (patient in lithotomy position)
 - PAINLESS rectal bleeding, anemia, prolapse, mucus discharge, pruritus, burning pain, rectal fullness
 - 1st degree:** bleed but do not prolapse through the anus
 - treatment: high fiber/bulk diet, sitz baths, steroid cream, pargoline (Anusol®), rubber band ligation, sclerotherapy, photocoagulation
 - 2nd degree:** bleed, prolapse with straining, spontaneous reduction
 - treatment: rubber band ligation, photocoagulation
 - 3rd degree:** bleed, prolapse, requires manual reduction
 - treatment: same as 2nd degree, but may require closed hemorrhoidectomy
 - 4th degree:** bleed, permanently prolapsed, cannot be manually reduced
 - treatment: closed hemorrhoidectomy
- external hemorrhoids
 - dilated venules usually mildly symptomatic
 - PAIN after bowel movement, associated with poor hygiene
 - medical treatment: dietary fiber, stool softeners, steroid cream (short course), pargoline (Anusol®), avoid prolonged straining
 - thrombosed hemorrhoids are very painful
 - resolve within 2 wk, may leave excess skin = perianal skin tag
 - treatment: consider surgical decompression within first 48 h of thrombosis, otherwise medical treatment

Always rule out more serious causes (e.g. colon CA) in a person with hemorrhoids and rectal bleeding

Figure 21. Hemorrhoids

Band ligation can be done as outpatient

External hemorrhoids will often recur

Table 17. Signs and Symptoms of Internal vs. External Hemorrhoids

Internal Hemorrhoids	External Hemorrhoids
Painless BRBPR	Sudden severe perianal pain
Rectal fullness or discomfort	Perianal mass
Mucus discharge	

Anal Fissures

Definition

- tear of anal canal below dentate line (very sensitive squamous epithelium)
- 90% posterior midline, 10% anterior midline
- if off midline: consider other possible causes such as IBD, STDs, TB, leukemia, or anal carcinoma
- repetitive injury cycle after first tear:
 - sphincter spasm occurs preventing edges from healing and leads to further tearing
 - ischemia may ensue and contribute to chronicity

Etiology

- forceful dilation of anal canal: large, hard stools and irritant diarrheal stools
- tightening of anal canal secondary to nervousness/pain leads to further tearing
- others: habitual use of cathartics, childbirth

Clinical Features

- acute fissure
 - very painful bright red bleeding especially after bowel movement, sphincter spasm on limited DRE
 - treatment is conservative: stool softeners, bulking agent, sitz baths (heals 90%)
- chronic fissure (anal ulcer)
 - triad: fissure, sentinel skin tags, hypertrophied papillae

- treatment
 - ♦ stool softeners, bulking agents, sitz baths
 - ♦ topical nitroglycerin or nifedipine: increases local blood flow, promoting healing and relieves sphincter spasm
 - ♦ lateral internal anal sphincterotomy (most effective): objective is to relieve sphincter spasm → increases blood flow and promotes healing; but 5% chance of fecal incontinence therefore not commonly done
- alternative treatment
 - ♦ botulinum toxin: inhibits release of acetylcholine (ACh), reducing sphincter spasm

Anorectal Abscess

Definition

- infection in one or more of the anal spaces
- usually bacterial infection of blocked anal gland at the dentate line
 - *E. coli*, *Proteus*, *Streptococci*, *Staphylococci*, *Bacteroides*, anaerobes

© Cynthia Yoon 2003

Figure 22. Different types of perianal abscesses

Clinical Features

- throbbing pain that may worsen with straining and ambulation
- abscess can spread vertically downward (perianal), vertically upward (supralelevator), or horizontally (ischiorectal)
- tender perianal/rectal mass on exam

Treatment

- I&D
 - curative in 50% of cases
 - 50% develop anorectal fistulas
- may require antibiotics if diabetic, heart murmur, or cellulitis

Recurrent perianal abscesses is associated with Crohn's disease

Antibiotics are not typically helpful in the treatment of perianal abscesses

Fistula-In-Ano

Definition

- anal fistula from rectum to perianal skin
- an inflammatory tract with internal os at dentate line, external os on skin

Etiology

- see *Fistula*, GS37
- same perirectal process as an anal abscess, therefore usually associated with an abscess
- other causes: post-operative, trauma, anal fissure, malignancy, radiation proctitis

Clinical Features

- intermittent or constant purulent discharge from perianal opening
- pain
- palpable cord-like tract

Treatment

- identification
 - internal opening
 - ♦ Goodsall's rule
 - fistulas originating anterior to a transverse line through the anus will have a straight course and exit anteriorly, whereas those originating posterior to the transverse line will begin in the midline and have a curved tract
 - fistulous tract
 - ♦ probing or fistulography under anesthesia
- surgery
 - fistulotomy: unroof tract from external to internal opening, allow drainage, heals by secondary intention
 - low lying fistula (does not involve external sphincter) → primary fistulotomy
 - high lying fistula (involves external sphincter) → staged fistulotomy with Seton suture placed through tract
 - ♦ promotes drainage
 - ♦ promotes fibrosis and decreases incidence of incontinence
 - ♦ delineates anatomy
 - ♦ usually done to spare muscle cutting

Post-Operative

- sitz baths, irrigation, and packing to ensure healing proceeds from inside to outside

Complications

- recurrence
- rarely fecal incontinence

**Figure 23. Goodsall's rule****Figure 24. Fistulotomy**

Pilonidal Disease

Definition

- chronic recurring abscess or chronic draining sinus in sacrococcygeal area

Epidemiology

- occurs most frequently in young men age 15-40 yr; rare in >50 yr

Etiology

- obstruction of the hair follicles in this area → formation of cysts, sinuses, or abscesses

Clinical Features

- asymptomatic until acutely infected, then pain/tenderness, purulent discharge, inspissated hair

Treatment

- acute abscess
 - I&D (often performed by primary care doctors)
 - wound packed open
 - 40% develop chronic pilonidal sinuses
- surgery
 - indication: failure of healing after I&D, recurrent disease, complex disease
 - pilonidal cystotomy: excision of sinus tract and cyst; wound closed by secondary intention, primary closure with tissue flap, or marsupialization (cyst edge sewn to surrounding tissue to leave sinus tract open)

Rectal Prolapse

Definition

- protrusion of some or all of rectal mucosa through external anal sphincter

Epidemiology

- extremes of ages: <5 yr old and >5th decade
- 85% women

Etiology

- lengthened attachment of rectum secondary to constant straining
- 2 types
 1. false/partial/mucosal: protrusion of mucosa only, radial furrows at junction with anal skin; most common type of rectal prolapse in childhood
 2. true/complete (most common): full thickness extrusion of rectal wall, concentric folds in:
 - ♦ first degree: prolapse includes mucocutaneous junction
 - ♦ second degree: without involvement of mucocutaneous junction
 - ♦ third degree (internal intussusception): prolapse is internal, concealed, or occult

**Figure 25. Rectal prolapse (true vs. false)**

Risk Factors

- gynecological surgery
- chronic neurologic/psychiatric disorders affecting motility

Clinical Features

- extrusion of mass with increased intra-abdominal pressure:
 - straining, coughing, laughing, Valsalva
- difficulty in bowel regulation
 - tenesmus, constipation, fecal incontinence
- permanently extruded rectum with excoriation, ulceration, and constant soiling
- may be associated with urinary incontinence or uterine prolapse

Treatment

- Type I
 - conservative: gentle manual reduction of prolapsed area, especially in children
 - mucosectomy with excision of redundant mucosa, mostly in adults
- Type II
 - conservative: reduce if possible
 - surgery: abdominal, perineal, transsacral approaches

Anal Neoplasms

ANAL CANAL**Squamous Cell Carcinoma of Anal Canal (Above Dentate Line)**

- most common tumor of anal canal (75%)
- anus prone to human papillomavirus (HPV) infection, therefore at risk for anal squamous intraepithelial lesions (ASIL)
 - high grade squamous intraepithelial lesion (HSIL) and low grade squamous intraepithelial lesion (LSIL) terminology used
- clinical features: anal bleeding, pain, mass, ulceration, pruritus; 25% asymptomatic
- treatment: chemotherapy ± radiation ± surgery
- prognosis: 80% 5 yr survival

Malignant Melanoma of Anal Canal

- 3rd most common site for primary malignant melanoma after skin, eyes
- aggressive, distant metastases common at time of diagnosis
- treatment: wide excision or APR ± chemoradiation
- prognosis: <5% 5 yr survival

ANAL MARGIN

- clinical features and treatment as for skin tumors elsewhere
- squamous and basal cell carcinoma, Bowen's disease (SCC *in situ*), and Paget's disease

Liver

**Figure 26. Anatomy of liver**

Liver Cysts

Table 18. Characteristics of Liver Cysts

	Simple Cysts	Polycystic Liver Disease	Choledochal Cysts	Hydatid (Cystic Echinococcosis)	Cystadenoma (Premalignant)/Cystadenocarcinoma
Description	Contain clear fluid that do not communicate with the intrahepatic biliary tree Most common	Several cysts that replace much of the liver	Congenital malformations of pancreaticobiliary tree high risk of malignancy majority present before age 10	Infection with parasite <i>Echinococcus granulosus</i> associated with exposure to dogs, sheep, and cattle in Southern Europe, Middle East, Australasia, South America	Rare cystic tumors that occur in the liver parenchyma or the extrahepatic bile ducts Cystadenocarcinoma is an invasive carcinoma
Clinical Features	Usually asymptomatic may have multiple simple cysts	Progressive 50% associated with polycystic kidney disease	Recurrent abdominal pain Intermittent jaundice RUQ mass Cholangitis, pancreatitis	Asymptomatic mass chronic pain hepatomegaly	Upper abdominal mass Abdominal pain Anorexia
Investigations	U/S: Used for diagnosis and follow-up CT: well demarcated lesion that does not enhance with contrast	U/S	U/S CT Transhepatic cholangiography LFTs	Anti-Echinococcus Ab (IgG) U/S CT: calcified mass Needle biopsy	Appear as complex cysts: internal septae, papillary projections, irregular lining Need histology for definite diagnosis
Treatment	Not required unless very large Monitor if > 4 cm	Only if symptomatic partial liver resection drainage	Complete excision of cysts liver transplant if cyst involves intrahepatic bile ducts (Caroli's disease)	Albendazole (anti-helminthic) – cure up to 30% Surgical (risk of spillage into abdomen): Conservative: open endocystectomy or PAIR (Percutaneous Aspiration, Injection of protoscolicidal agent, Re-aspiration) Radical: partial hepatectomy or total pericystectomy	All complex, multiloculated cysts (except echinococcal) should be excised because of malignancy risk
Complications	Intracystic hemorrhage		Biliary cirrhosis, portal HTN, rupture, cholangiocarcinoma Abnormal pancreaticobiliary junction is associated with increased risk of malignancy	Inferior vena cava compression rupture can cause biliary colic, jaundice, cholangitis, pancreatitis, or anaphylactic reaction	Cystadenocarcinoma can invade adjacent tissues and metastasize

Liver Abscesses

Etiology

- types
 - pyogenic (bacterial): most common etiology; most often polymicrobial – *E. coli*, *Klebsiella*, *Proteus*, *Strep. milleri*
 - parasitic (amoebic): *Entamoeba histolytica*, *Echinococcal* cyst
 - fungal: *Candida*
- sources: direct spread from biliary tract infection, portal spread from GI infection, systemic infection (e.g. endocarditis)

Clinical Features

- fever, malaise, chills, anorexia, weight loss, abdominal pain, nausea
- RUQ tenderness, hepatomegaly, jaundice

Investigations

- leukocytosis, anemia, elevated liver enzymes, hemagglutination titres for *Entamoeba* antibodies
- U/S, CXR (right basilar atelectasis/effusion), CT, cyst aspiration with C&S

Treatment

- treat underlying cause
- generally will treat initially with antibiotics alone and add surgical or percutaneous drainage and IV antibiotics for larger abscesses (initially ceftriaxone + metronidazole or piperacillin/tazobactam)

Prognosis

- overall mortality 15% – higher rate if delay in diagnosis, multiple abscesses, malnutrition

Neoplasms

BENIGN LIVER NEOPLASMS

Hemangioma (cavernous)

- pathogenesis: most common benign hepatic tumor; results from malformation of angioblastic fetal tissue
- risk factors: F:M = 3:1
- clinical features
 - usually small and asymptomatic
 - consumptive coagulopathy if giant (in children)
- investigations
 - contrast CT (well-demarcated hypodense mass with peripheral enhancement and delayed venous emptying), U/S (homogenous hyperechoic mass), arteriography (rarely used; "cotton wool" appearance), MRI
 - biopsy may result in hemorrhage
- treatment
 - usually none unless tumor bleeds or is symptomatic, then excision by lobectomy or enucleation

Focal Nodular Hyperplasia

- pathogenesis: unclear, may be regenerative response to hyperperfusion from anomalous arteries at center of nodule
- risk factors: female, age 20-50
- clinical features: asymptomatic, rarely grows or bleeds, no malignant potential
- investigations: central stellate scar on CT scan; MRI, biopsy may be required
- treatment: may be difficult to distinguish from adenoma/fibrolamellar HCC (malignant potential) → often resected

Adenoma

- definition: benign glandular epithelial tumor
- risk factors: female, age 20-50, estrogen (OCP, pregnancy)
- clinical features: asymptomatic, 25% present with RUQ pain or mass, may present with bleeding
- investigations: CT (well-demarcated masses, often heterogeneous enhancement on arterial phase, isodense on venous phase without washout of contrast), U/S, MRI, biopsy often needed
- treatment
 - stop anabolic steroids or OCP
 - excise, especially if large (>5 cm), due to risk of transformation to hepatocellular carcinoma and spontaneous rupture/hemorrhage

MALIGNANT LIVER NEOPLASMS

Primary

- usually hepatocellular carcinoma (HCC)/hepatoma
- others include angiosarcoma, hepatoblastoma, hemangioendothelioma
- epidemiology: 3rd leading cause of cancer death worldwide, 9th in United States; highest in Africa, China, Taiwan
- risk factors
 - chronic liver inflammation: chronic hepatitis B (inherently oncogenic) and C, cirrhosis (especially macronodular), hemochromatosis, α_1 -antitrypsin deficiency
 - medications: OCPs (3x increased risk), steroids
 - smoking, alcohol, Betel nuts
 - chemical carcinogens (aflatoxin, microcystin, vinyl chloride – associated with angiosarcoma)
- clinical features
 - RUQ discomfort, right shoulder pain
 - jaundice, weakness, weight loss, \pm fever (if central tumor necrosis)
 - hepatomegaly, bruit, hepatic friction rub
 - ascites with blood (sudden intra-abdominal hemorrhage)
 - paraneoplastic syndromes – hypoglycemia, hypercalcemia, erythrocytosis, watery diarrhea
 - metastasis: lung, bone, brain, peritoneal seeding

Secondary liver metastases are common in many cancers, with some studies showing a prevalence of 40-50% amongst patients with extrahepatic cancers. They commonly arise from breast, lung, and colorectal cancers. For metastases secondary to colorectal cancer, surgical resection offers the greatest likelihood of cure

- investigations
 - elevated ALP, bilirubin, and α -fetoprotein (80% of patients)
 - U/S (poorly-defined margins with internal echos), triphasic CT (enhancement on arterial phase and washout on portal venous phase), MRI
 - liver enzyme and liver function tests: AST, ALT, ALP, bilirubin, albumin, INR
- treatment
 - cirrhosis is a *relative* contraindication to tumor resection due to decreased hepatic reserve
 - surgical: resection (10% of patients have resectable tumors)
 - liver transplant; may use bridging therapy while awaiting transplant
 - ♦ **absolute contraindications:** extrahepatic disease, vascular invasion
 - ♦ **relative contraindications:** dependent on liver transplant protocol based on staging criteria followed by transplant center
 - non-surgical: radiofrequency ablation, percutaneous ethanol injection, transcatheter arterial chemoembolization (TACE), chemotherapy (consider sorafenib for HCC; pre-operative chemotherapy for hepatoblastoma is standard of care), radiotherapy
- prognosis
 - median survival: 6-20 mo
 - 5 yr survival: all patients – 5%; patients undergoing complete resection – 11-40%

Secondary

- metastases to the liver are the most common malignant tumors found in the liver
- etiology
 - GI (colorectal most common), lung, breast, pancreas, ovary, uterus, kidney, gallbladder, prostate
- treatment
 - hepatic resection for metastatic colorectal liver metastases if control of primary is possible, no extrahepatic or extrapulmonary metastases and if possibility of “curative” resection
 - possible chemotherapy
- prognosis: 30-40% 5 yr survival with a “curative” resection; prognosis same if metastases are multilobar compared with confined to one lobe

Staging Criteria for Hepatocellular Carcinoma

Milan Criteria*	1 tumor \leq 5 cm Up to 3 tumors each \leq 3 cm
UCSF Criteria*	1 tumor \leq 6.5 cm Up to 3 tumors each \leq 4.5 cm, total diameter \leq 8 cm
Toronto Criteria*	No tumor size or number restrictions No systemic symptoms Not poorly differentiated

*Each criteria assumes no extrahepatic and no macrovascular invasion

Differential Diagnosis of Metastatic Liver Mass

Some **GU Cancers** Produce Bumpy Lumps:

Stomach
GenitoUrinary cancers
(kidney, ovary, uterus)
Colon
Pancreas
Breast
Lung

Child-Turcotte-Pugh Score (Prognosis of Chronic Liver Disease/Cirrhosis, Including Post-Operatively)

	1 Point	2 Points	3 Points
Albumin (g/dL)	>3.5	2.8-3.5	<2.8
Ascites	Absent	Easily controlled	Poorly controlled
Bilirubin (mg/dL)	<2.0	2.0-3.0	>3.0
Coagulation (INR)	<1.7	1.7-2.3	>2.3
Hepatic Encephalopathy	None	Minimal (Grade I-II)	Advanced (Grade III-IV)

Points	Class	One Year Survival	Two Year Survival
5-6	A	100%	85%
7-9	B	81%	57%
10-15	C	45%	35%

Living Liver Donors vs. Deceased Liver Donors

The right lobe of a living donor liver is transplanted into the recipient whereas whole livers from deceased donors are transplanted orthotopically into the recipient

Liver Transplantation

Table 19. Conditions Leading to Transplantation

Parenchymal Disease	Cholestatic Disease	Inborn Errors	Tumors
Chronic hepatitis B or C*	Biliary atresia**	α_1 -antitrypsin deficiency	Hepatocellular carcinoma
Alcoholic cirrhosis	Primary biliary cirrhosis	Wilson's disease	
Acute liver failure	Sclerosing cholangitis	Hemochromatosis	
Budd-Chiari syndrome			
Congenital hepatic fibrosis			
Cystic fibrosis (CF)			
Autoimmune hepatitis			
Cryptogenic cirrhosis			
Drug induced hepatotoxicity			
Non-alcoholic steatohepatitis			

*leading cause in adults; **leading cause in children

Clinical Indications

- early referral for transplant should be considered for all patients with progressive liver disease not responsive to medical therapy, especially:
 - decompensated cirrhosis (ascites, esophageal variceal hemorrhage, spontaneous hepatic encephalopathy, coagulopathy, progressive jaundice, severe fatigue)
 - unresectable primary liver cancers
 - fulminant hepatic failure
- end-stage liver disease with life expectancy <1 yr and if no other therapy is appropriate

Criteria for Transplantation

- Model for End-Stage Liver Disease (MELD): prognostic model to estimate 3 mo survival and disease severity if patient does not receive transplant; based on creatinine, bilirubin, INR; MELD scores from 6-40 used to prioritize liver allocation
- Child-Turcotte-Pugh Score: classification system to assess the prognosis and mortality of liver disease; patient must have \geq 7 points (Class B)

Contraindications

- active alcohol/substance abuse
- extrahepatic malignancy within 5 yr
- advanced cardiopulmonary disease
- active uncontrolled infection

Post-Operative Complications

- primary non-function (graft failure): urgent re-transplantation is indicated
- acute and chronic rejection, ischemia-reperfusion injury
- vascular: hepatic artery or portal vein thrombosis, IVC obstruction
- biliary complications: fever, increasing bilirubin and ALP
- complications related to immunosuppression: HTN, renal disease, DM, obesity, hyperlipidemia, osteoporosis, malignancy, neurologic complications, infection (leading cause of mortality following transplant)

Prognosis

- patient survival at 1 yr: 85%
- graft survival at 1 yr: >80%, at 5 yr: 60-70%

Biliary Tract

Cholelithiasis

Definition

- the formation of gallstones

Pathogenesis

- imbalance of cholesterol and its solubilizing agents (bile salts and lecithin)
- excessive hepatic cholesterol secretion → bile salts and lecithin are “overloaded” → supersaturated cholesterol can precipitate and form gallstones
- North America: cholesterol stones (80%), pigment stones (20%)

Risk Factors

- cholesterol stones
 - obesity, age <50
 - estrogens: female, multiparity, OCPs
 - ethnicity: First Nations heritage (especially Pima Indians) > Caucasian > Black
 - terminal ileal resection or disease (e.g. Crohn’s disease)
 - impaired gallbladder emptying: starvation, TPN, DM
 - rapid weight loss: rapid cholesterol mobilization and biliary stasis
- pigment stones (contain calcium bilirubinate)
 - cirrhosis
 - chronic hemolysis
 - biliary stasis (strictures, dilation, biliary infection)
- protective factors: statins, vitamin C, coffee, exercise

Figure 27. Gallstone disease

Clinical Presentation

- asymptomatic (80%)
 - most do NOT require treatment
 - consider cholecystectomy if: increased risk of malignancy (cholechoal cysts, Caroli’s disease, porcelain or calcified gallbladder), sickle cell disease, pediatric patient, bariatric surgery, immunosuppression

Which Matters Most: Number of Tumors, Size of the Largest Tumor, or Total Tumor Volume?

Liver Transplant 2011;17:S58-66

Purpose: To determine if the size and/or number of hepatocellular carcinoma (HCC) nodules predict disease recurrence and survival after liver transplantation.

Methods: Systematic review and meta-analysis.

Results: 74 studies were included for analysis.

Patients beyond the Milan criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the UCSF criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the Milan criteria but within the UCSF criteria had reduced overall and disease-free survivals. Overall and disease-free survivals were reduced for patients with larger total tumor diameter, ≥10 cm vs. <10 cm, and ≥9 cm vs. <9 cm, respectively. Similarly, patients with higher diameter of largest tumor nodule (≥3 cm vs. <3 cm) had reduced overall survival and higher recurrence. Overall and disease-free survivals were reduced and recurrence higher for patients with tumor size ≥5 cm vs. <5 cm. Mixed results were found regarding number of tumor nodules.

Conclusion: Tumor size and volume are important factors in survival after liver transplantation.

Outcomes of Living and Deceased Donor Liver Transplant Recipients With Hepatocellular Carcinoma: Results of the A2ALL Cohort

Am J Transplant 2012;12:1997-3007

Purpose: To compare the overall survival and hepatocellular carcinoma (HCC) recurrence rates after living donor liver transplantation (LDLT) vs. deceased donor liver transplantation (DDLT) in a series of patients with HCC.

Methods: Study conducted between 1998 and 2009 at nine clinical centers. 229 patients with HCC undergoing liver transplantation included, with approximately 57% transplanted prior to MELD score implementation.

Results: The 5 yr survival rates were 59% in LDLT recipients and 66% in DDLT recipients (HR=1.32; p=0.27). Recurrence-free survival between LDLT and DDLT recipients did not differ (without using MELD score HR=1.51, p=0.13; using MELD score (HR=1.23, p=0.61). Recurrence rates at 5 yr were higher in LDLT recipients (HR=2.35, p=0.04), but not significantly different than in DDLT recipients following introduction of MELD scoring (HR=1.36, p=0.57).

Conclusion: Overall survival was not significantly different between LDLT and DDLT recipients. Although the HCC recurrence rate was higher in LDLT recipients, it was most likely due to more advanced HCC prior to transplant and less liver-directed HCC therapy compared to DDLT.

Summary of Biliary Tract Conditions

Gall Bladder	Asymptomatic	Pain Only	Infection + Pain
Cholelithiasis	√ (majority)		
Biliary Colic		√	
Cholecystitis			√
Common Bile Duct	Asymptomatic	Pain Only	Infection + Pain
Choledocholithiasis	√ (majority)	√	
Cholangitis			√ (majority)

Risk Factors for Cholesterol Stones

4Fs
Fat
Female
Fertile
Forties

- biliary colic (10-25%)
- cholecystitis
- choledocholithiasis (8-15%)
- cholangitis
- gallstone pancreatitis (see *Acute Pancreatitis, GS50*)
- gallstone ileus (0.3-0.5%)
- other: empyema of the gallbladder, liver abscess, gallbladder perforation with bile peritonitis

Investigations

- Labs
 - CBC, LFTs, amylase and lipase
- U/S – diagnostic procedure of choice
 - image for signs of inflammation, obstruction, localization of stones
 - 95% specific for detecting stones
 - signs: gallbladder wall thickening >4 mm, edema (double-wall sign), gallbladder sludge, pericholecystic fluid, sonographic Murphy's sign
- ERCP
 - visualization of upper GI tract, ampullary region, biliary and pancreatic ducts
 - method for treatment of CBD stones in periampullary region
 - complications: traumatic pancreatitis (1-2%), pancreatic or biliary sepsis
- MRCP
 - same information gained as ERCP but non-invasive
 - cannot be used for therapeutic purposes
- PTC
 - injection of contrast via needle passed through hepatic parenchyma
 - useful for proximal bile duct lesions or when ERCP fails or not available
 - requires prophylactic antibiotics
 - contraindications: coagulopathy, ascites, peri/intrahepatic sepsis, disease of right lower lung or pleura
 - complications: bile peritonitis, chylothorax, pneumothorax, sepsis, hemobilia
- HIDA scan
 - used less commonly
 - radioisotope technetium-99 injected into a vein is excreted in high concentrations into bile, allowing visualization of the biliary tree
 - does not visualize stones; diagnosis by seeing occluded cystic duct or CBD

Biliary Colic

Pathogenesis

- gallstone transiently impacted in cystic duct, no infection

Clinical Features

- steady, severe dull pain in epigastrium or RUQ for minutes to hours, crescendo-decrescendo pattern
- may present with chest pain
- N/V
- frequently occurs at night or after fatty meal, not after fasting
- can radiate to right shoulder or scapula
- patients often restless
- no peritoneal findings, no systemic signs

Investigations

- normal blood work: CBC, electrolytes, LFTs, bilirubin, amylase
- U/S shows cholelithiasis, may show stone in cystic duct

Treatment

- analgesia, rehydration during colic episode
- elective cholecystectomy (95% success)
 - complications: CBD injury (0.3-0.5%), hollow viscus injury, bile peritonitis, vessel injury
 - laparoscopic cholecystectomy is the standard of care, no benefit to delaying surgery
 - risk of open cholecystectomy higher in emergency situations

Acute Cholecystitis

Pathogenesis

- inflammation of gallbladder resulting from sustained gallstone impaction in cystic duct or Hartmann's pouch
- no cholelithiasis in 5-10% (see *Acalculous Cholecystitis, GS47*)

Clinical Features

- often have history of biliary colic
- severe constant (hours to days) epigastric or RUQ pain, anorexia, N/V, low grade fever (<38.5°C)

MELD Score for Prioritization of Liver Transplants

Ann Gastroenterol 2012;25:6-13

Adopted in the US in 2002. Based on serum bilirubin, creatinine, and INR

Advantages

- Statistically validated.
- Discriminative ability similar to Child-Turcotte-Pugh (CTP) score based on 5 factors: ascites, encephalopathy, serum bilirubin, albumin, and prothrombin time.
- Use of objective and widely available laboratory tests.
- Inclusion of renal dysfunction.
- Minimized 'ceiling effect' (upper limit of 40).
- Limited effect on post-transplant mortality after implementation.

Disadvantages

- Medical 'urgency' score, which does not take into account the degree of survival benefit after liver transplantation (revised MELD-age score).
- No increased discriminative ability compared to CTP score.
- Less convenient to use at the bedside compared with the CTP score.
- Inter-laboratory variations for measurement of serum creatinine and INR.
- Serum creatinine provides only a rough estimation of renal function.
- Systematic adverse female gender bias (revised MELD-gender score).
- Further refinement is needed (e.g. inclusion of serum sodium [MELD-Na], re-weighting of MELD score components).
- Exclusion of complications of cirrhosis, some of which warrant transplantation at low MELD scores (e.g. hepatic encephalopathy).
- Weak predictor of mortality after liver transplantation (exclusion of donor characteristics).

2 Most Important Lab Tests for Biliary Pain

- Amylase
- Bilirubin

Biliary colic is a **constant** pain not colicky

Early vs. Delayed Laparoscopic Cholecystectomy for Uncomplicated Biliary Colic

Cochrane DB Syst Rev 2013;6:CD007196

Study: To assess the benefits and harms of early vs. delayed laparoscopic cholecystectomy for patients with uncomplicated biliary colic due to gallstones.

Results: One trial with 75 participants, average age 43 yr. Early laparoscopic cholecystectomy (<24 h) vs. delayed (mean wait period 4.2 mo). The proportion of serious adverse events was lower in the early vs. delayed group (0% vs. 22.5%, respectively). There was a shorter hospital stay in the early group (MD -1.25 d, 95% CI -2.05 to -0.45) and a shorter operating time in the early group (MD -14.80 min, 95% CI -18.02 to -11.58). There was no difference in the proportion of patients requiring conversion to open cholecystectomy in the two groups.

Conclusion: Early laparoscopic cholecystectomy (<24 h of diagnosis of biliary colic) decreased morbidity during the waiting period for elective laparoscopic cholecystectomy, hospital stay, and operating time.

- focal peritoneal findings: Murphy's sign, palpable, tender gallbladder (in 33%)
- Boas' sign: right subscapular pain

Investigation

- blood work: elevated WBC and left shift, mildly elevated bilirubin, AST, ALT, and ALP
- U/S: 98% sensitive, consider HIDA scan if U/S negative

Complications

- gallbladder mucocele (hydrops): long-term cystic duct obstruction results in mucous accumulation in gallbladder (clear fluid)
- gangrene (20%), perforation (2%): result in abscess formation or peritonitis
- empyema of gallbladder: suppurative cholecystitis, pus in gallbladder + sick patient
- cholecystoenteric fistula, from repeated attacks of cholecystitis, can lead to gallstone ileus
- emphysematous cholecystitis: bacterial gas present in gallbladder lumen, wall, or pericholecystic space (risk in diabetic patient)
- organisms involved in secondary infection: *E. coli*, *Klebsiella*, *Enterococcus*
- Mirizzi syndrome: extra-luminal compression of CBD/CHD due to large stone in cystic duct

Treatment

- admit, hydrate, NPO, NGT (if persistent vomiting from associated ileus), analgesics once diagnosis is made
- antibiotics
 - cefazolin if uncomplicated cholecystitis
- cholecystectomy
 - early (within 72 h) vs. delayed (after 6 wk)
 - ♦ equal morbidity and mortality
 - ♦ early cholecystectomy preferred: shorter hospitalization and recovery time, no benefit to delaying surgery
 - ♦ emergent OR indicated if high risk, e.g. emphysematous
 - laparoscopic is standard of care (convert to open for complications or difficult case)
 - ♦ laparoscopic: reduced risk of wound infections, shorter hospital stay, reduced post-operative pain, increased risk of bile duct injury
- intraoperative cholangiography (IOC)
 - indications: clarify bile duct anatomy, obstructive jaundice, history of biliary pancreatitis, small stones in gallbladder with a wide cystic duct (>15 mm), single faceted stone in gallbladder, bilirubin >8 mg/dL
- percutaneous cholecystostomy tube: critically ill or if general anesthetic contraindicated

Rouviere's Sulcus

Fissure between right lobe and caudate process of liver; keeping dissection anterior to this landmark prevents bile duct injury

Critical View of Safety

Space between the gallbladder and liver clear of any structures other than the cystic artery

Mirizzi Syndrome

Extrinsic compression of the common hepatic duct by a gallstone in the cystic duct or Hartmann's pouch. Impacted gallstone may erode into the CHD or CBD, creating a cholecystohepatic or cholecystocholedochal fistula; Mirizzi syndrome has an association with gallbladder cancer

Biliary colic is treated with analgesia and elective cholecystectomy

Acute cholecystitis is treated with antibiotics and early cholecystectomy

Acalculous Cholecystitis

Definition

- acute or chronic cholecystitis in the absence of stones

Pathogenesis

- typically due to gallbladder ischemia, stasis

Risk Factors

- DM, immunosuppression, ICU admission, trauma patient, TPN, sepsis

Clinical Features

- see *Acute Cholecystitis*, GS46
- occurs in 20% of cases of acute cholecystitis

Investigations

- U/S: shows sludge in gallbladder, other U/S features of cholecystitis (see *Acute Cholecystitis*, GS46)
- CT or HIDA scan

Treatment

- broad-spectrum antibiotics, cholecystectomy
- if patient unstable → cholecystostomy

Choledocholithiasis

Definition

- stones in CBD

Clinical Features

- 50% asymptomatic
- often have history of biliary colic
- tenderness in RUQ or epigastrium
- acholic stool, dark urine, fluctuating jaundice

- primary vs. secondary stones
 - primary: formed in bile duct, indicates bile duct pathology (e.g. benign biliary stricture, sclerosing cholangitis, choledochal cyst, CF)
 - secondary: formed in gallbladder (85% of cases in U.S.)

Investigations

- CBC: usually normal; leukocytosis suggests cholangitis
- LFTs: increased AST, ALT early in disease, increased bilirubin (more sensitive), ALP, GGT later
- amylase/lipase: to rule out gallstone pancreatitis
- U/S: intra-/extra-hepatic duct dilatation; differential diagnosis is choledochal cyst
- ERCP, PTC
- MRCP (90% sensitive, almost 100% specific, not therapeutic)

Complications

- cholangitis, pancreatitis, biliary stricture, and biliary cirrhosis

Treatment

- if no evidence of cholangitis: treat with ERCP for CBD stone extraction possibly followed by elective cholecystectomy in 25% of patients

Acute Cholangitis

Pathogenesis

- obstruction of CBD leading to biliary stasis, bacterial overgrowth, suppuration and biliary sepsis – may be life-threatening, especially in elderly

Etiology

- choledocholithiasis (60%), stricture, neoplasm (pancreatic or biliary), extrinsic compression (pancreatic pseudocyst or pancreatitis), instrumentation of bile ducts (PTC, ERCP), biliary stent
- organisms: *E. coli*, *Klebsiella*, *Pseudomonas*, *Enterococcus*, *B. fragilis*, *Proteus*

Clinical Features

- Charcot's triad: fever, RUQ pain, jaundice
- Reynold's pentad: fever, RUQ pain, jaundice, shock, confusion
- may have N/V, abdominal distention, ileus, acholic stools, tea-colored urine (elevated direct bilirubin)

Investigations

- CBC: elevated WBC + left shift
- may have positive blood cultures
- LFTs: obstructive picture (elevated ALP, GGT, and conjugated bilirubin, mild increase in AST, ALT)
- amylase/lipase: rule out pancreatitis
- U/S: intra-/extra-hepatic duct dilatation

Treatment

- initial: NPO, fluid and electrolyte resuscitation, \pm NGT, IV antibiotics (treats 80%)
- biliary decompression
 - ERCP + sphincterotomy: diagnostic and therapeutic
 - PTC with catheter drainage: if ERCP not available or unsuccessful
 - laparotomy with CBD exploration and T-tube placement if above fails
- all patients should also have a cholecystectomy, unless contraindicated

Prognosis

- suppurative cholangitis mortality rate: 50%

Gallstone Ileus

Pathogenesis

- repeated inflammation causing a cholecystoenteric fistula (usually duodenal) \rightarrow large gallstone enters the gut and impacts at or near the ileocecal valve, causing a true bowel obstruction (note: ileus is a misnomer in this context)

Clinical Features

- crampy abdominal pain, N/V (see *Bowel Obstruction*, GS24)

Investigations

- AXR: dilated small intestine, air fluid levels, may reveal radiopaque gallstone, air in biliary tree (pneumobilia) (40%)
- CT: biliary tract air, obstruction, gallstone in intestine
- Rigler's triad: pneumobilia (air in biliary tree), small bowel obstruction (partial or complete), gallstone (usually in right iliac fossa)

Laparoscopic vs. Open Cholecystectomy

Laparoscopic Cholecystectomy

- Shorter operating time
- Shorter length of stay
- Shorter sick leave
- Shorter time to return to daily activities
- Less post-operative pain
- Decreased use of post-operative analgesia
- Decreased reduction in pulmonary function*
- Fewer pulmonary complications
- Decreased acute phase response
- Less impairment in intestinal motility*

Open Cholecystectomy

- Lower conversion rates to open surgery (for mini-laparotomies)

*NOTE:

Pulmonary function = O_2 consumption, spirometric parameters, ABG, and acid-base balance

Intestinal motility = auscultating intestinal peristalsis, abdominal circumference measurement, and time interval to restitution of defecation

American Society of Gastrointestinal Endoscopy 2010 Predictors for Risk of CBD Stones

- Very strong:
 - CBD stone on ultrasound
 - Clinical ascending cholangitis
 - Bilirubin > 4 mg/dL
- Strong:
 - CBD dilated > 6 mm on ultrasound
 - Bilirubin 1.8-4 mg/dL
- Moderate:
 - Abnormal liver test (besides bilirubin)
 - Age > 55 yr
 - Clinical gallstone pancreatitis

Charcot's Triad

Fever, RUQ pain, jaundice

Reynolds' Pentad

Fever, RUQ pain, jaundice, shock, confusion

Rigler's Triad of Gallstone Ileus

- Pneumobilia
- Small bowel obstruction
- Gallstone

Common Bacteria in Biliary Tract

KEEPS

Klebsiella
Enterococcus
E. coli, *Enterobacter*
Proteus, *Pseudomonas*
Serratia

Treatment

- fluid resuscitation, NGT decompression
- surgery: enterolithotomy and removal of stone, inspect small and large bowel for additional proximal stones
- may close fistula surgically or manage expectantly (can resolve spontaneously)
- cholecystectomy either during enterolithotomy or after recovery if patient experiences gallbladder symptoms

**Bouveret's Syndrome**

Gastric outlet/duodenal obstruction caused by a large gallstone passing through a cholecystogastric or cholecystoduodenal fistula

Carcinoma of the Gallbladder

Risk Factors

- chronic symptomatic gallstones (70% of cases), old age, female, gallbladder polyps, porcelain gallbladder, chronic infection (*Salmonella*, *Helicobacter*), abnormal pancreaticobiliary duct junction

Clinical Features

- majority are adenocarcinoma
- may be incidental finding on elective cholecystectomy (~1% of elective cholecystectomies)
- many patients are asymptomatic until late
- local: non-specific RUQ pain, ± palpable RUQ mass
- Courvoisier's gallbladder: an enlarged, often palpable gallbladder in a patient with carcinoma of the head of the pancreas; associated with jaundice due to obstruction of the CBD
- systemic: jaundice (50%) due to invasion of CBD or compression of CBD by pericholedochal nodes, weight loss, malaise, anorexia
- early local extension to liver, may extend to stomach, duodenum
- early metastasis common to liver, lung, bone

Investigations

- U/S: mural thickening, calcification, loss of interface between gallbladder and liver, fixed mass
- endoscopic U/S (EUS): good for distinguishing carcinomas from other diagnoses such as polyps, good for staging, allows sampling of bile for cytology
- abdominal CT: polypoid mass, mural thickening, liver invasion, nodal involvement, distant metastases
- MRI/MRCP: good for distinguishing benign and malignant polyps

Treatment

- if carcinoma of the gallbladder is suspected pre-operatively, an open cholecystectomy should be considered to avoid tumor seeding of the peritoneal cavity
- confined to mucosa (rare): cholecystectomy
- beyond mucosa: cholecystectomy, en bloc wedge resection of 3-5 cm underlying liver, dissection of hepatoduodenal lymph nodes

Prognosis

- poor 5 yr survival (10%) as gallbladder carcinoma is often detected late
- better outcomes when detected incidentally following cholecystectomy

Cholangiocarcinoma

Definition

- malignancy of extra- or intrahepatic bile ducts

Risk Factors

- age 50-70, gallstones, ulcerative colitis, primary sclerosing cholangitis, choledochal cyst, *Clonorchis sinensis* infection (liver fluke), chronic intrahepatic stones (hepatolithiasis)

Clinical Features

- majority are adenocarcinomas
- gradual signs of biliary obstruction: jaundice, pruritus, dark urine, pale stools
- anorexia, weight loss, RUQ pain, Courvoisier's sign (if CBD obstructed), hepatomegaly
- early metastases are uncommon, but commonly tumor grows into portal vein or hepatic artery
- Klatskin tumor: cholangiocarcinoma located at bifurcation of common hepatic duct

Investigations

- LFTs show obstructive picture
- U/S, CT: bile ducts usually dilated, but not necessarily
- ERCP or PTC: to determine resectability, for biopsies
- CXR, bone scan: for metastatic workup

Obstructive jaundice is the most common presenting symptom for cholangiocarcinoma

**Courvoisier's Sign**

Palpable, nontender distended gallbladder due to CBD obstruction. Present in 33% of patients with pancreatic carcinoma. The distended gallbladder could not be due to acute cholecystitis or stone disease because the gallbladder would actually be scarred and smaller, not larger

Treatment

- if resectable: biliary drainage and wide excision margin
 - upper third lesions: duct resection + Roux-en-Y hepaticojejunostomy, ± liver resection
 - middle third lesions (uncommon): duct resection + Roux-en-Y hepaticojejunostomy
 - lower third lesions: Whipple procedure
- unresectable lesions: stent or choledochojejunostomy (surgical bypass)
- chemotherapy ± radiotherapy
- role for transplantation in some patients with Klatskins tumors

Prognosis

- radiotherapy useful for additional palliation, chemotherapy may be helpful
- the more proximal to the liver, the worse the prognosis
- overall 5 yr survival: 15%

Efficacy of Neoadjuvant Chemoradiation, Followed by Liver Transplantation, for Perihilar Cholangiocarcinoma at 12 US Centers

Gastroenterology 2012;143:88-98

Purpose: To determine the effectiveness of neoadjuvant chemoradiation and liver transplantation for unresectable perihilar cholangiocarcinoma and to determine the appropriateness of the United Network of Organ Sharing/Organ Procurement and Transplantation Network (UNOS/OPTN) criteria for model of end-stage liver disease (MELD) exception for patients with this disease.

Methods: Study conducted from 1993-2010 in 12 transplant centers. 287 patients included.

Results: Median follow-up was 2.5 yr. 43% of patients (n=122) died after a median of 1.2 yr from presentation, and of these, 60 died pretransplant. Post-transplant, 43 patients had recurrences and 62 died. Recurrence-free survival at 2, 5, and 10 yr were 78%, 65%, and 59%, respectively. Intention-to-treat survival rates at 2 and 5 yr were 68% and 53%, respectively. 25% of patients left the waiting list after a median of 4.6 mo. The waiting list drop-out rate increased by an average of 11.5% every 3 mo. Patients who received transplantation outside of the criteria for MELD exception or who had a malignancy within 5 yr had significantly worse recurrence-free survival compared to those who met the criteria (HR=2.98, 95% CI 1.79-4.95). Recurrence-free survival at 5 yr was shorter for patients with tumors >3 cm vs. ≤3 cm (p<0.001).

Conclusions: Neoadjuvant chemoradiation and liver transplantation are effective treatments for unresectable perihilar cholangiocarcinoma. Furthermore, the UNOS/OPTN criteria for MELD exception appear to be appropriate.

Pancreas

Acute Pancreatitis

- see [Gastroenterology](#), G45

GALLSTONE PANCREATITIS (35% of acute pancreatitis)

Pathogenesis

- obstruction of pancreatic duct by large or small gallstones and biliary sludge
- backup of pancreatic enzymes can cause autodigestion of the pancreas

Clinical Features (pancreatitis of any etiology)

- pain (epigastric pain radiating to back), N/V, ileus, peritoneal signs, jaundice, fever
- Ingelfinger's sign: pain worse when supine, better when sitting forward
- rarely may have coexistent cholangitis or pancreatic necrosis
- Ranson's criteria for determining prognosis of acute pancreatitis (see sidebar)
- physical exam may show: tachypnea, tachycardia, hypotension, abdominal distention and tenderness, Cullen's sign, Gray Turner's sign

Investigations

- high amylase (higher than alcoholic pancreatitis), lipase, leukocytosis
- elevated ALT (>150 IU/L), AST strongly suggest gallstone etiology of pancreatitis
- U/S may show multiple stones (may have passed spontaneously), edematous pancreas
- CXR, AXR, CT (if severe to evaluate for complications)

Treatment

- supportive: e.g. NPO, hydration, analgesia, early enteric nutrition
- antibiotics for severe cases of necrotizing pancreatitis or signs of sepsis
- stone often passes spontaneously (~90%); usually no surgical management in uncomplicated acute pancreatitis
- cholecystectomy during same admission (25-60% recurrence if no surgery)
- may need urgent ERCP + sphincterotomy if failure of conservative management if stone impacted in CBD (benefits of early ERCP controversial)
- early ERCP if concomitant cholangitis
- **surgical indications** in acute pancreatitis (rare)
 - debridement and drain placement for necrotizing pancreatitis if refractory to medical management, if septic or in ICU without other sources of sepsis

Complications

- pseudocyst (collection of pancreatic secretions >4 wk old surrounded by a defined wall of granulation tissue)
- abscess/infection, necrosis
- splenic/mesenteric/portal vessel thrombosis or rupture
- pancreatic ascites/pancreatic pleural effusion
- DM
- ARDS/sepsis/multiorgan failure
- coagulopathy/DIC
- encephalopathy
- severe hypocalcemia

Ranson's Criteria

A. At admission

1. Age >55 yr
2. WBC >16,000/mm³
3. Glucose >200 mg/dL
4. LDH ≥350 IU/L
5. AST >250 IU/L

B. During initial 48 h

1. Hct drop >10%
2. BUN rise >5 mg/dL
3. Arterial PO₂ <60 mmHg
4. Base deficit 72mg/dL
5. Calcium <8 mg/dL
6. Fluid sequestration >6 L

C. Interpretation

- ≥2 = difficult course
- ≥3 = high mortality (≥15%)

Chronic Pancreatitis

- see [Gastroenterology](#), G47

Surgical Treatment

- treatment is generally medical
- indications for surgery
 - failure of medical treatment
 - debilitating abdominal pain
 - pseudocyst complications: persistence, hemorrhage, infection, rupture
 - CBD obstruction (e.g. strictures), duodenal obstruction
 - pancreatic fistula, variceal hemorrhage secondary to splenic vein obstruction
 - rule out pancreatic cancer (present in 15% of chronic pancreatitis treated surgically)
 - anatomical abnormality causing recurrent pancreatitis
- pre-operative CT and/or ERCP are mandatory to delineate anatomy
- minimally invasive options
 - endoscopic pancreatic duct decompression: less effective than surgery
 - extracorporeal shockwave lithotripsy: if pancreatic duct stones
 - celiac plexus block: lasting benefit in 30% patients, less effective in those <45 yr or with prior pancreatic surgery
- surgical options
 - drainage procedures: only effective if ductal system is dilated
 - ♦ Puestow procedure (lateral pancreaticojejunostomy): improves pain in 80% of patients
 - pancreatectomy: best option in absence of dilated duct
 - ♦ proximal disease: Whipple procedure (pancreaticoduodenectomy) – pain relief in 80%
 - ♦ distal disease: distal pancreatectomy ± Roux-en-Y pancreaticojejunostomy
 - ♦ total pancreatectomy: refractory disease
 - denervation of celiac ganglion and splanchnic nerves

PSEUDOCYST

- localized fluid collections rich in pancreatic enzymes, with a non-epithelialized wall consisting of fibrous and granulation tissue
- complication of chronic and/or acute pancreatitis
- often resolve spontaneously
- cyst wall must be mature prior to drainage (4-6 wk)
- pseudoaneurysm an absolute contraindication to endoscopic drainage, must embolize first

Treatment

- surgical drainage (gold standard)
 - cystgastrostomy
 - cystenterostomy
 - resection
- endoscopic drainage
 - cystgastrostomy
 - cystduodenostomy
 - percutaneous catheter drainage
- consider biopsy of cyst wall to rule out cystadenocarcinoma

The hallmark of chronic pancreatitis is epigastric pain radiating to the back

The lining of pancreatic pseudocysts consists of fibrous and granulation tissue; the lack of an epithelial lining distinguishes pseudocysts from true cystic lesions of the pancreas

Pancreatic Cancer

Epidemiology

- fourth most common cause of cancer-related mortality in both men and women in Canada
- M:F = 1.3:1, average age: 50-70

Risk Factors

- increased age
- smoking: 2-5x increased risk, most clearly established risk factor
- high fat/low fiber diets, heavy alcohol use
- obesity
- DM, chronic pancreatitis
- partial gastrectomy, cholecystectomy
- chemicals: betanaphthylamine, benzidine
- African descent

Clinical Features

- head of the pancreas (70%)
 - weight loss, obstructive jaundice, steatorrhea, vague constant mid-epigastric pain (often worse at night, may radiate to back)
 - painless jaundice (occurs more often with peri-ampullary), Courvoisier's sign (see sidebar GS49)
- body or tail of pancreas (30%)
 - tends to present later and usually inoperable
 - weight loss, vague mid-epigastric pain
 - <10% jaundiced
 - sudden onset DM

Vague abdominal pain with weight loss ± jaundice in a patient over 50 yr old is pancreatic cancer until proven otherwise

Trousseau's Sign
Spontaneous peripheral venous thrombosis, often associated with pancreatic and other cancers

Investigations

- serum chemistry is non-specific, can have elevated ALP and bilirubin $>300 \mu\text{mol/L}$
- CA 19-9 (most useful serum marker of pancreatic cancer)
- U/S, contrast CT (also evaluates metastasis and resectability), ERCP, MRI, MRCP

Pathology

- ductal adenocarcinoma: most common type (75-80%); exocrine pancreas
- intraductal papillary mucinous neoplasm (IPMN)
- other: pancreatic neuroendocrine tumors (non-functional, insulinoma, gastrinoma, VIPoma, glucagonoma, somatostatinoma), mucinous cystic neoplasm (MCN), acinar cell carcinoma,
- see *Surgical Endocrinology*, GS60 for functional pancreatic neuroendocrine tumors

Treatment

- resectable (10-20% of pancreatic cancer)
 - no involvement of liver, peritoneum, or vasculature (hepatic artery, SMA, SMV, portal vein, IVC, aorta), no distant metastasis
 - Whipple procedure (pancreaticoduodenectomy) for cure $<5\%$ mortality
 - distal pancreatectomy \pm splenectomy, lymphadenectomy if carcinoma of midbody and tail of pancreas
- borderline resectable
 - tumors that abut the SMA, SMV, portal vein, hepatic artery, or celiac artery
- non-resectable (palliative \rightarrow relieve pain, obstruction)
 - most body/tail tumors are not resectable (due to late presentation)
 - relieve biliary/duodenal obstruction with endoscopic stenting or double bypass procedure (choledochoenterostomy + gastroenterostomy)
 - chemotherapy (gemcitabine, folfinrox), radiotherapy – only slightly increase survival

Prognosis

- most important prognostic indicators are lymph node status, margin status, size $>3 \text{ cm}$, perineural invasion (invasion of tumor into microscopic nerves of pancreas)
- overall 5 yr survival for all patients with pancreas cancer is 1%; following surgical resection 5 yr survival is 20%
- median survival for unresectable disease: 3-6 mo if metastatic, 8-12 mo if locally advanced at presentation

Table 20. TNM Classification System for Exocrine and Endocrine Tumors of the Pancreas

Primary Tumor (T)	Regional Lymph Nodes (N)	Distant Metastasis (M)
TX Primary tumor cannot be assessed	NX Regional lymph nodes cannot be assessed	M0 No distant metastasis
T0 No evidence of primary tumor	N0 No regional lymph node metastasis	M1 Distant metastasis
Tis Carcinoma <i>in situ</i>	N1 Regional lymph node metastasis	
T1 Tumor limited to pancreas, $<2 \text{ cm}$ in greatest dimension		
T2 Tumor limited to pancreas, $>2 \text{ cm}$ in greatest dimension		
T3 Tumor extends beyond pancreas, no involvement of celiac axis or superior mesenteric artery		
T4 Tumor involves celiac axis or superior mesenteric artery (unresectable)		

Table 21. Staging and Treatment of Pancreatic Cancer

Stage	Classification	5-Yr Survival	Treatment
0	Tis, N0, M0		Surgical resection \pm chemotherapy
IA	T1, N0, M0	14%	Same as above
IB	T2, N0, M0	12%	Same as above
IIA	T3, N0, M0	7%	Same as above
IIB	T1-3, N1, M0	5%	Same as above
III	T4, any N, M0	3%	Borderline resectable, trial of chemotherapy and radiation
IV	any T, any N, M1	1%	Non-resectable, palliative treatments

Diagnostic Value of Serum Carbohydrate Antigen 19-9 in Pancreatic Cancer: A Meta-Analysis

Tumor Biol 2014;35:7459-65 [Epub ahead of print]

Summary: 11 studies with 2,316 patients were included in the analysis. The sensitivity of CA19-9 in the diagnosis of pancreatic cancer was found to be 0.8 (95% CI 0.77-0.82) and the specificity also 80% (95% CI 0.77-0.82) with a diagnostic odds ratio of 14.79 (95% CI 8.55-25.59). Overall, CA19-9 plays an important role in the diagnosis of pancreatic cancer.

Steps of a Whipple Resection (Pancreaticoduodenectomy)

- Assessment of metastatic disease (all peritoneal surfaces)
- Mobilization of the duodenum and head of the pancreas
- Identification of the superior mesenteric vein and mobilization of the pancreatic neck
- Mobilization of the stomach; dissection of the hepatoduodenal ligament and cholecystectomy
- Division of the stomach, proximal jejunum, and CBD
- Transection of the pancreatic neck and dissection of the uncinate process from the retroperitoneum
- Restoration of gastrointestinal continuity: construction of a pancreaticojejunostomy, hepaticojejunostomy, gastrojejunostomy using a neoduodenum

Removed:

- CBD
- Gallbladder
- Duodenum
- Pancreatic head
- Distal stomach (sometimes)

Figure 28. Schematic of Whipple resection, showing the resected components

Spleen

Splenic Trauma

- typically from blunt trauma (especially in people with splenomegaly)
- most common intra-abdominal organ injury in blunt trauma
- may have Kehr's sign

Treatment

- non-operative
 - in stable patients: extended bed rest with serial hematocrit levels, close monitoring for 3-5 d; pediatric guidelines for days of bed rest is grade plus 1 (i.e. grade 3 splenic laceration requires 4 d of bed rest)
 - hemostatic control
 - splenic artery embolization if patient stable and one of: active contrast extravasation, splenic pseudoaneurysm, hemoperitoneum
- operative
 - splenorrhaphy (suture of spleen) ± splenic wrapping with hemostatic mesh – if patient hemodynamically stable, patient has stopped bleeding and laceration does not involve hilum
 - partial splenectomy, rarely performed due to risk of recurrent hemorrhage
 - total splenectomy if patient unstable or high-grade injury

Kehr's Sign

Left shoulder pain due to diaphragmatic irritation from splenic rupture, worsens with inspiration

Splenectomy

Indications

- splenic trauma (most common reason for splenectomy), hereditary spherocytosis, primary hypersplenism, chronic immune thrombocytopenic purpura (ITP), splenic vein thrombosis causing esophageal varices, splenic abscess, thrombotic thrombocytopenic purpura (TTP), sickle cell disease
- does not benefit all thrombocytopenic states (e.g. infection, most malignancies involving the bone marrow, drugs/toxins)
- probability of cure of ITP by splenectomy is 60-70%, may be predicted by response to IVIg

Complications

- short-term
 - injury to surrounding structures (e.g. gastric wall, tail of pancreas)
 - post-operative thrombocytosis, leukocytosis
 - thrombosis of portal, splenic, or mesenteric veins
 - subphrenic abscess
- long-term
 - post-splenectomy sepsis (encapsulated organisms): 4% of splenectomized patients (highest risk in those <16 yr old)
 - ♦ 50% mortality
 - ♦ prophylaxis with vaccinations, ideally 2 wk pre- or post-operative (pneumococcal, *H. influenzae*, and meningococcus)
 - ♦ liberal use of penicillin especially in children <6 yr old
 - splenosis: intra-abdominal "seeding" of splenic tissue during removal

Indication of Splenectomy

SHIRTS

Splenic abscess/splenomegaly
Hereditary spherocytosis
Immune thrombocytopenic purpura
Rupture of spleen
Thrombotic thrombocytopenic purpura
Splenic vein thrombosis

Breast

Figure 29. Anatomy of the breast

Levels of Axillary Lymph Nodes
Level I: lateral to pectoralis minor
Level II: deep to pectoralis minor
Level III: medial to pectoralis minor
 (higher level = worse prognosis)

Benign Breast Lesions

NON-PROLIFERATIVE LESIONS

- also known as fibrocystic change, chronic cystic mastitis, mammary dysplasia
- benign breast condition characterized by fibrous and cystic changes in the breast
- no increased risk of breast cancer
- age 30 to menopause (and after if HRT used)
- clinical features
 - breast pain, focal areas of nodularity or cysts often in the upper outer quadrant, frequently bilateral, mobile, varies with menstrual cycle, nipple discharge (straw-like, brown, or green)
- treatment
 - evaluation of breast mass and reassurance
 - if >40 yr old: mammography every 3 yr
 - no strong evidence for avoidance of xanthine-containing products (coffee, tea, chocolate, cola)
 - analgesia (ibuprofen, ASA)
 - for severe symptoms: OCP, danazol, bromocriptine

PROLIFERATIVE LESIONS – No Atypia

Fibroadenoma

- most common benign breast tumor in women <30 yr
- risk of subsequent breast cancer is increased only if fibroadenoma is complex, there is adjacent atypia, or a strong family history of breast cancer
- clinical features
 - nodules: smooth, rubbery, discrete, well-circumscribed, non-tender, mobile, hormone-dependent
 - unlike cysts, needle aspiration yields no fluid
- investigations
 - core or excisional biopsy required
 - U/S and FNA alone cannot differentiate fibroadenoma from Phyllodes tumor
- treatment
 - generally conservative: serial observation
 - consider excision if size 2-3 cm and growing on serial U/S (q6mo x 2 yr is usual follow-up), if symptomatic, formed after age 35, or patient preference

Intraductal Papilloma

- solitary intraductal benign polyp
- present as nipple discharge (most common cause of spontaneous, unilateral, bloody nipple discharge), breast mass, nodule on U/S
- can harbor areas of atypia or DCIS
- treatment: excision of involved duct to ensure no atypia

DDx for Breast Mass

Benign

- Fibrocystic changes
- Fibroepithelial lesions (fibroadenoma most common; benign phyllodes also)
- Fat necrosis
- Papilloma/papillomatosis
- Galactocele
- Duct ectasia
- Ductal/lobular hyperplasia
- Sclerosing adenosis
- Lipoma
- Neurofibroma
- Granulomatous mastitis (e.g. TB, granulomatosis with polyangiitis, sarcoidosis)
- Abscess
- Silicone implant

Malignant

- Breast cancer (likely invasive, DCIS rarely forms a breast mass)
- Malignant phyllodes
- Angiosarcoma (rare)

Ductal Hyperplasia Without Atypia

- increased number of cells within the ductal space
- cells retain benign cytology
- no treatment required
- slightly increased cancer risk if moderate or florid hyperplasia

PROLIFERATIVE LESIONS – With Atypia**Atypical Hyperplasias**

- can involve ducts (ductal hyperplasia with atypia) or lobules (lobular hyperplasia with atypia)
- cells lose apical-basal orientation
- increased risk of breast cancer
- diagnosis: core or excisional biopsy
- treatment: complete resection, risk modification (avoid exogenous hormones), close follow-up

OTHER LESIONS**Fat Necrosis**

- uncommon, result of trauma (may be minor, positive history in only 50%), after breast surgery (i.e. reduction)
- firm, ill-defined mass with skin or nipple retraction, \pm tenderness
- regress spontaneously, but complete imaging \pm biopsy to rule out carcinoma

Mammary Duct Ectasia

- obstruction of a subareolar duct leading to duct dilation, inflammation, and fibrosis
- may present with nipple discharge, bluish mass under nipple, local pain
- risk of secondary infection (abscess, mastitis)
- resolves spontaneously

Montgomery Tubercle

- Montgomery tubercles (or Morgagni tubercles) are papular projections at the edge of the areola
- obstruction of these glands can lead to inflammation or cystic collections (cyst of Montgomery i.e. retroareolar cyst)
- if signs of secondary infection, start treatment for mastitis
- resolves spontaneously in weeks to years

Abscess

- lactational (see [Obstetrics, OB49](#)) vs. periductal/subareolar
- unilateral localized pain, tenderness, erythema, subareolar mass, nipple discharge, nipple inversion
- rule out inflammatory carcinoma, as indicated
- treatment: initially broad-spectrum antibiotics and I&D, if persistent total duct excision (definitive)
- if mass does not resolve: U/S to assess for presence of abscess, core biopsy to exclude cancer, consider MRI

Breast Cancer

Epidemiology

- 2nd leading cause of cancer mortality in women (1st is lung cancer)

Risk Factors

- gender (99% female)
- age (80% >40 yr)
- important risk factors are prior history of breast cancer and/or prior breast biopsy (regardless of pathology)
- 1st degree relative with breast cancer (greater risk if relative was premenopausal)
- increased risk with high breast density, nulliparity, first pregnancy >30 yr, menarche <12 yr, menopause >55 yr
- decreased risk with lactation, early menopause, early childbirth
- radiation exposure (e.g. mantle radiation for Hodgkin's disease)
- >5 yr HRT

Gender followed by age are the two greatest risk factors for breast cancer

Investigations

- mammography
 - indication
 - ♦ screening, see [Family Medicine, FM4](#)
 - findings indicative of malignancy
 - ♦ mass that is poorly defined, spiculated border
 - ♦ microcalcifications
 - ♦ architectural distortion
 - ♦ interval mammographic changes
 - ♦ normal mammogram does not rule out suspicion of cancer based on clinical findings
- other radiographic studies
 - U/S: differentiate between cystic and solid
 - MRI: high sensitivity, low specificity
 - galactogram/ductogram (for nipple discharge): identifies lesions in ducts
 - metastatic workup as indicated (usually after surgery or if clinical suspicion of metastatic disease): bone scan, abdominal U/S, CXR (or CT chest/abdomen/pelvis), CT head (only if specific neurological symptoms)

Any palpable dominant breast mass requires further investigation

Diagnostic mammography is indicated in all patients, even in women <50 yr

Phyllodes tumors are rare fibroepithelial breast tumors that can be benign or malignant that mostly affect women from 35-55 yr

Diagnostic Procedures

- needle aspiration: for palpable cystic lesions; send fluid for cytology if blood or cyst does not completely resolve
- U/S or mammography guided core needle biopsy (most common)
- fine needle aspiration (FNA): for palpable solid masses; need experienced practitioner for adequate sampling
- excisional biopsy: only performed as second choice to core needle biopsy; should not be done for diagnosis if possible

Genetic Screening

- consider testing for BRCA1/2 if:
 - patient diagnosed with breast AND ovarian cancer
 - strong family history of breast/ovarian cancer
 - family history of male breast cancer
 - young patient (<35 yr)
 - bilateral breast cancer in patients <50 yr

Staging

- clinical
 - tumor size by palpation, mammogram
 - nodal involvement by palpation
 - metastasis by physical exam, CXR, and abdominal U/S (or CT chest/abdomen/pelvis), bone scan (usually done post-operative if node-positive disease)
- pathological
 - tumor size
 - grade: modified Bloom and Richardson score (I to III) – histologic, nuclear, and mitotic grade
 - number of axillary nodes positive for malignancy out of total nodes resected, extranodal extension, sentinel node positive/negative
 - estrogen receptor (ER) + progesterone receptor (PR) testing
 - Her2Neu receptor testing
 - margins: negative, <1 mm, positive
 - lymphovascular invasion (LVI)
 - extensive *in situ* component (EIC): DCIS in surrounding tissue
 - involvement of dermal lymphatics (inflammatory) – automatically Stage IIIB

Table 22. Staging of Breast Cancer (American Joint Committee on Cancer)

Stage	Tumor	Nodes (regional) (clinical)	Metastasis	Survival (5 yr)
0	<i>in situ</i>	None	None	99%
I	<2 cm	None	None	94%
II A	<2 cm	Mobile ipsilateral	None	85%
II B	2-5 cm or >5 cm	None or mobile ipsilateral	None None	70%
III A	Any size	Fixed ipsilateral or internal mammary	None	52%
III B	Skin/chest wall invasion	Any	None	48%
III C	Any size	Ipsilateral infraclavicular/internal mammary plus axillary nodes; ipsilateral supraclavicular node(s) ± axillary nodes	None	33%
IV	Any	Any	Distant	18%

Favorable Features

- <2 cm
- Grade I (low grade)
- Node negative
- ER positive
- Mucinous pattern

Unfavorable Features

- >5 cm
- Grade III (high grade)
- Node positive
- ER negative
- Inflammatory cancer
- Her2Neu positive
- Positive margins
- LVI
- EIC
- Dermal lymphatics involved

Pathology

- non-invasive (cannot penetrate basement membrane)
 - ductal carcinoma *in situ* (DCIS)
 - ♦ proliferation of malignant ductal epithelial cells completely contained within breast ducts, often multifocal
 - ♦ 80% non-palpable, detected by screening mammogram
 - ♦ risk of invasive ductal carcinoma in same breast up to 35% in 10 yr
 - ♦ treatment
 - lumpectomy with wide excision margins + radiation (5-10% risk invasive cancer)
 - mastectomy if large area of disease, high grade, or multifocal (risk of invasive cancer reduced to 1%)
 - possibly tamoxifen as an adjuvant treatment
 - 99% 5 yr survival
 - lobular carcinoma *in situ* (LCIS)
 - ♦ neoplastic cells completely contained within breast lobule
 - ♦ no palpable mass, no mammographic findings, usually incidental finding on breast biopsy for another indication
 - ♦ treatment
 - clinical follow-up
 - chemoprevention (tamoxifen)
 - surgery (uncommon)
 - ♦ not a precursor lesion, but considered a risk factor for breast cancer development
- invasive
 - invasive ductal carcinoma (most common 80%)
 - ♦ originates from ductal epithelium and infiltrates supporting stroma
 - ♦ characteristics: hard, scirrhous, infiltrating tentacles, gritty on cross-section
 - invasive lobular carcinoma (8-15%)
 - ♦ originates from lobular epithelium
 - ♦ 20% bilateral (i.e. more often than infiltrating ductal carcinoma)
 - ♦ does not form microcalcifications, harder to detect mammographically (may benefit from MRI)
 - Paget's disease (1-3%)
 - ♦ ductal carcinoma that invades nipple with scaling, eczematoid lesion
 - inflammatory carcinoma (1-4%)
 - ♦ ductal carcinoma that invades dermal lymphatics
 - ♦ most aggressive form of breast cancer
 - ♦ clinical features: erythema, skin edema, warm, swollen and tender breast ± lump
 - ♦ peau d'orange indicates advanced disease (IIIb-IV)
 - male breast cancer (<1%)
 - ♦ most commonly invasive ductal carcinoma
 - ♦ often diagnosed at later stages
 - ♦ stage-for-stage similar prognosis to breast cancer in females
 - ♦ consider genetic testing
 - sarcomas: rare
 - ♦ most commonly Phyllodes tumor, a variant of fibroadenoma with potential for malignancy
 - ♦ can also be angiosarcomas – after previous radiation
 - lymphoma: rare
 - other: papillary, medullary, mucinous, tubular cancers
 - ♦ generally better prognosis

Treatment

Table 23. Breast Cancer Treatment by Stage

Stage	Primary Treatment Options	Adjuvant Systemic Therapy
0 (<i>in situ</i>)	BCS + radiotherapy BCS alone if margins > 1 cm and low nuclear grade Mastectomy* ± SLNB	None
I	BCS + axillary node dissection + radiotherapy Mastectomy* + axillary node dissection/SLNB	May not be needed; discuss risks/benefits of chemotherapy and tamoxifen
II	BCS + axillary node dissection + radiotherapy Mastectomy* + axillary node dissection/SLNB	Chemotherapy for premenopausal women or postmenopausal and estrogen receptor (ER) negative, followed by tamoxifen if ER positive
III	Likely mastectomy + axillary node dissection + radiotherapy	Neoadjuvant therapy may be considered i.e. pre-operative chemotherapy and/or hormone therapy. Adjuvant radiation and chemotherapy may also be appropriate (i.e. post-operative)
Inflammatory	Likely mastectomy + axillary node dissection + radiotherapy	Neoadjuvant therapy
IV	Surgery as appropriate for local control	Primary treatment is systemic therapy i.e. chemotherapy and/or hormone therapy

BCS = breast-conserving surgery; SLNB = sentinel lymph node biopsy

*If no reason to select mastectomy, the choice between BCS + radiotherapy and mastectomy can be made according to patient's preference since choice of local treatment does not significantly affect survival if local control is achieved

Diagnosis of Breast Lesions: Fine-Needle Aspiration Cytology or Core Needle Biopsy? A Review

J Clin Pathol 2012;65:287-292

CNB

- High sensitivity (85-100%) and specificity (86-100%).
- High success rates for diagnosis of malignancy for palpable lesions (97%), non-palpable lesions (94%), and lesions <10 mm (90%).
- More accurate for histologic and immunohistochemistry examinations, and differentiation between *in situ* and invasive malignancies.
- Reliable for testing of ER, PR, and HER2 status and proliferation assessment.
- More painful procedure.

FNAC

- Variable sensitivity (35-95%) and specificity (48-100%).
- Quality correlates with skill of aspirator.
- Lower success rates for diagnosis of malignancy for palpable lesions (75-90%), non-palpable lesions (34-58%), and lesions <10 mm (50%).
- High rates of insufficient sampling for lesions >40 mm or calcified lesions.
- Quick to perform.
- Low technical costs.

Conclusions: FNAC is preferable for palpable, low malignancy-risk lesions. However, for potential malignancies, CNB is advantageous with respect to prognostication and prediction and is likely cost-effective in the long-term.

Breast conserving surgery can be offered to most women with stage I/II disease

Primary Surgical Treatment

- BCS: lumpectomy with wide local excision
 - for treatment of stage I and II disease
 - must be combined with radiation for survival equivalent to mastectomy
 - contraindications
 - ♦ high risk of local recurrence: extensive malignant-type calcifications on mammogram, multifocal primary tumors, or failure to obtain tumor-free margins after re-excision
 - ♦ contraindications to radiation therapy (pregnancy, previous radiation, collagen vascular disease)
 - ♦ large tumor size relative to breast
- mastectomy
 - radical mastectomy (rarely done anymore): removes all breast tissue, skin, pectoralis muscle, axillary nodes
 - modified radical mastectomy (MRM): removes all breast tissue, skin, and axillary nodes
 - simple mastectomy: removes all breast tissue and skin
 - see [Plastic Surgery, PL32](#) for breast reconstruction
- axillary lymph node dissection (ALND)
 - performed if SLNB is positive or nodes are clinically concerning
 - risk of arm lymphedema (10-15%), decreased arm sensation, shoulder pain
- sentinel lymph node biopsy (SLNB)
 - technetium-99 ± blue dye injected at tumor site prior to surgery to identify sentinel node(s)
 - intraoperative frozen section
 - proceed with ALND if positive
 - 5% false negative rate

Adjuvant/Neoadjuvant

- radiation
 - indications
 - ♦ decrease risk of local recurrence; almost always used after BCS, sometimes after mastectomy (if >4 nodes positive or tumor >5 cm)
 - ♦ inoperable locally advanced cancer
 - axillary nodal radiation may be added if nodal involvement
- hormonal
 - indications
 - ♦ ER positive plus node-positive or high-risk node-negative
 - ♦ palliation for metastases
 - tamoxifen if premenopausal or aromatase inhibitors (e.g. anastrozole)
 - ovarian ablation (e.g. goserelin/GnRH agonist, oophorectomy), progestins (e.g. megestrol acetate), androgens (e.g. fluoxymesterone) are other options
- chemotherapy
 - indications
 - ♦ ER negative plus node-positive or high-risk node-negative
 - ♦ ER positive and young age
 - ♦ stage I disease at high risk of recurrence (high grade, lymphovascular invasion)
 - ♦ palliation for metastatic disease

Post-Treatment Follow-Up

- visits q3-6mo x 2 yr and annually thereafter (frequency is controversial)
- annual mammography; no other imaging unless clinically indicated
- psychosocial support and counseling

Local/Regional Recurrence

- recurrence in treated breast or ipsilateral axilla
- 1% per year up to maximum of 15% risk of developing contralateral malignancy
- 5x increased risk of developing metastases

Metastasis

- bone > lungs > pleura > liver > brain
- treatment is palliative: hormone therapy, chemotherapy, radiation

Analysis of Circulating Tumor DNA to Monitor Metastatic Breast Cancer

NEJM 2013;368:1199-1209

Study: The quantification of circulating tumor DNA, cancer antigen 15-3 (CA 15-3), and circulating tumor cells in 30 women with metastatic breast cancer receiving systemic therapy. The results were compared with radiographic imaging of tumors.

Results/Conclusions: Circulating tumor DNA was detected in 97% of women and showed greater correlation with changes in tumor burden than did CA 15-3 or circulating tumor cells, providing the earliest measure of treatment response in 53% of women. CA 15-3 and circulating tumor cells were detected in 78% and 87% of women, respectively. Circulating tumor DNA may therefore be an informative biomarker for metastatic breast cancer.

There is no survival benefit of mastectomy over lumpectomy plus radiation for stage I and II disease

Personalized Medicine Gene Expression (Oncotype DX)

Biomark Cancer 2013;5:61-70

- Real time PCR assay to provide prognostic information independent of clinical and pathological factors.
- Analyzes 21 different genes (16 cancer related and 5 reference genes) within a tumor sample.
- Used in women with stages I and II, hormone receptors positive, lymph node negative, invasive breast cancer, who received tamoxifen for 5 yr.
- Calculated the risk of recurrence based on gene expression to help decide whether more aggressive treatment such as chemotherapy should be considered.
- Score between 0-100 indicating risk of recurrence if treated with hormonal therapy only.
 - Score <17: low risk of recurrence (treat with hormonal therapy only).
 - Score 18-30: medium risk of recurrence; chemotherapy is considered.
 - Score >31: high risk of recurrence; chemotherapy will benefit patient.

Surgical Endocrinology

Thyroid and Parathyroid

- see [Endocrinology](#), E20 and [Otolaryngology](#), OT35-OT38

Thyroidectomy

- indications: thyroid cancer, symptomatic thyroid mass or goiter, medically refractory Graves' or hyperthyroidism
- contraindications: uncontrolled severe hyperthyroidism (i.e. Graves') due to risk of intraoperative or post-operative thyroid storm
- pre-operative workup: thyroid U/S for thyroid nodules, FNA for large nodules, U/S of the neck for lesions suspicious for papillary or medullary thyroid cancer, CT neck useful to rule out extension, vocal cord function
- complications: hypocalcemia secondary to hypoparathyroidism, recurrent/superior laryngeal nerve injury, neck hematoma, infection, thyrotoxic storm

Parathyroidectomy

- indications: symptomatic primary hyperparathyroidism due to effects of PTH on bone or kidneys, asymptomatic primary hyperparathyroidism with specific laboratory criteria (elevated serum Ca, marked hypercalciuria, Cr clearance <30% normal, bone density reduction with T score <2.5, age <50 yr)
- contraindications: familial hypocalciuric hypercalcemia
- pre-operative workup: ^{99m}Tc sestamibi scanning, ± SPECT or CT, U/S
- complications: recurrent/superior laryngeal nerve injury, post-operative hypocalcemia, infection, bleeding

Adrenal Gland

- see [Endocrinology](#), E29
- functional anatomy
 - cortex: glomerulosa (mineralocorticoids), fasciculata (glucocorticoids), reticularis (sex steroids)
 - medulla: catecholamines (epinephrine, norepinephrine)
- types of adrenal tumors: functional (e.g. Cushing's syndrome, Conn's syndrome) or non-functional

INCIDENTALOMA

- adrenal mass discovered by investigation of unrelated symptoms

Epidemiology

- benign adenoma (38%) > metastases to adrenal (22%) >> cyst, carcinoma, pheochromocytoma, neuroblastoma
- metastasis to adrenal gland from: lung > breast, colon, lymphoma, melanoma, kidney
- peak incidence of carcinoma: females age 50-60, risk decreases with increasing age and male gender

Investigations

- MRI, CT: size >6 cm is best predictor of primary adrenal carcinoma (92% are >6 cm)
- functional studies
 - pheochromocytoma: 24 h urine epinephrine, norepinephrine, metanephrine, normetanephrine, VMA (vanillylmandelic acid)
 - Cushing's: 24 h urine cortisol or 1 mg overnight dexamethasone suppression test
 - aldosteronoma: electrolytes, aldosterone:renin level, saline suppression test if appropriate
 - adrenal androgens: 17-OH progesterone, DHEAS
- FNA biopsy: if suspect metastasis to adrenal (must exclude pheochromocytoma first to prevent a hypertensive crisis)
 - indicated if history of cancer or patient is smoker
- iodocholesterol scintigraphy: may distinguish benign vs. malignant disease

Treatment

- functional tumor: resect
- non-functional tumor
 - >4 cm: resect
 - <4 cm: follow-up imaging in 6-12 mo, resect if >1 cm enlargement

Pancreas

INSULINOMA

- tumor that secretes insulin
- most common pancreatic endocrine neoplasm; 10% associated with MEN1 syndrome

Clinical Features

- Whipple's triad
- palpitations, trembling, diaphoresis, confusion, seizure, personality changes

Investigations

- blood work: decreased serum glucose and increased serum insulin and C-peptide
- U/S, CT: insulinomas evenly distributed throughout head, body, tail of pancreas

Treatment

- only 10% are malignant
- enucleation of solitary insulinomas may be done endoscopically
- tumors >2 cm located close to the pancreatic duct may require pancreatectomy or pancreaticoduodenectomy

Whipple's Triad

- Symptomatic fasting hypoglycemia
- Serum glucose <50 mg/dL
- Relief of symptoms when glucose is administered

GASTRINOMA

- tumor secreting gastrin; cause of Zollinger-Ellison syndrome

Clinical Features

- abdominal pain, PUD, severe esophagitis
- multiple ulcers in atypical locations refractory of antacid therapy

Investigations

- blood work: serum gastrin levels (usually >1,000 pg/mL), secretin stimulation test
- U/S, CT: 70-90% found in Passaro's triangle (head of pancreas medially, 2nd portion of duodenum inferiorly, and the confluence of the cystic and CBD superiorly)
- octreotide scintigraphy scan

Treatment

- 50% are malignant
- surgical resection of tumor dependent on location
- non-surgical treatment: chemotherapy, somatostatin analogues, interferon, chemoembolization
- if inoperable, vagotomy can be performed for symptomatic control

VASOACTIVE INTESTINAL PEPTIDE-SECRETING TUMOR

- tumor secreting VIP; commonly located in the distal pancreas and most are malignant when diagnosed

Clinical Features

- severe watery diarrhea causing dehydration, weakness, electrolyte imbalance

Investigations

- blood work: serum VIP levels
- U/S, CT

Treatment

- somatostatin analogues
- surgical resection/palliative debulking

Pediatric Surgery

Table 24. Pediatric Surgery

Condition	Epidemiology and Risk Factors	Pathophysiology	Clinical Features and History	Physical Exam	Investigations	Treatment	Prognosis
Hydrocele (see Urology, U28) 	1-2% of live births Present at birth, majority close spontaneously by 1 yr M:F = 6:1 Prematurity	Communicating hydroceles: processus vaginalis fails to close with small opening for fluid to move freely between peritoneal cavity through patent processus (if opening progresses to allow passage of intestine, it is a hernia) Noncommunicating hydroceles: fluid trapped in tunica vaginalis; in older children, may be secondary to testicular pathology (reactive hydrocele)	Painless scrotal mass Communicating hydroceles increase in size with standing or Valsalva, may be absent in the morning and large in the evening	Transillumination suggests hydrocele Silk glove sign: gently palpating hydrocele sac over pubic tubercle feels like rubbing silk on silk	U/S if suspect pathology	Most resolve spontaneously by 1 yr Surgical repair if: – Persistence > 2 yr – Pain – Fluctuating in size which suggests communication – Cosmetic reasons – Infection	<2% recurrence
Hypertrophic Pyloric Stenosis	0.03-1.0% of live births Can present at 1-20 wk, most commonly at 6-8 wk M:F = 4:1 Early erythromycin exposure (<13 d old)	Acquired pyloric circular muscle hypertrophy results in gastric outlet obstruction Hypovolemia caused by emesis of gastric contents causes hypochloremic hypokalemic metabolic alkalosis Electrolyte exchange based volume retention in kidneys results in paradoxical aciduria	Projectile non-bilious vomiting Vomiting 30-60 min after feeds Hungry after vomiting Dehydration (variable severity)	Smooth oblong 1-2 cm mass palpable above umbilicus, "olive" Visible left-to-right gastric contraction "waves" after feeding	Electrolytes (assess hypochloremia, dehydration) U/S shows pyloric length > 14 mm, muscle thickness > 4 mm Upper GI series necessary only when U/S unavailable or non-diagnostic will show "string sign"	Fluid resuscitate with normal saline, correct electrolyte and acid/base abnormalities with D5, 1/2NS + 20 mEq/L KCl at maintenance rate NGT decompression unnecessary Pyloromyotomy, open (Ramstedt vs. transumbilical or laparoscopic approach) Alternative therapies such as TPN/wait or atropine impractical due to long time course of effect	Pyloromyotomy curative
Congenital Diaphragmatic Hernias 3 types: – Posterolateral (Bochdalek) – Left-sided, 85% – Right-sided, 13% – Bilateral, rare, often fatal – Anterior (Morgagni) – Hiatus	1 in 2,000 to 5,000 live births Presents within hours of life although some cases of delayed presentation M=F >10% are associated with other congenital anomalies Prenatal diagnosis common	Left-sided: small bowel, large bowel, stomach, and solid viscera (spleen, left lobe of liver) herniate into thorax Right-sided: liver, large bowel herniate into thorax Pulmonary hypoplasia Pulmonary HTN	Early respiratory distress Cyanosis Scaphoid abdomen Prenatal diagnosis	Decreased air entry ± bowel sounds in the chest Displaced heart sounds	Prenatal US/MRI ABG CXR (bowel loops in hemithorax, shifted heart) Echocardiography Genetic consultation if warranted	Intubate Orogastric suction Period of respiratory stabilization due to associated pulmonary hypoplasia (may require extracorporeal membrane oxygenation) Surgical repair after stable by hernia reduction and closure of diaphragmatic defect – open vs. thoracoscopic vs. laparoscopic with or without prosthetic or muscular patch depending on size of defect	Later presentations have better outcomes Hearing deficit (40%) Associated GERD MSK defects – chest wall and scoliotic defects a potential complication of thoracotomy Need for long-term surveillance for potential recurrence Failure to thrive Chronic lung disease if severe hypoplasia

Hypertrophic Pyloric Stenosis
 Non-bilious emesis in infant is the classic presentation

Table 24. Pediatric Surgery (continued)

Condition	Epidemiology and Risk Factors	Pathophysiology	Clinical Features and History	Physical Exam	Investigations	Treatment	Prognosis
Meckel's Diverticulum Most common remnant of vitelline duct that connects yolk sac with primitive midgut	1-3% of population M:F = 3:1 Present most frequently during first 5 yr of life Symptomatic in 2% of cases	Failure of vitelline duct to regress 5-7 wk <i>in utero</i> ; 50% contain heterotopic tissue (e.g. gastric mucosa, ectopic pancreas); other associated anomalies include omphalomesenteric fistula, umbilical sinus, umbilical cyst, fibrous band	BRBPR (heterotopic gastric mucosa in Meckel's causing mucosal ulceration and bleeding in adjacent small bowel mucosa) Abdominal sepsis (Meckel's diverticulitis ± perforation) Small bowel volvulus around fibrous band	Tenderness (lower abdomen) near umbilicus	AXR Meckel scan: scan for ectopic gastric mucosa with technetium Tc99m pertechnetate IV (sensitivity 85%, specificity 95%)	Stabilize, resection by laparotomy or laparoscopy ± incidental appendectomy	Resection curative
Malrotation	1:500 live births 1/3 present by 1 wk of age, 3/4 by 1 mo of age, 90% by 1 yr of age M:F = 1:1; higher incidence among patients with cardiac anomalies, heterotaxy syndromes	Failure of gut to normally rotate around SMA with associated abnormal intestinal attachments and anatomic positions Represent a spectrum of rotational abnormalities including complete non-rotation (which is not at high risk for volvulus)	Bilious emesis is THE cardinal sign, especially if abdomen nondistended If bilious emesis in ill child with distended abdomen, consider surgical exploration to rule out volvulus Rectal bleed (late/ominous signs) Intermittent symptoms	Bilious drainage from NGT Tachycardic, pale Diaphoretic Flat abdomen Tenderness	AXR: obstruction of proximal small bowel, double-bubble sign, intestinal wall thickened Immediate UGI: dilated duodenum, duodenojejunal segment (Ligament of Treitz) right of midline and not fixed posteriorly over spinal column, "corkscrew" sign indicating volvulus U/S: "whirlpool" sign, abnormal SMA/SMV relationship indicates UGI to rule out rotational anomalies	IV antibiotics Fluid resuscitation EMERGENT LAPAROTOMY Ladd procedure: counterclockwise reduction of midgut volvulus, division of Ladd's bands, division of peritoneal attachments between cecum and abdominal wall that obstruct duodenum, broadening of the mesentery (open folded mesentery like a book and divide congenital adhesions), ± appendectomy Positioning the bowel into non-rotation (small bowel in right abdomen, large bowel in left abdomen)	Mortality related to length of bowel loss: 10% necrosis – 100% survival rate, 75% necrosis – 35% survival rate Recurrence 2-6%
Gastroschisis	1:2,000 live births Antenatal diagnosis common Increases with younger maternal age and associated with IUGR M:F = 1:1	Defect of abdominal wall, with free extrusion of intestine into amniotic cavity No specific environmental factor identified Defect in embryogenesis unclear	Not associated with genetic syndromes 10% with intestinal atresia Some cases associated with short bowel syndrome due to antenatal volvulus and necrosis of herniated bowel	Hollow viscera (stomach, small and large bowels) Defect lateral to cord (usually right) Bowel may be inflamed, thickened, matted, foreshortened Defect size variable	Prenatal U/S Elevated MS-AFP	NGT decompression IV fluids IV antibiotics Keep viscera moist and protected until surgical reduction with primary abdominal closure or staged closure with silo May have bowel dysmotility requiring motility medications	>90% survival rate
Omphalocele	1:5,000 live birth Antenatal diagnosis common Lower gestational age Increased maternal age M:F = 1.5:1	Defect of abdominal wall, with extrusion of sac covered viscera (amnion, Wharton's jelly, peritoneum) Duhamel's theory – failure of body wall morphogenesis	Associated with genetic syndromes 30-70% (e.g. Pentalogy of Cantrell, congenital heart disease, Beckwith-Wiedemann syndrome) Associated pulmonary hypoplasia	Hollow viscera (stomach, small and large bowels, often liver) Cord on the sac	Prenatal U/S Elevated MS-AFP	NGT decompression IV fluids IV antibiotics Small defect (<2 cm): Primary closure Medium (2-4 cm) and large (>4 cm) defects best treated with silver sulfadiazine to promote epithelialization coupled with compression dressing to allow gradual reduction, followed by future repair with or without mesh	40-70% survival rate Higher survival rates most likely related to antenatal mortality of fetuses with giant omphaloceles

Bilious vomiting in infant is a life-threatening emergency secondary to midgut volvulus until proven otherwise

Rule of 2s for Meckel's Diverticulum

- 2% of the population
- 2:1 male-to-female ratio
- Symptomatic in 2% of cases
- Found within 2 feet (10-90 cm) of the ileocecal (IC) valve
- 2 inches in length
- 2 inches in diameter
- 2 types of tissue (gastric, pancreatic)
- Often present by 2 yr of age

Table 24. Pediatric Surgery (continued)

Condition	Epidemiology and Risk Factors	Pathophysiology	Clinical Features and History	Physical Exam	Investigations	Treatment	Prognosis
Umbilical Hernias	Incidence 2-14% Increases with prematurity Decreases with increasing age	Incomplete closure of peritoneal and fascial layers within umbilicus by 5 yr	Majority asymptomatic Majority spontaneously resolve by age 5 Incarceration prior to age 5 very rare Most symptoms occur in late adolescence or adulthood	Protrusion from umbilicus Important to differentiate from less common abdominal wall hernias that do not spontaneously resolve (e.g. epigastric hernias) Most umbilical fascial defects > 1.5 cm in infancy will not close spontaneously	None if uncomplicated	Repair if not spontaneously closed by age 5 Earlier repair of large "proboscoid" hernias with extensive skin stretching may be warranted for cosmetic reasons Simple primary closure of fascial defect	Low risk of recurrence
Intestinal Atresia	Incidence 2-14% May be antenatally diagnosed by dilated bowel loops or "double-bubble" sign on x-ray for duodenal atresia Decreasing with increasing age	Duodenal – failure of bowel to recanalize after endodermal epithelium proliferation (wk 8-10) Jejunal/ileal – acquired as a result of vascular disruption → ischemic necrosis → resorption of necrotic tissue → blind distal and proximal ends Colonic – mechanism unknown, thought to be similar to small bowel atresia	Gastric distension and vomiting (usually bilious) Duodenal – may be associated with other anomalies (tracheoesophageal fistula, cardiac, renal, and vertebral anomalies), 24-28% have Down syndrome Jejunal/ileal – within 2 d of birth, may be associated with CF Colonic – within 3 d of birth	Complete physical Special attention to abdominal exam Perineum and anus Include evaluation of respiratory distress and signs of volume depletion Congenital anomalies Jaundice	Contrast enema ± UGI with small bowel follow through (SBFT) Group and screen INR and PTT if for surgery	NPO NGT decompression Fluid resuscitate TPN Broad spectrum antibiotics Duodenal – duodenoduodenostomy or duodenojejunostomy Jejunal/ileal – primary anastomosis; or if atresia associated with short bowel then may create end stoma or defer surgery for bowel lengthening procedures Colonic – primary anastomosis	Long-term survival Duodenal – 86% Jejunal/ileal – 84% Colonic – 100%
Hirschsprung's Disease	1:5,000 births M:F = 3:1 to 4:1, approaches 1:1 when whole colon involved Can have aganglionosis of small bowel as well Familial Hirschsprung's in <5% of cases	Defect in migration of neurocrest cells to intestine resulting in aganglionic bowel that fails to peristaltise and internal sphincter that fails to relax (internal anal sphincter achalasia) causing functional and partial mechanical obstruction, respectively; always starts in the rectum and variable involvement proximally; RET mutation	Failure to pass meconium spontaneously within 48 h of life is the classic history (95% of normal children should pass meconium within 24 h, and the remaining 5% within 48 h) Symptoms of bowel obstruction: abdominal distension, constipation, bilious emesis Enterocolitis/sepsis Failure to thrive	± abdominal distension Squirt/blast sign	Rectal biopsy (gold standard) – look for aganglionosis and neural hypertrophy AXR Contrast enema to find narrow rectum and transition zone Anal manometry unreliable in infants – classic finding is absence of rectoanal inhibitory reflex	Surgical resection of aganglionic intestinal segment and anastomosis of remaining intestine to anus Either in newborn period or staged if extensive aganglionosis	Most have normal/near-normal anorectal function Complications: fecal incontinence and constipation, post-operative enterocolitis (medical emergency if progresses to sepsis)
Cryptorchidism	2-5% of term males – most of these descend spontaneously by 6 mo of age 1% of males do not spontaneously descend	Idiopathic Descent is mediated by descendin which is created in response to testosterone Descent usually begins at 28 wk	Palpable testicle within inguinal canal or testicle which can be milked down into scrotum (called retractile testis) Occasionally no palpable testis as it is intra-abdominal Consider other congenital abnormalities	Bi-annual testicular exam with palpation Distinguish truly undescended testis from retractile testis (which is "high" testis due to hyperactive cremasteric muscles)	Depends on age of presentation U/S or MRI if no palpable testis Older child: LH, FSH, MIS, hCG stimulation test for gonadotropin production Infant: U/S, FSH, LH, karyotype, MIS, 17-hydroxyprogesterone	hCG to stimulate testosterone production and descent Orchidopexy – especially if undescended by age 6 mo-2 yr	Orchidopexy Decreased risk of torsion and blunt trauma to testicle No effect on malignant potential of testicle Descent can preserve spermatogenesis if performed by 1 yr of age 1/1,000 risk for testicular cancer (population risk is 1/4,000)

Table 24. Pediatric Surgery (continued)

Condition	Epidemiology and Risk Factors	Pathophysiology	Clinical Features and History	Physical Exam	Investigations	Treatment	Prognosis
Intussusception	Most common cause of bowel obstruction between the ages of 6-36 mo 26/100,000 newborns M:F = 3:2 Pathologic lead points: enlarged Peyer's patches due to viral infections of the GI tract, polyps, Meckel's diverticulum CF, lymphoma, IBD may increase risk	Idiopathic is most common Usually starts at ileocecal junction Telescoping of bowel into itself causing an obstruction and vascular compromise	Acute onset of abdominal pain which is classic episodic "colicky" pain Vomiting ± bilious Abdominal mass Currant-jelly stool suggests mucosal necrosis and sloughing	Abdominal exam Palpate for masses (especially sausage shaped upper abdominal mass) and tenderness Signs of bowel obstruction: distended abdomen Look for localized peritonitis which suggests transmural ischemia	AXR for signs of bowel obstruction or perforation U/S if suspect pathology	If peritonitis, then consider operative management Non-operative management involves reduction via air contrast enema Operative reduction can be done open or laparoscopically Resection of involved colon if failure to reduce or bowel appears compromised	10% recurrence rate If recurrent = more likely non-idiopathic In successfully reduced by enema in older children allow 2 wk resolution of edema then perform SBFT to rule out pathologic lead points
Tracheoesophageal Fistula (TEF)	1:3,000-1:4,500	Associated anomalies in 50%: VACTERL association (see Pediatrics P42) 	Varies with type of fistula May have history of maternal polyhydramnios May present after several months (if no associated esophageal atresia) of non-bilious vomiting, coughing, cyanosis with feeds, respiratory distress, recurrent pneumonia, frothy bubbles of mucus in mouth and nose that return after suctioning		X-ray: anatomic abnormalities, NGT curled in pouch	Investigate for other congenital anomalies, early repair by surgical ligation to prevent lung damage and maintain nutrition and growth	Complications: pneumonia, sepsis, reactive airways disease Following repair: esophageal stenosis and strictures at repair site, GERD, and poor swallowing (i.e. dysphagia, regurgitation)
Inguinal Hernias	5% of all term newborns 2x risk and more likely bilateral if pre-term M:F = 4:1 Low birth weight increases risk 1/5 inguinal hernias will become incarcerated if patient is <1 yr old Incarceration is more common in females Associated with other conditions: androgen insensitivity, connective tissue diseases	All infant hernias are indirect: descent of intra-abdominal contents through the internal inguinal ring through a patent tunica vaginalis	Most common presentation: painless intermittent mass in groin, may also note extension into scrotum (scrotal mass in absence of inguinal mass is a hydrocele) If incarcerated: tender, vomiting, firm mass, erythema then cyanosis of mass may be noted	Palpate for "bag of worms" suggests possible testicular varicocele Biannual testicular exam + palpation along inguinal canal to evaluate for any masses "Silk sign" – palpable thickening of cord Mass palpated at external inguinal ring and reducible through inguinal canal into abdomen Must always try reduction to confirm that hernia is not incarcerated	Physical exam is gold standard U/S only if physical exam uncertain (e.g. in small infants where exam can be difficult)	Manual reduction – to relieve acute symptoms Herniorrhaphy – definitive treatment by reduction of herniated contents and high ligation of sac for indirect hernias Laparoscopic or open techniques	Risk of recurrence after surgical reduction <3% but higher if repair done in premature infants or if hernia was incarcerated/strangulated at repair

Skin Lesions

- see [Dermatology, D5](#); [Emergency Medicine, ER17](#); [Plastic Surgery PL5](#)

All inguinal hernias of infancy and childhood require repair at the earliest convenience; emergent repair if incarcerated/strangulated

Common Medications

Antiemetics	<ul style="list-style-type: none"> • dimenhydrinate (Gravol®) 25-50 mg PO/IV/IM q4-6h prn • prochlorperazine (Stemetil®) 5-10 mg PO/IV/IM bid-tid prn • metoclopramide (Maxeran®) 10 mg IV/IM q2-3h prn, 10-15 mg PO qid (30 min before meals and qhs) • ondansetron (Zofran®) 4-8 mg PO q8h prn • granisetron (Kytrel®) 1 mg PO bid (for nausea from chemotherapy/radiation)
Analgesics	<ul style="list-style-type: none"> • acetaminophen ± codeine (Tylenol® #3/plain) 1-2 tabs q4-6h PO/PR prn • hydromorphone i-ii tabs PO q4h prn, 0.5-2 mg IV q3-4h prn • ibuprofen 200-400 mg PO q4-6h prn • morphine 2.5-10 mg IM/SC q4-6h prn + 1-2 mg IV q1h prn for breakthrough • ketorolac (Toradol®) 30-60 mg IM/IV q6h prn • Percocet® (acetaminophen/oxycodone, 325/5 mg) 1-2 tabs PO q4-6h prn
DVT Prophylaxis	<ul style="list-style-type: none"> • heparin 5,000 units SC bid, if cancer patient then heparin 5,000 units SC tid • dalteparin (Fragmin®) 5,000 units SC daily • enoxaparin (Lovenox®) 40 mg SC daily
Antidiarrheals	<ul style="list-style-type: none"> • loperamide (Imodium®) 4 mg PO initially, then 2 mg PO after each loose stool up to 16 mg/d • diphenoxylate + atropine (Lomotil®) 2 tabs/10 mL PO qid
Laxatives	<ul style="list-style-type: none"> • sennosides (Senokot®) 1-2 tabs qhs • docusate sodium (Colace®) 100 mg PO bid • glycerine suppository 1 tab PR prn • lactulose 15-30 mL PO qid prn • milk of magnesia (MOM) 30-60 mL PO qid prn • bisacodyl (Dulcolax®) 10-15 mg PO prn
Sedatives	<ul style="list-style-type: none"> • zopiclone (Imovane®) 5-7.5 mg PO qhs prn • lorazepam (Ativan®) 0.5-2 mg PO/SL qhs prn
Antibiotics	<ul style="list-style-type: none"> • cefazolin (Ancef®) 1 g IV/IM on call to OR or q8h – GP except <i>Enterococcus</i>, GN only <i>E. coli</i>, <i>Klebsiella</i>, and <i>Proteus</i> • cefalexin (Keflex®) 250-500 mg PO qid – <i>Listeria</i>, GP except <i>Enterococcus</i>, GN only <i>E. coli</i>, <i>Klebsiella</i>, and <i>Proteus</i> • ceftriaxone 1-2 g IM/IV q24h – broad coverage including <i>Pseudomonas</i> • ampicillin 1-2 g IV q4-6h – <i>Listeria</i>, GP (<i>Enterococcus</i>) except <i>Streptococcus</i> and <i>E. coli</i>, oral anaerobes except <i>Bacteroides</i> • gentamicin 3-5 mg/kg/d IM/IV divided q8h; monitor creatinine, gentamicin levels – GN including <i>Pseudomonas</i> • ciprofloxacin 400 mg IV q12h, 500 mg PO bid – GN including <i>Pseudomonas</i> • metronidazole (Flagyl®) 500 mg PO/IV bid (500 mg PO tid for <i>C. difficile</i>) – anaerobes • clindamycin 600-900 mg IV q8h, 150-400 mg PO qid – GP except <i>Enterococcus</i>, anaerobes • piperacillin/tazobactam 4.5 mg IV q6h – GP, GN, and anaerobes • vancomycin 1 g IV q12h – GP and MRSA • sulfamethoxazole/trimethoprim DS (Septra®) PO bid – GP, GN including norcardia
Over-the-Counter Medications	<ul style="list-style-type: none"> • Pepto-Bismol® (bismuth subsalicylate) 2 tabs or 30 mL PO q30min-1h up to 8 doses/d side effects: black stools, risk of Reye's syndrome in children • Alka-Seltzer® (ASA + citrate + bicarbonate) 2 tabs in 4 oz water PO q4h prn, max 8 tabs • Maalox® (aluminum hydroxide + magnesium hydroxide) 10-20 mL or 1-4 tabs PO prn • Tums® (calcium carbonate) 1-3 g PO q2h prn • Roloids® (calcium carbonate and magnesium hydroxide) 2-4 tabs PO q1h prn, max 12 tabs/d

Acronyms

ACEI	angiotensin converting enzyme inhibitor	FAP	familial adenomatous polyposis	NE	norepinephrine
ARB	angiotensin receptor blocker	GCA	giant cell arteritis	NSTEMI	non-ST elevation myocardial infarction
BPH	benign prostatic hypertrophy	HR	heart rate	PPI	proton pump inhibitor
CABG	coronary artery bypass graft	IBD	inflammatory bowel disease	PPS	palliative performance scale
CHF	congestive heart failure	IBS	irritable bowel syndrome	PTH	parathyroid hormone
CO	cardiac output	ICP	intracranial pressure	RA	rheumatoid arthritis
CVA	cerebrovascular accident	LOC	level of consciousness	SLE	systemic lupus erythematosus
DHPCCB	dihydropyridine calcium channel blocker	MMSE	mini mental status examination	UTI	urinary tract infection
ESAS	Edmonton symptom assessment scale				

Seniors in the U.S.

Health Status

Table 1. Causes of Mortality and Morbidity in Canadian and American Seniors

Mortality (U.S.)	Morbidity
1. Diseases of the heart and circulatory system (27.0%)	1. HTN
2. Malignant neoplasms (22.0%)	2. Arthritis
3. Cerebrovascular disease (6.0%)	3. Heart disease
4. Chronic lower respiratory disease (7.0%)	4. Diabetes
5. Accidents (4.4%)	5. Ulcers
6. Alzheimer's (5.0%)	6. Stroke
	7. Asthma
	8. Allergies

Death in the United States. NCHS Data Brief 2009;No64:2011

Geriatric Giants

- Memory (cognitive function)
- Falls
- Incontinence
- Polypharmacy

5 Is of Geriatrics

- Immobility
- Intellect
- Incontinence
- Iatrogenesis
- Impaired homeostasis

Most Common Acute Disorders in the Elderly

- Cardiovascular disease (CHF, CVA, MI)
- Fracture (hip, vertebrae, wrist)
- Medication-related
- Pneumonia
- Sepsis

Most Common Chronic Disorders in the Elderly

- Arthritis
- Cataracts and other visual problems
- COPD
- Cardiovascular disease
- Diabetes Mellitus (Type 2)
- Hearing impairment
- HTN
- Mental disorders
- Orthopedic disorders
- Sinusitis

Physiology and Pathology of Aging

Definition

- major categories of impairment that appear with old age and affect the physical, mental, and social domains of the elderly, usually due to many predisposing and precipitating factors, rather than a single cause

Table 2. Changes Occurring Frequently with Aging

System	Physiological Changes	Pathological Changes
Neurologic	Decreased wakefulness, brain mass, cerebral blood flow	Increased insomnia, neurodegenerative disease, stroke, decreased reflex response
Special Senses	Decreased lacrimal gland secretion, lens transparency, dark adaptation, decreased sense of smell and taste	Increased glaucoma, cataracts, macular degeneration, presbycusis, presbyopia, tinnitus, vertigo, oral dryness
Cardiovascular	Increased sBP, dBP, decreased HR, CO Decreased vessel elasticity, cardiac myocyte size and number, β -adrenergic responsiveness	Increased atherosclerosis, CAD, MI, CHF, HTN, arrhythmias
Respiratory	Increased tracheal cartilage calcification, mucous gland hypertrophy Decreased elastic recoil, mucociliary clearance, pulmonary function reserve	Increased COPD, pneumonia, pulmonary embolism
Gastrointestinal	Increased intestinal villous atrophy Decreased esophageal peristalsis, gastric acid secretion, liver mass, hepatic blood flow, calcium and iron absorption	Increased cancer, diverticulitis, constipation, fecal incontinence, hemorrhoids, intestinal obstruction
Renal and Urologic	Increased proteinuria, urinary frequency Decreased renal mass, creatinine clearance, urine acidification, hydroxylation of vitamin D, bladder capacity	Increased urinary incontinence, nocturia, BPH, prostate cancer, pyelonephritis, nephrolithiasis, UTI
Reproductive	Decreased androgen, estrogen, sperm count, vaginal secretion Decreased ovary, uterus, vagina, breast size	Increased breast and endometrial cancer, cystocele, rectocele, atrophic vaginitis
Endocrine	Increased NE, PTH, insulin, vasopressin Decreased thyroid and adrenal corticosteroid secretion	Increased DM, hypothyroidism, stress response
Musculoskeletal	Increased calcium loss from bone Decreased muscle mass, cartilage	Increased arthritis, bursitis, osteoporosis, muscle weakness with gait abnormalities, polymyalgia rheumatica
Integumentary	Atrophy of sebaceous and sweat glands Decreased epidermal and dermal thickness, dermal vascularity, melanocytes, collagen synthesis	Increased lentigo, cherry hemangiomas, pruritus, seborrheic keratosis, herpes zoster, decubitus ulcers, skin cancer
Psychiatric	None	Increased depression, dementia, delirium, suicidality, substance abuse, anxiety, insomnia

Differential Diagnoses of Common Presentations

Constipation

- see [Gastroenterology](#), G24

Definition

- less than 3 bowel movements in one week and/or hard stools, straining, sense of blockade, needing manual maneuvers or incomplete evacuation on more than 25% of occasions for at least 12 wk (does not need to be consecutive)

Epidemiology

- chronic constipation increases with age (up to 1/3 of patients >65 yr experience constipation)

Pathophysiology

- impaired rectal sensation (increased rectal distention required to stimulate the urge to defecate)
- colorectal dysmotility

Treatment

- non-pharmacological
 - increase fiber intake
 - ensure adequate fluid intake
 - discourage chronic laxative use
 - engage in regular exercise
 - review medication regime, reduce dosages or substitute
- pharmacologic
 - see [Common Medications](#), GM15

Risk Factors for Constipation in the Elderly Include:

- Immobility
- Diet: low fiber/calorie diet, dehydration
- Medications:
 - Polypharmacy
 - Drugs: narcotics, calcium channel blockers, anticholinergics
- GI: obstructive lesions (bowel obstruction, cancer, diverticular disease, IBD, strictures, uterine prolapse), altered colonic motility (IBS, colonic inertia)
- Neurological: spinal cord injury, Parkinson's disease, stroke, autonomic dysfunction
- Metabolic: diabetes, hypokalemia, hypercalcemia
- Psychiatric: depression, dementia

Remember to first exclude low fiber and lack of activity as causes of constipation

Docusate sodium has been shown to be ineffective for the prevention/ treatment of constipation in the elderly

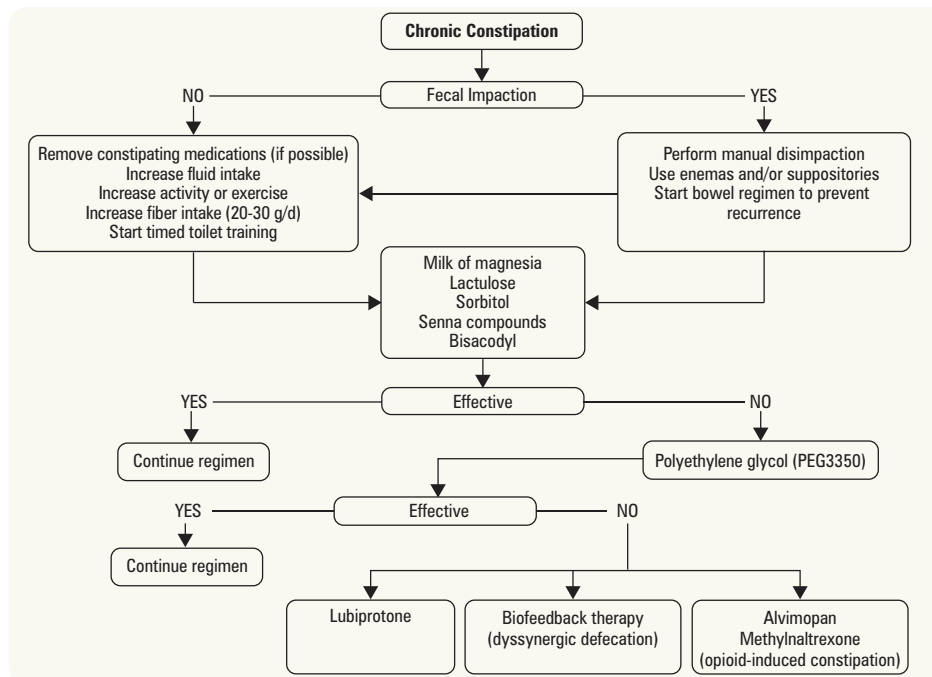

Figure 1. Treatment algorithm for the management of chronic constipation in the elderly

Adapted from: Clin Interv Aging 2010;5:163-171

Delirium, Dementia, and Depression

- see [Psychiatry](#), PS16, PS17, PS7 and [Neurology](#), N19

Definition

- pathologic decrease in memory, language, or executive function

Differential Diagnosis

- delirium, dementia, or pseudodementia of depression

Table 3. Differentiating the Three Ds of Cognitive Impairment

	Dementia	Delirium	Depression
Onset	Gradual or step-wise decline	Acute (hours-days)	Subacute
Duration	Months-years	Days-weeks	Variable
Natural History	Progressive, usually irreversible	Fluctuating, reversible High morbidity/mortality in very old	Recurrent Usually reversible
Level of Consciousness	Normal	Fluctuating	Normal
Attention	Intact initially	Decreased, wandering	Difficulty concentrating
Orientation	Intact initially	Impaired, fluctuates	Intact
Behavior	Disinhibition, loss of ADL/IADLs, personality change	Severe agitation/retardation	Importuning, self-harm/suicide
Psychomotor	Normal	Fluctuates between extremes	Slowing
Sleep-Wake Cycle	Fragmented sleep at night	Reversed sleep-wake cycle	Early morning awakening
Mood and Affect	Labile but not usually anxious	Anxious, irritable, fluctuating	Depressed, stable
Cognition	Decreased executive function, paucity of thought	Fluctuation preceded by mood changes	Concentration impaired
Memory Loss	Recent, eventually remote	Marked recent	Recent
Language	Agnosia, aphasia, decreased comprehension, repetition	Dysnomia, dysgraphia, speech rambling, subject changes, incoherence	Not affected
Delusions	Compensatory	Nightmarish, poorly formed	Nihilistic, somatic
Hallucinations	Variable, vacuous, bland	Visual common, frightening/bizarre	Self-deprecatory

Delirium Prevention in Elderly

- ensure optimal vision and hearing to support orientation (e.g. appropriate eyewear and hearing aids)
- provide adequate nutrition and hydration (up in chair to eat and drink whenever feasible)
- encourage regular mobilization to build and maintain strength, balance, and endurance
- avoid unnecessary medications and monitor for drug interactions
- avoid bladder catheterization if possible
- ensure adequate sleep

Elder Abuse**Definition**

- includes physical abuse, sexual abuse, emotional/psychological abuse, financial abuse, abandonment, and neglect
- in the U.S., most states have criminal penalties for elder abuse

Epidemiology

- in the U.S., estimates of the frequency of elder abuse range from 3-8%
- insufficient evidence to include/exclude screening in the Periodic Health Exam

Risk Factors**Table 4. Risk Factors for Elder Abuse**

Situational Factors	Isolation Unstable or unsafe living arrangements Lack of family, community or living facility resources for additional care
Victim Characteristics	Physical or emotional dependence on caregiver Lack of close family ties History of family violence Dementia or recent deterioration in health
Perpetrator Characteristics	Related to victim Living with victim Long duration of care for victim (mean 9.5 yr) Financial, marital, occupational or other stressors

**Atypical Antipsychotics in the Treatment of Delirium**

Psychiatry and Clinical Neurosciences 2013;67:323-331

The aim of this study was to review the efficacy and safety of atypical antipsychotics. Antipsychotics were compared to comparing within placebo, different classes of antipsychotics, or to another active treatment for delirium. A literature search was conducted using PubMed, EMBASE, and the Cochrane database (1 January 1990–5 November 2012). Selection criteria for review were prospective, controlled studies (comparison studies), using validated delirium rating scales as outcome measures. A total of six prospective, randomized controlled studies were included in the review. It was found that atypical antipsychotics are effective and safe in treating delirium, even though there seemed to be no difference between each agent. In particular, comparison studies with haloperidol showed that the efficacy of atypical antipsychotics was similar to that of low-dose haloperidol. It was concluded that atypical antipsychotics appear to be effective and tolerable in the management of delirium, even though the evidence is limited.

**Elder Abuse Suspicion Index (EASI)****Instructions**

- Questions 1-5 are to be asked of the patient
 - Question 6 is to be answered by the doctor
 - A response of “yes” on one or more of questions 2-6 may establish concern
 - Validated for use by family practitioners of cognitively intact seniors seen in ambulatory setting
1. Have you relied on people for any of the following: bathing, dressing, shopping, banking, or meals?
 2. Has anyone prevented you from getting food, clothes, medication, glasses, hearing aids, or medical care, or from being with people you wanted to be with?
 3. Have you been upset because someone talked to you in a way that made you feel shamed or threatened?
 4. Has anyone tried to force you to sign papers or to use your money against your will?
 5. Has anyone made you afraid, touched you in ways that you did not want, or hurt you physically?
 6. Doctor: elder abuse may be associated with findings such as: poor eye contact, withdrawn nature, malnourishment, hygiene issues, cuts, bruises, inappropriate clothing, or medication compliance issues. Did you notice any of these today or in the last 12 months?

NICE net. Elder Abuse Suspicion Index. 2006

Caregiver Abuse Screen (CASE)

- instructions
 - to be answered by caregivers, if answer “yes” to a question, further explore issue
 - the more “yes” responses, the more likely the presence of abuse
- screening tool
 - please answer the following questions as a helper/caregiver
 1. Do you sometimes have trouble making _____ control his/her temper or aggression?
 2. Do you often feel you are being forced to act out of character/do things you feel badly about?
 3. Do you find it difficult to manage _____’s behavior?
 4. Do you sometimes feel that you are forced to be rough with _____?
 5. Do you sometimes feel that you can’t do what is really necessary or what should be done for _____?
 6. Do you often feel you have to reject/ignore _____?
 7. Do you often feel so tired and exhausted that you cannot meet _____’s needs?
 8. Do you often feel you have to yell at _____?

From: NICE. Case: Caregiver Abuse Screen. 2010. Reproduced with permission from NICE

Management

- assess safety and determine capacity to make decisions about living arrangements
- establish need for hospitalization or alternate accommodation (e.g. immediate risk of physical harm by self or caregiver)
- involve multidisciplinary team (e.g. nurse, social worker, family members, and physicians including geriatrician, psychiatrist or family physician)
- educate and assist caregiver, contact local resources (e.g. legal aid, crisis support, PSW, caregiver support groups)
- interpret critical and lab findings that are key in exclusion, differentiation and diagnosis

Falls**Epidemiology**

- 30-40% of people >65 yr old and ~50% of people >80 yr old fall each yr
 - equally common between men and women, but more likely to result in injury in women
 - 5% of falls lead to hospitalization
 - falls are the leading cause of death from injury in persons older than 65 yr
 - 25% associated with serious injuries (e.g. hip fracture, head injury, bruises, laceration)
 - between 25-75% do not recover to previous level of ADL function
 - mortality increases with age (171/100,000 in men >85 yr old) and type of injury (25% with hip fracture die within 6 mo)

Etiology

- multifactorial
- extrinsic
 - environmental (e.g. home layout, lighting, stairs, footwear), accidental, abuse
 - medications/substances (e.g. alcohol)
 - acute illness, exacerbation of chronic illness
- intrinsic
 - orthostatic/syncopal
 - age-related changes and diseases associated with aging: musculoskeletal (arthritis, muscle weakness), sensory (visual, proprioceptive, vestibular), cognitive (depression, dementia, delirium, anxiety), cardiovascular (CAD, arrhythmia, MI, low BP), neurologic (stroke, decreased LOC, gait disturbances/ataxia), metabolic (glucose, electrolytes)

Investigations

- directed by history and physical
- comprehensive geriatric assessment to identify all potential causes
- CBC, electrolytes, BUN, creatinine, glucose, Ca^{2+} , TSH, B_{12} , urinalysis, cardiac enzymes, ECG, CT head

Prevention

- multidisciplinary, multifactorial, health, and environment risk factor screening and intervention programs in the community
- muscle strengthening, balance retraining, and group exercise programs (e.g. tai chi)
- home hazard assessment and modification (e.g. remove rugs, add shower bars, etc.)
- prescription of vitamin D 1000 IU daily
- tapering or gradual discontinuation of psychotropic medication
- postural hypotension, heart rate, and rhythm abnormalities management
- eyesight and footwear optimization

**Red Flags for Elder Abuse**

- Delay in seeking medical attention
- Disparity in histories
- Implausible or vague explanations
- Frequent emergency room visits for exacerbations of chronic disease despite plan for medical care and adequate resources
- Presentation of functionally impaired patient without designated caregiver
- Lab findings inconsistent with history

**Key Physical Findings in the Elderly Patient Who Falls or Nearly Falls****I HATE FALLING**

Inflammation of joints
 Hypotension (orthostatic changes)
 Auditory and visual abnormalities
 Tremor
 Equilibrium (balance) problem
 Foot Problems
 Arrhythmia, heart block or valvular disease
 Leg-length discrepancy
 Lack of conditioning (generalized weakness)
 Illness
 Nutrition
 Gait disturbance

Adapted from: *Am Fam Physician* 2001;61:2159-2172

A history of falls within the past 1-2 yr is a predictor of motor vehicle crashes in the older population. These patients should be evaluated on their ability to drive and counseled about driving.

**Drugs That May Increase the Risk of Falling**

- Sedative-hypnotic and anxiolytic drugs (especially long-acting benzodiazepines)
- Antidepressants (including MAOIs, SSRIs, TCAs)
- Antipsychotics and tranquilizers (phenothiazines and butyrophenones)
- Antihypertensive drugs
- Antiarrhythmics (Class IA)
- Diuretics
- Systemic corticosteroids
- NSAIDs
- Anticholinergic drugs
- Hypoglycemic agents
- Alcohol

Adapted from: *Am Fam Physician* 2001;61:2159-2172
Geriatrics At Your Fingertips, 13th ed. New York: Am Geriatr Soc, 2011

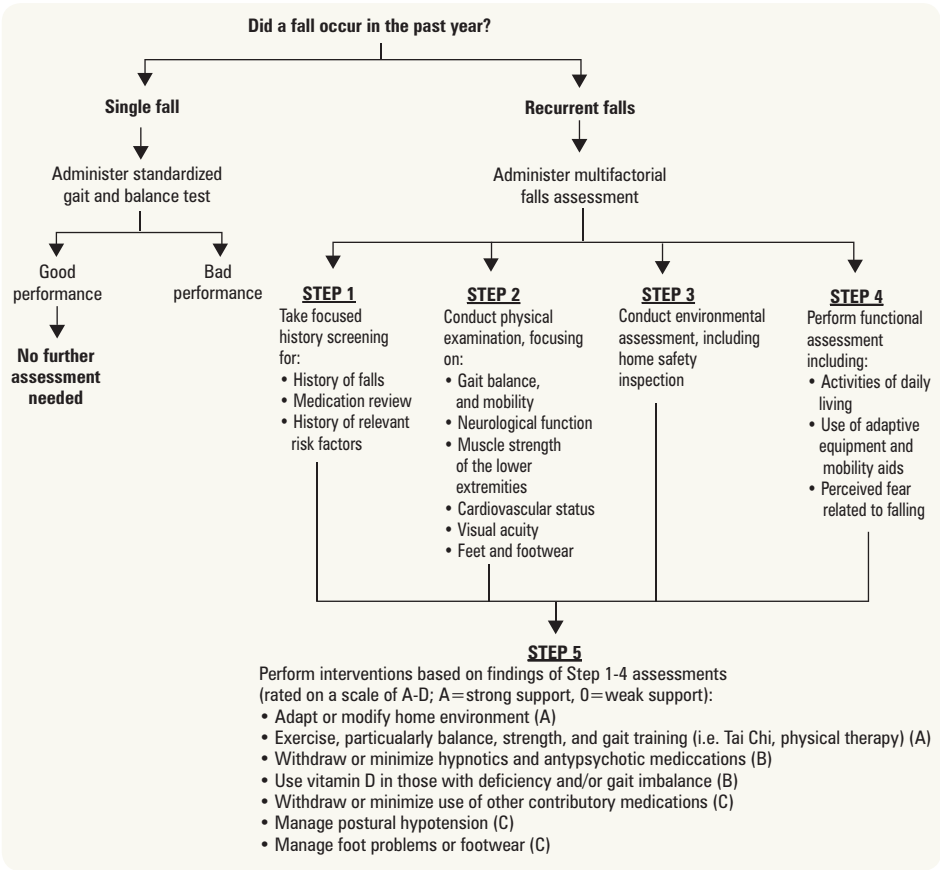

Figure 2. Approach to falls in the elderly
Adapted from: Davuluri S, Dharmarajan TS. *Clinical Geriatrics* 2013;21(10)

Fall Prevention Tips

- Home hazard assessment and modification
- Exercise and physical therapy
- Multifactorial risk assessment and intervention
- Evaluation of medications and withdrawal of medications that increase risk of falling
- Dual-chamber pacemaker placement for selected patients
- Hip protectors for patients at high risk of falling in an institutional setting

Adapted from: *Am Fam Physician* 2005;72:81-88

Will My Patient Fall?
JAMA 2007;297:77-86

Purpose: To identify the prognostic value of risk factors for future falls among older patients.

Study Selection: Prospective cohort studies of risk factors for falls that performed a multivariate analysis of such factors.

Results: 18 studies were included. Clinically identifiable risk factors were identified across 6 domains: orthostatic hypotension, visual impairment, impairment of gait or balance, medication use, limitations in basic or instrumental activities of daily living, and cognitive impairment. The estimated pretest probability of falling at least once in any given yr for individuals ≥65 was 27% (95% CI 19-36%). Patients who have fallen in the past yr are more likely to fall again (LR2.3-2.8). The most consistent predictors of future falls are clinically detected abnormalities of gait or balance (LR 1.7-2.4). Visual impairment, medication variables, decreased activities of daily living, and impaired cognition did not consistently predict falls across studies. Orthostatic hypotension did not predict falls after controlling for other factors.

Conclusions: Screening for risk of falling during the clinical examination begins with determining if the patient has fallen in the past yr. For patients who have not previously fallen, screening consists of an assessment of gait and balance. Patients who have fallen or who have a gait or balance problem are at higher risk of future falls.

Can use formal assessment tools such as the Lawton-Brody Instrumental Activities of Daily Living Scale to assess functioning

Frailty (Failure to Thrive)

Definition

- declining independence and functional capacity with loss of energy, vigor, and/or weight in older adults
- not an inevitable consequence of aging

Etiology

- malnutrition, functional impairment, cognitive impairment, and depression

Table 5. Common Medical Conditions Associated with Failure to Thrive

Medical Condition	Cause of Failure to Thrive
Cancer	Metastases, malnutrition, cachexia
Chronic lung disease	Respiratory failure
Chronic renal insufficiency	Renal failure
Chronic steroid use	Steroid myopathy, diabetes, osteoporosis, vision loss
Cirrhosis, hepatitis	Hepatic failure
Depression, other psychiatric disorder	Major depression, psychosis, poor functional status, cognitive loss
Diabetes	Malabsorption, poor glucose homeostasis, end-organ damage
Gastrointestinal surgery	Malabsorption, malnutrition
Hip, long bone fracture	Functional impairment
Inflammatory bowel disease	Malabsorption, malnutrition
Myocardial infarction, congestive heart failure	Cardiac failure
Recurrent UTI, pneumonia	Chronic infection, functional impairment
Rheumatologic disease (GCA, RA, SLE)	Chronic inflammation
Stroke	Dysphagia, depression, cognitive loss, functional impairment
Tuberculosis, other systemic infection	Chronic infection

Adapted from: *Clin Geriatr Med* 1997;13:769-778

The CHSA Clinical Frailty Scale – Shown to Predict Death and Need for Institution

CMAJ 2005;173:489-495

The CHSA Clinical Frailty Scale

1. Very fit – robust, active, energetic, well motivated and fit; these people commonly exercise regularly and are in the most fit group for their age.
2. Well – without active disease, but less fit than people in category 1.
3. Well, with treated comorbid disease – disease symptoms are well controlled compared with those in category 4.
4. Apparently vulnerable – although not frankly dependent, these people commonly complain of being "slowed up" or have disease symptoms.
5. Mildly frail – with limited dependence on others for instrumental activities of daily living.
6. Moderately frail – help is needed with both instrumental and non-instrumental activities of daily living.
7. Severely frail – completely dependent on others for the activities of daily living, or terminally ill.

Functional Assessment (ADLs and IADLs)

ADLs: ABCDE-TT

Ambulating
Bathing
Continence
Dressing
Eating
Transferring
Toileting

IADLs: SHAFT-TT

Shopping
Housework
Accounting/Managing finances
Food preparation
Transportation
Telephone
Taking medications

Can use formal assessment tools such as the Lawton-Brody Instrumental Activities of Daily Living Scale to assess functioning

Transient Causes of Incontinence

DIAPERS

Delirium
Infection
Atrophic urethritis/vaginitis
Pharmaceuticals
Excessive urine output
Restricted mobility
Stool impaction

Incontinence

FECAL INCONTINENCE

Epidemiology

- second leading cause of nursing home placement

Etiology

- commonly multifactorial
 - structural abnormalities
 - trauma (e.g. prior vaginal delivery, surgery)
 - prolapse
 - tumor/trauma (e.g. brain, spinal cord, cauda equina)
 - overflow (e.g. encopresis, impaction)
- functional abnormalities
 - neurologic conditions – neuropathy, multiple sclerosis, stroke, dementia
- others
 - constipation with overflow may be a factor
 - psychosis (willful soiling)
 - age >80 yr: decreased external sphincter strength and weak anal squeeze, increased rectal compliance, decreased resting tone and internal sphincter, impaired anal sensation
 - medications (e.g. laxatives, anticholinergics, antidepressants, caffeine, muscle relaxants)

Investigations (if cause not apparent from history and physical)

- differentiate true incontinence from frequency and urgency (i.e. IBS, IBD)
- stool studies
- endorectal ultrasound
- colonoscopy, sigmoidoscopy, anoscopy
- anorectal manometry/functional testing

Management

- diet/bulking agent if stool is liquid or loose
- disimpaction, prevent impaction
- anti-diarrheal agents (e.g. loperamide)
- regular defecation program in patients with dementia
- counsel about biofeedback therapy (retraining of pelvic floor muscles)

URINARY INCONTINENCE

- see [Urology, U5](#)

Epidemiology

- 15-30% prevalence dwelling in community and at least 50% of institutionalized seniors
- morbidity: cellulitis, pressure ulcers, urinary tract infections, falls with fractures, sleep deprivation, social withdrawal, depression, sexual dysfunction
- not associated with increased mortality

Pathophysiology

- not a normal part of aging, urinary incontinence is a loss of control due to a combination of:
 - genitourinary pathology: increased post-void residual volume, increased involuntary bladder contractions (urge incontinence)
 - age-related changes: decreased bladder capacity
 - comorbid conditions and medications
 - functional impairment
- in elderly women: decline in bladder outlet and urethral resistance pressure promoting stress incontinence
- in elderly men: prostatic enlargement can cause overflow and urge incontinence

Gait Disorders

- see [Neurology, N34](#)

Hazards of Hospitalization

Table 6. Recommendations for Sequelae of Hospitalization in Older Patients

Sequelae	Recommendations
Malnutrition	No dietary restrictions (except diabetes), assistance, dentures if necessary, sitting in a chair to eat
Urinary incontinence	Medication review, remove environmental barriers, discontinue use of catheter
Depression	Routine screening
Adverse drug event	Medication review
Confusion/delirium	Orientation, visual and hearing aids, volume repletion, noise reduction, early mobilization, medication review, remove restraints
Pressure ulcers	Low-resistance mattress, daily inspection, repositioning every 2 h
Infection	Early mobilization, remove unnecessary IV lines, catheters, NG tubes
Falls	Appropriate footwear, assistive devices, early mobilization, remove restraints, medication review
Hypotension/dehydration	Early recognition and repletion
Diminished aerobic capacity/loss of muscle strength/contractures	Early mobilization
Decreased respiratory function	Incentive spirometry, physiotherapy

Hypertension

- see [Family Medicine, FM35](#)
- 60-80% of elderly (>65 yr old) have HTN
 - 60% of these have isolated systolic HTN
 - the benefit of treating HTN in the elderly is 2-4 times greater than that achieved in the treatment of younger patients with primary HTN
 - systolic and pulse pressure are major predictors of outcome in the elderly patient
 - in older adults, base treatment on sBP
- target BP: sBP <140, 65<dBP<90; for patients with DM: sBP <130, dBP <80
 - more recently, some argue a target of sBP<140 reasonable for all elderly patients, and minimizes risk of hypotension
- treatment:
 - non-pharmacologic treatments are first-line, then thiazide monotherapy is recommended
 - add ACEI/ARB if also atherosclerosis, DM, CHF or chronic kidney disease
 - add β -blockers if also angina or CHF

Cognitive Decline after Hospitalization in a Community Population of Older Persons

Neurology 2012;78:950-956

Study: 12 yr Cohort study of 1,870 elderly residents interviewed at 3 yr intervals with cognitive testing and information on hospitalization (from hospital records).

Results: 71.4% of residents were hospitalized at least once. Post-hospital cognitive decline measured by episodic memory (3.3-fold increase) and executive function (1.7-fold increase) was evident and not related to cognitive function at baseline but moderately correlated with rate of cognitive decline before hospitalization ($r=0.55$).

Conclusions: Cognitive function declines post-hospitalization even after controlling for illness severity and pre-hospital cognitive decline.

Treatment of HTN in Patients 80 Years of Age or Older

NEJM 2008;358:1887-1898

Study: Randomized, double-blind, placebo-controlled, multicenter trial.

Subjects: 3,845 patients who were 80 yr of age or older and had a sustained systolic blood pressure of 160 mmHg were followed for a median 1.8 yr.

Intervention: Indapamide (sustained release, 1.5 mg) or matching placebo. The angiotensin-converting enzyme inhibitor perindopril (2-4 mg), or matching placebo, was added if necessary to achieve the target blood pressure of 150/80 mmHg.

Primary Outcome: Fatal or nonfatal stroke.

Results: Mean BP was 173.0/90.8 mmHg. At 2 yr, the mean BP while sitting was 15.0/6.1 mmHg lower in the treatment group than in the placebo group. Treatment was associated with a 30% reduction in the rate of fatal or nonfatal stroke (95% CI -1.51; $p=0.06$), 39% reduction in the rate of death from stroke (95% CI 1.62; $p=0.05$), 21% reduction in the rate of death from any cause (95% CI, 4 to 35; $p=0.02$), 23% reduction in the rate of death from cardiovascular causes (95% CI -1.40; $p=0.06$), and 64% reduction in the rate of heart failure (95% CI, 42-78; $p<0.001$). Fewer serious adverse events were reported in the treatment group (358 vs. 448 in the placebo group; $p=0.001$).

Conclusions: Antihypertensive treatment with indapamide (sustained release), with or without perindopril, in persons 80 yr of age or older reduces death from stroke, death from any cause, and the incidence of heart failure.

Immobility

Complications

- cardiovascular: orthostatic hypotension, venous thrombosis, embolism
- respiratory: decreased ventilation, atelectasis, pneumonia
- gastrointestinal: anorexia, constipation, incontinence, dehydration, malnutrition
- genitourinary: infection, urinary retention, bladder calculi, incontinence
- musculoskeletal: atrophy, contractures, bone loss
- skin: pressure ulcers
- psychological: sensory deprivation, delirium, depression

Immunizations

- the following immunizations are recommended for people 65 yr of age and older
 - tetanus: every 10 yr
 - pneumococcus: every 5 yr
 - influenza: every autumn
 - herpes zoster: Zostivax®

Malnutrition

Definition

- involuntary weight loss of $\geq 5\%$ baseline body weight or ≥ 5 kg
- hypoalbuminemia, hypocholesterolemia

Etiology

- nutritional
 - decreased assimilation: impaired transit, maldigestion, malabsorption
 - decreased intake: financial, psychiatric (depression), cognitive deficits, anorexia associated with chronic disease, functional deficits (e.g. difficulty shopping, preparing meals or feeding oneself due to functional impairment)
- stress: acute or chronic illness/infection, chronic inflammation, abdominal pain
- mechanical: dental problems, dysphagia
- age-related changes: appetite dysregulation, decreased thirst
- mixed: increased energy demands (e.g. hyperthyroidism), abnormal metabolism, protein-losing enteropathy

Clinical Features

- history
 - recent or chronic illness
 - ♦ depression, GI symptoms
 - functional disability: impaired ADLs and IADLs
 - social factors: economic barriers, dental problems and living situation (e.g. living alone)
 - constitutional symptoms (e.g. recent weight loss)
- physical exam
 - BMI < 23.5 in males, < 22 in females should raise concern
 - temporal wasting, muscle wasting, presence of triceps skin fold
 - assess cognition

Investigations

- CBC, electrolytes, Ca^{2+} , Mg^{2+} , PO_4^{3-} , creatinine, LFTs (albumin, INR, bilirubin), B_{12} , folate, TSH, transferrin, lipid profile, urinalysis, ESR, CXR

Osteoporosis

- see [Endocrinology](#), E42

Presbycusis

- see [Otolaryngology](#), OT20

Remember to Calculate BMI

BMI outside 22-27 kg/m² is a health risk

Calculating Basic Caloric and Fluid Requirements

WHO daily energy estimates for adults > 60 yr:

Female: $10.5 \times (\text{weight in kg}) + 596$

Male: $13.5 \times (\text{weight in kg}) + 487$

Maintenance fluid requirements for the elderly without cardiac or renal disease: 1500-2500 cc/24 h

Etiology of Malnutrition in the Elderly

MEALS ON WHEELS

Medications

Emotional problems

Anorexia

Late-life paranoia

Swallowing disorders

Oral problems

Nosocomial infections

Wandering/dementia related activity

Hyperthyroid/Hypercalcemia/

Hypoadrenalism

Enteric disorders

Eating problems

Low-salt/Low-fat diet

Stones

Pressure Ulcers

- see [Plastic Surgery](#), PL16

Risk Factors

- extrinsic factors: friction, pressure, shear force
- intrinsic factors: immobility, malnutrition, moisture, sensory loss

Table 7. Classification of Pressure Ulcers

Stage I	Changes include skin temperature, tissue consistency or sensation An area of persistent erythema in lightly pigmented, intact skin; in darker skin, it may appear red, blue or purple
Stage II	Partial thickness skin loss involving the epidermis, dermis or both The ulcer is superficial and presents as an abrasion, blister or shallow crater
Stage III	Full thickness skin loss involving damage or necrosis of subcutaneous tissue which may extend down to, but not through, underlying fascia Presents as a deep crater with or without undermining of adjacent tissue
Stage IV	Full thickness skin loss with extensive destruction, tissue necrosis or damage to muscle, bone or supporting structures May have associated undermining and/or sinus tracts

Prevention

- pressure reduction
 - frequent repositioning
 - pressure-reducing devices (static, dynamic)
- maintaining nutrition, encouraging mobility and managing incontinence

Treatment

- optimize nutritional status
- minimize pressure on wound
- analgesia
- wound debridement (mechanical, enzymatic, autolytic) and dressing application
- maintain moist wound environment to enable re-epithelialization
- treatment of wound infections (topical gentamicin, silver sulfadiazine, mupirocin)
- swab wounds not demonstrating clinical improvement for C&S; biopsy chronic wounds to rule out malignancy
- stage IV ulcers typically warrant surgical debridement
- consider other treatment options
 - negative pressure wound therapy/vacuum-assisted closure (VAC)
 - biological agents: application of fibroblast growth factor, platelet-derived growth factor to wound
 - non-contact normothermic wound therapy
 - electrotherapy

Pressure-Reducing Devices

Static devices distribute pressure over a greater surface area. Dynamic devices use alternating air currents to shift pressure to different body sites

Driving Competency

Reporting Requirements

- not an issue unique to geriatrics – any patient may suffer from a medical condition that impairs their ability to drive should be reported
- in the U.S., varies by state

Conditions that may Impair Driving

Table 8. Conditions that Impair Driving

Alcohol	Patients with history of impaired driving and those with high probability of future impaired driving should not drive until further assessed Alcohol dependence or abuse: if suspected, should be advised not to drive Alcohol withdrawal seizure: must complete a rehabilitation program and remain abstinent and seizure-free for 6 mo before driving
Blood Pressure Abnormalities	HTN: sustained BP > 170/110 should be evaluated carefully Hypotension: if syncopal, discontinue until attacks are treated and preventable

Table 8. Conditions that Impair Driving (continued)

Cardiovascular Disease	Suspected asymptomatic CAD or stable angina: no restrictions STEMI, NSTEMI with significant LV damage, coronary artery bypass surgery: no driving for one month following hospital discharge NSTEMI with minor LV damage, unstable angina: no driving for 48 h if percutaneous coronary intervention (PCI) performed or 7 d if no PCI performed
Cerebrovascular Conditions	TIA: should not be allowed to drive until a medical assessment is completed Stroke: should not drive for at least one month; may resume driving if functionally able; no clinically significant motor, cognitive, perceptual or vision deficits; no obvious risk of sudden recurrence; underlying cause appropriately treated; no post-stroke seizure
COPD	Mild/moderate impairment: no restrictions Moderate or severe impairment requiring supplemental oxygen: road test with supplemental oxygen
Cognitive Impairment/ Dementia	Moderate to severe dementia is a contraindication to driving; defined as the “inability to independently perform 2 or more IADLs or any basic ADL” Patients with mild dementia should be assessed; if indicated, refer to specialized driving testing center; if deemed fit to drive, re-evaluate patient every 6-12 mo Poor performance on MMSE, clock drawing or Trails B suggests a need to investigate driving ability further MMSE score alone (whether normal or low) is insufficient to determine fitness to drive
Diabetes	Diet controlled or oral hypoglycemic agents: no restrictions in absence of diabetes complications that may impair ability to drive (e.g. retinopathy, nephropathy, neuropathy, cardiovascular or cerebrovascular disease) Insulin use: may drive if no complications (as above) and no severe hypoglycemic episode in the last 6 mo
Drugs	Be aware of: analgesics, anticholinergics, anticonvulsants, antidepressants, antipsychotics, opiates, sedatives, stimulants Degree of impairment varies: patients should be warned of the medication/withdrawal effect on driving
Hearing Loss	Effect of impaired hearing on ability to drive safely is controversial Acute labyrinthitis, positional vertigo with horizontal head movement, recurrent vertigo: advise not to drive until condition resolves
Musculoskeletal Disorders	Physician’s role is to report etiology, prognosis and extent of disability (pain, range of motion, coordination, muscle strength)
Post-Operative	Outpatient, conscious sedation: no driving for 24 h Outpatient, general anesthesia: no driving for ≥24 h
Seizures	First, single, unprovoked: no driving for 3 mo until complete neurologic assessment, EEG, CT head Epilepsy: can drive if seizure-free on medication and physician has insight into patient compliance
Sleep Disorders	If patient is believed to be at risk due to a symptomatic sleep disorder but refuses investigation with a sleep study or refuses appropriate treatment, the patient should not drive
Visual Impairment	Visual acuity: contraindicated to drive if <20/50 with both eyes examined simultaneously Visual field: contraindicated to drive if <120° along horizontal meridian and 15° continuous above and below fixation with both eyes examined simultaneously

N.B. guidelines included refer specifically to private driving.

Systematic Review of Driving Risk and the Efficacy of Compensatory Strategies in Persons with Dementia
J Am Geriatr Soc 2007;55:878-884
Purpose: To determine whether persons with dementia are at greater driving risk and, if so, to estimate the magnitude of this risk and determine whether there are efficacious methods to compensate for or accommodate it.
Study Selection: Systematic review of the case-control studies of drivers with a diagnosis of dementia.
Results: Drivers with dementia universally exhibited poorer performance on road tests and simulator evaluations. The one study that used an objective measure of motor vehicle crashes found that the crash risk in persons with dementia was 2-2.5 times greater than matched controls. No studies were found that examined the efficacy of methods to compensate for or accommodate the decreased driving performance.
Conclusions: Drivers with dementia are poorer drivers than cognitively normal drivers, but studies have not consistently demonstrated higher crash rates. Clinicians and policy makers must take these findings into account when addressing issues pertinent to drivers with a diagnosis of dementia.

Key Factors to Consider in Older Drivers
SAFEDRIVE
Safety record
Attention (e.g. concentration lapses, episodes of disorientation)
Family observations
Ethanol abuse
Drugs
Reaction time
Intellectual impairment
Vision/Visuospatial function
Executive functions (e.g. planning, decision-making, self-monitoring behaviors)
Geriatrics 1996;51:36-45

Health Care Institutions

Table 9. Classification of Health Care Services and Institutions

Institution/Service	Description
Home Health Agency	Health care services offered at home for those who can live independently at home or under the care of family members including professional health care services, personal care and support (ADL assistance), homemaking (IADL assistance), community support services (e.g. transportation, meal delivery, day programs, caregiver relief, security checks, etc.)
Residential	Divided into short (<60-90 d/yr) and long (indefinite) stay
a) Seniors Affordable Housing	Seniors who live independently and manage their own care but prefer to live near other seniors; usually has accessibility features and rent is adjusted based on income
b) Retirement/Nursing Home	Residents are fairly independent and require minimal support with ADLs and IADLs; often privately owned
c) Supportive Housing	Residents require minimal to moderate assistance with daily activities while living independently; often rental units in an apartment and may offer some physiotherapy and rehabilitation services
d) Long-term Care/Skilled Nursing Facility	Around the clock nursing care and on-call physician coverage; often offers occupational therapy, physiotherapy, respiratory therapy, and rehabilitation services; may be used short-term for caregiver respite, or for supportive patient care to regain strength and confidence after leaving the hospital
e) Hospice	Free-standing facility or designated floor in a hospital or nursing home for care of terminally ill patients and their families; focus is on quality of life and often requires prognosis ≤3 mo

- names of community health care institutions, types of facilities, and services offered vary between geographical locations
- factors to consider when seeking services/institutions include level of care required, support networks, duration of stay, and cost

Palliative and End-of-Life Care

Principles and Quality of Life

- support, educate, and treat both patient and family
- address physical, psychological, social and spiritual needs
- focus on symptom management and comfort measures
- offer therapeutic environment and bereavement support
- ensure maintenance of human dignity

End-of-Life Care Discussions

When to Initiate End-of-Life Care Discussions

- recent hospitalization for serious illness
- severe progressive medical condition(s)
- death expected within 6-12 mo
- patient inquires about end-of-life care

Suggested Topics for Discussion

- goals of care (disease vs. symptom management)
- advance directives, power of attorney, public guardian and trustee
- treatment options and likelihood of success
- common medical interventions
 - mechanical ventilation
 - antibiotic therapy
 - feeding tubes
- resuscitation options and likelihood of success (Full Code vs. DNR status including preferences for CPR, intubation, ICU admission, artificial hydration)

Power of Attorney

- see [Ethical, Legal, and Organizational Medicine, ELOAM8](#)

Instructional Advance Directives

- see [Ethical, Legal, and Organizational Medicine, ELOAM8](#)

Symptom Management

Assessment Tools

- **Edmonton Symptom Assessment System (ESAS):** a tool that asks patients to rate the intensity of symptoms from 0-10 and allows for tracking of the efficacy of interventions. Assesses: pain, tiredness, nausea, depression, anxiety, drowsiness, appetite, well being, shortness of breath, and "other problem"
- **Palliative Performance Scale (PPS):** a tool that uses functional status to predict survival in terminally ill patients. Assesses 5 components: ambulation, activity and evidence of disease, self-care, intake and conscious level

Source: *J Palliat Care* 1991;7:6-9 and Victoria Hospice Society 2006;120-121

Table 10. Management of Common End-of-Life Symptoms

Symptom	Non-Pharmacologic Management	Pharmacologic Management
Constipation	Rule out obstruction, impaction, anorectal disease; hydration and high fiber intake; increase mobility	Stop unnecessary opioids and medications with anticholinergic side effects; provide stool softener (e.g. docusate sodium), increase peristalsis (e.g. senna), alter water and electrolyte secretion (e.g. magnesium hydroxide, lactulose, peg3350)
Death Rattle/ Increased Pulmonary Secretions	Oral suctioning Discontinue unnecessary IV solutions	Scopolamine SC or transdermal
Dry Mouth	Oral hygiene q2h, ice cubes, sugarless gum	Artificial saliva substitutes, bethanechol, pilocarpine 1% solution as mouth rinse
Dysphagia	Frequent small feeds, ideally seated, keep head of bed elevated for 30 min after eating, suction as necessary	Treat painful mucositis (diphenhydramine: lidocaine: Maalox® in a 1:2:8 mixture), candidiasis (fluconazole)
Dyspnea	Elevate head of bed, eliminate allergens, open window/use fan	Oxygen, bronchodilators, opioids (e.g. morphine, hydromorphone)
Hiccups	Dry sugar, breathing in paper bag	Chlorpromazine, haloperidol, metoclopramide, baclofen, marijuana
Nausea and Vomiting	Frequent and small meals, avoid offensive strong odors, treat constipation if present	Raised ICP: dexamethasone Anticipatory nausea, anxiety: lorazepam Vestibular disease, vertigo: dimenhydrinate Drug induced, hepatic or renal failure: prochlorperazine, haloperidol GERD: PPI or H2 antagonist Gastric stasis: metoclopramide Bowel obstruction: metoclopramide, dexamethasone, octreotide
Pain	Hot and cold compresses, music therapy, relaxation techniques, individualized program of physical activity designed to improve flexibility, strength and endurance	Nociceptive pain: non-opioids (NSAIDs, acetaminophen), weak opioids (codeine, hydrocodone, oxycodone), strong opioids (morphine, hydromorphone, oxycodone, fentanyl) Neuropathic pain: anticonvulsants (gabapentin, pregabalin), antidepressants (TCAs, SSRIs), steroids (dexamethasone) Bony pain: non-opioids, weak opioids, bisphosphonates, radiation therapy
Pruritus	Bathing with tepid water, avoid soap, bath oils; sodium bicarbonate for jaundice	Antihistamines, phenothiazines, topical corticosteroids, calamine lotion
Weakness	Modify environment and activities to decrease energy expenditure	Treat insomnia, anemia, depression; consider psychostimulants

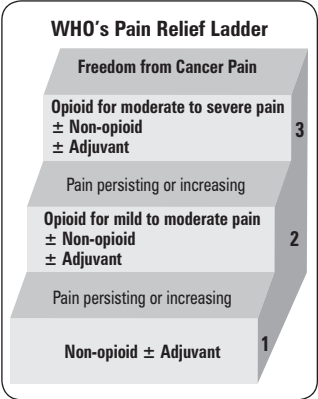

Source: J Am Geriatr Soc 2002;50:S205-S224 and On Continuing Practice 1993;20:20-25 and Am Fam Physician 2009;79(12):1059-1065

Geriatric Pharmacology

Pharmacokinetics

Table 11. Age-Associated Pharmacokinetics

Parameter	Age Effect	Implications
Absorption (less significant)	Increased gastric pH Decreased splanchnic blood flow, GI absorptive surface and dermal vascularity; delayed gastric emptying	Drug-drug and drug-food interactions are more likely to affect absorption
Distribution	Increased total body fat and α1-glycoprotein Decreased lean body mass, total body water and albumin	Lipophilic drugs have a larger volume of distribution Decreased binding of acidic drugs, increased binding of basic drugs
Metabolism (less significant)	Decreased hepatic mass and hepatic blood flow; impaired phase I reactions (oxidative system)	Lower doses may be therapeutic
Elimination	Decreased renal blood flow, GFR, tubular secretion and renal mass	For every x% reduction in clearance, decrease the dose by x% and increase the interval by x%

Death Rattle
Noise caused by the oscillatory movement of mucous secretions in the upper airway with inspiration and expiration

Nociceptive Pain
Somatic: localized to bone/skin/joint/muscle; gnawing, dull pain
Visceral: not well localized; crampy pain, pressure

Neuropathic Pain
Burning, shooting, radiating pain; localized to dermatomal regions

Opioid Equivalent Doses (to 10 mg of IV morphine)

Opioid	SC/IV dose	PO dose
Morphine	10 mg	20-30 mg
Codeine	Not recommended	180-240 mg
Oxycodone	Not recommended	10-15 mg
Hydromorphone	2 mg	4-6 mg

Fentanyl transdermal 25 µg/h = morphine 90 mg PO/24 h, however fentanyl takes 12-16 h to reach steady state

Serum creatinine does not reflect creatinine clearance in the elderly, as they can have falsely lowered serum creatinine levels. Some advocate for rounding geriatrics' patients low serum creatinine numbers to 1 mg/dL, however this is controversial

Pharmacodynamics

Drug Sensitivity

- changes in pharmacokinetics as well as intrinsic sensitivity lead to altered drug responses
- increased sensitivity to warfarin, sedatives, antipsychotics, digoxin and narcotics
- decreased sensitivity to β -blockers in majority of elderly patients, though some may have increased sensitivity

Decreased Homeostasis

- poorer compensatory mechanisms leading to more adverse reactions (e.g. bleeding with NSAIDs/anticoagulants, altered mental status with anticholinergic/sympathomimetic/anti-Parkinsonian drugs)

Polypharmacy

Definition

- prescription, administration or use of five or more medications at the same time

Epidemiology

- patients over 65 years old are the largest medication consumers in the United States
- many elderly patients do not understand their medications
- hospitalized elderly are given an average of 10 medications during admission

Risk Factors for Non-Compliance

- risk of non-compliance correlates with medication factors, not age
 - number of medications – compliance with 1 medication is 80%, but drops to 25% with ≥ 6 medications
- increased dosing frequency, complicated container design, financial constraints, and cognitive impairment

Adverse Drug Reactions

- any noxious or unintended response to a drug that occurs at doses used for prophylaxis or therapy
- risk factors in the elderly
 - intrinsic: comorbidities, age-related changes in pharmacokinetics and pharmacodynamics
 - extrinsic: number of medications, multiple prescribers, unreliable drug history
- 90% of ADRs are from: ASA, analgesics, anticoagulants, antimicrobials, antineoplastics, digoxin, diuretics, hypoglycemics, steroids

Preventing Polypharmacy

- consider drug: safer side effect profiles, convenient dosing schedules, convenient route, efficacy
- consider patient: other medications, clinical indications, medical comorbidities
- consider patient-drug interaction risk factors for ADRs
- review drug list regularly to eliminate medications with no clinical indication or with evidence of toxicity
- avoid treating an ADR with another medication

Inappropriate Prescribing in the Elderly

Epidemiology

- the estimated prevalence of potentially inappropriate prescribing ranges from 12-40%

Beers Criteria

- a list of medications to avoid in adults 65 and older due to safety concerns
- examples include long-acting benzodiazepines, strong anticholinergics, high-dose sedatives
- the elderly are also often under-treated (ACEI, ASA, β -blockers, thrombolytics, warfarin)

Benzodiazepines of Choice in the Elderly

LOT

Lorazepam
Oxazepam
Temazepam

Approach to Medication Review in the Elderly

NO TEARS

Need and indication

Open-ended questions (to get patient's perspective on medications)

Tests and monitoring (to assess disease control)

Evidence and guidelines

Adverse events

Risk reduction (of adverse events such as falls)

Simplification/switches

New medications: Start Low, Go Slow!

Principles for Prescribing in the Elderly

CARED

Caution/Compliance

Age (adjust dosage for age)

Review regimen regularly

Educate

Discontinue unnecessary medications

Geriatric Pearls. Philadelphia: FA Davis Company, 1999.

Adverse drug reactions in the elderly may present as delirium, falls, fractures, urinary incontinence/retention or fecal incontinence/impaction

Beers Criteria

Common Medications

Table 12. Common Medications

Drug Name	Brand Name	Dosing Schedule	Indications	Contraindications	Side Effects	Mechanism of Action
ANALGESICS (non-opioid)						
acetaminophen	Tylenol®	325-650 mg PO q4-6h prn (up to 4 g/d)	Fever, mild pain	Lower doses for hepatic and renal disease, chronic alcoholism, known hypersensitivity	Hepatotoxicity (in overdose)	Prostaglandin-synthesis inhibition, no anti-inflammatory effects
ibuprofen	Advil® Motrin®	200-800 mg PO q4-6h prn (up to 1200 mg/d)	Mild to moderate pain, inflammatory disorders, fever	Active GI bleed/ulcer disease, known hypersensitivity, severe renal or hepatic disease Geriatrics: more susceptible to adverse effects	Dyspepsia, nausea, diarrhea, dizziness, rash, GI toxicity (ulcer, perforation, bleed)	Prostaglandin-synthesis inhibition, anti-inflammatory effects
celecoxib	Celebrex®	200 mg PO daily or 100 mg PO bid	Osteoarthritis, rheumatoid arthritis, FAP	Cardiovascular or cerebrovascular disease, CABG (perioperative), sulfonamide or ASA/NSAID allergy, active GI bleed/ulcer, IBD, severe renal or hepatic disease, hyperkalemia	GI symptoms (pain, diarrhea, dyspepsia, flatus), GI bleed, serious cardiovascular events	COX-2 inhibitor, analgesic, anti-inflammatory and anti-pyretic effects
ANALGESICS (opioid) – see Anesthesia and Perioperative Medicine, A28 						
ANTI-HYPERTENSIVES						
thiazide diuretic e.g. hydrochlorothiazide	Hydrodiuril®	12.5-25 mg PO daily	HTN, edema	Anuria, hepatic coma, pre-coma, known sensitivity to thiazides	Hypotension, transient hyperlipidemia, hypokalemia and other electrolyte disturbances, hyperuricemia, GI symptoms	Inhibition of Na ⁺ /Cl ⁻ co-transporter
ACEI e.g. ramipril	Altace®	2.5-20 mg PO daily	Essential HTN, post-MI, cardiovascular disease, renal protection	Known hypersensitivity, angioedema	Hypotension, cough, headache, dizziness, asthenia, chest pain, nausea, peripheral edema, arthritis, dyspnea, angioedema, hyperkalemia	Inhibition of angiotensin-converting enzyme
ARB e.g. losartan	Cozaar®	50-100 mg PO daily	Essential HTN (± diabetes mellitus)	Known hypersensitivity	Dizziness, hypotension, fatigue, headache, hyperkalemia	Antagonizes angiotensin II via blockade of the angiotensin type 1 receptor
DHP CCB e.g. amlodipine	Norvasc®	2.5-10 mg PO daily (initially)	Essential HTN, chronic stable angina	Known hypersensitivity, severe hypotension, caution in aortic stenosis	Edema, muscle cramps, dizziness, headache, constipation, heartburn	Calcium ion influx inhibition
COGNITIVE ENHANCERS						
donepezil	Aricept®	5-10 mg PO daily	Moderate to severe dementia of Alzheimer's type	Known hypersensitivity, caution in pulmonary disease, sick sinus syndrome, seizure disorder	N/V, diarrhea, anorexia, falls, hip fracture, increase need for pacemaker insertion	Reversible inhibition of acetylcholinesterase
galantamine	Razadyne®	8-12 mg PO bid	Mild to moderate dementia of Alzheimer's type	Known hypersensitivity, caution in sick sinus syndrome, seizure disorder, pulmonary disease, low body weight	N/V, diarrhea, anorexia, falls, hip fracture, increase need for pacemaker insertion	Reversible inhibition of acetylcholinesterase
rivastigmine	Exelon®	1.5 mg PO daily (starting) up to 6 mg PO bid	Mild to moderate dementia of Alzheimer's type	Known hypersensitivity, severe hepatic disease, caution in sick sinus syndrome, pulmonary disease, seizure disorder	N/V, diarrhea, anorexia, falls, hip fracture, increase need for pacemaker insertion	Acetylcholinesterase inhibition (reversible but very slow)
memantine	Ebixa®/ Namenda® (Can)/(U.S.)	5 mg PO daily (starting) up to 10 mg PO bid	Mild to moderate dementia of Alzheimer's type	Known hypersensitivity, conditions that alkalize urine, caution in cardiovascular conditions	Agitation, fatigue, dizziness, headache, HTN, constipation	NMDA-receptor antagonist

Table 12. Common Medications (continued)

Drug Name	Brand Name	Dosing Schedule	Indications	Contraindications	Side Effects	Mechanism of Action
LAXATIVES						
bran	All-Bran®	1 cup/d	Constipation		Bloating, flatus	Bulk-forming laxative
psyllium	Metamucil® Prodiem Plain®	1 tsp PO tid	Constipation, hypercholesterolemia	N/V, abdominal pain, obstruction	Bloating, flatus	Bulk-forming laxative
lactulose	Chronulac® Cephulac® Kristalose®	15-30 cc PO daily/bid	Constipation, hepatic encephalopathy, bowel evacuation following barium exam	Patients on low galactose diets Abdominal pain, N/V	Flatus, cramps, nausea, diarrhea	Hyperosmolar agent, lowers pH of colon to decrease blood ammonia levels
senna	Senokot®/ Ex-lax® Glyssennid®	1-2 tabs PO daily or 10-15 cc syrup PO daily	Constipation	Abdominal pain, N/V	Cramps, griping, dependence	Stimulant laxative
bisacodyl	Dulcolax®	5-15 mg PO (10 mg PR)	Constipation	Ileus, obstruction, abdominal pain, N/V, severe dehydration	Cramps, pain, diarrhea	Stimulant laxative
PARKINSONIAN AGENTS – see Neurology, N54 						
SLEEPING MEDICATIONS						
eszopiclone	Lunesta®	3.75 mg PO qhs (initially)	Insomnia	Known hypersensitivity, caution in myasthenia gravis, severe hepatic disease Geriatrics: dose reduction (dose-related adverse events)	Bitter taste, palpitations, vomiting, anorexia, sialorrhea, confusion, agitation, anxiety, tremor, sweating	Short-acting hypnotic (no tolerance effects)
temazepam	Restoril®	15 mg PO qhs	Short-term management of insomnia	Known hypersensitivity, myasthenia gravis, sleep apnea Geriatrics: dose reduction recommended	Drowsiness, dizziness, impaired coordination, hangover, lethargy, dependence	Benzodiazepine: generalized CNS depression mediated by GABA
lorazepam	Ativan®	0.5 mg PO qhs (initially)	Anxiety, insomnia	Known hypersensitivity, myasthenia gravis, narrow- angle glaucoma Geriatrics: dose reduction recommended	Dizziness, drowsiness, lethargy, dependence	Benzodiazepine: generalized CNS depression mediated by GABA

Note: Docusate has been shown to be ineffective for the prevention/treatment of constipation in the elderly

Landmark Geriatric Trials

Trial	Reference	Results
Delirium is a strong risk factor for dementia in the oldest-old: a population-based cohort study	<i>Brain</i> 2012; 135(9): 2809-16	First population study to show that delirium is a strong risk factor for dementia and cognitive decline in elderly patients
Donepezil and Memantine for Moderate-to-Severe Alzheimer's Disease	<i>NEJM</i> 2012; 366:893-903	Continued treatment with donepezil was associated with cognitive benefits over the course of 12 mo in patients with moderate or severe Alzheimer's disease
Early palliative care for metastatic lung cancer	<i>NEJM</i> 2010; 363:733-742	Among patients with metastatic non-small-cell lung cancer, early palliative care led to significant improvements in both quality of life and mood. As compared with patients receiving standard care, patients receiving early palliative care had less aggressive care at the end-of-life but longer survival
Hip protectors for fracture prevention	<i>NEJM</i> 2000; 343:1506-1513	The risk of hip fracture can be reduced in frail elderly adults by the use of an anatomically designed external hip protector
HYVET	<i>NEJM</i> 2008; 358:1887-1898	Antihypertensive treatment with indapamide (sustained release), with or without perindopril, in adults 80 yr or older is beneficial
PROFET	<i>Lancet</i> 1999; 353:93-97	Demonstrates that an interdisciplinary approach to elderly adults with a previous history of falls can significantly decrease the risk of further falls and limit functional impairment
Yale Delirium Prevention Trial	<i>NEJM</i> 1999; 340:669-676	A risk-factor intervention strategy can result in significant reductions in the number and duration of episodes of delirium in hospitalized older patients

Basic Anatomy Review

Figure 1. Vulva and perineum

A. EXTERNAL GENITALIA (Figure 1)

- referred to collectively as the vulva
- blood supply: internal pudendal artery
- sensory innervation: pudendal nerve
- lymphatic drainage: inguinal nodes

B. VAGINA

- muscular canal extending from cervix to vulva, anterior to rectum and posterior to bladder
- lined by rugated, stratified-squamous epithelium
- upper vagina separated by cervix into anterior, posterior, and lateral fornices
- blood supply: vaginal branch of internal pudendal artery with anastomoses from uterine, inferior vesical, and middle rectal arteries

C. UTERUS

- thick walled, muscular organ between bladder and rectum, consisting of two major parts:
 - uterine corpus
 - ♦ blood supply: uterine artery (branch of the internal iliac artery)
 - cervix
 - ♦ blood supply: cervical branch of uterine artery
- supported by the pelvic diaphragm, the pelvic organs, and 4 paired sets of ligaments
 - round ligaments: travel from anterior surface of uterus, through broad ligaments, and inguinal canals then terminate in the labia majora
 - ♦ function: anteversion
 - ♦ blood supply: Sampson's artery (branch of uterine artery running through round ligament)
 - uterosacral ligaments: arise from sacral fascia and insert into posterior inferior uterus
 - ♦ function: mechanical support for uterus and contain autonomic nerve fibers
 - cardinal ligaments: extend from lateral pelvic walls and insert into lateral cervix and vagina
 - ♦ function: mechanical support, prevent prolapse
 - broad ligaments: pass from lateral pelvic wall to sides of uterus; contain fallopian tube, round ligament, ovarian ligament, nerves, vessels, and lymphatics
- infundibulopelvic ligament: continuous tissue that connects ovary to pelvic wall
 - contains the ovarian artery, ovarian vein, ovarian plexus, and lymphatic vessels
- position of the uterus
 - anteverted (majority)
 - retroverted

Figure 2. External genital organs

Figure 3. Positioning of uterus

D. FALLOPIAN TUBES

- 8-14 cm muscular tubes extending laterally from the uterus to ovary
- interstitial, isthmic, ampullary, and infundibular segments; terminates at fimbriae
- mesosalpinx: peritoneal fold that attaches fallopian tube to broad ligament
- blood supply: uterine and ovarian arteries

E. OVARIES

- consist of cortex with ova and medulla with blood supply
- supported by infundibulopelvic ligament (suspensory ligament of ovary)
- mesovarium: peritoneal fold that attaches ovary to broad ligament
- blood supply: ovarian arteries (branches off aorta), left ovarian vein (drains into left renal vein), right ovarian vein (drains into inferior vena cava)

Figure 4. Vascular supply

Anteversion: forward-tilted uterus

Anteflexion: bending of uterus so the fundus is thrust forward

Retroversion: backward-tilted uterus

Retroflexion: bending of uterus so the fundus is thrust backward

Determination of uterine position by clinical exam:

- If cervix faces anteriorly (under the urethra and less easily accessible), i.e. toward vaginal orifice, more likely **RETROVERTED UTERUS**
- If cervix faces posteriorly (easily accessible), i.e. toward sacrum or rectum, more likely **ANTEVERTED UTERUS**
- If uterus palpable on bimanual exam, more likely **ANTEVERTED UTERUS**

"Water under the bridge"

The ureters run posterior to the uterine arteries

Stages of Puberty

"Boobs, Pubes, Grow, Flow"

Thelarche, Pubarche, Growth spurt, Menarche

Tanner Stage

Thelarche

- I. None
- II. Breast bud
- III. Further enlargement of areola and breasts with no separation of contours
- IV. 2° mound of areola and papilla
- V. Areola recessed to general contour of breast – adult

Pubarche

- I. None
- II. Downy hair along labia only
- III. Darker/coarse hair extends over pubis
- IV. Adult type covers smaller area, no thigh involvement
- V. Adult hair in quantity and type; extends over thighs

Menstruation

Stages of Puberty

- see [Pediatrics, P31](#)
- adrenarche: increase in secretion of adrenal androgens; usually precedes gonadarche by 2 yr
- gonadarche: increased secretion of gonadal sex steroids; ~age 8
- thelarche: breast development
- pubarche: pubic and axillary hair development
- menarche: onset of menses, usually following peak height velocity and/or 2 yr following breast budding

Menstrual Cycle

© Tess Peters 2009 and Sonya Anim 2003

	FOLLICULAR/PROLIFERATIVE PHASE (Variable Duration)			LUTEAL/SECRETORY PHASE (Fixed Duration - 14 days)		
	Early	Mid	Late	OVULATION	Early-Mid	Late
Initiating Events	↓ E and ↓ P (from end of previous cycle)	↑ FSH acts on ovarian granulosa cells	Growing follicles continue to secrete E	Sudden switch from negative to positive feedback (E and P now ↑ FSH & LH)	Switch back to negative feedback	No fertilized oocyte
HPO Axis	↑ GnRH pulse frequency ↑ FSH ↑ LH pulse frequency	↑ E from follicles (ovary)		↑↑ LH pulse amplitude (LH surge)	↓ LH	
Hormones			↑ E from follicles, especially from dominant follicle	E peaks → LH surge → ovulation	↑ P from corpus luteum	↓ P secondary to degeneration of corpus luteum
Feedback on HPO Axis		Negative feedback E → ↓ FSH, ↓ LH		Positive feedback: E and P → ↑ FSH, ↑ LH	Negative feedback P → ↓ FSH, ↓ LH	
Ovaries	↑ FSH → follicular growth in 3-30 follicles	↑ follicular growth (by reducing atresia) → ↑ E	Dominant follicle persists, remainder undergo atresia Granulosa cells luteinize → produce P	~36 h after LH surge, dominant follicle releases oocyte; corpus luteum (remnant of dominant follicle) produces P		Cessation of P from corpus luteum
Endometrium	Menses from P withdrawal (from end of previous cycle)		E builds up endometrium		P stabilizes endometrium	Withdrawal of P → menses
Cervical Mucus		Cervical mucus: Clear, ↑ amount, Spinnbarkeit 8-10 cm, more stringy				Opaque, scant amount, Spinnbarkeit 1-2 cm

E = estrogen; FSH = follicle-stimulating hormone; GnRH = gonadotropin-releasing hormone; HPO = hypothalamic-pituitary-ovarian; LH = luteinizing hormone; P = progesterone

Figure 5. Events of the normal menstrual cycle

Characteristics

- Menarche 10-15 yr
- Average 12.2 yr
- Entire cycle 28 ± 7 d with bleeding for 1-6 d
- 25-80 mL blood loss per cycle

Estrogen

ESTROGEN is the main hormone in the follicular/proliferative phase and is stimulated by FSH. As the level increases it acts negatively on FSH. The majority of estrogen is secreted by the dominant follicle.

Estrogen effects:

- On the follicles in the ovaries:
 - Reduces atresia
- On the endometrium:
 - Proliferation of glandular and stromal tissue
- On all target tissues:
 - Decreases E receptors

Progesterone

PROGESTERONE is the main hormone in the luteal/secretory phase and is stimulated by LH. Increased progesterone acts negatively on LH and is secreted by the corpus luteum (remnant of dominant follicle).

Progesterone effects:

- On the endometrium:
 - Cessation of mitoses (stops building endometrium up)
 - "Organization" of glands (initiates secretions from glands)
 - Inhibits macrophages, interleukin-8, and enzymes from degrading endometrium
- On all target tissues:
 - Decrease E receptors (the "anti-estrogen" effect)
 - Decrease P receptors

Premenstrual Syndrome

- synonyms: “ovarian cycle syndrome,” “menstrual molimina” (moodiness)

Etiology

- multifactorial: not completely understood; genetics likely play a role
- CNS-mediated neurotransmitter interactions with sex steroids (progesterone, estrogen, and testosterone)
- serotonergic dysregulation – currently most plausible theory

Diagnostic Criteria for Premenstrual Syndrome

- at least one affective and one somatic symptom during the 5 d before menses in each of the three prior menstrual cycles
 - affective: depression, angry outbursts, irritability, anxiety, confusion, social withdrawal
 - somatic: breast tenderness, abdominal bloating, headache, swelling of extremities
- symptoms relieved within 4 d of onset of menses
- symptoms present in the absence of any pharmacologic therapy, drug or alcohol use
- symptoms occur reproducibly during 2 cycles of prospective recording
- patient suffers from identifiable dysfunction in social or economic performance

Treatment

- goal: symptom relief
- psychological support
- diet/supplements
 - avoid sodium, simple sugars, caffeine, and alcohol
 - calcium (1,200-1,600 mg/d), magnesium (400-800 mg/d), vitamin E (400 IU/d), vitamin B₆
- medications
 - NSAIDs for discomfort, pain
 - spironolactone for fluid retention: used during luteal phase
 - SSRIs: used during luteal phase x 14 d or continuously
 - OCP: primarily beneficial for physical/somatic symptoms
 - danazol: an androgen that inhibits the pituitary-ovarian axis
 - GnRH agonists if PMS is severe and unresponsive to treatment (may use prior to considering definitive treatment with BSO)
- mind/body approaches
 - regular aerobic exercise
 - cognitive behavioral therapy
 - relaxation, light therapy biofeedback, and guided imagery
- herbal remedies (variable evidence)
 - evening primrose oil, black cohosh, St. John's wort, kava, ginkgo, agnus castus fruit extract
- BSO if symptoms severe

Premenstrual Syndrome

Physiological and emotional disturbances that occur 1-2 wk prior to menses and last until a few days after onset of menses; common symptoms include depression, irritability, tearfulness, and mood swings

Premenstrual Dysphoric Disorder

Definition

- official diagnosis in the DSM-5
- described as a more severe form of PMS with specific diagnostic criteria
- treatment with SSRIs (first line), and Yaz® OCP (highly effective)

Differential Diagnoses of Common Presentations

Abnormal Uterine Bleeding

- see *Disorders of Menstruation*, GY11
- definition: change in frequency, duration, or amount of menstrual flow
- classified as
 - amenorrhea: absence of menstrual periods
 - hypomenorrhea: bleeding that is decreased in amount
 - oligomenorrhea: bleeding occurring at intervals >35 d
 - polymenorrhea: bleeding occurring at intervals <21 d
 - menorrhagia/hypermenorrhea: bleeding at regular intervals that is prolonged in duration (>7 d) or excessive in amount (>80 cc per menstrual cycle)
 - metrorrhagia: bleeding at irregular intervals, particularly between expected menstrual periods
 - menometrorrhagia: excessive bleeding at usual time of menstrual periods and at other irregular intervals
 - postmenopausal bleeding: any bleeding that presents >1 yr after menopause; must rule out endometrial cancer

Postmenopausal bleeding is endometrial cancer until proven otherwise

Dysmenorrhea

- see *Disorders of Menstruation*, GY9
- primary/idiopathic
- secondary (acquired)
 - endometriosis
 - adenomyosis
 - uterine polyps
 - uterine anomalies (e.g. non-communicating uterine horn)
 - leiomyoma
 - intrauterine synechiae
 - ovarian cysts
 - cervical stenosis
 - imperforate hymen, transverse vaginal septum
 - pelvic inflammatory disease
 - IUD (copper)
 - foreign body

Dysmenorrhea
Painful menstruation

Vaginal Discharge/Pruritus

- see *Gynecological Infections*, GY23
- physiologic discharge and cervical mucus production
- non-physiologic
 - genital tract infection
 - vulvovaginitis: candidiasis, trichomoniasis, BV, polymicrobial superficial infection
 - chlamydia, gonorrhea
 - pyosalpinx, salpingitis
 - genital tract inflammation (non-infectious)
 - local: chemical irritants, douches, sprays, foreign body, trauma, atrophic vaginitis, desquamative inflammatory vaginitis, focal vulvitis
 - neoplasia: vulvar, vaginal, cervical, endometrial
 - systemic: toxic shock syndrome, Crohn's disease, collagen disease, dermatologic (e.g. lichen sclerosis)
 - IUD, OCP (secondary to progesterone)

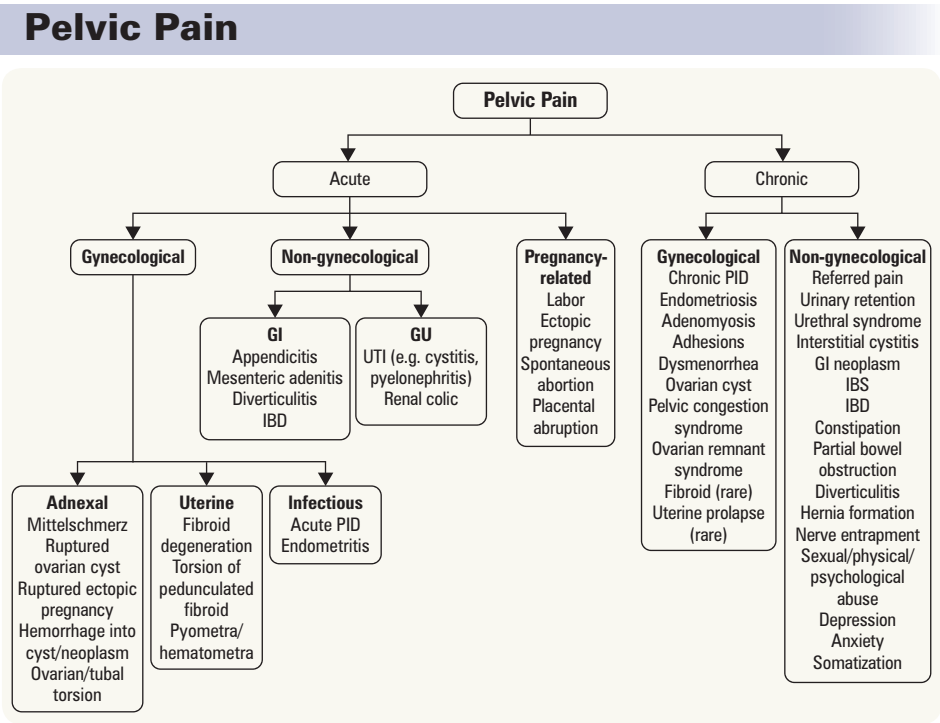

Figure 6. Approach to pelvic pain

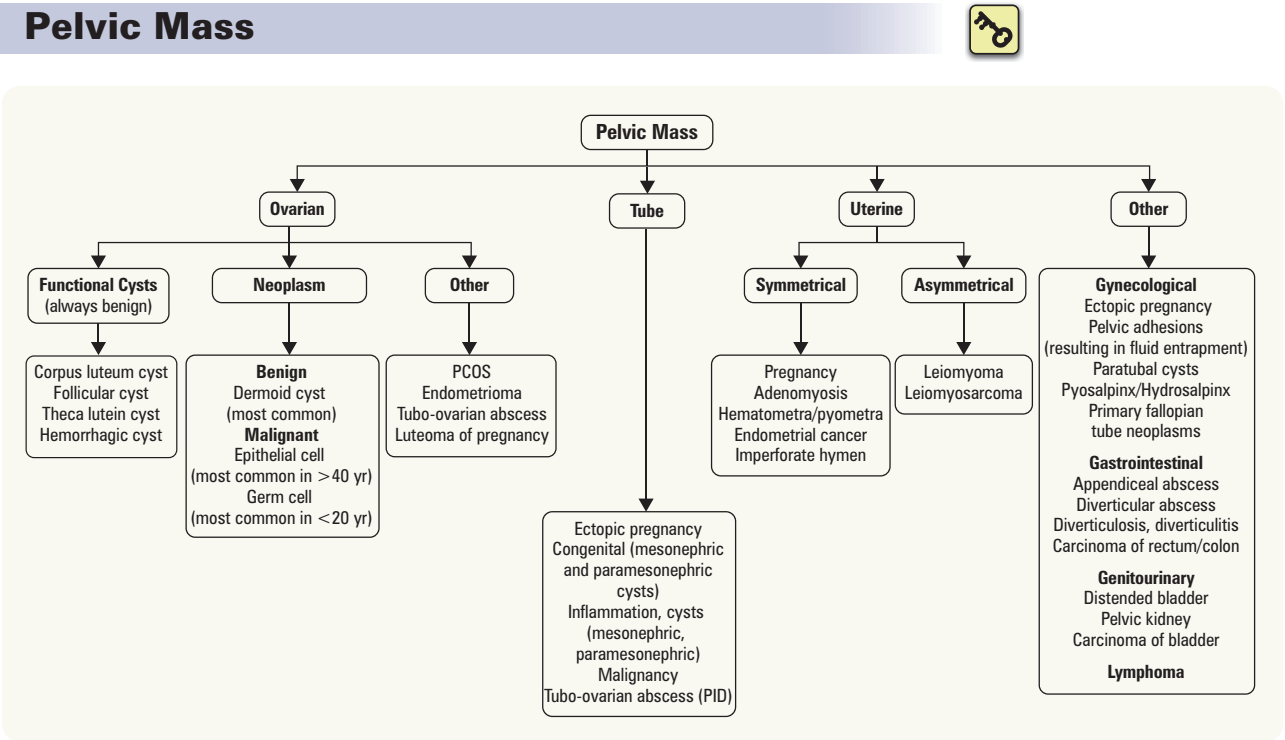

Figure 7. Differential diagnosis of pelvic mass

Dyspareunia

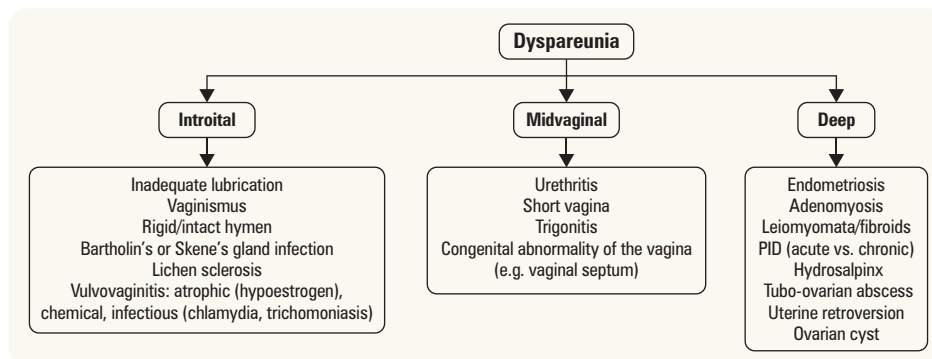

Figure 8. Approach to dyspareunia

Common Investigations and Procedures

Imaging

Ultrasound

- transabdominal or transvaginal U/S is the imaging modality of choice for pelvic structures
- transvaginal U/S provides better resolution of uterus and adnexal structures
 - detects early pregnancy if β -hCG $\geq 1,500$ (β -hCG must be $\geq 6,500$ for transabdominal U/S)
- may be used to identify pelvic pathology
 - identify ectopic pregnancy, intrauterine pregnancy
 - assess uterine, adnexal, cul-de-sac, ovarian masses (e.g. solid or cystic)
 - determine endometrial thickness, locate/characterize fibroids
 - monitor follicles during assisted reproduction
 - assess endometrial lining in postmenopausal women

Dyspareunia
Painful intercourse

Endometrial Biopsy

- performed in the office using an endometrial suction curette (pipelle) guided through the cervix to aspirate fragments of endometrium
 - pre-treatment with misoprostol (Cytotec®) if nulliparous or postmenopausal
- more invasive procedure (D&C) may be done in the office or operating room \pm hysteroscopy
- indications
 - AUB/PMB
 - cancer screening (e.g. following specific cervical cytology results (i.e. AGUS) or in high-risk women)

Every woman of childbearing age presenting to ER with abdominal or pelvic pain should have β -hCG measured

Hysterectomy

Indications

- uterine fibroids
- endometriosis, adenomyosis
- uterine prolapse
- pelvic pain
- AUB
- cancer (endometrium, ovaries, fallopian tubes, cervix)

Complications

- general anesthetic
- bleeding
- infection
- injury to other organs (ureter, bladder, rectum)
- loss of ovarian function (if ovaries removed, iatrogenic menopause)

Approaches

- vaginal vs. abdominal
 - indications for vaginal approach: mobile uterus, uterine size <12 wk
 - advantages of vaginal approach: less pain, faster recovery time, allows for simultaneous repair of rectocele/cystocele/enterocele, improved aesthetics
- open vs. laparoscopic-assisted
 - advantages of laparoscopy: less pain, faster recovery, improved aesthetics, shorter hospital stay
 - unless contraindicated or unavailable laparoscopic hysterectomy is the standard of care
- robotic
 - similar advantages to laparoscopy
 - more dexterous

Approaches to Hysterectomy

- Abdominal hysterectomy: uterus removed via transverse or vertical laparotomy
- Vaginal hysterectomy: uterus removed via vagina; no visualization or entry into abdomen unless laparoscopic-assisted
- Laparoscopic/Robotic: uterus removed via vagina or morcellation

Table 1. Classification of Hysterectomy

Classification	Tissues Removed	Indications
Subtotal Hysterectomy	Uterus	Inaccessible cervix (e.g. adhesions) Patient choice/preference
Total Hysterectomy (extrafascial simple hysterectomy/type 1)	Uterus, cervix, uterine artery ligated at uterus	Uterine fibroids Endometriosis Adenomyosis Menorrhagia DUB
Total Hysterectomy (extrafascial simple hysterectomy/type 1) + Bilateral Salpingo-Oophorectomy (TAH/BSO)	Uterus, cervix, uterine artery ligated at uterus, fallopian tubes, ovaries	Endometrial cancer Malignant adnexal masses >45 yr old Consider for endometriosis
Modified Radical Hysterectomy (type 2)	Uterus, cervix, proximal 1/3 parametria, uterine artery ligated medial to the ureter, mid point of uterosacral ligaments and upper 1-2 cm vagina	Cervical cancer (up to stage IBI)
Radical Hysterectomy (type 3)	Uterus, cervix, upper 1/3-1/2 vagina, entire parametria, uterine artery ligated at its origin from internal iliac artery, uterosacral ligament at most distal attachment (rectum)	Cervical cancer

Disorders of Menstruation

Amenorrhea

Differential Diagnosis of Amenorrhea

Table 2. Differential Diagnosis of Primary Amenorrhea

With Secondary Sexual Development		Without Secondary Sexual Development	
<i>Normal breast and pelvic development</i>	<i>Normal breast, abnormal uterine development</i>	<i>High FSH (hypergonadotropic hypogonadism)</i>	<i>Low FSH (hypogonadotropic hypogonadism)</i>
Hypothyroidism	Androgen insensitivity	Gonadal dysgenesis	Constitutional delay (most common)
Hyperprolactinemia	Anatomic abnormalities	• Abnormal sex chromosome (Turner's XO)	Congenital abnormalities
PCOS	• Müllerian agenesis, uterovaginal septum, imperforate hymen	• Normal sex chromosome (46XX, 46XY)	• Isolated GnRH deficiency
Hypothalamic dysfunction			• Pituitary failure (Kallman syndrome, head injury, pituitary adenoma, etc.)
			Acquired
			• Endocrine disorders (type 1 DM)
			• Pituitary tumors
			• Systemic disorders (IBD, JRA, chronic infections, etc.)

Primary Amenorrhea

No menses by age 13 in absence of 2° sexual characteristics or no menses by age 15 with 2° sexual characteristics or no menses 2 yr after thelarche

Secondary Amenorrhea

No menses for >6 mo or 3 cycles after documented menarche

Oligomenorrhea

Episodic vaginal bleeding occurring at intervals >35 d

Table 3. Differential Diagnosis of Secondary Amenorrhea

With Hyperandrogenism	Without Hyperandrogenism
PCOS Autonomous hyperandrogenism (androgen secretion independent of the HPO axis) <ul style="list-style-type: none"> • Ovarian: tumor, hyperthecosis • Adrenal androgen-secreting tumor Late onset or mild congenital adrenal hyperplasia (rare)	Hypergonadotropic hypogonadism (i.e. premature ovarian failure: high FSH, low estradiol) <ul style="list-style-type: none"> • Idiopathic • Autoimmune: type 1 DM, autoimmune thyroid disease, Addison's disease • Iatrogenic: cyclophosphamide drugs, radiation Hyperprolactinemia Endocrinopathies: most commonly hyper or hypothyroidism Hypogonadotropic hypogonadism (low FSH): <ul style="list-style-type: none"> • Pituitary compression or destruction: pituitary adenoma, craniopharyngioma, lymphocytic hypophysitis, infiltration (sarcoidosis), head injury, Sheehan's syndrome Functional hypothalamic amenorrhea (often related to stress excessive exercise and/or anorexia)

**Prolactinoma Symptoms**

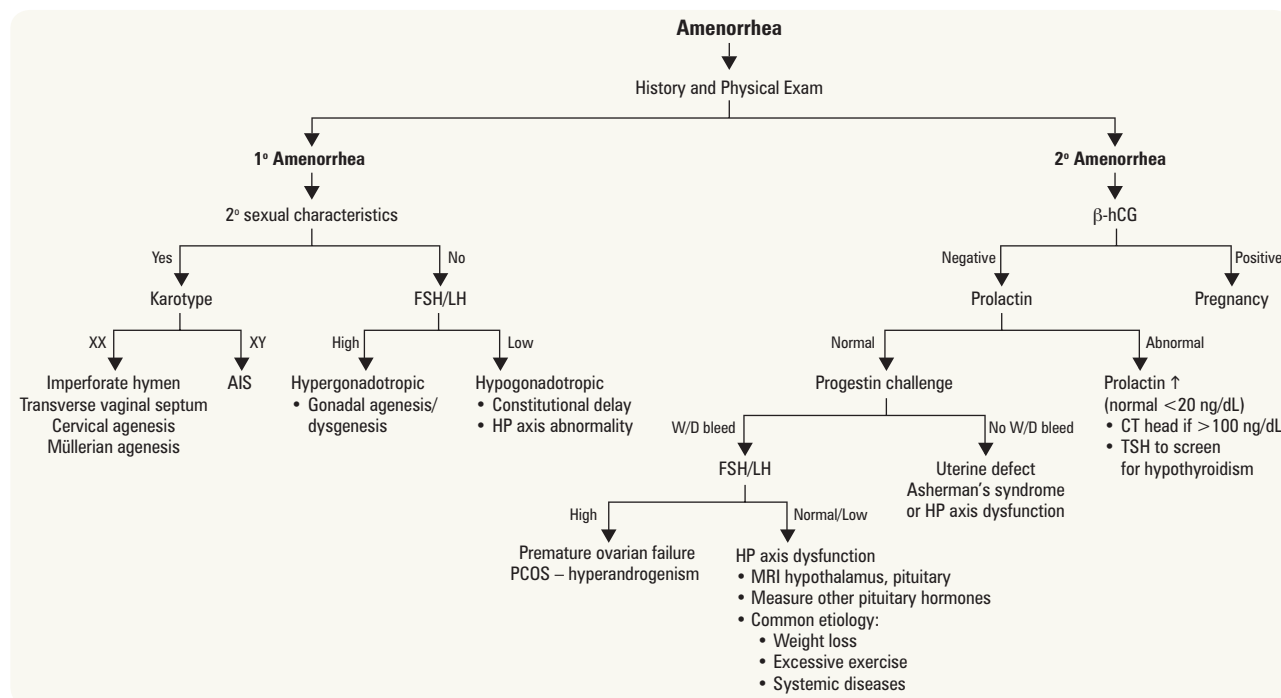

Galactorrhea, visual changes, headache

2° amenorrhea is pregnancy until proven otherwise

Functional hypothalamic amenorrhea is the most common cause of secondary amenorrhea

Investigations**Figure 9. Diagnostic approach to amenorrhea**

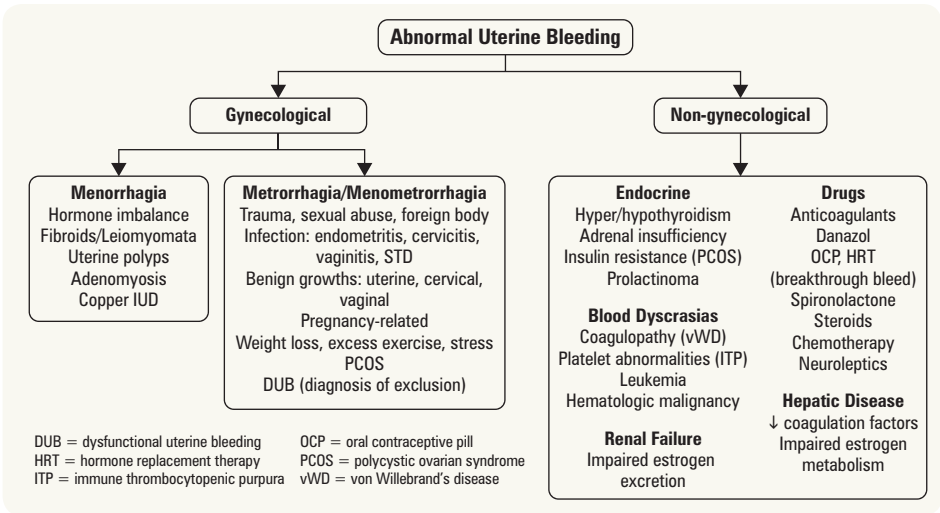

- β -hCG, hormonal workup (TSH, prolactin, FSH, LH, androgens, estradiol)
- progesterone challenge to assess estrogen status
 - medroxyprogesterone acetate (Provera®) 10 mg PO OD for 10-14 d
 - any uterine bleed within 2-7 d after completion of Provera® is considered to be a positive test/withdrawal bleed
 - ♦ withdrawal bleed suggests presence of adequate estrogen to thicken the endometrium; thus withdrawal of progesterone results in bleeding
 - ♦ if no bleeding occurs, there may be inadequate estrogen (hypoestrogenism) or excessive androgens or progesterones (decidualization)
- karyotype: indicated if premature ovarian failure or absent puberty
- U/S to confirm normal anatomy, identify PCOS

Treatment

Table 4. Management of Amenorrhea

Etiology	Management
1° AMENORRHEA	
AIS	<ul style="list-style-type: none">• Gonadal resection after puberty• Psychological counseling• Creation of neo-vagina
Anatomical <ul style="list-style-type: none">• Imperforate hymen• Transverse vaginal septum• Cervical agenesis	<ul style="list-style-type: none">• Surgical management

Abnormal Uterine Bleeding

Abnormal Uterine Bleeding
Change in frequency, duration, or amount of menstrual flow

Determine if patient is hemodynamically stable prior to any other task

AUB in women >40 yr requires an endometrial biopsy to rule out cancer even if known to have fibroids

Figure 10. Approach to abnormal uterine bleeding

Causal Conditions

- pre-menarchal
 - trauma, sexual abuse
- pre-menopausal
 - ovulatory (see Table 5)
 - anovulatory (see Table 5)
 - pregnancy-related
- post-menopausal
 - genital tract disease
 - ♦ atrophy
 - ♦ neoplasms
 - systemic disease
 - drugs
 - ♦ HRT
 - ♦ anti-coagulants

Table 5. Comparison of Anovulatory and Ovulatory Abnormal Uterine Bleeding

	Anovulatory	Ovulatory
Incidence	90%	10%
Definition	Unpredictable endometrial bleeding of variable flow and duration; sex steroids are produced but not cyclically, resulting in irregular bleeding	Typically cyclic, but heavy or prolonged
Etiology	PCOS Thyroid dysfunction Elevated prolactin levels Rare estrogen-producing tumors Stress, weight loss, exercise Liver and kidney disease Structural disease Medication side effect	Anatomic or physical lesion (e.g. polyp, fibroid, adenomyosis, neoplasm, foreign body) Hemostatic defect Infection; trauma Local disturbances in prostaglandins (elevated endomyometrial vasodilatory prostaglandin, decreased vasoconstrictive prostaglandin)
Pathophysiology	Estrogen-dependent breakthrough bleeding: chronic estrogen production unopposed by adequate progesterone production → continued proliferation of the endometrium → thickened endometrium outgrows its blood supply → focal necrosis with partial shedding not uniformly → bleeding is usually irregular, prolonged, and heavy	Depends on underlying etiology

Investigations

- vitals ± orthostatic vitals
- CBC, serum ferritin
- β-hCG to rule out pregnancy
- TSH, free T₄
- coagulation profile (especially in adolescents): rule out von Willebrand's disease
- prolactin if amenorrheic
- FSH, LH
- serum androgens (especially free testosterone)
- day 21 (luteal phase) progesterone to confirm ovulation
- Pap test
- pelvic U/S: detect polyps, fibroids, measure endometrial thickness (postmenopausal)
- SHG: very sensitive for intrauterine pathology (polyps, submucous fibroids)
- HSG
- endometrial biopsy: consider biopsy in women >40 yr
 - must do endometrial biopsy in all women presenting with postmenopausal bleeding to exclude endometrial cancer
- D&C: not for treatment; diagnosis only (usually with hysteroscopy)

Treatment

- resuscitate patient if hemodynamically unstable
- treat underlying disorders
 - if anatomic lesions and systemic disease have been ruled out, consider DUB
- medical
 - mild DUB
 - ♦ NSAIDs
 - ♦ anti-fibrinolytic (e.g. Cyklokapron®) at time of menses
 - ♦ combined OCP
 - ♦ progestins (Provera®) on first 10-14 d of each mo or every 3 mo if oligomenorrheic
 - ♦ Mirena® IUD
 - ♦ danazol
 - acute, severe DUB
 - ♦ replace fluid losses, consider admission
 - ♦ a) estrogen (Premarin®) 25 mg IV q4h x 24 h with dimenhydrinate 50 mg IV/PO q4h or anti-fibrinolytic (e.g. Cyklokapron®) 10 mg/kg IV q8h
 - ♦ b) any OCP with minimum 50 µg estradiol 1 tab PO q4h x 24 h with dimenhydrinate 50 mg IV/PO q4h
 - taper to 1 tab tid x 2 d → bid x 2 d → OD
 - ♦ after (a) or (b), maintain patient on monophasic OCP for next several months or consider alternative medical treatment
 - clomiphene citrate
 - ♦ consider in patients who are anovulatory and who wish to get pregnant
- surgical
 - endometrial ablation; consider pretreatment with danazol or GnRH agonists
 - ♦ if finished childbearing
 - ♦ repeat procedure may be required if symptom reoccur especially if <40 yr
 - hysterectomy: definitive treatment

Dysfunctional Uterine Bleeding

Abnormal bleeding not attributable to organic (anatomic/systemic) disease; DUB is a diagnosis of exclusion; anovulatory AUB often used synonymously with DUB

Dysmenorrhea

Etiology

- see *Differential Diagnoses of Common Presentations*, GY6

Table 6. Comparison of Primary and Secondary Dysmenorrhea

	Primary Dysmenorrhea	Secondary Dysmenorrhea
Features	Menstrual pain in absence of organic disease Begins 6 mo-2 yr after menarche (once ovulatory cycles established)	Menstrual pain due to organic disease Usually begins in women who are in their 20s, worsens with age May improve temporarily after childbirth
Signs and Symptoms	Colicky pain in abdomen, radiating to the lower back, labia, and inner thighs beginning hours before onset of bleeding and persisting for hours or days (48-72 h) Associated symptoms: N/V, altered bowel habits, headaches, fatigue (prostaglandin-associated)	Associated dyspareunia, abnormal bleeding, infertility
Diagnosis	Associated dyspareunia, abnormal bleeding, infertility Rule out underlying pelvic pathology and confirm cyclic nature of pain	Bimanual exam: uterine or adnexal tenderness, fixed uterine retroflexion, uterosacral nodularity, pelvic mass, or enlarged irregular uterus (findings are rare in women <20 yr) U/S, laparoscopy and hysteroscopy may be necessary to establish the diagnosis Screening for infections (vaginal and cervical cultures) and Papanicolaou smear may be required
Treatment	PG synthetase inhibitors (e.g. Anaprox®) should be started before onset of pain OCP: suppress ovulation/reduce menstrual flow	Treat underlying cause

Primary Dysmenorrhea

Menstrual pain in absence of organic disease

Secondary Dysmenorrhea

Menstrual pain due to organic disease

Endometriosis

Etiology

- not fully understood
- proposed mechanisms (combination likely involved)
 - retrograde menstruation (Sampson's theory)
 - ♦ seeding of endometrial cells by transtubal regurgitation during menstruation
 - ♦ endometrial cells most often found in dependent sites of the pelvis
 - immunologic theory: altered immunity may limit clearance of transplanted endometrial cells from pelvic cavity (may be due to decreased NK cell activity)
 - metaplasia of coelomic epithelium
 - ♦ undefined endogenous biochemical factor may induce undifferentiated peritoneal cells to develop into endometrial tissue
 - extrapelvic disease may be due to aberrant vascular or lymphatic dissemination of cells
 - ♦ e.g. ovarian endometriosis may be due to direct lymphatic flow from uterus to ovaries

Epidemiology

- incidence: 15-30% of pre-menopausal women
- mean age at presentation: 25-30 yr
- regresses after menopause

Risk Factors

- family history (7-10x increased risk if affected 1st degree relative)
- obstructive anomalies of the genital tract (earlier onset) – resolve with treatment of anomaly
- nulliparity
- age >25 yr

Sites of Occurrence

- ovaries: 60% patients have ovarian involvement
- broad ligament, vesicoperitoneal fold
- peritoneal surface of the cul-de-sac, uterosacral ligaments
- rectosigmoid colon, appendix
- rarely may occur in sites outside abdomen/pelvis, including lungs

Endometriosis

The presence of endometrial tissue (glands and stroma) outside of the uterine cavity

Differential Diagnoses

- Chronic PID, recurrent acute salpingitis
- Hemorrhagic corpus luteum
- Benign/malignant ovarian neoplasm
- Ectopic pregnancy

Endometrioma

Endometriotic cyst on surface of ovary

Clinical Features

- may be asymptomatic
- history
 - menstrual symptoms
 - ♦ cyclic symptoms due to growth and bleeding of ectopic endometrium, usually precede menses (24-48 h) and continue throughout and after flow
 - ♦ secondary dysmenorrhea
 - ♦ sacral backache with menses
 - ♦ pain may eventually become chronic, worsening perimenstrually
 - ♦ premenstrual and postmenstrual spotting
 - ♦ deep dyspareunia
 - infertility
 - ♦ 30-40% of patients with endometriosis will be infertile
 - ♦ 15-30% of those who are infertile will have endometriosis
 - bowel and bladder symptoms
 - ♦ frequency, dysuria, hematuria
 - ♦ diarrhea, constipation, hematochezia, dyschezia
- physical
 - tender nodularity of uterine ligaments and cul-de-sac felt on rectovaginal exam
 - fixed retroversion of uterus
 - firm, fixed adnexal mass (endometrioma)
 - physical findings not present in adolescent population

Investigations

- definitive diagnosis requires
 - direct visualization of lesions typical of endometriosis at laparoscopy
 - biopsy and histologic exam of specimens (2 or more of: endometrial epithelium, glands, stroma, hemosiderin-laden macrophages)
- laparoscopy
 - mulberry spots: dark blue or brownish-black implants on the uterosacral ligaments, cul-de-sac, or anywhere in the pelvis
 - endometrioma: "chocolate" cysts on the ovaries
 - "powder-burn" lesions on the peritoneal surface
 - early white lesions and clear blebs
 - peritoneal "pockets"
- CA-125
 - may be elevated in patients with endometriosis

Treatment

- depends on certainty of the diagnosis, severity of symptoms, extent of disease, desire for future fertility, and impact to GI/GU systems (e.g. intestinal obstruction)
- medical
 - NSAIDs (e.g. naproxen sodium – Anaprox®)
 - pseudopregnancy
 - ♦ cyclic/continuous estrogen-progestin (OCP)
 - ♦ medroxyprogesterone (Depo-Provera®)
 - ♦ dienogest (Natazia®)
 - pseudomenopause
 - ♦ 2nd line: only short-term (<6 mo) due to osteoporotic potential with prolonged use, unless combined with add-back therapy (e.g. estrogen/progesterone or SERM); if long-term use required, add-back estrogen+progesterone
 - ♦ danazol (Danocrine®): weak androgen
 - side effects: weight gain, fluid retention, acne, hirsutism, voice change
 - ♦ leuprolide (Lupron®): GnRH agonist (suppresses pituitary)
 - side effects: hot flashes, vaginal dryness, reduced libido
 - can use ≥12 mo with add-back progestin or estrogen
- surgical
 - conservative laparoscopy using laser, electrocautery ± laparotomy
 - ♦ ablation/resection of implants, lysis of adhesions, ovarian cystectomy of endometriomas
 - definitive: bilateral salpingo-oophorectomy ± hysterectomy
 - ± follow-up with medical treatment for pain control not shown to impact on preservation of fertility
 - best time to become pregnant is immediately after conservative surgery

There may be little correlation between the extent of endometriosis and symptomatology

Classic Triad of Endometriosis

- Dysmenorrhea
- Dyspareunia (cul-de-sac, uterosacral ligament)
- Dyschezia (uterosacral ligament, cul-de-sac, rectosigmoid attachment)

A sharp, firm, and exquisitely tender "barb" on the uterosacral ligament is a classic feature of endometriosis

Laparoscopic Surgery for Endometriosis

Cochrane DB Syst Rev 2014;4:CD011031

Purpose: To assess the effectiveness and safety of laparoscopic surgery for the treatment of painful symptoms and subfertility associated with endometriosis.

Selection Criteria: RCTs in which effectiveness and safety of laparoscopic surgery was compared with any other laparoscopic or robotic intervention, holistic or medical treatment, or diagnostic laparoscopy only.

Results: 10 RCTs, 973 participants. Laparoscopic surgery was associated with decreased overall pain compared with diagnostic laparoscopy at 6 and 12 mo (OR 6.58, 95% CI 3.31-13.10; OR 10.00, 95% CI 3.21-31.17). Laparoscopic surgery was also associated with an increased live birth or ongoing pregnancy rate compared with diagnostic laparoscopy (OR 1.94, 95% CI 1.20-3.16) and increased pregnancy rate (OR 1.94, 95% CI 1.25-2.86). Compared to diagnostic laparoscopy plus medical therapy (GnRHa plus add-back therapy), laparoscopic ablation resulted in a greater number of participants reporting no pain at 12 mo (OR 5.63, 95% CI 1.18-26.85) although there was no difference in overall pain relief at 12 mo comparing laparoscopic ablation to laparoscopic excision.

Conclusions: Moderate quality evidence suggests that laparoscopic surgery to treat mild and moderate endometriosis reduces overall pain and increases live birth and ongoing pregnancy rates. There was insufficient evidence on adverse events to allow any conclusions regarding safety.

Endometriosis is classified according to a scoring system standardized by the American Society for Reproductive Medicine; score is based on location and extent of disease

Recurrence Rates

Medical therapy: 30-50%

Conservative surgery: 14-40%

Adenomyosis

- synonym: "endometriosis interna" (uterine wall may be diffusely involved)

Epidemiology

- 15% of females >35 yr old; found in 20-40% of hysterectomy specimens
- mean age at presentation: 40-50 yr old (older age group than seen in endometriosis)
- adenomyosis is a common histologic finding in asymptomatic patients

Clinical Features

- often asymptomatic
- menorrhagia, secondary dysmenorrhea, pelvic discomfort
- dyspareunia, dyschezia
- uterus symmetrically bulky, usually <14 cm, mobility not restricted, no associated adnexal pathology
- Halban sign: tender, softened uterus on premenstrual bimanual exam

Investigations

- clinical diagnosis
- U/S or MRI can be helpful
- endometrial sampling to rule out other pathology

Treatment

- iron supplements as necessary
- analgesics, NSAIDs
- OCP, medroxyprogesterone (Depo-Provera®)
- low dose danazol 100-200 mg PO OD (trial x 4 mo)
- GnRH agonists (e.g. leuprolide)
- definitive: hysterectomy (no conservative surgical treatment)

Adenomyosis
Extension of areas of endometrial glands and stroma into the myometrium

Final diagnosis of adenomyosis is based on pathologic findings, but predictably identified on MRI

Leiomyomata (Fibroids)

Epidemiology

- diagnosed in approximately 40-50% of pre-menopausal women >35 yr
- more common in African Americans, where they are also larger and occur at earlier age
- common indication for major surgery in females
- minimal malignant potential (1:1,000)
- typically regress after menopause; enlarging fibroids in a postmenopausal woman should prompt consideration of malignancy
 - 50% of leiomyosarcomas originate from within fibroids

Pathogenesis

- estrogen stimulates monoclonal smooth muscle proliferation
- progesterone stimulates production of proteins that inhibit apoptosis
- degenerative changes (occur when tumor outgrows blood supply)
 - hyaline degeneration (most common degenerative change)
 - cystic degeneration (from breakdown of hyaline)
 - red/carneous degeneration (hemorrhage into tumor, may occur in pregnancy)
 - fatty degeneration
 - calcification
 - sarcomatous degeneration (rare)
 - parasitic myoma: tumor becomes attached to another organ (typically omentum or small bowel mesentery), develops new blood supply and loses connection to uterus

Clinical Features

- majority asymptomatic (60%), often discovered as incidental finding on pelvic exam or U/S
- abnormal uterine bleeding (30%): dysmenorrhea, menorrhagia
- pressure/bulk symptoms (20-50%)
 - pelvic pressure/heaviness
 - increased abdominal girth
 - urinary frequency and urgency
 - acute urinary retention (extremely rare but surgical emergency!)
 - constipation, bloating (rare)
- acute pelvic pain
 - fibroid degeneration
 - fibroid torsion (pedunculated subserosal)

Leiomyomata/Fibroids
Benign smooth muscle tumor of the uterus (most common gynecological tumor)

Submucosal leiomyomata are most symptomatic (bleeding, infertility)

AUB in women >40 yr requires an endometrial biopsy to rule out cancer even if known to have fibroids

Figure 11. Possible anatomic locations of uterine leiomyomata

- infertility, recurrent pregnancy loss
- pregnancy complications (potential enlargement and increased pain, obstructed labor, difficult C-section)

Investigations

- bimanual exam: uterus asymmetrically enlarged, usually mobile
- CBC: anemia
- U/S: to confirm diagnosis and assess location of fibroids
- sonohysterogram: useful for differentiating endometrial polyps from submucosal fibroids, or if intracavitary growth
- endometrial biopsy to rule out uterine cancer for abnormal uterine bleeding (especially if age >40 yr)
- occasionally MRI is used for pre-operative planning (e.g. before myomectomy)

Treatment

- only if symptomatic, rapidly enlarging, menorrhagia, menometrorrhagia, intracavitary
- treat anemia if present
- conservative approach (watch and wait) if:
 - symptoms absent or minimal
 - fibroids <6-8 cm or stable in size
 - not submucosal (submucosal fibroids are more likely to be symptomatic)
 - currently pregnant due to increased risk of bleeding (follow-up U/S if symptoms progress)
- medical approach
 - antiprostaglandins (ibuprofen, other NSAIDs)
 - tranexamic acid (Cyklokapron®)
 - OCP/Depo-Provera®
 - GnRH agonist: leuprolide (Lupron®), danazol (Danocrine®)
 - ♦ short-term use only (6 mo)
 - ♦ often used pre-myomectomy or pre-hysterectomy to reduce fibroid size
 - ♦ reduced bleeding
 - ulipristal acetate: a partial progesterone receptor agonist
- interventional radiology approach
 - uterine artery embolization (occludes both uterine arteries) → shrinks fibroids by 50% at 6 mo; improves menorrhagia in 90% of patients within 1-2 mo; not an option in women considering childbearing
- surgical approach
 - myomectomy (hysteroscopic, transabdominal, or laparoscopic): preserves fertility
 - hysteroscopic resection of fibroid and endometrial ablation for menorrhagia
 - hysterectomy (see [Hysterectomy, GY8](#))
 - note: avoid operating on fibroids during pregnancy (due to ↑ vascularity and potential pregnancy loss); expectant management usually best

The effect of pregnancy on fibroid size is variable

Ulipristal Acetate vs. Leuprolide Acetate for Uterine Fibroids

NEJM 2012;366:421-432

Study: Phase III, double-blind RCT of the efficacy and side-effect profile of ulipristal acetate vs. those of leuprolide acetate for the treatment of symptomatic uterine fibroids before surgery.

Outcomes: Control of uterine bleeding at week 13 was the primary outcome. Secondary outcomes included bleeding pattern, amenorrhea, changes in fibroid/uterine volume, and global pain score.

Patients: 307 premenopausal women with symptomatic fibroids and excessive uterine bleeding were randomly assigned to oral ulipristal acetate (5 mg or 10 mg) or intramuscular injections of leuprolide acetate.

Results: Control of bleeding at week 13 was not significantly different between the treatment groups. All three treatments reduced uterine volume, although this decrease was significantly greater in the leuprolide group (47% reduction) than in the ulipristal groups (20-22%). 40% of the leuprolide group reported moderate-to-severe hot flashes, but only 11% (5 mg) and 10% (10 mg) of the ulipristal groups did.

Conclusions: Oral ulipristal acetate (5 mg or 10 mg) is noninferior to intramuscular leuprolide acetate for control of uterine bleeding due to fibroids, and it had a better side-effect profile.

Suppression of Ovarian Activity with a Drospirenone-Containing Oral Contraceptive in a 24/4 Regimen

Contraception 2008;78:16-25

Study: Double-blind randomized.

Patients: Women aged 18-35 yr, post-ovulation or had a follicular diameter ≥15 mm before day 23 during a pre-treatment cycle.

Intervention: Drospirenone 3 mg plus ethinyl estradiol 20 µg administered in 24/4 regimen vs. 21/7 regimen.

Outcome: Suppression of ovarian activity (Hoogland score).

Results: Women on a 24/4 regimen had greater and more consistent ovarian suppression than the 21/7 group. More women in the 24/4 group had no ovarian activity compared to women in the 21/7 group.

Conclusion: A 24/4 regimen is associated with greater ovarian suppression than a 21/7 regimen.

Counseling the Adolescent about Contraception

More than 90% of adolescent pregnancies are unintended, and ~50% of all pregnancies occur within the first 6 mo of initiating sexual activity; in addition, 85% of sexually active women become pregnant within 1 yr if no contraception is used and even some of the least effective contraceptive methods markedly decrease the risk of pregnancy

Contraception

- see [Family Medicine, FM19](#)

Table 7. Classification of Contraceptive Methods

Type	Effectiveness (perfect use, typical use)
Physiological	
Withdrawal/coitus interruptus	77%
Rhythm method/calendar/mucus/symptothermal	98%, 76%
Lactational amenorrhea	98% (first 6 mo postpartum)
Chance – no method used	10%
Abstinence of all sexual activity	100%
Barrier Methods	
Condom alone	98%, 85%
Spermicide alone	82%, 71%
Sponge – Parous	80%, 68%
– Nulliparous	91%, 84%
Diaphragm with spermicide	94%, 84%
Female condom	95%, 79%
Cervical cap – Parous	74%, 68%
– Nulliparous	91%, 84%

Table 7. Classification of Contraceptive Methods (continued)

Type	Effectiveness (perfect use, typical use)
Hormonal	
OCP	99.7%, 92%
Nuva Ring®	99.7%, 92%
Transdermal (Ortho Evra®)	99.7%, 92%
Depo-Provera®	99.7%, 97%
Progestin-only pill (Micronor®)	90-99%
Mirena® IUD	99.9%
Subdermal implant (Nexplanon/Implanon®)	99.9%
Copper IUD	99.3%
Surgical	
Tubal ligation	99.65%
Vasectomy	99.9%
Emergency Postcoital Contraception (EPC)	
Yuzpe® method	98% (within 24 h), decreases by 30% at 72 h
"Plan B" levonorgestrel only	98% (within 24 h), decreases by 70% at 72 h
Postcoital IUD	99.9%

Effectiveness: percentage of women reporting no pregnancy after 1 yr of use

Hormonal Methods

Combined Oral Contraceptive Pills

- most contain low dose ethinyl estradiol (20-35 µg) plus progestin (norethindrone, norgestrel, levonorgestrel, desogestrel, norgestimate, drospirenone)
- failure rate (0.3% to 8%) depending on compliance
- monophasic or triphasic formulations (varying amount of progestin throughout cycle)

Transdermal (Ortho Evra®)

- continuous release of 6 mg norelgestromin and 0.60 mg ethinyl estradiol into bloodstream
- applied to lower abdomen, back, upper arm, buttocks, NOT breast
- worn for 3 consecutive wk (changed every wk) with 1 wk off to allow for menstruation
- as effective as OCP in preventing pregnancy (>99% with perfect use)
- may be less effective in women >90 kg
- may not be covered by drug plans

Contraceptive Ring (Nuva Ring®)

- thin flexible plastic ring; releases etonogestrel 120 µg/d and estradiol 15 µg/d
- works for 3 wk then removed for 1 wk to allow for menstruation
- as effective as OCP in preventing pregnancy (98%)
- avoids first pass effect
- side effects: vaginal infections/irritation, vaginal discharge
- may have better cycle control; i.e. decreased breakthrough bleeding

Starting Hormonal Contraceptives

- thorough history and physical exam, including blood pressure and breast exam
- follow-up visit 6 wk after hormonal contraceptives prescribed
- pelvic exam not required as STD screening can be done by urine and pap smear screening does not start until >21 yr

Oral Contraceptives and the Risk of Venous Thromboembolism: An Update (2010)

J Obstet Gyn Canada 2010;32:1192-1197

Rates of Venous Thromboembolism

(VTE: DVT and PE) expressed in women/yr
 Non-users of reproductive age 4-5/10,000
 OCP users* 9-10/10,000
 Pregnancy 29/10,000
 Immediate post-partum 300-400/10,000

*Risk is highest in the first months of use and in medication switch.

Effect of Ethinyl Estradiol Dose

ALL OCPs with ≤35 µg ethinyl estradiol carry a lower risk of VTE compared with oral contraceptives with 50 µg.

Effect of Progestin Type

Drospirenone: third generation progestin, e.g. Yasmin® and Yaz®

Levonorgestrel: second generation progestin, e.g. Alesse®

Two high quality research studies found comparable VTE rates with drospirenone-containing OCPs and other approved products.

1. Dinger et al., *Contraception* 2007;75:344-354

2. Seeger et al., *Obstet Gynecol* 2007;110:587-593

Two reports with significant methodological flaws found increased VTE risk. Results and conclusions may have been distorted by residual confounding.

1. Lidegaard et al., *BMJ* 2009;339:b2890

2. Van Hylckama Vlieg et al., *BMJ* 2009;339:b2921

Conclusion

- Occurrence of serious risks, such as VTE, is rare with all contemporary OCPs.
- Individualized risk assessment is mandatory.
- For most healthy women of reproductive age, the benefits of OCPs will outweigh the risks.

Thrombotic Stroke and Myocardial Infarction with Hormonal Contraception

NEJM 2012;366:2257-2266

Study: 15 yr Danish historical cohort study. Non-pregnant women 15-49 yr of age with no history of cardiovascular disease or cancer.

Results: Total of 1,626,158 women, thrombotic stroke rate 21.4/100,000 person yr, MI rate 10.1/100,000 person yr. Oral contraceptives with ethinyl estradiol at a dose of 30-40 µg according to progestin type and risk of thrombotic stroke and MI (RR [CI]): norethindrone 2.2 (1.5-3.2) and 2.3 (1.3-3.9); levonorgestrel 1.7 (1.4-2.0) and 2.0 (1.6-2.5); norgestimate 1.5 (1.2-1.9) and 1.3 (0.9-1.9); desogestrel 2.2 (1.8-2.7) and 2.1 (1.5-2.8); gestodene 1.8 (1.6-2.0) and 1.9 (1.6-2.3); and drospirenone 1.6 (1.2-2.2) and 1.7 (1.0-2.6). With ethinyl estradiol at a dose of 20 µg, risks according to progestin type were: desogestrel 1.5 (1.3-1.9) and 1.6 (1.1-2.1); gestodene 1.7 (1.4-2.1) and 1.2 (0.8-1.9) and drospirenone 0.9 (0.2-3.5) and 0.0.

Conclusions: Although the absolute risk of thrombotic stroke and MI with hormonal contraception is low, it is increased by a factor of 0.9-1.7 with oral contraceptives that contain ethinyl estradiol at a dose of 20 µg and by a factor of 1.3-2.3 with ethinyl estradiol doses of 30-40 µg, with relatively small differences in risk according to progestin type.

Risk of Non-Fatal Venous Thromboembolism in Women Using Oral Contraceptives Containing Drospirenone Compared with Women Using Oral Contraceptives Containing Levonorgestrel: A Case-Control Study Using United States Claims Data

BMJ 2011;342:d2151

Study: Nested case-control and cohort study.

Patients: Women aged 15-44 yr receiving oral contraceptives.

Intervention: Drospirenone-containing contraceptive vs. levonorgestrel-containing contraceptive.

Outcome: Non-fatal venous thromboembolism.

Results: Women receiving drospirenone-containing oral contraceptives were two times as likely to develop non-fatal VTE compared to women receiving levonorgestrel-containing contraceptives (age adjusted incidence rate ratio was 2.8).

Table 8. Combined Estrogen and Progestin Contraceptive Methods

Mechanism of Action	Advantages	Side Effects	Contraindications
<ul style="list-style-type: none"> Ovulatory suppression through inhibition of LH and FSH Decidualization of endometrium Thickening of cervical mucus resulting in decreased sperm penetration 	<ul style="list-style-type: none"> Highly effective Reversible Cycle regulation Decreased dysmenorrhea and menorrhagia (less anemia) Decreased benign breast disease and ovarian cyst development Decreased risk of ovarian and endometrial cancer Increased cervical mucus which may lower risk of STDs Decreased PMS symptoms Improved acne Osteoporosis protection (possibly) 	<p>Estrogen-related</p> <ul style="list-style-type: none"> Nausea Breast changes (tenderness, enlargement) Fluid retention/bloating/edema Weight gain (rare) Migraine, headaches Thromboembolic events Liver adenoma (rare) Breakthrough bleeding (low estradiol levels) <p>Progestin-related</p> <ul style="list-style-type: none"> Amenorrhea/breakthrough bleeding Headaches Breast tenderness Increased appetite Decreased libido Mood changes HTN Acne/oily skin* Hirsutism* <p>* Androgenic side effects may be minimized by prescribing formulations containing desogestrel, norgestimate, drospirenone, or cyproterone acetate</p>	<p>Absolute</p> <ul style="list-style-type: none"> Known/suspected pregnancy Undiagnosed abnormal vaginal bleeding Prior thromboembolic events, thromboembolic disorders (Factor V Leiden mutation; protein C or S, or antithrombin III deficiency), active thrombophlebitis Cerebrovascular or coronary artery disease Estrogen-dependent tumors (breast, uterus) Impaired liver function associated with acute liver disease Congenital hypertriglyceridemia Smoker age > 35 yr Migraines with focal neurological symptoms (excluding aura) Uncontrolled HTN <p>Relative</p> <ul style="list-style-type: none"> Migraines (non-focal with aura < 1 h) DM complicated by vascular disease SLE Controlled HTN Hyperlipidemia Sickle cell anemia Gallbladder disease <p>Drug Interactions/Risks</p> <ul style="list-style-type: none"> Rifampin, phenobarbital, phenytoin, and primidone can decrease efficacy, requiring use of back-up method No evidence of fetal abnormalities if conceived on OCP No evidence that OCP is harmful to nursing infant but may decrease milk production; not recommended until 6 wk postpartum, ideally until 3 mo postpartum

Reference: World Health Organization Guidelines for Oral Contraceptive Pill Use

Table 9. Selected Examples of OCPs

Type	Active Compounds (estriol and progestin derivative)	Advantages	Disadvantages
Alesse®	<ul style="list-style-type: none"> 20 µg ethinyl estradiol and 0.5 mg levonorgestrel 	<ul style="list-style-type: none"> Low dose (20 µg) OCP Can improve acne and help regulate menstrual cycles 	<ul style="list-style-type: none"> Low-dose pills can often result in breakthrough bleeding If this persists for longer than 3 mo, patient should be switched to an OCP with higher estrogen content
Tri-cyclen®	<ul style="list-style-type: none"> 35 µg ethinyl estradiol and 0.180/0.215/0.250 mg norgestimate Triphasic oral contraceptive (graduated levels of progesterone) 	<ul style="list-style-type: none"> Low androgenic activity can help with acne 	<ul style="list-style-type: none"> Triphasic OCPs should not be used continuously (unlike monophasic formulations), although should be used continuously for 1 pack
Yasmin® and Yaz®	<ul style="list-style-type: none"> Yasmin®: 30 µg ethinyl estradiol + 3 mg drospirenone (a new progestin) Yaz®: 20 µg ethinyl estradiol + 3 mg drospirenone – 24/4-d pill (4 d pill free interval) Drospirenone has antimineralocorticoid activity and antiandrogenic effects 	<ul style="list-style-type: none"> Decreased perception of cyclic weight gain/bloating Fewer PMS symptoms Improved acne 	<ul style="list-style-type: none"> Hyperkalemia (rare, contraindicated in renal and adrenal insufficiency) Check potassium if patient also on ACE inhibitor, ARB, K⁺-sparing diuretic, heparin Continue use of spironolactone Increased risk of DVT-PE

PROGESTIN-ONLY METHOD**Table 10. Progestin Only Contraceptive Methods**

Indications	Mechanism of Action	Side Effects	Contraindications
<ul style="list-style-type: none"> Suitable for postpartum women (does not affect breast milk supply) Women with contraindications to combined OCP (e.g. thromboembolic or myocardial disease) Women intolerant of estrogenic side effects of combined OCPs 	<ul style="list-style-type: none"> Progestin prevents LH surge Thickening of cervical mucus Decrease tubal motility Endometrial decidualization Ovulation suppression – oral progestins (not IM) do not consistently suppress compared to combined OCPs 	<ul style="list-style-type: none"> Irregular menstrual bleeding Weight gain Headache Breast tenderness Mood changes Functional ovarian cysts Acne/oily skin Hirsutism 	<p>Absolute</p> <ul style="list-style-type: none"> None

Irregular breakthrough bleeding often occurs in the first few months after starting OCP; usually resolves after three cycles

**Missed Combined OCPs**

Miss 1 pill in <24 h

- Take 1 pill ASAP, and the next pill at the usual time

Miss ≥1 pill in a row in first wk

- Take 1 pill ASAP, and continue taking one pill daily until the end of the pack
- Use back-up contraception for 7 d; EPC may be necessary

Miss <3 pills in 2nd or 3rd wk of cycle

- Take 1 pill ASAP, and continue taking one pill daily until the end of the pack
- Do not take placebo (28-d packs) or do not take a hormone free interval (21-d packs)
- Start the next pack immediately after finishing the previous one
- No need for back-up contraception

Miss ≥3 pills during the 2nd or 3rd wk

- Take 1 pill ASAP, and continue taking one pill daily until the end of the pack
- Don't take placebo (28-d packs) or do not take a hormone free interval (21-d packs)
- Start the next pack immediately after finishing the previous one
- Use back-up contraception for 7 d; EPC may be necessary

SOGC Committee Opinion on Missed Hormonal Contraceptives: New Recommendations. *JOGC* 2008;30:1050-1062. <http://www.sogc.org/guidelines/documents/gui219EC00811.pdf>

Selected Examples of Progestin-Only Methods

Progestin-Only Pill ("minipill")

- Micronor® 0.35 mg norethindrone
- taken daily at same time of day to ensure reliable effect; no pill free interval
- higher failure rate (1.1-13% with typical use, 0.51% with perfect use) than other hormonal methods
- ovulation inhibited in 60% of women; most have regular cycles (but may cause oligo/amenorrhea)
- highly effective if also post-partum breastfeeding, or if >35 yr

Depo-Provera®

- injectable depot medroxyprogesterone acetate
- dose 150 mg IM q12-14wk (convenient dosing)
- initiate within 5 d of beginning of normal menses, immediately postpartum in breastfeeding and non-breastfeeding women
- irregular spotting progresses to complete amenorrhea in 70% of women (after 1-2 yr of use)
- highly effective 99%; failure rate 0.3%
- side effect: decreased bone density (may be reversible)
- disadvantage: restoration of fertility may take up to 1-2 yr

Nexplanon/Implanon®

- subdermal contraceptive rod
- contains 68 mg of etonogestrel, released at a rate of 25-30 µg per d
- inserted subdermally into the inner side of the non-dominant upper arm
- can be inserted during a small office procedure, lasts up to 3 yr
- Nexplanon is the second generation model which contains barium sulfate to make it radio-opaque so its position can be visualized by x-ray if unable to palpate the rod to remove it

Missed Progestin-Only Pills >3 h

Use back-up contraceptive method for at least 48 h; continue to take remainder of pills as prescribed

Missed Depo-Provera

- If last injection given 13-14 wk prior: give next injection immediately
- if >14 wk prior, do β-hCG
 - If β-hCG is positive, give EPC and no injection
 - If β-hCG is negative, give next injection right away and:
 - Intercourse occurred in last 5 d: give EPC, use back-up contraception for 7 d
 - Repeat β-hCG in 3 wk
 - Intercourse occurred >5 d ago but within the last 14 d: use back-up contraception for 7 d
 - Repeat β-hCG in 3 wk
 - Intercourse occurred >14 d ago: use back-up contraception for 7 d
 - No evidence of fetal abnormalities if conceived on DMPA

SOGC Committee Opinion on Missed Hormonal Contraceptives: New Recommendations.
JOGC 2008;30:1050-62. <http://www.sogc.org/guidelines/documents/guid219EC00811.pdf>

Steroidal Contraceptives and Bone Fractures in Women: Evidence from Observational Studies

Cochrane DB Syst Rev 2012;8:CD009849

Background: Steroidal contraceptives have been associated with effects on bone mineral density (BMD) in women.

Study: Systematic review of observational studies of comparisons of hormonal contraceptive with nonhormonal contraceptive, no contraceptive, or other hormonal contraceptive as they affected risk of fracture (primary outcome).

Results: 7 case-control and 7 cohort studies were included.

- One study reported increased fracture risk for depot medroxyprogesterone acetate (DMPA) ever-use (OR 1.44), >4 yr use (OR 2.16)
- One study reported decreased fracture risk for ever-use (OR 0.75) and longer use of hormonal IUD.

Continuous or Extended Cycle vs. Cyclic Use of Combined Oral Contraceptives for Contraception

Cochrane DB Syst Rev 2005;3:CD004695

Background: The efficacy and side effects of cyclic administration vs. extended use (longer periods of active pills and/or shorter periods placebo) or continuous use (uninterrupted active pill administration) of combination oral contraceptives (COC) are unclear.

Study: Systematic review of randomized clinical trials comparing continuous or extended vs. cyclic COC administration.

Findings: Eight RCTs met inclusion criteria.

- No difference in efficacy of pregnancy prevention.
- No difference in compliance with dosing schedules.
- Extended cycle use lowered prevalence of menstrual symptoms (e.g. headaches, pain, fatigue).
- No difference in bleeding patterns, but continuous use may improve over time.

Intrauterine Device

Table 11. IUD Contraceptive Methods

Mechanism of Action	Side Effects	Contraindications
<ul style="list-style-type: none"> • Copper-containing IUD (Paragard-T®): mild foreign body reaction in endometrium toxic to sperm and alters sperm motility • Progesterone-releasing IUD (Mirena®): decidualization of endometrium and thickening of cervical mucus; minimal effect on ovulation • Highly effective (95-99%); failure rate 0-1.2% • Contraceptive effects last 5 yr • Reversible, private, convenient • May be used in women with contraindications to OCPs or wanting long-term contraception 	<ul style="list-style-type: none"> • Both Copper and Progesterone IUD <ul style="list-style-type: none"> • Breakthrough bleeding • Expulsion (5% in the 1st yr, greatest in 1st mo and in nulliparous women) • Uterine wall perforation (1/1,000) on insertion • If pregnancy occurs with an IUD, increased risk of ectopic • Increased risk of PID (within first 10 d of insertion only) • Copper IUD: increased blood loss and duration of menses, dysmenorrhea • Progesterone IUD: bloating, headache 	<ul style="list-style-type: none"> • Absolute <ul style="list-style-type: none"> • Both Copper and Progesterone IUD <ul style="list-style-type: none"> • Known or suspected pregnancy • Undiagnosed genital tract bleeding • Acute or chronic PID • Lifestyle risk for STDs* • Copper IUD: <ul style="list-style-type: none"> • Known allergy to copper • Wilson's disease • Relative <ul style="list-style-type: none"> • Both Copper and Progesterone IUD <ul style="list-style-type: none"> • Valvular heart disease • Past history of PID or ectopic pregnancy • Presence of prosthesis • Abnormalities of uterine cavity, intracavitary fibroids • Cervical stenosis • Immunosuppressed individuals (e.g. HIV) • Copper IUD: severe dysmenorrhea or menorrhagia

*Cervical swabs for gonorrhea and chlamydia should be done prior to IUD insertion

Depot Medroxyprogesterone Acetate and Bone Effects

ACOG Committee Opinion 415, 2008

Obstet Gynecol 2008;112:727-730

- The effect of DMPA on BMD should neither prevent practitioners from prescribing DMPA nor limit its use to 2 consecutive yr.
- The greatest loss of BMD occurs in the first 1-2 yr of DMPA use.
- Contraceptive implants and intrauterine devices that do not affect BMD should be considered as first-line for adolescents.
- Inform patients about benefits and the potential risks of DMPA, and encourage daily exercise, calcium and vitamin D intake.
- Routine BMD monitoring is not recommended for DMPA users.

Emergency Postcoital Contraception

Table 12. Emergency Contraceptive Methods

Method	Mechanism of Action	Side Effects	Contraindications
HORMONAL			
Yuzpe Method <ul style="list-style-type: none"> Used within 72 h of unprotected intercourse; limited evidence of benefit up to 5 d Ovral® 2 tablets then repeat in 12 h (ethinyl estradiol 100 µg/levonorgestrel 500 µg) Can substitute with any OCP as long as same dose of estrogen used 2% overall risk of pregnancy Efficacy decreased with time (e.g. less effective at 72 h than 24 h) 	<ul style="list-style-type: none"> Unknown; theories include: <ul style="list-style-type: none"> Suppresses ovulation or causes deficient luteal phase Alters endometrium to prevent implantation Affects sperm/ova transport 	<ul style="list-style-type: none"> Nausea (due to estrogen; treat with dimenhydrinate) Irregular spotting 	<ul style="list-style-type: none"> Pre-existing pregnancy (although not teratogenic) Caution in women with contraindications to OCP (although NO absolute contraindications)
"Plan B" <ul style="list-style-type: none"> Consists of levonorgestrel 750 µg q12h for 2 doses (can also take 2 doses together); taken within 72 h of intercourse Greater efficacy (75-95% if used within 24 h) and better side effect profile than Yuzpe method but efficacy decreases with time; 1st line if >24 h No estrogen thus very few contraindications/side effects (less nausea) Less effective in overweight individuals (>75 kg less effective, >80 kg not recommended) 			
NON-HORMONAL			
Postcoital IUD (Copper) <ul style="list-style-type: none"> Insert up to 7 d postcoitus Prevents implantation 1% failure rate Can use for short duration in higher risk individuals Mirena® IUD cannot be used as EPC 	• See Table 11	• See Table 11	• See Table 11

Follow-up

- 3-4 wk post treatment to confirm efficacy (confirmed by spontaneous menses or pregnancy test)
- contraception counseling

Infertility

Epidemiology

- 10-15% of couples
- must investigate both members of the couple

Female Factors

Etiology

- ovulatory dysfunction (15-20%)
 - hypothalamic (hypothalamic amenorrhea)
 - pituitary (prolactinoma, hypopituitarism)
 - ovarian
 - PCOS
 - premature ovarian failure
 - luteal phase defect (poor follicle production, premature corpus luteum failure, failed uterine lining response to progesterone), poorly understood
 - systemic diseases (thyroid, Cushing's syndrome, renal/hepatic failure)
 - congenital (Turner's syndrome, gonadal dysgenesis or gonadotropin deficiency)
 - stress, poor nutrition, excessive exercise (even with presence of menstruation)
- outflow tract abnormality (15-20%)
 - tubal factors (20-30%)
 - PID
 - adhesions (previous surgery, peritonitis, endometriosis)
 - ligation/occlusion (e.g. previous ectopic pregnancy)
 - uterine factors (<5%)
 - congenital anomalies, bicornuate uterus, septate uterus, prenatal DES exposure
 - intrauterine adhesions (e.g. Asherman's syndrome)
 - infection (endometritis, pelvic TB)
 - fibroids/polyps (particularly intrauterine)
 - endometrial ablation
 - cervical factors (5%)
 - hostile or acidic cervical mucus
 - anti-sperm antibodies
 - structural defects (cone biopsies, laser or cryotherapy)

Any OCP can be used as EPC; 100 µg ethinyl estradiol PO q12h x 2 doses.

- Levonorgestrel emergency contraception regimens are more effective and cause fewer side effects than the Yuzpe regimen
- Levonorgestrel emergency contraception single dose (1.5 mg) and the 2-dose levonorgestrel regimen (0.75 mg 12 h apart) have similar efficacy with no difference in side effects

SOGC Clinical Practice Guidelines: Emergency Contraception. *JOGC* 2012;34:870-878.
http://www.sogc.org/guidelines/documents/gui280CPG1209E_000.pdf

Infertility: inability to conceive or carry to term a pregnancy after 1 yr of regular, unprotected intercourse

Primary infertility: infertility in the context of no prior pregnancies

Secondary infertility: infertility in the context of a prior conception

Generally, 75% of couples achieve pregnancy within 6 mo, 85% within 1 yr, 90% within 2 yr

Requirements for Conception

- Ovary
- Tube
- Cervix
- Endometrium
- Sperm

- endometriosis (15-30%)
- multiple factors (30%), see GY22
- unknown factors (10-15%)

Investigations

- ovulatory
 - day 3: FSH, LH, TSH, prolactin \pm DHEA, free testosterone (if hirsute)
 - day 21-23: serum progesterone to confirm ovulation
 - initiate basal body temperature monitoring (biphasic pattern)
 - postcoital test: evaluate mucus for clarity, pH, spinnbarkeit/fibrosity (rarely done)
- tubal factors
 - HSG (can be therapeutic – opens fallopian tube)
 - SHG (can be therapeutic – opens fallopian tube)
 - laparoscopy with dye insufflation (or tubal dye test)
- peritoneal/uterine factors
 - HSG/SHG, hysteroscopy
- other
 - karyotype

Treatment

- education: timing of intercourse in relation to ovulation (from 2 d prior to 2 d following presumed ovulation), every other day
- medical
 - ovulation induction
 - ♦ clomiphene citrate (Clomid®): estrogen antagonist that causes a perceived decreased estrogen state, resulting in increased pituitary gonadotropins; causes increased FSH and LH, leading to ovulation induction (works much better if anovulatory)
 - ♦ human menopausal gonadotropin – FSH and LH extracted from urine of postmenopausal women
 - ♦ followed by β -hCG for stimulation of ovum release
 - may add
 - ♦ bromocriptine (dopamine agonist) if elevated prolactin
 - ♦ dexamethasone for hyperandrogenism (adult onset congenital adrenal hyperplasia)
 - ♦ metformin (for PCOS)
 - ♦ luteal phase progesterone supplementation for luteal phase defect (mechanism not completely understood)
 - ♦ ASA (81 mg PO OD) for women with a history of recurrent spontaneous abortions (for antiphospholipid antibody syndrome)
- surgical/procedural
 - tubuloplasty
 - lysis of adhesions
 - artificial insemination: intracervical insemination (ICI), intrauterine insemination (IUI), intrauterine tuboperitoneal insemination (IUTPI), intratubal insemination (ITI)
 - sperm washing
 - IVF (*in vitro* fertilization)
 - IFT (intrafallopian transfer)
 - GIFT (gamete intrafallopian transfer): immediate transfer with sperm after oocyte retrieval
 - ZIFT (zygote intrafallopian transfer): transfer after 24 h culture of oocyte and sperm
 - TET (tubal embryo transfer): transfer after >24 h culture
 - ICSI (intracytoplasmic sperm injection)
 - IVM (*in vitro* maturation)
 - \pm oocyte or sperm donors
 - \pm pre-genetic screening for single gene defects in karyotype of zygote

When Should Investigations Begin?

- <35 yr: after 1 yr of regular unprotected intercourse
- 35-40 yr: after >6 mo
- >40 yr: immediately
- Earlier if:
 - History of PID
 - History of infertility in previous relationship
 - Prior pelvic surgery
 - Chemotherapy/radiation in either partner
 - Recurrent pregnancy loss
 - Moderate-severe endometriosis

Controversial and Evolving Ethical Issues

- Infertility demands non-judgmental discussion
- Ethical issues surrounding therapeutic donor insemination in same sex couples, surrogacy, donor gametes, and other advanced reproductive technologies are still evolving and remain controversial
- If the doctor finds that certain treatment options lie outside of their moral boundaries, the infertile couple should be referred to another physician

Male Factors

- see [Urology](#), U33

Etiology

- varicocele (>40%)
- idiopathic (>20%)
- obstruction (~15%)
- cryptorchidism (~8%)
- immunologic (~3%)

Investigations

- semen analysis and culture
- postcoital (Huhner) test: rarely done

Normal Semen Analysis (WHO lower reference limits)

- Must be obtained after 2-7 d of abstinence
 - Volume 1.5 cc
 - Count 15 million/cc
 - Vitality 58% live
 - Motility 32% progressive, 40% total (progressive + non-progressive)
 - Morphology 4.0% normal

Polycystic Ovarian Syndrome

- also called chronic ovarian androgenism

Etiology

Figure 12. Pathophysiology of polycystic ovarian syndrome

Diagnosis

- 2 of 3 to make diagnosis:
 - oligomenorrhea/irregular menses for 6 mo
 - clinical or lab evidence of hyperandrogenism
 - polycystic ovaries on U/S

Clinical Features

- average age 15-35 yr at presentation
- in adolescents, wait at least 1-2 yr to make diagnosis
- abnormal/irregular uterine bleeding, hirsutism, infertility, obesity, virilization
- insulin resistance occurs in both lean and obese patients
- acanthosis nigricans: browning of skin folds in intertriginous zones (indicative of insulin resistance)
- family history of DM

Investigations

- goal of investigations is to identify hyperandrogenism or chronic anovulation; and rule out specific pituitary or adrenal disease as the cause
- laboratory
 - prolactin, 17-hydroxyprogesterone, free testosterone, DHEA-S, TSH, free T_4 , androstenedione, SHBG
 - LH:FSH >2:1; LH is chronically high with FSH mid-range or low (low sensitivity and specificity)
 - increased DHEA-S, androstenedione and free testosterone (most sensitive), decreased SHBG
- transvaginal or transabdominal U/S: polycystic-appearing ovaries ("string of pearls" – 12 or more small follicles 2-9 mm, or increased ovarian volume)
- tests for insulin resistance or glucose tolerance
 - fasting glucose:insulin ratio <4.5 is consistent with insulin resistance (U.S. units)
 - 75 g OGTT yearly (particularly if obese)
- laparoscopy
 - not required for diagnosis
 - most common to see white, smooth, sclerotic ovaries with a thick capsule; multiple follicular cysts in various stages of atresia; hyperplastic theca and stroma
- rule out other causes of abnormal bleeding

Treatment

- **cycle control**
 - lifestyle modification (decrease BMI, increase exercise) to decrease peripheral estrone formation
 - OCP monthly or cyclic Provera® to prevent endometrial hyperplasia due to unopposed estrogen
 - oral hypoglycemic (e.g. metformin) if type 2 diabetic or if trying to become pregnant
 - tranexamic acid (Cyklokapron®) for menorrhagia only
- **infertility**
 - medical induction of ovulation: clomiphene citrate, human menopausal gonadotropins (HMG [Pergonal®]), LHRH, recombinant FSH, and metformin
 - ♦ metformin may be used alone or in conjunction with clomiphene citrate for ovulation induction
 - ovarian drilling (perforate the stroma), wedge resection of the ovary
 - bromocriptine (if hyperprolactinemia)
- **hirsutism**
 - any OCP can be used
 - ♦ Androcur® (cyproterone acetate): antiandrogenic
 - ♦ Yasmin® (drospirenone and ethinyl estradiol): spironolactone analogue (inhibits steroid receptors)
 - mechanical removal of hair
 - finasteride (5- α reductase inhibitor)
 - flutamide (androgen reuptake inhibitor)
 - spironolactone: androgen receptor inhibitor

Clinical Signs of Endocrine Imbalance

- Menstrual disorder/amenorrhea (80%)
- Infertility (74%)
- Hirsutism (69%)
- Obesity (49%)
- Impaired glucose tolerance (35%)
- DM (10%)

Polycystic Ovarian Syndrome – HAIR-AN

Hirsutism, HyperAndrogenism, Infertility, Insulin Resistance, Acanthosis Nigricans

PCOS may be confused with:

- Late onset congenital adrenal hyperplasia (21-hydroxylase deficiency)
- Cushing's syndrome
- Ovarian and adrenal neoplasms
- Hyperprolactinemia
- Hypothyroidism

Long-Term Health Consequences

- Hyperlipidemia
- Adult-onset DM
- Endometrial hyperplasia
- Infertility
- Obesity
- Sleep apnea

Use of Metformin in Polycystic Ovary Syndrome. A Meta-Analysis

Obstet Gynecol 2008;111(4):959-68.

Study: This meta-analysis of 17 RCTs assessed the efficacy of metformin or metformin in combination with clomiphene citrate in women with PCOS who were seeking pregnancy.

Main Outcomes: Ovulation, pregnancy, and live birth. Patients: 1,639 patients with PCOS were followed up for up to 12 mo.

Results: Compared to placebo, metformin increased the odds of ovulation (OR 2.94, 95% CI 1.43-6.02). However, when used alone, metformin did not significantly increase the odds of achieving pregnancy (OR 1.56, 95% CI 0.74-3.33). When compared to clomiphene alone, the combination of metformin and clomiphene increased the likelihood of ovulation (OR 4.39, 95% CI 1.94-9.96) and pregnancy (OR 2.67, 95% CI 1.45-4.94). The effect of combination therapy was most prominent in clomiphene-resistant and obese women with PCOS. Furthermore, the combination therapy had a higher likelihood of having a live birth compared to clomiphene alone, but this did not reach significance (OR 1.74, 95% CI 0.79-3.86).

Conclusions: Metformin increases the likelihood of ovulation. When used together with clomiphene, metformin increases the likelihood of both ovulation and pregnancy, especially in clomiphene-resistant and obese women.

Gynecological Infections

Physiologic Discharge

- clear, white, flocculent, odorless discharge; pH 3.8-4.2
- smear contains epithelial cells, *Lactobacilli*
- increases with increased estrogen states: pregnancy, OCP, mid-cycle, PCOS, or premenarchal
- if increased in perimenopausal/postmenopausal woman, consider investigation for other effects of excess estrogen (e.g. endometrial cancer)

Vulvovaginitis

PREPUBERTAL VULVOVAGINITIS

- clinical features
 - irritation, pruritus
 - discharge
 - vulvar erythema
 - vaginal bleeding (specifically due to Group A *Streptococci* and *Shigella*)
- differential diagnosis
 - non-specific vulvovaginitis (25-75%)
 - infections (respiratory, enteric, systemic, sexually acquired)
 - foreign body (toilet paper most common)
 - *Candida* (if using diapers)
 - pinworms
 - polyps, tumor (ovarian malignancy)
 - vulvar skin disease (lichen sclerosis, condyloma acuminata)
 - trauma (accidental straddle injury, sexual abuse)
 - psychosomatic vaginal complaints (specific to vaginal discharge)
 - endocrine abnormalities (specific to vaginal bleeding)
 - blood dyscrasia (specific to vaginal bleeding)
- etiology
 - infectious
 - ◆ poor hygiene, proximity of vagina to anus
 - ◆ recent infection (respiratory, enteric, systemic)
 - ◆ STD: investigate sexual abuse
 - nonspecific
 - ◆ lack of protective hair and labial fat pads
 - ◆ lack of estrogenization
 - ◆ susceptible to chemicals, soaps (bubble baths), medications, and clothing
 - ◆ enuresis
- investigations
 - vaginal swab for culture (specifically state that it is a pre-pubertal specimen), pH, wet-mount, and KOH smear in adults only
- treatment
 - enhanced hygiene and local measures (handwashing, white cotton underwear, no nylon tights, no tight fitting clothes, no sleeper pajamas, sitz baths, avoid bubble baths, use mild detergent, eliminate fabric softener, avoid prolonged exposure to wet bathing suits, urination with legs spread apart)
 - A&D® dermatological ointment (vitamin A/D) to protect vulvar skin
 - infectious: treat with antibiotics for organism identified

Table 13. Other Common Causes of Vulvovaginitis in Prepubertal Girls

	Pinworms	Lichen Sclerosis	Foreign Body
Diagnosis	Cellophane tape test	Area of white patches and thinning of skin	
Treatment	Empirical treatment with mebendazole	Topical steroid creams	Irrigation of vagina with saline, may require local anesthesia or an exam under anesthesia

Diagnostic Criteria for Polycystic Ovary Syndrome: Pitfalls and Controversies

JOGC 2008;8:671-9

At present, there is no clear-cut definition of biochemical hyperandrogenemia, particularly since there is dependence on poor laboratory standards for measuring androgens in women. Clinical signs of hyperandrogenism are ill-defined in women with PCOS, and diagnosis of both hirsutism and polycystic ovarian morphology remains subjective. There is also the inappropriate tendency to assign ovulatory status solely on basis of menstrual cycle history or poorly timed endocrine measurements. Therefore it is important as clinicians to recognize the multi-factorial and complex nature of PCOS and place this in the context of our present diagnostic limitations.

Vulvovaginitis

Vulvar and vaginal inflammation

Most common gynecological problem in prepubertal girls is non-specific vulvovaginitis, not yeast

There is no high quality evidence showing a link between vulvovaginal candidiasis and hygienic habits or wearing tight or synthetic clothing

Prepubertal and Adolescent Gynecological Infections: Legal Aspects of Confidentiality

- Clinicians who treat adolescents must be aware of federal and state laws related to adolescent consent and confidentiality
- They must be aware of guidelines governing funding sources for particular services and be familiar with the consent and confidentiality policies of the facility in which they practice

POSTMENOPAUSAL VAGINITIS/ATROPHIC VAGINITIS

- clinical features
 - dyspareunia
 - postcoital spotting
 - mild pruritus
- investigations
 - atrophy is usually a visual diagnosis: thinning of tissues, erythema, petechiae, bleeding points, dryness on speculum exam
 - rule out malignancy: especially endometrial cancer
- treatment
 - local estrogen replacement (ideal): Premarin® cream, VagiFem® tablets, or Estrin®
 - oral or transdermal hormone replacement therapy (if treatment for systemic symptoms is desired)
 - good hygiene

INFECTIOUS VULVOVAGINITIS

Table 14. Infectious Vulvovaginitis

	Candidiasis (Moniliasis)	Bacterial Vaginosis (BV)	Trichomoniasis
Organisms	<i>Candida albicans</i> (90%) <i>Candida glabrata</i> (<5%) <i>Candida tropicalis</i> (<5%)	<i>Gardnerella vaginalis</i> <i>Mycoplasma hominis</i> Anaerobes: <i>Prevotella</i> , <i>Mobiluncus</i> , <i>Bacteroides</i>	<i>Trichomonas vaginalis</i> (flagellated protozoan)
Pathophysiology or Transmission	Predisposing factors include: <ul style="list-style-type: none"> Immunosuppressed host (DM, AIDS, etc.) Recent antibiotic use Increased estrogen levels (e.g. pregnancy, OCP) 	Replacement of vaginal <i>Lactobacillus</i> with organisms above	Sexual transmission
Discharge	Whitish, "cottage cheese," minimal	Gray, thin, diffuse	Yellow-green, malodorous, diffuse, frothy
Other	<ul style="list-style-type: none"> 20% asymptomatic 	<ul style="list-style-type: none"> 50-75% asymptomatic 	<ul style="list-style-type: none"> 25% asymptomatic

Sexually Transmitted Diseases

- see [Family Medicine, FM45](#)

Figure 13. Speculum exam

TRICHOMONIASIS

- see [Infectious Vulvovaginitis, Table 14, GY24](#)

CHLAMYDIA

Etiology

- *Chlamydia trachomatis*

Epidemiology

- common bacterial STD in the United States
- often associated with *N. gonorrhoeae*

Clinical Features

- asymptomatic (80% of women)
- muco-purulent endocervical discharge
- urethral syndrome: dysuria, frequency, pyuria, no bacteria on culture
- pelvic pain
- postcoital bleeding or intermenstrual bleeding (particularly if on OCP and prior history of good cycle control)
- symptomatic sexual partner

Investigations

- cervical culture or nucleic acid amplification test
- obligate intracellular parasite: tissue culture is the definitive standard
- urine and vaginal tests now available, which are equally or more effective than cervical culture

Treatment

- doxycycline 100 mg PO bid for 7 d or azithromycin 1 g PO in a single dose
- if pregnant: azithromycin 1 g PO in a single dose or amoxicillin 500 mg PO tid for 7 d
- also treat gonorrhea because of high rate of co-infection
- treat partners
- reportable disease
- test of cure for chlamydia required in pregnancy (cure rates lower in pregnant patients) → retest 3-4 wk after initiation of therapy

Screening

- high risk groups
- during pregnancy
- with initiation of OCP (independent risk factor)

STD Testing

- Vaginal swab
 - Tests for bacterial vaginosis, trichomoniasis, candida
- Cervical swab
 - Tests for gonorrhea and chlamydia

Risk Factors for STDs

- History of previous STD
- Contact with infected person
- Sexually active individual <25 yr
- Multiple partners
- New partner in last 3 mo
- Lack of barrier protection use
- Street involvement (homelessness, drug use)

CDC Notifiable Diseases

- Chancroid
- Chlamydia
- Gonorrhea
- Hepatitis A, B, C
- HIV
- Syphilis

Complications

- acute salpingitis, PID
- Fitz-Hugh-Curtis syndrome (liver capsule inflammation)
- reactive arthritis (male predominance, HLA-B27 associated), conjunctivitis, urethritis
- infertility: tubal obstruction from low grade salpingitis
- ectopic pregnancy
- chronic pelvic pain
- perinatal infection: conjunctivitis, pneumonia

GONORRHEA

Etiology

- *Neisseria gonorrhoeae*
- symptoms and risk factors same as with chlamydia

Investigations

- Gram stain shows Gram-negative intracellular diplococci
- cervical, rectal, and throat culture (if clinically indicated)

Treatment

- single dose of ceftriaxone 250 mg IM plus single dose of azithromycin 1 g PO or doxycycline 100 mg PO bid for 7d
- if pregnant: above regimen or alternate cephalosporin, or single dose of azithromycin 2 g PO
- also treat chlamydia, because of high rate of co-infection
- treat partners
- reportable disease
- screening as with Chlamydia

Test of cure for *C. trachomatis* and *N. gonorrhoeae* is not routinely indicated. Repeat testing if symptomatic, if compliance with treatment is uncertain, or if pregnant

HUMAN PAPILLOMAVIRUS

Etiology

- common viral STD in the United States
- >200 subtypes, of which >30 are genital subtypes
- HPV types 6 and 11 are classically associated with anogenital warts/condylomata acuminata
- HPV types 16 and 18 are the most oncogenic (classically associated with cervical HSIL)
- types 16, 18, 31, 33, 35, 36, 45 (and others) associated with increased incidence of cervical and vulvar intraepithelial hyperplasia and carcinoma

Clinical Features

- latent infection
 - no visible lesions, asymptomatic
 - only detected by DNA hybridization tests
- subclinical infection
 - visible lesion found during colposcopy or on Pap test
- clinical infection
 - visible wart-like lesion without magnification
 - hyperkeratotic, verrucous or flat, macular lesions
 - vulvar edema

Investigations

- cytology (see *Cervical Screening Pap Test*, GY41)
 - koilocytosis: nuclear enlargement and atypia with perinuclear halo
- biopsy of lesions at colposcopy
- detection of HPV DNA subtype using nucleic acid probes (not routinely done but can be done in presence of abnormal Pap test to guide treatment)

Treatment

- patient administered
 - podofilox 0.5% solution or gel bid x 3 d in a row (4 d off) then repeat x 4 wk
 - imiquimod (Aldara®) 5% cream 3x/wk qhs x 16 wk
- provider administered
 - cryotherapy with liquid nitrogen: repeat q1-2wk
 - podophyllin resin 10-25% in tincture of benzoin: weekly
 - trichloroacetic acid (TCA) or bichloroacetic acid weekly (BCA) (80-90%); safe in pregnancy
 - surgical removal/laser

Prevention

- vaccination: Gardasil®, Cervarix® (see *Table 24*, GY43)
- condoms may not fully protect (areas not covered, must be used every time throughout entire sexual act)

Genital Warts During Pregnancy

- Condyloma tend to get larger in pregnancy and should be treated early (consider excision)
- C-section only if obstruction of birth canal or risk of extensive bleeding
- Do not use imiquimod, podophyllin, or podofilox

Human Rights in Health Equity: Cervical Cancer and HPV Vaccines

- Am J Law Med* 2009;35:365-387
- While cervical cancer rates have drastically fallen in developed countries due to effective prevention and treatment, socially disadvantaged women within these countries remain disproportionately more likely to develop and die of cervical cancer.
 - In most developing countries cervical cancer rates have risen or remained unchanged.
 - Must recognize that cervical cancer disparities between race groups, urban and rural residence, and high and low SES are attributed to disparate screening and vaccination coverage.
 - Programs are implemented without sufficient attention to conditions that render screening less effective or inaccessible to disadvantaged social groups including: lack of information, undervaluing of preventive care, opportunistic delivery in limited health care settings, sexual health stigma, and related privacy concerns.

HERPES SIMPLEX VIRUS OF VULVA

Etiology

- 90% are HSV-2, 10% are HSV-1

Clinical Features

- may be asymptomatic
- initial symptoms: present 2-21 d following contact
- prodromal symptoms: tingling, burning, pruritus
- multiple, painful, shallow ulcerations with small vesicles appear 7-10 d after initial infection (absent in many infected persons); lesions are infectious
- inguinal lymphadenopathy, malaise, and fever often with first infection
- dysuria and urinary retention if urethral mucosa affected
- recurrent infections: less severe, less frequent and shorter in duration (especially with HSV-1)

Investigations

- viral culture preferred in patients with ulcer present, however decreased sensitivity as lesions heal
- cytologic smear (Tzanck smear)
 - multinucleated giant cells, acidophilic intranuclear inclusion bodies
- type specific serologic tests for antibodies to HSV-1 and HSV-2
- HSV DNA PCR

Treatment

- first episode
 - acyclovir 400 mg PO tid or 200 mg PO five times daily x 7-10 d, or famciclovir 250 mg PO tid x 7-10 d, or valacyclovir 1 g PO bid x 7-10 d
- recurrent episode
 - acyclovir 400 mg PO tid or 800 mg PO bid x 5 d, or acyclovir 800 mg PO tid x 2 d; famciclovir and valacyclovir may also be used
- daily suppressive therapy
 - consider if more than 6 recurrences per yr or one every 2 mo
 - acyclovir 400 mg PO bid, or famciclovir 250 mg bid, or valacyclovir 0.5-1 g PO OD
- severe disease
 - IV therapy: acyclovir 5-10 mg/kg IV q8h x 2-7 d or until clinical improvement, followed by oral antiviral therapy to complete at least 10 d
- education regarding transmission
- avoid contact from onset of prodrome until lesions have cleared
- use barrier contraception

Classically

HSV I: disease above the belt (oral)

HSV II: disease below the belt (genital)

HSV Infections During Pregnancy

- Antiviral suppression of women with first episode or history of HSV infections from 36 wk GA onward
- C-section should be performed on women who have active genital lesions at time of delivery
- Treatment: acyclovir 400 mg PO tid

SYPHILIS

Etiology

- *Treponema pallidum*

Classifications

- primary syphilis
 - 3-4 wk after exposure
 - painless chancre on vulva, vagina, or cervix
 - painless inguinal lymphadenopathy
 - serological tests usually negative, local infection only
- secondary syphilis (can resolve spontaneously)
 - 2-6 mo after initial infection
 - nonspecific symptoms: malaise, anorexia, headache, diffuse lymphadenopathy
 - generalized maculopapular rash: palms, soles, trunk, limbs
 - condylomata lata: anogenital, broad-based fleshy gray lesions
 - serological tests usually positive
- latent syphilis
 - no clinical manifestations; detected by serology only
- tertiary syphilis
 - may involve any organ system
 - neurological: tabes dorsalis, general paresis
 - cardiovascular: aortic aneurysm, dilated aortic root
 - vulvar gumma: nodules that enlarge, ulcerate and become necrotic (rare)
- congenital syphilis
 - may cause fetal anomalies, stillbirths, or neonatal death

Epidemiology of Genital Ulcers

HSV	70-80%
1° Syphilis	5%
Chancroid	<1%
<i>(Haemophilus ducreyi)</i>	

Investigations

- aspiration of ulcer serum or node
- darkfield microscopy (most sensitive and specific diagnostic test for syphilis)
 - spirochetes
- non-treponemal screening tests (VDRL, RPR); nonreactive after treatment, can be positive with other conditions
- specific anti-treponemal antibody tests (FTA-ABS, MHA-TP, TP-PA)
 - confirmatory tests; remain reactive for life (even after adequate treatment)

Treatment

- treatment of primary, secondary, latent syphilis of <1 yr duration
 - benzathine penicillin G 2.4 million units IM single dose
 - treat partners, reportable disease
- treatment of latent syphilis >1 yr duration
 - benzathine penicillin G 2.4 million units IM q1wk x 3 wk
- treatment of neurosyphilis
 - IV aqueous penicillin G 3-4 million units IM q4h x 10-14 d
- screening
 - high risk groups
 - in pregnancy (see [Obstetrics](#), Table 12, OB19)

Complications

- if untreated, 1/3 will experience late complications

HIV

- see [Infectious Diseases](#), ID29

Bartholinitis/Bartholin Gland Abscess

Etiology

- often anaerobic and polymicrobial
- *U. urealyticum*, *N. gonorrhoeae*, *C. trachomatis*, *E. coli*, *P. mirabilis*, *Streptococcus* spp., *S. aureus* (rare)
- blockage of duct

Clinical Features

- unilateral swelling and pain in inferior lateral opening of vagina
- sitting and walking may become difficult and/or painful

Treatment

- sitz baths, warm compresses
- antibiotics: cephalexin x 1 wk
- incision and drainage using local anesthesia with placement of Word catheter (10 French latex catheter) for 2-3 wk
- marsupialization under general anesthetic – more definitive treatment
- rarely treated by removing gland

Figure 14. Bartholin's gland abscess

Pelvic Inflammatory Disease

- up to 20% of all gynecology-related hospital admissions

Etiology

- causative organisms (in order of frequency)
 - *C. trachomatis*
 - *N. gonorrhoeae*
 - gonorrhea and chlamydia often co-exist
 - endogenous flora: anaerobic, aerobic, or both
 - ♦ *E. coli*, *Staphylococcus*, *Streptococcus*, *Enterococcus*, *Bacteroides*, *Peptostreptococcus*, *H. influenzae*, *G. vaginalis*
 - ♦ cause of recurrent PID
 - ♦ associated with instrumentation
 - *Actinomyces israelii* (Gram-positive, non acid-fast anaerobe)
 - ♦ 1-4% of PID cases associated with IUDs
 - others (TB, Gram-negatives, CMV, *U. urealyticum*, etc.)

Risk Factors

- age <30 yr
- risk factors as for chlamydia and gonorrhea
- vaginal douching
- IUD (within first 10 d after insertion)
- invasive gynecologic procedures (D&C, endometrial biopsy)

PID

Inflammation of the upper genital tract (above cervix) including endometrium, fallopian tubes, ovaries, pelvic peritoneum, ± contiguous structures

PID accounts for up to 20% of all gynecological hospital admissions

Clinical Presentation

- up to 2/3 asymptomatic: many subtle or mild symptoms
- common
 - fever $>38.3^{\circ}\text{C}$
 - lower abdominal pain and tenderness
 - abnormal discharge: cervical or vaginal
- uncommon
 - N/V
 - dysuria
 - AUB
- chronic disease (often due to chlamydia)
 - constant pelvic pain
 - dyspareunia
 - palpable mass
 - very difficult to treat, may require surgery

Investigations

- blood work
 - β -hCG (must rule out ectopic pregnancy), CBC, blood cultures if suspect septicemia
- urine R&M
- speculum exam, bimanual exam
 - vaginal swab for Gram stain, C&S
 - cervical cultures for *N. gonorrhoeae*, *C. trachomatis*
 - endometrial biopsy will give definitive diagnosis (rarely done)
- ultrasound
 - may be normal
 - free fluid in cul-de-sac
 - pelvic or tubo-ovarian abscess
 - hydrosalpinx (dilated fallopian tube)
- laparoscopy (gold standard)
 - for definitive diagnosis: may miss subtle inflammation of tubes or endometritis

Treatment

- must treat with polymicrobial coverage
- inpatient if
 - moderate to severe illness
 - atypical infection
 - adnexal mass, tubo-ovarian or pelvic abscess
 - unable to tolerate oral antibiotics or failed oral therapy
 - immunocompromised
 - pregnant
 - adolescent – first episode
 - surgical emergency cannot be excluded (e.g. ovarian torsion)
 - PID is secondary to instrumentation
 - recommended treatment
 - cefotetan 2 g IV q12h or cefoxitin 2 g IV q6h + doxycycline 100 mg PO/IV q12h, or clindamycin 900 mg IV q8h + gentamicin 2 mg/kg IV/IM loading dose followed by 1.5 mg/kg loading dose q8h
 - continue IV antibiotics for 24 h after symptoms have improved then doxycycline 100 mg PO bid to complete 14 d
 - percutaneous drainage of abscess under U/S guidance
 - when no response to treatment, laparoscopic drainage
 - if failure, treatment is surgical (salpingectomy, TAH/BSO)
- outpatient if
 - typical findings
 - mild to moderate illness
 - oral antibiotics tolerated
 - compliance ensured
 - follow-up within 48-72 h (to ensure symptoms not worsening)
 - recommended treatment
 - ♦ single dose ceftriaxone 250 mg IM + doxycycline 100 mg PO bid x 14 d \pm metronidazole 500 mg PO bid x 14 d
 - ♦ consider removing IUD after a minimum of 24 h of treatment
 - ♦ reportable disease
 - ♦ treat partners
 - ♦ consider re-testing for *C. trachomatis* and *N. gonorrhoeae* 4-6 wk after treatment if documented infection

PID Complications

I FACE PID

Infertility
 Fitz-Hugh-Curtis syndrome
 Abscesses
 Chronic pelvic pain
 Ectopic pregnancy
 Peritonitis
 Intestinal obstruction
 Disseminated infection (sepsis, endocarditis, arthritis, meningitis)

PID Diagnosis

- **Must** have:
 - Lower abdominal pain
- **Plus** one of
 - Cervical motion tenderness
 - Adnexal tenderness
- **Plus** one or more of
 - High risk partner
 - Temperature $>38^{\circ}\text{C}$
 - Mucopurulent cervical discharge
 - Positive culture for *N. gonorrhoeae*, *C. trachomatis*, *E. coli*, or other vaginal flora
 - Cul-de-sac fluid, pelvic abscess or inflammatory mass on U/S or bimanual
 - Leukocytosis
 - Elevated ESR or CRP (not commonly used)

Treat PID with **FOXY DOXY**
 (cefotetan + doxycycline)

Alternative PID Treatments

- Azithromycin (1 g PO weekly x 2 wk) + ceftriaxone 250 mg IM x 1
 - \pm metronidazole 500 mg PO bid x 14 d
 - Quinolones are no longer recommended for treatment of PID due to quinolone-resistant *N. gonorrhoeae*
- Source: Centers for Disease Control and Prevention. Sexually Transmitted Diseases Treatment Guidelines. *MMWR* 2010;59(RR-12):63-67

Complications of Untreated PID

- chronic pelvic pain
- abscess, peritonitis
- adhesion formation
- ectopic pregnancy
- infertility
 - 1 episode of PID → 13% infertility
 - 2 episodes of PID → 36% infertility
- bacteremia
- septic arthritis, endocarditis

Toxic Shock Syndrome

- see [Infectious Diseases](#), ID24

Risk Factors

- tampon use
- diaphragm, cervical cap, or sponge use (prolonged use, i.e. >24 h)
- wound infections
- post-partum infections
- early recognition and treatment of syndrome is imperative as incorrect diagnosis can be fatal

Clinical Presentation

- sudden high fever
- sore throat, headache, diarrhea
- erythroderma
- signs of multisystem organ failure
- refractory hypotension
- exfoliation of palmar and plantar surfaces of the hands and feet 1-2 wk after onset of illness

Treatment

- remove potential sources of infection (foreign objects and wound debris)
- debride necrotic tissues
- adequate hydration
- penicillinase-resistant antibiotics, e.g. cloxacillin
- steroid use controversial but if started within 72 h, may reduce severity of symptoms and duration of fever

**Toxic Shock Syndrome**

Multiple organ system failure due to *S. aureus* exotoxin (rare condition)

Sexual Abuse

- see [Family Medicine](#), FM27, [Emergency Medicine](#), ER28

**Sexual Dysfunction****Etiology**

- psychological or emotional: depression, abuse
- hormonal: menopause
- neurologic dysfunction: spinal cord injury
- vascular insufficiency: DM
- drug side effects: β -blockers
- trauma: episiotomy

Classification

- lack of desire (60-70% of women)
- lack of arousal
- anorgasmia (5-10%)
 - primary anorgasmia: never before achieved orgasm under any circumstances
 - secondary anorgasmia: was able to achieve orgasms before but now unable to
- dyspareunia (3-6%): painful intercourse, superficial or deep
 - vaginismus (15%)
 - vulvodynia
 - vaginal atrophy
 - vulvar vestibulitis: associated with history of frequent yeast infections
 - PID

Treatment

- lack of desire: assess factors, rule out organic causes, relationship therapy, sensate focus exercises
- anorgasmia: self-exploration/pleasuring, relationship therapy if needed, bridging techniques (different sexual positions, clitoral stimulation during intercourse)

- dyspareunia
 - Kegel and reverse Kegel exercises
 - dilator treatment
 - comfort with self-exam
 - psychotherapy, other behavioral techniques
 - female on top position: allows for control of speed and duration
 - vestibulitis: remove local irritants, change in contraceptive methods, dietary changes (increased citrate, decreased oxalate), and vestibulectomy (rare)
 - vulvodynia: local moisturization, cold compresses, systemic nerve blocking therapy (amitriptyline, gabapentin), topical anesthetics, estrogen cream
 - pain clinic

**Kegel Exercises**

Regular contraction and relaxation to strengthen pelvic floor muscles

Reverse Kegel Exercises

1 s contraction then 5 s of relaxation

**Menopause**

Occurrence of last spontaneous menstrual period, resulting from loss of ovarian function (loss of oocyte response to gonadotropins)

"Being in menopause"

Lack of menses for 1 yr

Perimenopause

Period of time surrounding menopause (2-8 yr preceding + 1 yr after last menses) characterized by fluctuating hormone levels, irregular menstrual cycles, and symptom onset

- 85% of women experience hot flashes
- 20-30% seek medical attention
- 10% are unable to work

- Osteoporosis is the single most important health hazard associated with menopause
- Cardiovascular disease is the leading cause of death post-menopause

- Increased risk of breast cancer (RR 1.3) is associated with estrogen+progesterone HRT, but not with estrogen-only HRT
- All women taking HRT should have periodic surveillance and counseling regarding its benefits and risks

Menopause

- see [Family Medicine, FM42](#)

Definitions

- lack of menses for 1 yr
- types of menopause
 - physiological; average age 51 yr (follicular atresia)
 - premature ovarian failure; before age 40 (autoimmune disorder, infection, Turner's syndrome)
 - iatrogenic (surgical/radiation/chemotherapy)

Clinical Features

- associated with estrogen deficiency
 - vasomotor instability (tends to dissipate with time)
 - ♦ hot flushes/flashes, night sweats, sleep disturbances, formication, nausea, palpitations
 - urogenital atrophy involving vagina, urethra, bladder
 - ♦ dyspareunia, pruritus, vaginal dryness, bleeding, urinary frequency, urgency, incontinence
 - skeletal
 - ♦ osteoporosis, joint and muscle pain, back pain
 - skin and soft tissue
 - ♦ decreased breast size, skin thinning/loss of elasticity
 - psychological
 - ♦ mood disturbance, irritability, fatigue, decreased libido, memory loss

Investigations

- increased levels of FSH (>35 IU/L) on day 3 of cycle (if still cycling) and LH (FSH>LH)
- FSH level not always predictive due to monthly variation; use absence of menses for 1 yr to diagnose
- decreased levels of estradiol (later)

Treatment

- goal is for individual symptom management
 - vasomotor instability
 - ♦ HRT (first line), SSRIs, venlafaxine, gabapentin, propranolol, clonidine
 - ♦ acupuncture
 - vaginal atrophy
 - ♦ local estrogen: cream (Premarin*), vaginal suppository (VagiFem*), ring (Estring*)
 - ♦ lubricants (Replens*)
 - urogenital health
 - ♦ lifestyle changes (weight loss, bladder re-training), local estrogen replacement, surgery
 - osteoporosis
 - ♦ 1,000-1,500 mg calcium OD, 800-1,000 IU vitamin D, weight-bearing exercise, smoking cessation
 - ♦ bisphosphonates (e.g. alendronate)
 - ♦ selective estrogen receptor modifiers (SERMs): raloxifene (Evista*) – mimics estrogen effects on bone, avoids estrogen-like action on breast and uterine cancer; does not help hot flashes
 - ♦ HRT: second-line treatment (unless for vasomotor instability as well)
 - decreased libido
 - ♦ vaginal lubrication, counseling, androgen replacement (testosterone cream or the oral form Android*)
 - cardiovascular disease
 - ♦ management of cardiovascular risk factors
 - mood and memory
 - ♦ antidepressants (first line), HRT (augments effect)
 - alternative choices (not evidence-based, safety not established)
 - ♦ black cohosh, phytoestrogens, St. John's wort, ginkgo biloba, valerian, evening primrose oil, ginseng, Don Quai

Hormone Replacement Therapy

- see [Family Medicine, FM42](#)
- primary indication is treatment of menopausal symptoms (vasomotor instability)
- keep doses low (e.g. 0.3 mg Premarin®) and duration of treatment short (<5 yr)

HRT Components

- estrogen
 - oral or transdermal (e.g. patch, gel)
 - transdermal preferred for women with hypertriglyceridemia or impaired hepatic function, smokers, and women who suffer from headaches associated with oral HRT
 - low-dose (preferred dose: 0.3 mg Premarin®/25 µg Estradot® patch, can increase if necessary)
- progestin
 - given in combination with estrogen for women with an intact uterus to prevent development of endometrial hyperplasia/cancer

Table 15. Examples of HRT Regimens

HRT Regimen	Estrogen Dose	Progestin Dose	Notes
Unopposed Estrogen	CEE 0.625 mg PO OD	None	If no intact uterus
Standard-dose	CEE 0.625 mg PO OD	MPA 2.5 mg PO OD, or micronized progesterone 100 mg PO OD	Withdrawal bleeding may occur in a spotty, unpredictable manner Usually abates after 6-8 mo due to endometrial atrophy Once patient has become amenorrheic on HRT, significant subsequent bleeding episodes require evaluation (endometrial biopsy)
Standard-dose Cyclic	CEE 0.625 mg PO OD	MPA 5-10 mg PO days 1-14 only, or micronized progesterone 200 mg PO OD days 1-14 only	Bleeding occurs monthly after day 14 of progestin (can continue for yr) PMS-like symptoms (breast tenderness, fluid retention, headache, nausea) are more prominent with cyclic HRT
Pulsatile	CEE 0.625 mg PO OD	MPA low-dose	3 d on, 3 d off
Transdermal	Estroderm®-Estradiol 0.05 mg/d or 0.1 mg/d Estalis®-Estradiol 140 µg/d or 250 µg/d	Estroderm®-MPA 2.5 mg PO OD Estalis®-NEA 50 µg/d	Use patch twice weekly Can use oral progestins (Estroderm®) Combined patches available (Estalis®)
Topical	Estrace® 2-4 g/d x 1-2 wk, 1 g/d maintenance Premarin® 0.5-2 g/d for 21 d then off 7 d for vaginal atrophy, 0.5 g/d for 21 d then off 7 d or twice/wk for dyspareunia Estragyn® 2-4 g/d	Crinone® 4% or 8% (45 or 90 mg applicator)	If simultaneously taking oral estrogen tablet, may need to adjust dosing If intact uterus, also take progesterone

CEE = conjugated equine estrogen (e.g. Premarin®); MPA = medroxyprogesterone acetate (e.g. Provera®); NEA = norethindrone acetate
Consider lower dose regimens, PREMPRO® 0.45/1.5 (Premarin® 0.45 mg and Provera® 1.5 mg); Estrace® (topical 17β-estradiol) = 0.1 mg active ingredient/g;
Premarin® (topical CEE) = 0.625 mg active ingredient/g; Estragyn® (topical estrone) = 1 mg active ingredient/g

Side Effects of HRT

- abnormal uterine bleeding
- mastodynia – breast tenderness
- edema, bloating, heartburn, nausea
- mood changes (progesterone)
- can be worse in progesterone phase of combined therapy

Contraindications to HRT

- absolute
 - acute liver disease
 - undiagnosed vaginal bleeding
 - known or suspected uterine cancer/breast cancer
 - acute vascular thrombosis or history of severe thrombophlebitis or thromboembolic disease
 - cardiovascular disease
- relative
 - pre-existing uncontrolled HTN
 - uterine fibroids and endometriosis
 - familial hyperlipidemias
 - migraine headaches

Menopause Pathophysiology

Degenerating theca cells fail to react to endogenous gonadotropins (FSH, LH)

Less estrogen is produced

Decreased negative feedback on hypothalamic-pituitary-adrenal axis

Increased FSH and LH

Stromal cells continue to produce androgens as a result of increased LH stimulation

Absolute Contraindications to HRT

ABCD

Acute liver disease
Bleeding
Cancer (breast/uterine), **C**ardiovascular disease
DVT (thromboembolic disease)

- family history of estrogen-dependent cancer
- chronic thrombophlebitis
- DM (with vascular disease)
- gallbladder disease, hypertriglyceridemia, impaired liver function (consider transdermal estrogen)
- fibrocystic disease of the breasts

WOMEN'S HEALTH INITIATIVE (launched in 1991)

- two non-randomized studies investigating health risks and benefits of HRT in healthy postmenopausal women 50-79 yr old
 - continuous combined HRT (CEE 0.625 mg + MPA 2.5 mg OD) in 16,608 women with an intact uterus
 - estrogen-alone (CEE 0.625 mg) in 10,739 women with a previous hysterectomy
- both arms of the trial were stopped early because of evidence of increased risk of breast cancer, stroke, PE, and CHD in the combined HRT arm, and increased risk of stroke with no CHD benefits in the estrogen-alone arm
- the apparent increase in CHD was in disagreement with results of previous observational trial
- results of the WHI study have since been challenged and revision of how CHD was diagnosed led to loss of statistical significance of the results
- benefits and risks reported as number of cases per 10,000 women each yr

Table 16. HRT Benefits vs. Risks

Benefits	Risks
Vasomotor Symptoms: less frequent and severe with use of either combined or estrogen-alone HRT	Stroke: 8 additional cases with combined HRT, and 12 additional cases for estrogen alone (WHI)
Osteoporosis: 5 fewer cases of hip fractures and 47 fewer cases of all fractures with combined HRT; 6 fewer cases of hip fractures with estrogen alone	DVT/PE: 18 additional cases with combined HRT, and 9 additional cases for estrogen-alone (WHI)
Colon Cancer: 6 fewer cases with combined HRT (WHI) One additional case with estrogen-alone	CHD: 7 additional MIs with combined HRT (WHI); secondary analysis suggests greater absolute risk for women aged >70 yr and for women who start HRT >10 yr post-menopause
	Breast Cancer: 8 additional cases with combined HRT (WHI) Risk only increased after >5 yr of combined HRT use; no increased risk for estrogen-alone
	Dementia and Mild Cognitive Impairment: 50% greater risk of developing dementia in women taking estrogen-alone after age 65; risk is greater for women taking combined HRT; risk of developing dementia was reduced for women taking HRT before age 65

Long-Term Hormone Therapy for Perimenopausal and Postmenopausal Women

Cochrane DB Syst Rev 2012;7:CD004143

Purpose: To determine the effect of long-term HRT on mortality, cardiovascular outcomes, cancer, gallbladder disease, fractures, cognition, and QOL in perimenopausal and postmenopausal women, during HRT use, and after cessation of HRT.

Results: 23 studies with 42,380 women included. 70% of the data from the WHI (1998) and HERS (1998). None of the studies focused on perimenopausal women. Combined continuous HRT: increased risk of coronary event after 1 yr (absolute risk 18/1,000, 95% CI 3-7), venous thromboembolism after 1 yr (AR 7/1,000, 95% CI 4-11), stroke after 3 yr (AR 18/1,000, 95% CI 14-23), breast cancer after 5.6 yr (AR 23/1,000, 95% CI 19-29), gallbladder disease after 5.6 yr (AR 27/1,000, 95% CI 21-34), and death from lung cancer after 5.6 yr use (AR 9/1,000, 95% CI 6-13). Estrogen only HRT: increased risk of venous thromboembolism after 1-2 yr use (AR 5/1,000, 95% CI 2-10; after 7 yr AR 21/1,000, 95% CI 16-28), stroke after 7 yr (AR 32/1,000, 95% CI 25-40), and gallbladder disease after 7 yr use (AR 45/1,000, 95% CI 36-57) and did not significantly affect the risk of breast cancer. Women >65 yr of age taking combined HRT had a statistically significant increase in the incidence of dementia after 4 yr use (AR 18/1,000, 95% CI 11-30). Women taking HRT had a decreased risk of fractures with combined HRT after 5.6 yr (AR 86/1,000, 95% CI 79-84) and 7.1 yr of estrogen only HRT (AR 102/1,000, 95% CI 91-112).

Conclusions: HRT is not indicated for primary or secondary prevention of cardiovascular disease or dementia. Although HRT is considered effective for the prevention of postmenopausal osteoporosis, it is generally recommended as an option only for women at significant risk, for whom non-estrogen therapies are unsuitable.

Urogynecology

Pelvic Relaxation/Prolapse

Etiology

- relaxation, weakness, or defect in the cardinal and uterosacral ligaments which normally maintain the uterus in an anteflexed position and prevent it from descending through the urogenital diaphragm (i.e. levator ani muscles)
- related to
 - vaginal childbirth
 - aging
 - decreased estrogen (post-menopause)
 - following pelvic surgery
 - increased intra-abdominal pressure (obesity, chronic cough, constipation, ascites, heavy lifting)
 - congenital (rarely)
 - ethnicity (Caucasian women > Asian or African women)
 - collagen disorders

GENERAL CONSERVATIVE TREATMENT

(for pelvic relaxation/prolapse and urinary incontinence)

- Kegel exercises
- local vaginal estrogen therapy
- vaginal pessary (intravaginal suspension disc)

Pelvic Relaxation/Prolapse

Protrusion of pelvic organs into or out of the vagina

Table 17. Pelvic Prolapse

Type	Clinical Features	Treatment
Uterine Prolapse (protrusion of cervix and uterus into vagina)	<ul style="list-style-type: none"> Groin/back pain (stretching of uterosacral ligaments) Feeling of heaviness/pressure in the pelvis <ul style="list-style-type: none"> Worse with standing, lifting Worse at the end of the day Relieved by lying down Ulceration/bleeding (particularly if hypoestrogenic) ± urinary incontinence 	<ul style="list-style-type: none"> See <i>General Conservative Treatment, G33</i> Vaginal hysterectomy ± surgical prevention of vault prolapse Consider additional surgical procedures if urinary incontinence, cystocele, rectocele, and/or enterocele are present
Vault Prolapse (protrusion of apex of vaginal vault into vagina, post-hysterectomy)		<ul style="list-style-type: none"> See <i>General Conservative Treatment, G33</i> Sacralcolpopexy (vaginal vault suspension), sacrospinous fixation, or uterosacral ligament suspension
Cystocele (protrusion of bladder into the anterior vaginal wall)	<ul style="list-style-type: none"> Frequency, urgency, nocturia Stress incontinence Incomplete bladder emptying ± associated increased incidence of urinary tract infections – may lead to renal impairment 	<ul style="list-style-type: none"> See <i>General Conservative Treatment, G33</i> Anterior colporrhaphy ("anterior repair") Consider additional/alternative surgical procedure if documented urinary stress incontinence
Rectocele (protrusion of rectum into posterior vaginal wall)	<ul style="list-style-type: none"> Straining/digitation to evacuate stool Constipation 	<ul style="list-style-type: none"> See <i>General Conservative Treatment, G33</i> Also laxatives and stool softeners Posterior colporrhaphy ("posterior repair"), plication of endopelvic fascia and perineal muscles approximated in midline to support rectum and perineum (can result in dyspareunia)
Enterocele (prolapse of small bowel in upper posterior vaginal wall)		<ul style="list-style-type: none"> Similar to hernia repair Contents reduced, neck of peritoneal sac ligated, uterosacral ligaments, and levator ani muscles approximated

Figure 15. Pelvic anatomy

**Grading of Pelvic Organ Prolapse**

- 0 = no descent during straining
- 1 = distal portion of prolapse > 1 cm above level of hymen
- 2 = distal portion of prolapse ≤ 1 cm above or below level of hymen
- 3 = distal portion of prolapse > 1 cm below level of hymen but without complete vaginal eversion
- 4 = complete eversion of total length of lower genital tract
- **Procidencia:** failure of genital supports and complete protrusion of uterus through the vagina

The only **true** hernia of the pelvis is an **ENTEROCELE** because peritoneum herniates with the small bowel

**Rectocele****Cystocele****Uterine Prolapse****Enterocele**

Figure 16. Rectocele, cystocele, uterine prolapse, enterocele

Urinary Incontinence

- see [Urology, U5](#)

STRESS INCONTINENCE

Definition

- involuntary loss of urine with increased intra-abdominal pressure (coughing, laughing, sneezing, walking, running)

Risk Factors for Stress Incontinence in Women

- pelvic prolapse
- pelvic surgery
- vaginal delivery
- hypoestrogenic state (post-menopause)
- age
- smoking
- neurological/pulmonary disease

Treatment

- see *General Conservative Treatment*, GY33
- surgical
 - tension-free vaginal tape (TVT), tension-free obturator tape (TOT), prosthetic/fascial slings or retropubic bladder suspension (Burch or Marshall-Marchetti-Krantz procedures)

URGE INCONTINENCE**Definition**

- urine loss associated with an abrupt, sudden urge to void
- “overactive bladder”
- diagnosed based on symptoms

Etiology

- idiopathic (90%)
- detrusor muscle overactivity (“detrusor instability”)

Associated Symptoms

- frequency, urgency, nocturia, leakage

Treatment

- behavior modification (reduce caffeine/liquid, smoking cessation, regular voiding schedule)
- Kegel exercises
- medications
 - anticholinergics: oxybutinin (Ditropan®), tolterodine (Detrol®), solifenacin (VESicare®)
 - tricyclic antidepressants: imipramine

The gold standard diagnostic test for urinary incontinence is multichannel urodynamics; a large proportion of cases are correctly diagnosed from clinical history alone and this can be supplemented with patient urinary and intake diaries

Systemic review and evaluation of methods of assessing urinary incontinence. *Health Technol Assess* 2006;10:1-132

**Urge Incontinence**

Urine loss associated with an abrupt, sudden urge to void

**Rule Out Neurological Causes of Urge Incontinence**

- MS
- Herniated disc
- DM

Gynecological Oncology

Uterus

ENDOMETRIAL CARCINOMA**Epidemiology**

- most common gynecological malignancy in North America (40%); 4th most common cancer in women
- 2-3% of women develop endometrial carcinoma during lifetime
- mean age is 60 yr
- majority are diagnosed in early stage due to detection of symptoms
- 85-90% 5 yr survival for stage I disease
- 70-80% overall 5 yr survival for all stages

Risk Factors

- Type I: excess estrogen (estrogen unopposed by progesterone)
 - obesity
 - PCOS
 - unbalanced HRT (balanced HRT is protective)
 - nulliparity
 - late menopause
 - estrogen-producing ovarian tumors (e.g. granulosa cell tumors)
 - HNPCC (hereditary non-polyposis colorectal cancer)/Lynch II syndrome
 - tamoxifen
- Type II: not estrogen-related
 - possibly tamoxifen

Classification and Clinical Features

- Type I (well-differentiated endometrioid adenocarcinoma) ~80% of cases:
 - postmenopausal bleeding in majority, abnormal uterine bleeding in majority of affected premenopausal women (menorrhagia, intermenstrual bleeding)

Incidence of Malignant Gynecological Lesions in North America
 endometrium > ovary > cervix > vulva
 > vagina > fallopian tube

**Complications of Therapy**

- Surgical site infection
- Lymphedema
- Radiation fibrosis
- Cystitis
- Proctitis

- Type II (serous, clear cell carcinoma, grade 3 endometrioid, undifferentiated, carcinosarcoma) ~15% of cases:
 - may not present with bleeding in early stage, more likely to present with advanced stage disease with symptoms like ovarian cancer (i.e. bloating, bowel dysfunction, pelvic pressure)

Investigations

- endometrial sampling
 - office endometrial biopsy
 - D&C ± hysteroscopy
- ± pelvic ultrasound (in women where adequate endometrial sampling not feasible without invasive methods)
 - not acceptable as alternative to pelvic exam or endometrial sampling to rule out cancer

Table 18. FIGO Staging of Endometrial Cancer (2009)

Stage	Description	Stage	Description
I	Confined to corpus	IIIC	Metastasis to pelvic ± para-aortic LNs
IA	No or less than half myometrial invasion	IIIC1	Positive pelvic LN
IB	Invades through $\geq \frac{1}{2}$ of myometrium	IIIC2	Positive para-aortic LN ± positive pelvic LNs
II	Tumor invades cervical stroma, but does not extend beyond uterus*	IV	Invasion of bladder ± bowel mucosa ± distant metastases
III	Local and/or regional spread of the tumor	IVA	Invasion of bladder ± bowel mucosa
IIIA	Invasion of serosa, corpus uteri ± adnexae	IVB	Invasion of bladder ± bowel mucosa
IIIB	Vaginal ± parametrial involvement		Distant mets, including intra-abdominal mets ± inguinal LNs

FIGO: International Federation of Gynecology and Obstetrics

*Note: endocervical glandular involvement is now considered as Stage I (previously Stage II)

Spread

- direct extension is most common
- lymphatic spread to pelvic and para-aortic nodes
- transtubal dissemination to peritoneal cavity
- hematogenous spread (usually to lungs, liver)

Treatment

- surgical: hysterectomy/bilateral salpingo-oophorectomy (BSO) and pelvic washings ± pelvic and para-aortic node dissection ± omentectomy
 - goals: diagnosis, staging, treatment, defining optimal adjuvant treatment
 - laparoscopic approach associated with improved quality of life (optimal for most patients)
- adjuvant radiotherapy (for improved local control in patients at risk for local recurrence) and adjuvant chemotherapy (in patients at risk for distant recurrence or with metastatic disease): based on presence of poor prognostic factors in definitive pathology
- chemotherapy: often used for recurrent disease (especially if high grade or aggressive histology)
- hormonal therapy: progestins can be used for recurrent disease (especially if low grade)

UTERINE SARCOMA

- rare; 2-6% of all uterine malignancies
- arise from stromal components (endometrial stroma, mesenchymal or myometrial tissues)
- behave more aggressively and are associated with worse prognosis than endometrial carcinoma; 5 yr survival is 35%
- vaginal bleeding is most common presenting symptom

Risk Factors for Endometrial Cancer

COLD NUT

Cancer (ovarian, breast, colon)
Obesity
Late menopause
DM

Nulliparity

Unopposed estrogen: PCOS, anovulation, HRT
Tamoxifen: chronic use

Postmenopausal bleeding = endometrial cancer until proven otherwise (95% present with vaginal bleeding)

An endometrial thickness of 5 mm or more is considered abnormal in a postmenopausal woman with vaginal bleeding

True Pelvis

Area of pelvis between pelvic inlet and outlet, i.e. it does not include the abdominal contents in the pelvis found above the pelvic inlet

Prognostic Factors

Most important is FIGO stage

Other Prognostic Factors:

- Age
- Grade
- Histologic subtype
- Depth of myometrial invasion
- Presence of lymphovascular space involvement (LVSI)
- Hormone receptor status

Uterine Sarcoma – Symptoms

BAD-P

Bleeding
Abdominal distention
Foul smelling vaginal Discharge
Pelvic Pressure

Table 19. Summary of Uterine Sarcoma Subtypes and Features

Type	Epidemiology	Features	Diagnosis	Treatment
PURE TYPE				
1. Leiomyosarcoma	<ul style="list-style-type: none"> Accounts for 40% Average age of presentation is 55 yr but may present in pre-menopause Often coexists with benign leiomyomata (fibroids) 50% arise within a fibroid ("sarcomatous degeneration") 	<ul style="list-style-type: none"> Histologic distinction from leiomyoma <ol style="list-style-type: none"> Increased mitotic count (> 10 mitoses/10 high power fields) Tumor necrosis Cellular atypia Rapidly enlarging fibroids in a pre-menopausal woman Enlarging fibroids in a postmenopausal woman 	<ul style="list-style-type: none"> Often post-operatively after uterus removed for presumed fibroids Staging using FIGO 2009 staging for leiomyosarcomas 	<ul style="list-style-type: none"> Hysterectomy/BSO usually No routine pelvic lymphadenectomy Adjuvant chemotherapy may be used if tumor has spread beyond uterus, for palliation Radiation therapy does not improve local control or survival Poor outcomes overall, even for early stage disease
2. Endometrial Stromal Sarcoma (ESS)	<ul style="list-style-type: none"> Accounts for 10-15% Usually presents in perimenopausal or postmenopausal women with abnormal uterine bleeding 	<ul style="list-style-type: none"> Abnormal uterine bleeding Good prognosis 	<ul style="list-style-type: none"> Diagnosed by histology of endometrial biopsy or D&C Staging using FIGO 2009 staging for ECC and adenosarcoma 	<ul style="list-style-type: none"> Hysterectomy/BSO (remove ovaries as ovarian hormones may stimulate growth) No routine pelvic lymphadenectomy Adjuvant therapy based on stage and histologic features (hormones and/or radiation) Hormonal therapy (progestins) may be used for metastatic disease
3. Undifferentiated Sarcoma	<ul style="list-style-type: none"> Accounts for 5-10% 	<ul style="list-style-type: none"> Severe nuclear pleomorphism, high mitotic activity, tumor cell necrosis, and lack smooth muscle or endometrial stromal differentiation Poor prognosis 	<ul style="list-style-type: none"> Often found incidentally post-operatively for abnormal bleeding 	<ul style="list-style-type: none"> Treatment primarily surgical Radiation and/or chemotherapy for advanced disease or unresectable disease
MIXED TYPE				
4. Adenosarcoma	<ul style="list-style-type: none"> The rarest of the uterine sarcoma Mixed tumor of low malignant potential 	<ul style="list-style-type: none"> Present with abnormal vaginal bleeding Polypoid mass in uterine cavity 	<ul style="list-style-type: none"> Mixture of benign epithelium with malignant low-grade sarcoma Often found incidentally at time of hysterectomy for PMB 	<ul style="list-style-type: none"> Treatment is surgical with TAH/BSO
RECLASSIFIED				
5. Carcinosarcoma	<ul style="list-style-type: none"> Most common (43%) Recently reclassified as high grade endometrioid carcinoma with associated metaplasia of the mesenchyme, rather than arising separately from stroma Surgical staging using FIGO 2009 staging for endometrial cancer 	<ul style="list-style-type: none"> Both epithelial and stromal malignant elements present Tend to form bulky polypoid masses that often fill uterine cavity and extend into or through the endocervical canal – often have extrauterine disease at presentation 	<ul style="list-style-type: none"> Diagnosed by histology of endometrial biopsy or D&C 	<ul style="list-style-type: none"> Usually treated as "high grade endometrial carcinoma" since behavior and treatment similar (i.e. surgical staging and resection of any gross metastatic disease, adjuvant chemotherapy and radiation)

Table 20. FIGO Staging of Uterine Sarcoma (2009)

Stage	Description	Stage	Description
I	Tumor limited to uterus	III	
IA	<5 cm	IIIA	Tumor invades abdominal tissues, one site
IB	>5 cm	IIIB	Metastasis to pelvic and/or para-aortic lymph nodes
		IIIC	Tumor invades bladder and/or rectum
II	Tumor extends beyond uterus	IV	
IIA	To the pelvis, adnexal involvement	IVA	Tumor invades bladder and/or rectum
IIB	To extra-uterine pelvic tissue	IVB	Distant metastasis

A rapidly enlarging uterus, especially in a postmenopausal woman, should prompt consideration of leiomyosarcoma

Ovarian Tumor Markers

- Epithelial cell – CA-125
- Stromal
 - Granulosa cell – inhibin
 - Sertoli-Leydig – androgens
- Germ cell
 - Dysgerminoma – LDH
 - Yolk sac – AFP
- Choriocarcinoma – β -hCG
- Immature Teratoma – none
- Embryonal cell – AFP + β -hCG

Ovary

BENIGN OVARIAN TUMORS

- see Table 21
- many are asymptomatic
- usually enlarge slowly, if at all
- may rupture or undergo torsion, causing pain
 - pain associated with torsion of an adnexal mass usually originates in the iliac fossa and radiates to the flank
- peritoneal irritation may result from an infarcted tumor – rare

MALIGNANT OVARIAN TUMORS

- see Table 21

Epidemiology

- lifetime risk 1.4% (1/70)
- in women >50 yr, more than 50% of ovarian tumors are malignant
- causes more deaths in North America than all other gynecologic malignancies combined
- 4th leading cause of cancer death in women
- 65% epithelial; 35% non-epithelial
- 5-10% of epithelial ovarian cancers are related to hereditary predisposition

Risk Factors (for epithelial ovarian cancers)

- excess estrogen
 - nulliparity
 - early menarche/late menopause
- age
- family history of breast, colon, endometrial, ovarian cancer
- race: Caucasian

Protective Factors (for epithelial ovarian cancers)

- OCP: likely due to ovulation suppression (significant reduction in risk even after 1 yr of use)
- pregnancy/breastfeeding
- tubal ligation (recently questioned)
- hysterectomy (without removal of ovaries)
- BSO (prophylactic surgery performed for this reason in high risk women – i.e. BRCA mutation carriers)

Screening

- no effective method of mass screening
- routine CA-125 level measurements or U/S not recommended
 - high false positive rates
- controversial in high risk groups: transvaginal U/S and CA-125, starting age 30 (no consensus on interval)
 - familial ovarian cancer (>1 first degree relative affected, BRCA-1 mutation)
 - other cancers (e.g. endometrial, breast, colon)
 - BRCA-1 or BRCA-2 mutation: may recommend prophylactic bilateral oophorectomy after age 35 or when child-bearing is completed

Clinical Features

- most women with epithelial ovarian cancer present with advanced stage disease since often “asymptomatic” until disseminated disease (symptoms with early stage disease are vague and non-specific)
- when present, symptoms may include
 - abdominal symptoms (nausea, bloating, dyspepsia, anorexia, early satiety)
 - symptoms of mass effect
 - ♦ increased abdominal girth – from ascites or tumor itself
 - ♦ urinary frequency
 - ♦ constipation
 - postmenopausal bleeding; irregular menses if pre-menopausal (rare)

Low Malignant Potential (also called “Borderline”) Tumors

- pregnancy, OCP, and breastfeeding are protective factors
- ~15% of all epithelial ovarian tumors
- tumor cells display malignant characteristics histologically, but no invasion is identified
- able to metastasize, but not commonly
- treated primarily with surgery (BSO/omental biopsy ± hysterectomy)
 - NO proven benefit of chemotherapy
- generally slow growing, excellent prognosis
 - 5 yr survival >99%
 - recurrences tend to occur late, may be associated with low grade serous carcinoma

Ovaries are like GEMS

Germ-cell
Epithelial
Metastatic
Sex cord stromal

Risk/Protective Factors for Epithelial Ovarian Cancer

NO CHILD

Nulliparity
OCP, breastfeeding, tubal ligation, hysterectomy (protective)
Caucasian
Family History
Increasing age (>40 yr)
Late menopause
Delayed child-bearing

Effects of Screening on Ovarian Cancer Mortality: The Prostate, Lung, Colorectal, and Ovarian Cancer Screening Randomized Controlled Trial JAMA 2011;305:2295-2303

Objective: To evaluate the effect of screening for ovarian cancer with CA-125 and transvaginal ultrasound on mortality in the prostate, lung, colorectal, and ovarian (PLCO) cancer screening trial.

Participants: 78,216 women aged 55-74 yr.

Study Groups: Intervention group – annual screening with CA-125 for 6 yr, transvaginal ultrasound for 4 yr; control group – no CA-125 or transvaginal ultrasound screening, received usual medical care.

Follow-up: Maximum 13 yr (median, 12.4 yr).

Outcome Measures: Mortality from ovarian cancer, including primary fallopian tube cancers. Secondary outcomes included ovarian cancer incidence and complications associated with screening, examinations, and diagnostic procedures.

Results: Of those diagnosed with ovarian cancer in the intervention and usual care group, the mortality was 3.1% and 2.6% respectively. 15% of women undergoing diagnostic evaluation following a false positive screening test suffered a complication of the procedure.

Conclusions: Simultaneous screening with CA-125 and transvaginal ultrasound compared with usual care did not reduce ovarian cancer mortality. Diagnostic evaluation following a false positive screening test was associated with complications.

Any adnexal mass in postmenopausal women should be considered malignant until proven otherwise

Most (70%) epithelial ovarian cancers present at stage III disease

Diagnosis of ovarian tumors requires surgical pathology

Table 21. Ovarian Tumors

Type	Description	Presentation	Ultrasound/Cytology	Treatment
FUNCTIONAL TUMORS (all benign)				
Follicular Cyst	Follicle fails to rupture during ovulation	Usually asymptomatic May rupture, bleed, tort, infarct causing pain \pm signs of peritoneal irritation	4-8 cm mass, unilocular, lined with granulosa cells	Symptomatic or suspicious masses warrant surgical exploration Otherwise if < 6 cm, wait 6 wk then re-examine as cyst usually regresses with next cycle OCP (ovarian suppression) – will prevent development of new cysts Treatment usually laparoscopic (cystectomy vs. oophorectomy, based on fertility choice)
Lutein Cyst	Corpus luteum fails to regress after 14 d, becoming cystic or hemorrhagic	More likely to cause pain than follicular cyst May delay onset of next period	Larger (10-15 cm) and firmer than follicular cysts	Same as for follicular cysts
Theca-Lutein Cyst	Due to atretic follicles stimulated by abnormal β -hCG levels	Associated with molar pregnancy, ovulation induction with clomiphene		Conservative Cyst will regress as β -hCG levels fall
Endometrioma	See <i>Endometriosis</i> , GY13			
Polycystic Ovaries	See <i>PCOS</i> , GY22			
BENIGN GERM-CELL TUMORS				
Benign Cystic Teratoma (dermoid)	Single most common ovarian germ cell neoplasm Elements of all 3 cell lines; contains dermal appendages (sweat and sebaceous glands, hair follicles, teeth)	May rupture, twist, infarct 20% bilateral 20% occur outside of reproductive yr	Smooth-walled, mobile, unilocular Ultrasound may show calcification which is pathognomonic	Treatment usually laparoscopic cystectomy; may recur
MALIGNANT GERM-CELL TUMORS				
General Information	Rapidly growing, 2-3% of all ovarian cancers	Usually children and young women (<30 yr)		Surgical resection (often conservative unilateral salpingo-oophorectomy \pm nodes) \pm chemotherapy
Dysgerminoma	Produces LDH	10% bilateral		Usually very responsive to chemotherapy, therefore complete resection is not necessary for cure
Immature Teratoma	No tumor marker identified			
Gonadoblastoma				
EPITHELIAL OVARIAN TUMORS (malignant or borderline)				
General Information	Derived from mesothelial cells lining peritoneal cavity Classified based on histologic type 80-85% of all ovarian neoplasms (includes malignant)		Varies depending on subtype	Borderline Cystectomy vs. unilateral salpingo-oophorectomy Malignant 1. Early stage (stage 1): Hysterectomy/BSO/staging (omentectomy, peritoneal biopsies, washings, pelvic and para-aortic lymphadenectomy) 2. Advanced stage: Upfront cytoreductive (debulking) followed by adjuvant chemotherapy consisting of IV carboplatin/paclitaxel vs. intraperitoneal chemotherapy (stage III) neoadjuvant chemotherapy with IV carboplatin/paclitaxel, followed by delayed debulking with further adjuvant IV chemotherapy
Serous	Most common ovarian tumor 50% of all ovarian cancers 75% of epithelial tumors 70% benign	20-30% bilateral	Lining similar to fallopian tube epithelium Often multilocular Histologically contain Psammoma bodies (calcified concentric concretions)	

Table 21. Ovarian Tumors (continued)

Type	Description	Presentation	Ultrasound/Cytology	Treatment
EPITHELIAL OVARIAN TUMORS (malignant or borderline)				
Mucinous	20% of epithelial tumors 85% benign	Rarely complicated by <i>Pseudomyxoma peritonei</i> : implants seed abdominal cavity and produce large quantities of mucin	Resembles endocervical epithelium Often multilocular May reach enormous size	Poor response to chemotherapy If mucinous, remove appendix as well to rule out possible source of primary disease
SEX CORD STROMAL OVARIAN TUMORS				
General Information				Surgical resection of tumor Chemotherapy may be used for unresectable metastatic disease
Fibroma/Thecoma (benign)	From mature fibroblasts in ovarian stroma	Non-functioning Occasionally associated with Meig's syndrome (benign ovarian tumor and ascites and pleural effusion)	Firm, smooth rounded tumor with interlacing fibrocytes	
Granulosa-Theca Cell Tumors (benign or malignant)	Can be associated with endometrial cancer Inhibin is tumor marker	Estrogen-producing → feminizing effects (precocious puberty, menorrhagia, postmenopausal bleeding)	Histologic hallmark of cancer is small groups of cells known as Call-Exner bodies	
Sertoli-Leydig Cell Tumor (benign or malignant)	Can measure elevated androgens as tumor markers	Androgen-producing → virilizing effects (hirsutism, deep voice, recession of front hairline)		
METASTATIC OVARIAN TUMORS				
From GI Tract, Breast, Endometrium, Lymphoma	4-8% of ovarian malignancies Krukenberg tumor – metastatic ovarian tumor (usually GI tract, commonly stomach or colon, breast) with "signet-ring" cells			

Investigation of Suspicious Ovarian Mass

- women with suspected ovarian cancer based on history, physical, or investigations should be referred to a gynecologic oncologist
 - bimanual examination
 - ♦ solid, irregular, or fixed pelvic mass is suggestive of ovarian cancer
 - RMI (Risk of Malignancy Index) is best tool available to assess likelihood of ovarian malignancy and need for pre-operative gynecologic oncology referral (see sidebar)
- blood work: CA-125 for baseline, CBC, liver function tests, electrolytes, creatinine
- radiology
 - bone scan or PET scan not indicated
 - transvaginal ultrasound best to visualize ovaries
 - CT scan abdomen and pelvis to look for metastatic disease
- try to rule out other primary source if suspected, based on:
 - occult blood per rectum: endoscopy ± barium enema
 - gastric symptoms, gastroscopy ± upper GI series
 - abnormal vaginal bleeding, endometrial biopsy to rule out concurrent endometrial cancer, colposcopy ± ECC to rule out cervical cancer if abnormal cervix
 - breast lesion identified or risk factors present: mammogram

Table 22. FIGO Staging for Primary Carcinoma of the Ovary (Surgical Staging) (2009)

Stage	Description
I	Growth limited to the ovaries
IA	1 ovary, no ascites, no tumor on external surface, capsule intact
IB	2 ovaries, no ascites, no tumor on external surface, capsule intact
IC	1 or 2 ovaries with any of the following: capsule ruptured, tumor on ovarian surface, or malignant cells in ascites
II	Growth involving one or both ovaries with pelvic extension
IIA	Extension ± metastases to uterus/tubes
IIB	Extension to other pelvic structures
IIC	II A/B with malignant cells in ascites or positive peritoneal washings
III	Tumor involving one or both ovaries with peritoneal implants outside the pelvis and/or positive retroperitoneal or inguinal nodes; superficial liver mets is Stage III
IIIA	Microscopic peritoneal metastasis beyond pelvis, LNs negative
IIIB	Macroscopic peritoneal metastasis beyond pelvis <2 cm, LNs negative
IIIC	Implant >2 cm and/or retroperitoneal or inguinal nodes
IV	Distant metastasis beyond peritoneal cavity

FIGO = International Federation of Gynecology and Obstetrics

Incorporation of Bevacizumab in the Primary Treatment of Ovarian Cancer

NEJM 2011;365:2473-2483

Purpose: To evaluate the effect of bevacizumab addition to standard front-line therapy for epithelial ovarian cancer.

Study: Double-blind, placebo-controlled phase 3 trial with patients with newly diagnosed stage III (incompletely resectable) or stage IV epithelial ovarian cancer who had undergone debulking surgery to receive one of three treatments. All three treatments included chemotherapy with intravenous paclitaxel plus carboplatin. Patients received chemotherapy with placebo, bevacizumab-initiation treatment (cycles 2-6 of 22 cycles) or bevacizumab-throughout (cycles 2-22).

Results: 1,873 participants. The median progression-free survival was 10.3 mo in the control group, 11.2 mo in the bevacizumab-initiation group, and 14.1 mo in the bevacizumab-throughout group. The rate of HTN requiring medical therapy was higher in the bevacizumab-initiation group (16.5%) and bevacizumab-throughout group (22.9%) than in the control group (7.2%) as well as gastrointestinal wall disruption (2.8%, 2.6%, 1.2%, respectively).

Conclusions: The use of bevacizumab during and up to 10 mo after carboplatin and paclitaxel chemotherapy prolongs the median progression-free survival by about 4 mo in patients with advanced epithelial ovarian cancer.

Cervix

BENIGN CERVICAL LESIONS

- Nabothian cyst/inclusion cyst
 - no treatment required
- endocervical polyps
 - treatment is polypectomy (office procedure)

MALIGNANT CERVICAL LESIONS

Epidemiology

- majority are SCCs (95%); adenocarcinomas increasing (5%); rare subtypes include SCC, adenosquamous
- 8,000 deaths annually in North America
- annual Pap test reduces a woman's chance of dying from cervical cancer from 0.4% to 0.05%
- average age at presentation: 52 yr old

Etiology

- at birth, vagina is lined with squamous epithelium; columnar epithelium lines only the endocervix and the central area of the ectocervix (original squamocolumnar junction)
- during puberty, estrogen stimulates eversion of a single columnar layer (ectopy), thus exposing it to the acidic pH of the vagina, leading to metaplasia (change of exposed epithelium from squamous to columnar)
 - a new squamocolumnar junction forms as a result
- the transformation zone (TZ) is the area located between the original and the current squamocolumnar junction
- the majority of dysplasias and cancers arise in the TZ of the cervix
- must have active metaplasia in presence of inducing agent (HPV) to get dysplasia
- dysplasia → carcinoma *in situ* (CIS) → invasion
- slow process (~10 yr on average)
- growth is by local extension
- metastasis occurs late

Risk Factors

- HPV infection
 - see *Sexually Transmitted Diseases*, GY26
 - high risk of neoplasia associated with types 16, 18
 - low risk of neoplasia associated with types 6, 11
 - >99% of cervical cancers contain one of the high risk HPV types
- high risk behaviors (risk factors for HPV infection)
 - multiple partners
 - other STDs (HSV, trichomonas)
 - early age at first intercourse
 - high risk male partner
- smoking
- at-risk groups include:
 - sex-trade workers
 - low socioeconomic status

Cervical Cancer Screening Guidelines (Pap Test)

- see [Family Medicine](#), FM5

Clinical Features

- SCC: exophytic, fungating tumor
- adenocarcinoma: endophytic, with barrel-shaped cervix
- early
 - asymptomatic
 - discharge: initially watery, becoming brown or red
 - postcoital bleeding
- late
 - 80-90% present with bleeding: either postcoital, postmenopausal or irregular bleeding
 - pelvic or back pain (extension of tumor to pelvic walls)
 - bladder/bowel symptoms
- signs
 - friable, raised, reddened, or ulcerated area visible on cervix

A Risk of Malignancy Incorporating CA125, Ultrasound, and Menopausal Status for the Accurate Pre-Operative Diagnosis of Ovarian Cancer
BJOG 1990;97:922-929

$RMI = U \times M \times CA-125$

Ultrasound Findings (1 pt for each)

- Multilocular cyst
- Evidence of solid areas
- Evidence of metastases
- Presence of ascites
- Bilateral lesions

$U = 1$ (for U/S scores of 0 or 1)

$U = 4$ (for U/S scores of 2-5)

Menopausal Status

- Postmenopausal: $M = 4$
- Premenopausal: $M = 1$

Absolute Value of CA-125 Serum Level

- For $RMI > 200$: Gynecologic oncology referral is recommended

Causes of Elevated CA-125

- Age influences reliability of test as a tumor marker
- 50% sensitivity in early stage ovarian cancer (poor) – therefore not good for screening

Malignant

- Gyne: ovary, uterus
- Non-Gyne: pancreas, stomach, colon, rectum

Non-Malignant

- Gyne: benign ovarian neoplasm, endometriosis, pregnancy, fibroids, PID
- Non-Gyne: cirrhosis, pancreatitis, renal failure

CA-125 is indicated for monitoring response to treatment

Malignant Ovarian Tumor Prognosis 5 yr Survival

Stage I	75-95%
Stage II	60-75%
Stage III	23-41%
Stage IV	11%

Figure 17. The cervix

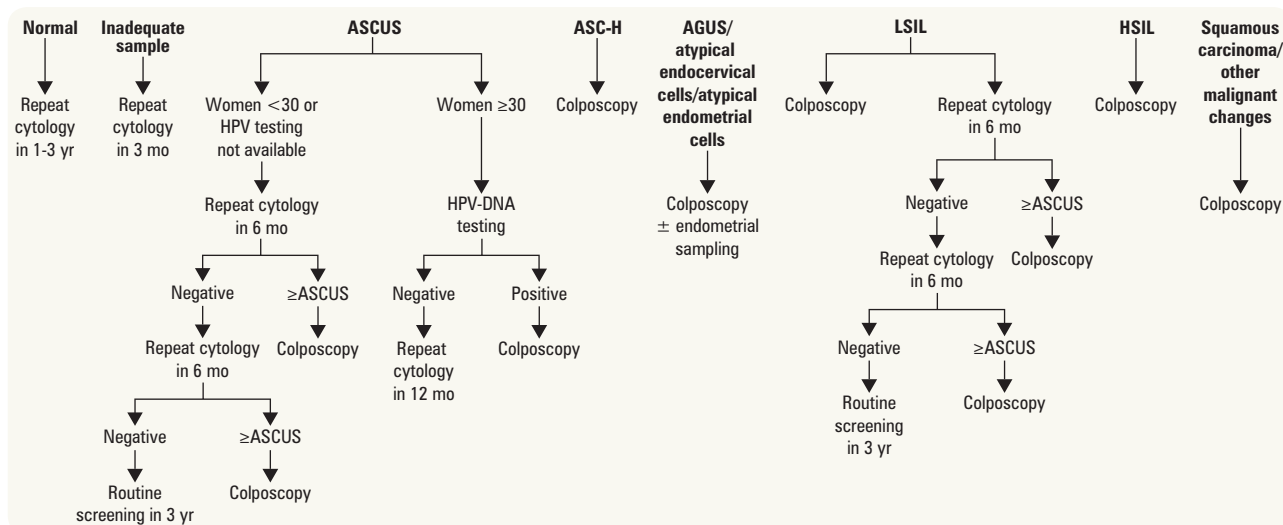

Figure 18. Decision making chart for Pap test (not applicable for adolescents)

Adapted from: Ontario Cervical Screening Practice Guidelines. May 2012. Cervical screening guidelines unique to each state.

Diagnosis

- apply acetic acid and identify acetowhite lesions, punctation, mosaicism, and abnormal blood vessels to guide cervical biopsy
- endocervical curettage (ECC) if entire lesion is not visible or no lesion visible
- diagnostic excision (LEEP) if
 - lesion extends into endocervical canal
 - positive ECC
 - discrepancy between Pap test results and colposcopy
 - microinvasive carcinoma
- consider cold knife conization (in OR) if glandular abnormality suspected based on cytology or colposcopic findings due to concern for margin interpretation
- tests permitted for FIGO clinical staging include: physical exam (including EUA), cervical biopsy (including cone biopsy), proctoscopy/cystoscopy, IVP, ultrasound liver/kidneys, CXR, LFTs
- MRI and/or CT and/or PET scan often done to facilitate planning of radiation therapy, results do not influence clinical stage

Treatment: Prevention and Management

Prevention: HPV Vaccine

- two vaccines currently approved (Gardasil®, Cervarix®)

Table 23. Comparison of Two Vaccines against Human Papillomavirus (HPV)

	Gardasil®	Cervarix®
Viral strains covered	6, 11, 16, 18	16, 18
Route of administration	IM	IM
Schedule of dosing	0, 2, 6 mo	0, 1, 6 mo
Side effects	Local: redness, pain, swelling General: headache, low grade fever, GI upset	Local: redness, pain, swelling General: headache, low grade fever, GI upset
Approved age	Females age 9-45, males age 9-26	Females age 10-25
Contraindications	Pregnant women and women who are nursing (limited data)	

- should be administered before onset of sexual activity (i.e. before exposure to virus) for optimal benefit of vaccination
- may be given at the same time as hepatitis B or other vaccines using a different injection site
- not for treatment of active infections
- most women will not be infected with all four types of the virus at the same time, therefore vaccine is still indicated for sexually active females or those with a history of previous HPV infection or HPV-related disease
- conception should be avoided until 30 d after last dose of vaccination

The Bethesda Classification System is based on cytological results of a Pap test that permits the examination of cells but not tissue structure; cervical intraepithelial neoplasia (CIN) or cervical carcinoma is a histological diagnosis, requiring a tissue sample via biopsy of suspicious lesions seen during colposcopy

Efficacy of Human Papillomavirus (HPV)-16/18 AS04-Adjuvanted Vaccine Against Cervical Infection and Precancer Caused by Oncogenic HPV Types (PATRICIA): Final Analysis of a Double-Blind, Randomized Study in Young Women

Lancet 2009;374:301-314

Study: Phase III double-blind, controlled RCT.

Patients: 18,644 women aged 15-25.

Selected Outcomes: Development of HPV-16/18 associated CIN II+ was the primary outcome. Secondary to this were persistence of infections with HPV-16, HPV-18, or other oncogenic HPV types.

Selected Results: Efficacy against development of HPV-16/18 associated CIN II+ was 98.1% ($p < 0.0001$). High levels of cross-protection were observed for persistent infection with HPV-31 and HPV-45 and HPV-31 or HPV-45 associated CIN II+.

Conclusions: The HPV-16/18 AS04-adjuvanted vaccine protected against HPV-16/18 associated CIN II+ lesions and lesions associated with HPV-31, HPV-33, and HPV-45.

Table 24. Management of Patients Abnormal Cervical Histology and Cervical Cancer

Management	
CIN I	<ul style="list-style-type: none"> Preferred option for biopsy-proven CIN I is observation Repeat assessment and cytology in 12 mo Management according to cytology results <p>If after HSIL or AGC</p> <ul style="list-style-type: none"> Cytology and histology should be reviewed If discrepancy remains, excisional biopsy may be considered
CIN II and CIN III	<p>Women ≥ 25 yr</p> <ul style="list-style-type: none"> CIN II or III should be treated Excisional procedures preferred for CIN III Those with positive margins should have follow-up with colposcopy and directed biopsies and/or endocervical curettage Treatment for recurrent CIN II or III should be by excision <p>Women < 25 yr</p> <ul style="list-style-type: none"> Pathologist should be asked to clarify whether lesion is CIN II or CIN III CIN II: observe with colposcopy at 6-mo intervals for up to 24 mo before treatment considered CIN III: should be treated <p>During pregnancy:</p> <ul style="list-style-type: none"> CIN II or III suspected or diagnosed during pregnancy, repeat colposcopy and treatment delayed until 8-12 wk after delivery
Stage IA₁ (no LVSI)	<ul style="list-style-type: none"> Trachelectomy (removal of only the cervix) if future fertility desired (and lesion ≤ 2 cm) Simple hysterectomy if future fertility is not desired
Stage IA₂, IB₁	<ul style="list-style-type: none"> Typically treated with radical hysterectomy and pelvic lymphadenectomy (sentinel nodes under study) Equal cure rates may be obtained with primary radiation therapy; advantage of surgery: may accurately stage and grade and more targeted adjuvant therapy Advantage is that ovaries can be spared if pre-menopausal For fertility preservation, may have radical trachelectomy (removal of cervix and parametria) and nodes instead of radical hysterectomy for early-stage disease Concurrent chemoradiation therapy if adverse high risk prognostic factors on radical surgical specimen, such as: positive pelvic lymph nodes, positive parametria, and/or positive margins
Stages IB₂, IB₃, II, III, IV	<ul style="list-style-type: none"> Primary chemoradiation therapy PET/CT to grade: evaluate pelvic and para-aortic nodes For positive nodes on PET: primary chemoradiation with extended field RT Hysterectomy generally not suggested following primary treatment with curative intent

Cervical cancer is most prevalent in developing countries and therefore is the only gynecologic cancer that uses clinical staging; this facilitates consistent international staging with countries that do not have technologies, such as CT and MRI

Cervical Cancer Prognosis 5 yr Survival

Stage 0	99%
Stage I	75%
Stage II	55%
Stage III	30%
Stage IV	7%
Overall	50-60%

CDC Advisory Committee on Immunization Practices (ACIP) Recommends Quadrivalent HPV4 Vaccine for Males

- Routine HPV4 vaccination for males aged 11-12 as a 3-dose series
- HPV4 vaccination for males aged 13-21 who have not been vaccinated previously or have not completed the 3-dose series
- Males 22-26 yr of age may be vaccinated

Source: Centers for Disease Control and Prevention. Recommendations on the Use of Quadrivalent Human Papillomavirus Vaccine in Males – Advisory Committee on Immunization Practices (ACIP), 2011. *MMWR* 2011;60:1705-1708

Abnormal Pap Tests in Pregnancy

- incidence: 1/2,200
- Pap test at all initial prenatal visits
 - if abnormal Pap or suspicious lesion, refer to colposcopy
- if diagnostic conization required, should be deferred until second trimester (T2) to minimize risk of pregnancy loss
- if invasive cancer ruled out, management of dysplasia deferred until completion of pregnancy (may deliver vaginally)
- if invasive cancer present, management depends on prognostic factors, degree of fetal maturity, and patient wishes
 - general recommendations in T1: consider pregnancy termination, management with either radical surgery (hysterectomy vs. trachelectomy if desires future fertility), or concurrent chemoradiation therapy
 - recommendations in T2/T3: delay of therapy until viable fetus and C/S for delivery with concurrent radical surgery or subsequent concurrent chemoradiation therapy

Vulva

BENIGN VULVAR LESIONS

Non-Neoplastic Disorders of Vulvar Epithelium

- biopsy is necessary to make diagnosis and/or rule out malignancy
- hyperplastic dystrophy (squamous cell hyperplasia)
 - surface thickened and hyperkeratotic
 - pruritus most common symptom
 - typically postmenopausal women
 - treatment: 1% fluorinated corticosteroid ointment bid for 6 wk

Any suspicious lesion of the vulva should be biopsied

- lichen sclerosis
 - subepithelial fat becomes diminished; labia become thin, atrophic, with membrane-like epithelium and labial fusion
 - pruritus, dyspareunia, burning
 - 'figure of 8' distribution
 - most common in postmenopausal women but can occur at any age
 - treatment: ultrapotent topical steroid 0.05% clobetasol x 2-4 wk then taper down
- mixed dystrophy (lichen sclerosis with epithelial hyperplasia)
 - hyperkeratotic areas with areas of thin, shiny epithelium
 - treatment: fluorinated corticosteroid ointment

Tumors

- papillary hidradenoma, nevus, fibroma, hemangioma

MALIGNANT VULVAR LESIONS**Epidemiology**

- 5% of genital tract malignancies
- 90% SCC; remainder melanomas, basal cell carcinoma, Paget's disease, Bartholin's gland carcinoma
 - Type I disease: HPV-related (50-70%)
 - ♦ more likely in younger women
 - ♦ 90% of VIN contain HPV DNA (usually types 16, 18)
 - Type II disease: not HPV-related, associated with current or previous vulvar dystrophy
 - ♦ usually postmenopausal women

Risk Factors

- HPV infection
- VIN: precancerous change which presents as multicentric white or pigmented plaques on vulva (may only be visible at colposcopy)
 - progression to cancer rarely occurs with appropriate management
 - treatment: local excision (i.e. superficial vulvectomy ± split thickness skin grafting to cover defects if required) vs. ablative therapy (i.e. laser, cauterization) vs. local immunotherapy (imiquimod)

Clinical Features

- many patients asymptomatic at diagnosis (many also deny or minimize symptoms)
- most lesions occur on the labia majora, followed by the labia minora (less commonly on the clitoris or perineum)
- localized pruritus or lesion most common
- less common: raised red, white or pigmented plaque, ulcer, bleeding, discharge, pain, dysuria
- patterns of spread
 - local
 - groin lymph nodes (usually inguinal → pelvic nodes)
 - hematogenous

Investigations

- ± colposcopy
- ALWAYS biopsy any suspicious lesion

Prognosis

- depends on stage – particularly nodal involvement (single most important predictor followed by tumor size)
- lesions >4 cm associated with poorer prognosis
- overall 5 yr survival rate: 79%

Fallopian Tube

- least common site for carcinoma of female reproductive system (0.3%)
- usually serous epithelial carcinoma
- recently considered to be origin of serous ovarian cancer
- more common in fifth and sixth decade

Clinical Features

- classic triad present in minority of cases, but very specific
 - watery discharge (most specific) = "hydros tubae profluens"
 - vaginal bleeding or discharge in 50% of patients
 - crampy lower abdominal/pelvic pain
- most patients present with a pelvic mass (see *Ovarian Cancer*, GY37 for guidelines regarding diagnosis/investigation)

Treatment

- as for malignant epithelial ovarian tumours

Gestational Trophoblastic Disease/Neoplasia

With development of HTN early in pregnancy (i.e. <20 wk), think gestational trophoblastic disease

- refers to a spectrum of proliferative abnormalities of the trophoblast

Epidemiology

- 1/1,000 pregnancies
- marked geographic variation – as high as 1/125 in Taiwan
- 80% benign, 15% locally invasive, 5% metastatic
- cure rate >95%

HYDATIDIFORM MOLE (Benign GTD)

Complete Mole

- most common type of hydatidiform mole
- diffuse trophoblastic hyperplasia, hydropic swelling of chorionic villi, no fetal tissues, or membranes present
- 46XX or 46XY, chromosomes completely of paternal origin (90%)
- 2 sperm fertilize empty egg or 1 sperm with reduplication
- 15-20% risk of progression to malignant sequelae
- risk factors
 - geographic (South East Asia most common)
 - others (maternal age >40 yr, β -carotene deficiency, vitamin A deficiency) – not proven
- clinical features
 - often present during apparent pregnancy with abnormal symptoms/findings:
 - ♦ vaginal bleeding (97%)
 - ♦ excessive uterine size for LMP (51%)
 - ♦ theca-lutein cysts >6 cm (50%)
 - ♦ preeclampsia (27%)
 - ♦ hyperemesis gravidarum (26%)
 - ♦ hyperthyroidism (7%)
 - ♦ β -hCG >100,000 IU/L
 - ♦ no fetal heart beat detected

Partial (or Incomplete) Mole

- focal trophoblastic hyperplasia and hydropic villi are associated with fetus or fetal parts
- often triploid (XXY, XYY, XXX) with chromosome complement from both parents
 - usually related to single ovum fertilized by two sperm
- low risk of progression to malignant sequelae (<4%)
- associated with fetus, which may be growth-restricted, and/or have multiple congenital malformations
- clinical features
 - typically present similar to threatened/spontaneous/missed abortion
 - pathological diagnosis often made after D&C

Investigations

- quantitative β -hCG levels (tumor marker) abnormally high for gestational age
- U/S findings
 - if complete: no fetus (classic “snow storm” due to swelling of villi)
 - if partial: molar degeneration of placenta \pm fetal anomalies, multiple echogenic regions corresponding to hydropic villi, and focal intrauterine hemorrhage
- CXR (may show metastatic lesions)
- features of molar pregnancies at high risk of developing persistent GTN post-evacuation
 - local uterine invasion as high as 31%
 - β -hCG >100,000 IU/L
 - excessive uterine size
 - prominent theca-lutein cysts

Treatment

- suction D&C with sharp curettage and oxytocin
- Rhogam® if Rh negative
- consider hysterectomy (if patient no longer desires fertility)
- prophylactic chemotherapy of no proven benefit
- chemotherapy for GTN if develops after evacuation

Follow-up

- contraception required to avoid pregnancy during entire follow-up period
- serial β -hCGs (as tumor marker) every wk until negative x 3 (usually takes several wk), then monthly for 6-12 mo prior to trying to conceive again
- increase or plateau of β -hCG indicates GTN \rightarrow patient needs chemotherapy

GTN Diagnosis

- β -hCG plateau: <10% drop in β -hCG over four values in 3 wk (e.g. days 1, 7, 14, and 21) OR
- β -hCG rise >20% in any two values over two wk or longer (e.g. measure at days 1, 7, 14) OR
- β -hCG persistently elevated >6 mo OR
- Metastases on workup

GTN (MALIGNANT GTD)**Invasive Mole or Persistent GTN**

- diagnosis made by rising or plateau in β -hCG, development of metastases following treatment of documented molar pregnancy
- histology: molar tissue from D&C
- metastases are rare (4%)

Choriocarcinoma

- often present with symptoms from metastases
- highly anaplastic, highly vascular
- no chorionic villi, elements of syncytiotrophoblast, and cytotrophoblast
- may follow molar pregnancy, abortion, ectopic, or normal pregnancy

Placental-site Trophoblastic Tumor

- rare aggressive form of GTN
- abnormal growth of intermediate trophoblastic cells
- low β -hCG, production of human placental lactogen (hPL), relatively insensitive to chemotherapy

CLASSIFICATION of GTN

- non-metastatic
 - ~15% of patients after molar evacuation
 - may present with abnormal bleeding
 - all have rising or plateau of β -hCG
 - negative metastases on staging investigations
- metastatic
 - 4% patients after treatment of complete molar pregnancy
 - metastasis more common with choriocarcinoma which tends toward early vascular invasion and widespread dissemination
 - if signs or symptoms suggest hematogenous spread, do not biopsy (they bleed)
 - ♦ lungs (80%): cough, hemoptysis, CXR lesion(s)
 - ♦ vagina (30%): vaginal bleeding, "blue lesions" on speculum exam
 - ♦ pelvis (20%): rectal bleeding (if invades bowel), U/S lesion(s)
 - ♦ liver (10%): elevated LFTs, U/S or CT findings
 - ♦ brain (10%): headaches, dizziness, seizure (symptoms of space-occupying lesion), CT/MRI findings
 - highly vascular tumor \rightarrow bleeding \rightarrow anemia
 - all have rising or plateau of β -hCG
 - classification of metastatic GTN
 - ♦ divided into good prognosis and bad prognosis
 - ♦ features of bad prognosis
 - long duration (>4 mo from antecedent pregnancy)
 - high pre-treatment β -hCG titre: >100,000 IU/24 h urine or >40,000 IU/L of blood
 - brain or liver metastases
 - prior chemotherapy
 - metastatic disease following term pregnancy
 - ♦ good prognosis characterized by the absence of each of these features

Lungs are #1 site for malignant GTN metastases; when pelvic exam and chest x-ray are negative, metastases are uncommon

Investigations – For Staging

- blood work: CBC, electrolytes, creatinine, β -hCG, TSH, LFTs
- imaging: CXR, U/S pelvis, CT abdo/pelvis, CT brain
- if suspect brain metastasis but CT brain negative, consider lumbar puncture for CSF β -hCG
 - ratio of plasma β -hCG:CSF β -hCG <60 indicates metastases

Table 25. FIGO Staging and Management of Malignant GTN

Stage	Findings	Management
I	Disease confined to uterine corpus	Single agent chemotherapy for low risk disease (WHO score ≤ 6) 1st line: pulsed – actinomycin D (Act-D) IV q2wk Alternatives: MTX-based regimen 20% of patients need to switch to alternate single-agent regimen due to failure of β -hCG to return to normal Combination chemotherapy (EMA-CO: etoposide, MTX, ACT-D, cyclophosphamide, vincristine) if high risk (WHO score ≥ 7) or if resistant to single agent chemotherapy Can consider hysterectomy if fertility not desired or placental-site trophoblastic tumor
II	Metastatic disease to genital structures	As above
III	Metastatic disease to lungs with or without genital tract involvement	As above
IV	Distant metastatic sites including brain, liver, kidney, GI tract	Usually high risk (EMA-CO) with surgical resection of sites of disease Persistence/resistance to chemotherapy Consider radiation for brain mets

Table 26. WHO Prognostic Score for GTD (2011)

Prognostic Factor	Score			
	0	1	2	4
Maternal Age	>40	40		
AP	Mole	Abortion	Term	
Interval (end of AP to chemotherapy in months)	<4	4-6	7-13	>13
hCG IU/l	<103	103-104	104-105	>105
Number of Metastases	0	1-4	5-8	>8
Site of Metastases	Lung	Spleen, kidney	GI tract	Brain, liver
Largest Tumor Mass		3-5 cm	>5 cm	
Prior Chemotherapy			Single drug	Two drug

Follow-up (for GTN)

- contraception for all stages to avoid pregnancy during entire follow-up period
- stage I, II, III
 - weekly β -hCG until 3 consecutive normal results
 - then monthly x 12 mo
- stage IV
 - weekly β -hCG until 3 consecutive normal results
 - then monthly x 24 mo

Common Medications

Table 27. Common Medications

Drug Name (Brand Name)	Action	Dosing Schedule	Indications	Side Effects (S/E), Contraindications (C/I), Drug Interactions (D/I)
acyclovir (Zovirax®)	Antiviral; inhibits DNA synthesis and viral replication	First Episode: 400 mg PO tid x 7-10 d Recurrence: 400 mg PO tid x 5 d	Genital herpes	S/E: headache, GI upset D/I: zidovudine, probenecid
bromocriptine (Parlodel®)	Dopaminomimetic Agonist at D ₂ R Antagonist at D ₁ R Acts directly on anterior pituitary cells to inhibit synthesis and release of prolactin	Initial: 1.25-2.5 mg PO qhs with food Then: increase by 2.5 mg every 2-7 d as needed until optimal therapeutic response Usual Range: 1.5-15 mg OD For IVF: Initial: 1.25 mg/d PO between days 4-6 of follicular phase Then: 2.5 mg/d until 3 d after onset menstruation	Galactorrhea + amenorrhea 2° to hyperprolactinemia Prolactin-dependent menstrual disorders and infertility Prolactin-secreting adenomas (microadenomas, prior to surgery of macroadenomas) IVF	S/E: N/V, headache, postural hypotension, somnolence C/I: uncontrolled HTN, pregnancy-induced HTN, CAD, breastfeeding D/I: domperidone, macrolides, octreotide
clomiphene citrate (Clomid®)	Increases output of pituitary gonadotropins which induces ovulation	50 mg OD x 5 d Try 100 mg or 160 mg OD if ineffective 3 courses = adequate trial	Patients with persistent ovulatory dysfunction (e.g. amenorrhea, PCOS) who desire pregnancy	S/E: Common – hot flashes, abdominal discomfort, exaggerated cyclic ovarian enlargement, accentuation of Mittelschmerz Rare – ovarian hyperstimulation syndrome, multiple pregnancy, visual blurring, birth defects C/I: pregnancy, liver disease, hormone-dependent tumors, ovarian cyst, undiagnosed vaginal bleeding
clotrimazole (Lotrimin®)	Antifungal; disrupt fungal cell membrane	Tablet: 100 mg/d intravaginally x 7 d or 200 mg/d x 3 d or 500 mg x 1 dose Cream (1 or 2%): 1 applicator intravaginally qhs x 3-7 d Topical: apply bid x 7 d	Vulvovaginal candidiasis	S/E: vulvar/vaginal burning
danazol (Danocrine®)	Synthetic steroid that inhibits pituitary gonadotropin output and ovarian steroid synthesis Has mild androgenic properties	200-800 mg in 2-3 divided doses Used for 3-6 mo Biannual hepatic U/S required if >6 mo use	Endometriosis 1° menorrhagia/DUB	S/E: weight gain, acne, mild hirsutism, hepatic dysfunction C/I: pregnancy, undiagnosed vaginal bleeding, breastfeeding, severely impaired renal/hepatic/cardiac function, porphyria, genital neoplasia, thromboembolic disease D/I: warfarin, carbamazepine, cyclosporine, tacrolimus, anti-hypertensives

Table 27. Common Medications (continued)

Drug Name (Brand Name)	Action	Dosing Schedule	Indications	Side Effects (S/E), Contraindications (C/I), Drug Interactions (D/I)
doxycycline	Tetracycline derivative; inhibit protein synthesis	100 mg PO bid x ≥ 7 d	Chlamydia, gonococcal infection, syphilis	S/E: GI upset, hepatotoxicity C/I: pregnancy, severe hepatic dysfunction D/I: warfarin, digoxin
fluconazole (Diflucan®)	Antifungal; disrupt fungal cell membrane	150 mg PO x 1 dose	Vulvovaginal candidiasis unresponsive to clotrimazole	S/E: headache, rash, N/V, abdominal pain, diarrhea D/I: terfenadine, cisapride, astemizole, hydrochlorothiazide, phenytoin, warfarin, rifampin
leuprolide (Lupron®)	Synthetic GnRH analog Induces reversible hypogestrogenic state	3.75 mg IM q1mo or 11.25 mg IM q3mo Usually ≤ 6 mo, check bone density if > 6 mo Retreatment with Lupron® alone not recommended because of effects on bone density	Endometriosis Leiomyomata DUB Precocious puberty	S/E: hot flashes, sweats, headache, vaginitis, reduction in bone density, acne, GI upset C/I: pregnancy, undiagnosed vaginal bleeding, breastfeeding
menotropin (Pergonal®)	Human gonadotropin with FSH and LH effects; induce ovulation and stimulate ovarian follicle development	75-150 U of FSH and LH IM OD x 7-12 d, then 10,000 U hCG one day after last dose	Infertility	S/E: bloating, irritation at injection site, abdominal/pelvic pain, headache, N/V, multiple pregnancy C/I: primary ovarian failure, intracranial lesion (e.g. pituitary tumor), uncontrolled thyroid/adrenal dysfunction, ovarian cyst (not PCOS), pregnancy, undiagnosed uterine bleeding
metronidazole (Flagyl®)	Bactericidal; forms toxic metabolites which damage bacterial DNA	2 g PO x 1 dose or 500 mg PO bid x 7 d	Bacterial vaginosis, trichomonas vaginitis	S/E: headache, dizziness, N/V, diarrhea, disulfiram-like reaction (flushing, tachycardia, N/V) C/I: pregnancy (1st trimester) D/I: cisapride, warfarin, cimetidine, lithium, alcohol, amiodarone, milk thistle, carbamazepine
oxybutinin (Ditropan®)	Anticholinergic – relaxes bladder smooth muscle, inhibits involuntary detrusor contraction	5 or 10 mg/d PO May increase doses by 5 mg weekly to a max of 30 mg/d	Overactive bladder (urge incontinence)	S/E: dry mouth/eyes, constipation, palpitations, urinary retention, dizziness, headache C/I: glaucoma, GI ileus, severe colitis, obstructive uropathy, use with caution if impaired hepatic/renal function
tolterodine (Detrol®)	Anticholinergic	1-2 mg PO bid	Overactive bladder (urge incontinence)	S/E: anaphylaxis, psychosis, tachycardia, dry mouth/eyes, headache, constipation, urinary retention, chest pain, abdominal pain C/I: glaucoma, gastric/urinary retention, use with caution if impaired hepatic/renal function
tranexamic acid (Cyklokapron®)	Anti-fibrinolytic, reversibly inhibits plasminogen activation	1-1.5 g tid-qid for first 4 d of cycle Max 4 g/d Ophthalmic check if used for several wk	Menorrhagia	S/E: N/V, diarrhea, dizziness, rare cases of thrombosis, abdominal pain, MSK pain C/I: thromboembolic disease, acquired disturbances of color vision, subarachnoid hemorrhage, age < 15 yr
urofollitropin (Metrodin®)	FSH	75 U/d SC x 7-12d	Ovulation induction in PCOS	S/E: ovarian enlargement or cysts, edema and pain at injection site, arterial thromboembolism, fever, abdominal pain, headache, multiple pregnancy C/I: primary ovarian failure, intracranial lesion (e.g. pituitary tumor), uncontrolled thyroid/adrenal dysfunction, ovarian cyst (not PCOS), pregnancy, abnormal uterine bleeding
combined oral contraceptive pill (OCP)	Ovulatory suppression by inhibiting LH and FSH Decidualization of endometrium Thickening of cervical mucus to prevent sperm penetration		Contraception Disorders of menstruation	See Tables 8-12
intrauterine device (IUD) copper IUD (Paragard-T®) progesterone-releasing IUD (Mirena®)	Copper IUD: mild foreign body reaction in endometrium which is toxic to sperm and alters sperm motility Progesterone-releasing IUD: decidualization of endometrium and thickening of cervical mucus, may suppress ovulation	Contraceptive effects last 5 yr	Same as above	See Table 8-12

Basics of Hematology

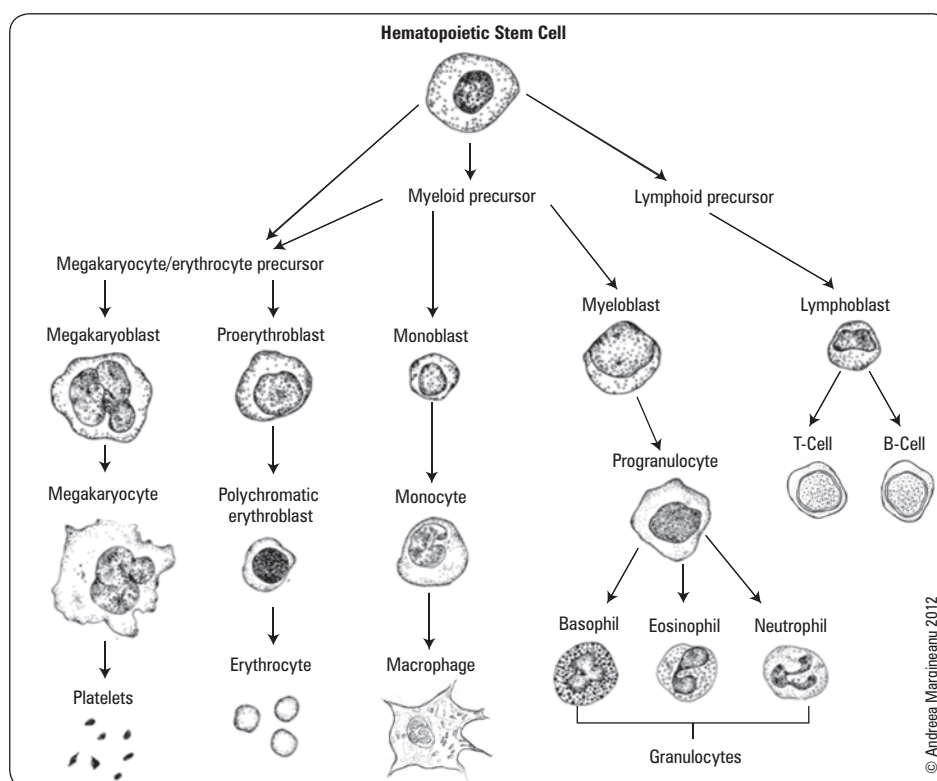

Figure 1. Hematopoiesis

- over 10^{11} blood cells are produced daily
- sites of hematopoiesis in adults: pelvis, sternum, vertebral bodies
- lifespan of mature cells in blood
 - erythrocytes (120 d), neutrophils (~1 d), platelets (10 d), lymphocytes (varies – memory cells persist for years)
- role of lymphoid organs
 - spleen: part of reticuloendothelial system, removes aged RBCs, removes antibody-coated bacteria/cells, site of antibody production
 - thymus: site of T-cell maturation, involutes with age
 - lymph nodes: sites of B and T-cell activation (adaptive immune response)

Erythrocyte: carries oxygen from lungs to peripheral tissues

Reticulocyte: immature erythrocyte

Neutrophil: granulocyte integral in innate immunity; main cell in acute inflammation

Eosinophil: involved in response to parasites (especially helminths) and allergic response

Basophil: granulocyte mainly involved in allergy and parasitic infection

Lymphocyte: integral cell in adaptive immunity

Monocyte: involved in innate immunity; can differentiate into macrophage or dendritic cell

Platelet: mediator of primary hemostasis

Plasma: liquid component of blood containing water, proteins, coagulation factors, and immunoglobulins

Serum: equivalent to plasma minus clotting factors and fibrinogen

Complete Blood Count

Table 1. Common Terms Found on CBC

Test	Definition	Normal Values*
Red Blood Cell (RBC) Count	The number of RBCs per volume of blood	4.2-6.9 x 10 ⁶ /mm ³
Hemoglobin (Hb)	Amount of oxygen-carrying protein in the blood	13-18 g/dL (male) 12-16 g/dL (female)
Hematocrit (Hct)	Percentage of a given volume of whole blood occupied by packed RBCs	45%-62% (male) 37%-48% (female)
Mean Corpuscular Volume (MCV)	Measurement of size of RBCs	80-100 µm ³
Mean Corpuscular Hb (MCH)	Amount of oxygen-carrying Hb inside RBCs	27-32 pg/cell
Mean Corpuscular Hb Concentration (MCHC)	Average concentration of Hb inside RBCs	32%-36%
RBC Distribution Width (RDW)	Measurement of variance in RBC size	11.0%-15.0%
White Blood Cell (WBC) Count	The number of WBCs per volume of blood	4,300-10,800/mm ³
WBC Differential	Includes neutrophils, eosinophils, basophils, lymphocytes, and monocytes	
Platelet Count	The number of platelets per volume of blood	150,000-400,000/mm ³
Mean Platelet Volume (MPV)	Measurement of platelet size	
Reticulocytes	Immature RBCs that contain no nucleus but have residual RNA	Normally make up 1% of total RBC count

*Normal values may vary depending on site and age

Clinical Use of RDW

- To distinguish the etiologies of microcytosis:
 - Iron deficiency: increased RDW (anisocytosis) as cells are of varying sizes in iron deficiency
 - Thalassemia minor: normal RDW (also expect a high RBC count) as cells are of similar size due to genetic defect in Hb

Complete Blood Count

Approach to Interpreting a CBC

- Consider values in the context of individual's baseline
 - up to 5% of population without disease may have values outside "normal" range
 - an individual may display a clinically significant change from their baseline without violating "normal" reference range
- Is one cell line affected or are several?
 - if all lines are low: pancytopenia (see *Pancytopenia, H8*)
 - if RBCs and platelets are low: consider a MAHA (see *H22*)
 - if single cell line affected: see corresponding section in *Common Presenting Problems, H6*

Blood Film Interpretation

RED BLOOD CELLS

Size

- microcytic (MCV <80), normocytic (MCV = 80-100), macrocytic (MCV >100)
- anisocytosis: RBCs with increased variability in size (increased RDW)
 - iron deficiency anemia, hemolytic anemias, myelofibrosis, blood transfusion

Color

- hypochromic: increase in size of central pallor (normal = less than 1/3 of RBC diameter)
 - iron deficiency anemia, anemia of chronic inflammation, sideroblastic anemia
- polychromasia: increased reticulocytes (pinkish-blue cells)
 - increased RBC production by bone marrow

Shape

- poikilocytosis: increased proportion of RBCs of abnormal shape
 - iron deficiency anemia, myelofibrosis

Table 2. Common Erythrocyte Shapes

Shape	Definition	Associated Conditions
Discocyte 	Biconcave disc	Normal RBC
Spherocyte 	Spherical RBC (due to loss of membrane)	Hereditary spherocytosis, immune hemolytic anemia, post-transfusion
Elliptocyte/Ovalocyte 	Oval-shaped, elongated RBCs • Elliptocytes: the RBC long axis is $\geq 2\times$ the length of the short axis • Ovalocytes: the RBC long axis is $< 2\times$ the length of the short axis	Hereditary elliptocytosis, megaloblastic anemia, myelofibrosis, iron-deficiency, MDS (myelodysplastic syndrome)
Schistocyte (helmet cell) 	Fragmented cells (due to traumatic disruption of membrane)	Microangiopathic hemolytic anemia (HUS/TTP, DIC, preeclampsia, HELLP, malignant HTN), vasculitis, glomerulonephritis, prosthetic heart valve
Sickle Cell 	Sickle-shaped RBC (due to polymerization of hemoglobin S)	Sickle cell disorders: HbSC, HbSS
Codocyte (target cell) 	"Bull's eye" on dried film	Liver disease, hemoglobin SC, thalassemia, Fe deficiency, asplenia
Dacrocyte (teardrop cell) 	Single pointed end, looks like a teardrop	Myelofibrosis, thalassemia major, megaloblastic anemia
Acanthocyte (spur cell) 	Distorted RBC with irregularly distributed thorn-like projections (due to abnormal membrane lipids)	Severe liver disease (spur cell anemia), starvation/anorexia, post-splenectomy
Echinocyte (burr cell) 	RBC with numerous regularly spaced, small spiny projections	Uremia, HUS, burns, cardiopulmonary bypass, post-transfusion, storage artifact
Rouleaux Formation 	Aggregates of RBC resembling stacks of coins (due to increased plasma concentration of high molecular weight proteins)	Pregnancy: most common cause; due to physiological increase in fibrinogen Inflammatory conditions: due to polyclonal immunoglobulins Plasma cell dyscrasias: due to monoclonal paraproteinemia, e.g. multiple myeloma, macroglobulinemia Storage artifact

DIC = disseminated intravascular coagulation; HELLP = hemolysis, elevated liver enzymes, and low platelet count; HUS = hemolytic uremic syndrome; TTP = thrombotic thrombocytopenic purpura

Illustrations: Ayalah Hutchins and Merry Shiyu Wang 2012

Table 3. RBC Inclusions

Inclusions	Definition	Associated Conditions
Nucleus 	Present in erythroblasts (immature RBCs)	Hyperplastic erythropoiesis (seen in hypoxia, hemolytic anemia), BM infiltration disorders, MPNs (MF)
Heinz Bodies 	Denatured and precipitated hemoglobin	G6PD deficiency (post-exposure to oxidant), thalassemia, unstable hemoglobins
Howell-Jolly Bodies 	Small nuclear remnant resembling a pyknotic nucleus	Post-splenectomy, hyposplenism (sickle cell disease), neonates, megaloblastic anemia
Basophilic Stippling 	Deep blue granulations indicating ribosome aggregation	Thalassemia, heavy metal (Pb, Zn, Ag, Hg) poisoning, megaloblastic anemia, hereditary (pyrimidine 5' nucleotidase deficiency)
Sideroblasts 	Erythrocytes with Fe containing granules in the cytoplasm	Hereditary, idiopathic, drugs, hypothyroidism (see Sideroblastic Anemia, H16), myelodysplastic syndrome

BM = bone marrow; MF = myelofibrosis; MPN = myeloproliferative neoplasm

Illustrations: Ayalah Hutchins and Merry Shiyu Wang 2012

WHITE BLOOD CELLS

- lymphocytes: comprise 30-40% of WBCs; great variation in "normal" lymphocyte morphology
- neutrophils
 - normally only mature neutrophils (with 3-4 lobed nucleus) and band neutrophils (immediate precursor with horseshoe-shaped nucleus) are found in circulation
 - hypersegmented neutrophil: >5 lobes suggests megaloblastic process (B_{12} or folate deficiency)
 - left shift (increased granulocyte precursors)
 - ♦ seen in leukemoid reactions: acute infections, pregnancy, neonates, hypoxia, shock, myeloproliferative neoplasms (CML, MF)
- blasts
 - immature, undifferentiated precursors; associated with acute leukemia, MDS, G-CSF (growth factor that stimulates neutrophil production) use

PLATELETS

- small, purple, anuclear cell fragments

Table 4. Abnormal White Blood Cells on Film

Appearance	Definition	Associated Conditions
Reed-Sternberg Cell 	Giant, multinucleated B-lymphocyte, only seen with bone marrow specimens	Primarily Hodgkin lymphoma, also seen in some non-Hodgkin lymphoma, CLL, and EBV infection
Smudge Cell 	Lymphocytes damaged during blood film preparation indicating cell fragility	Chronic lymphocytic leukemia (CLL) and other lymphoproliferative disorders Pathognomonic in EBV infection
Auer Rod 	Clumps of granular material that form long needles in the cytoplasm of myeloblasts	Pathognomonic for acute myeloid leukemia (AML)

EBV = Epstein-Barr virus

Illustrations: Ayalah Hutchins and Merry Shiyu Wang 2012

Left Shift

Refers to an increase in granulocyte precursors in the peripheral smear (myelocytes, metamyelocytes, promyelocytes, blasts). If present, implies increased marrow production of granulocytes (e.g. inflammation, infection, G-CSF administration, CML). The presence of predominantly blasts in the peripheral smear without cells between mature neutrophil and blast suggests clonal cell disorder (MDS, acute leukemias)

This is a MEDICAL EMERGENCY

Bone Marrow Aspiration and Biopsy

- sites: posterior iliac crest, sternum
- analyses: most often done together; exception is in follow-up of conditions or diagnosis of CML where aspiration alone could suffice
 - aspiration: takes a fluid marrow sample for cellular morphology, flow cytometry, cytogenetics, molecular studies, microbiology (C&S, AFB, PCR)
 - biopsy: takes a sample of intact bone marrow to assess histology and immunohistochemistry

Indications

- unexplained CBC abnormalities
- diagnosis and evaluation of infiltrating cancers: plasma cell disorders, leukemias, solid tumors
- diagnosis and staging of lymphoma or solid tumors
- evaluate iron metabolism and stores (gold standard, but rarely done)
- evaluate suspected deposition and storage disease (e.g. amyloidosis, Gaucher's disease)
- evaluate fever of undetermined origin, suspected mycobacterial, fungal/parasitic infections, or granulomatous disease
- unexplained splenomegaly
- confirm normal bone marrow in potential allogenic hematopoietic cell donor

Contraindications

- absolute: untreated hemophilia, severe DIC, infection over skin site
- relative: platelet count <10, recent warfarin use with INR >2.0, liver disease with associated coagulopathy
- thrombocytopenia is not a contraindication; may need platelet transfusion prior to procedure

Common Presenting Problems

Anemia

Definition

- a decrease in red blood cell (RBC) mass that can be detected by hemoglobin (Hb) concentration, hematocrit (Hct), and RBC count
 - adult males: Hb <13 g/dL or Hct <0.41
 - adult females: Hb <12 g/dL or Hct <0.36

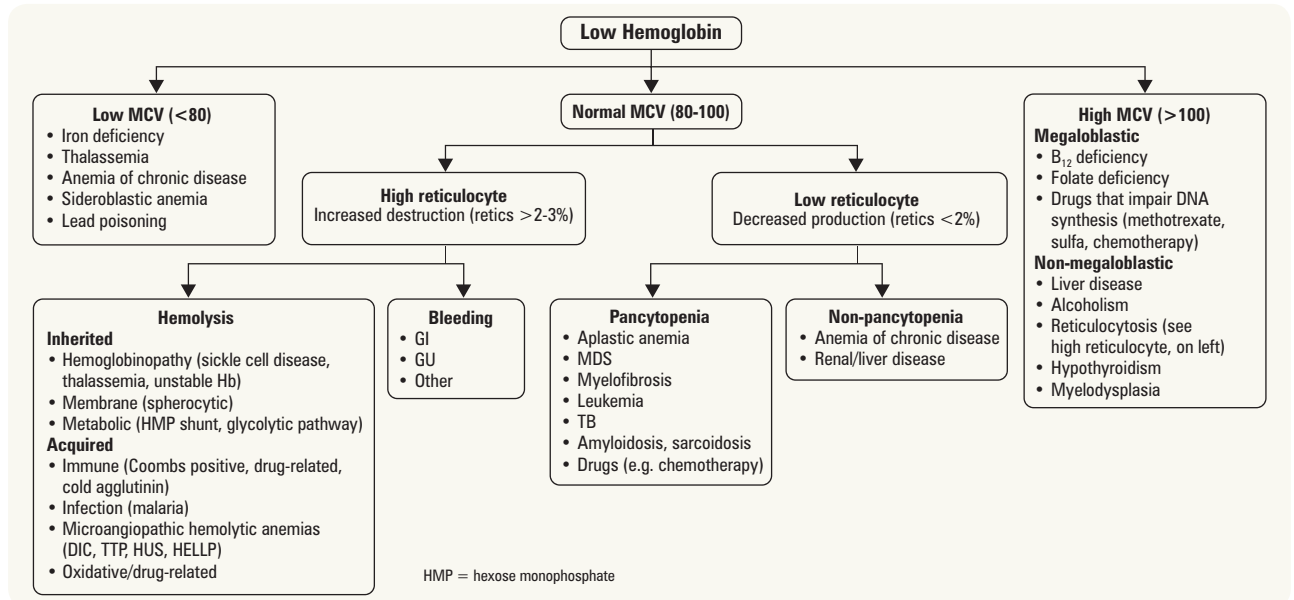

Figure 2. Approach to anemia – classification by size of RBC

Clinical Features

- history
 - symptoms of anemia: fatigue, malaise, weakness, dyspnea, decreased exercise tolerance, palpitations, headache, dizziness, tinnitus, syncope
 - acute vs. chronic, bleeding, systemic illness, diet, alcohol, family history
 - menstrual history: menorrhagia, menometrorrhagia, dysfunctional uterine bleeding
 - rule out pancytopenia (recurrent infection, mucosal bleeding/easy bruising)
- physical signs
 - HEENT: pallor in mucous membranes, palmar creases and conjunctiva at Hb <9.0 g/dL, ocular bruits at Hb <5.5 g/dL, angular cheilosis, jaundice
 - cardiac: tachycardia, orthostatic hypotension, systolic flow murmur, wide pulse pressure, signs of CHF
 - dermatologic: pallor in palmar skin creases at Hb <7.5 g/dL, jaundice (if due to hemolysis), nail changes, glossitis

Investigations

- rule out dilutional anemia (low Hb due to increased effective circulating volume)
- CBC with differential (MCV, RDW, RBC count)
- reticulocyte count – very useful to evaluate for blood cell production problems but must be corrected for anemia
- blood film
- rule out nutritional deficit, gastrointestinal and genitourinary disease in iron deficiency anemia
- additional laboratory investigations as indicated (see *Microcytic Anemia*, H13, *Normocytic Anemia*, H17, *Hemolytic Anemia*, H18, and *Macrocytic Anemia*, H24)

Reticulocytes

- Reticulocytes are immature erythrocytes and are markers of erythrocyte production
- Should normally increase when there is a decrease in RBC
- With blood loss, reticulocytes should increase 2-3x initially and then 5-7x over the next week
- A normal reticulocyte count in anemia should be interpreted as a sign of decreased production

Erythrocytosis

Definition

- an increase in the number of RBCs: Hb >18.5 g/dL or Hct >52% (males); Hb >16.5 g/dL or Hct >47% (females and African males)

Etiology

- relative/spurious erythrocytosis (decreased plasma volume): diuretics, severe dehydration, burns, “stress” (Gaisböck’s syndrome)
- absolute erythrocytosis

Table 5. Etiology of Erythrocytosis

Primary	Secondary	Inappropriate Production of Erythropoietin
Polycythemia Vera (PV) (see <i>Polycythemia Vera</i> , H41)	Physiologic (poor tissue oxygenation/hypoxia) Carbon monoxide poisoning Heavy smoking High altitude Pulmonary disease COPD Sleep apnea Pulmonary HTN Cardiovascular disease R to L shunt (Eisenmenger syndrome) RBC defects (Hb with increased O ₂ affinity, methemoglobinemia)	Tumors Hepatocellular carcinoma Renal cell carcinoma Cerebellar hemangioblastoma Pheochromocytoma Uterine leiomyoma Ovarian tumor Other Polycystic kidney disease Post-kidney transplant Hydronephrosis Androgens Exogenous erythropoietin

Clinical Features

- secondary to high red cell mass and hyperviscosity
 - headache, dizziness, tinnitus, visual disturbances, hypertensive symptoms
 - symptoms of angina, congestive heart failure, aquagenic pruritus
- thrombosis (venous or arterial) or bleeding (abnormal platelet function)
- physical findings
 - splenomegaly ± hepatomegaly, facial plethora/ruddy complexion (70%) and/or palms, gout

Investigations

- serum erythropoietin (EPO): increased EPO suggests autonomous production or hypoxia, and is used to rule out PV
 - search for tumor as source of EPO as indicated (e.g. abdominal U/S, CT head)
 - JAK-2 mutation analysis: positive in >96% of cases of PV
 - only send if low/normal EPO level
- ferritin (iron deficiency can mask the diagnosis)

Treatment

- if primary: see *Polycythemia Vera*, H41
- if secondary: treat underlying cause
 - O₂ for hypoxemia, CPAP for sleep apnea, surgery for EPO-secreting tumors
 - often cardiologists will not treat high HCT in cyanotic patients (or will have high threshold)

Thrombocytopenia

**Definition**

- platelet count <150,000/mm³

Clinical Features

- history: bleeding gums, epistaxis, bleeding post-surgical procedures, metromenorrhagia
- physical exam: bruising, petechiae, ecchymoses, non-palpable purpura
 - hemarthrosis and deep muscle hematomas are rarely initial signs in patients with primary hemostatic disorders
- see *Disorders of Primary Hemostasis*, H27, for complications

Investigations

- CBC and differential
- blood film
 - decreased production: other cell line abnormalities, blasts, hypersegmented PMNs, leukoerythroblastic changes
 - increased destruction: large platelets, schistocytes (seen in MAHA)
 - rule out platelet clumping
- workup for nutritional deficiencies: B₁₂, RBC folate
- PT/INR, aPTT and fibrinogen if DIC suspected
- LFTs

Treatments

- life threatening bleeding: platelet transfusion (repeat CBC 1 h post-transfusion to confirm an appropriate rise in counts)
- if secondary: treat underlying cause
- ITP: see *Immune Thrombocytopenic Purpura*, H27

**Must rule out factitious**

thrombocytopenia: platelet clumping (secondary to EDTA antibodies from collection tube). This can be seen on blood film and confirmed by repeating in a citrated sample (i.e. using a sodium citrate tube to collect blood, rather than EDTA)

In hospitalized patients, drugs and infection account for the majority of cases of thrombocytopenia

Thrombocytosis

Definition

- platelet count >400,000/mm³
- primary thrombocytosis: due to myeloproliferative neoplasms (e.g. CML, polycythemia vera [PV], primary myelofibrosis, essential thrombocytosis [ET]; rarely associated with MDS)
- reactive/secondary thrombocytosis: acute phase reactant (e.g. surgery, inflammation, infection, trauma, bleeding, iron deficiency, neoplasms, ischemic injury); much more common than primary

Clinical Features

- history: trauma, surgery, splenectomy, infection, inflammation, bleeding, iron deficiency, prior diagnosis of chronic hematologic disorder, constitutional symptoms (malignancy)
- vasomotor symptoms: headache, visual disturbances, lightheadedness, atypical chest pain, acral dysesthesia, erythromelalgia, livedo reticularis, aquagenic pruritus
- clotting risk, bleeding risk (rare)
- physical exam: splenomegaly can be seen in myeloproliferative neoplasms (MPNs)

Investigations

- CBC, peripheral blood film, serum ferritin concentration
- non-specific markers of infection or inflammation (e.g. CRP, ESR, ferritin)
- JAK-2 PCR (mutation in ~50% of ET)
- if reactive process has been ruled out, bone marrow biopsy may be required to rule out MPN/MDS

Treatment

- primary: ASA ± cytoreductive agents
- secondary: treat underlying cause

Pancytopenia

**Definition**

- a decrease in all hematopoietic cell lines

Clinical Features

- anemia: fatigue
- leukopenia: recurrent infections
- thrombocytopenia: mucosal bleeding and ecchymoses

Investigations

- CBC, peripheral blood film, serum ferritin concentration
- non-specific markers of infection or inflammation (e.g. CRP, ESR, ferritin)
- JAK-2 PCR (mutation in ~50% of ET)
- if reactive process has been ruled out, bone marrow biopsy may be required to rule out MPN/MDS

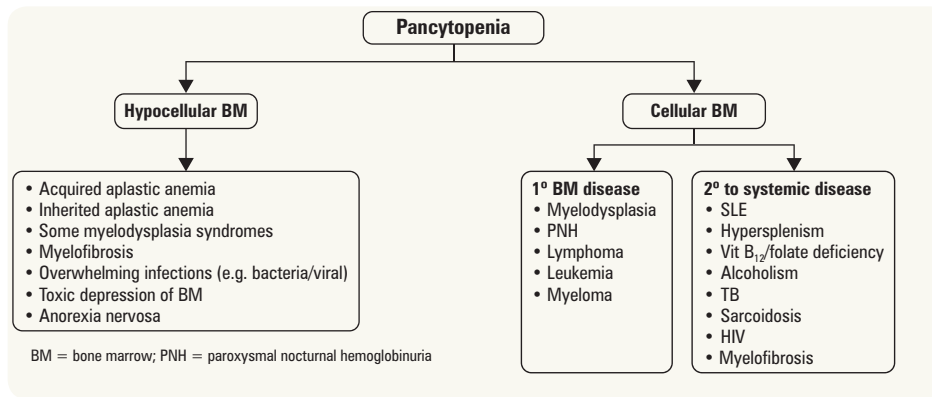

Figure 4. Approach to pancytopenia

Neutrophilia

Definition

- different guidelines, but absolute neutrophil count (ANC) $>7.7 \times 10^9/L$

Etiology

- primary neutrophilia
 - chronic myeloid leukemia (CML)
 - other myeloproliferative disorders: PV, essential thrombocytosis (ET), myelofibrosis
 - hereditary neutrophilia (autosomal dominant)
 - chronic idiopathic neutrophilia in otherwise healthy patients
 - leukocyte adhesion deficiency
- secondary neutrophilia
 - smoking: most common cause of mild neutrophilia
 - infection: leukocytosis with left shift \pm toxic granulation, Döhle bodies (intra-cytoplasmic structures composed of agglutinated ribosomes)
 - inflammation: e.g. rheumatoid arthritis (RA), IBD, chronic hepatitis, MI, PE, burns
 - malignancy: hematologic (i.e. marrow invasion by tumor) and non-hematologic (especially large cell lung cancer)
 - stress/exercise/epinephrine: movement of neutrophils from marginated pool into circulating pool
 - medications: glucocorticoids, β -agonists, lithium

Clinical Features

- look for signs and symptoms of fever, inflammation, malignancy to determine appropriate further investigations
 - including lymph nodes and organomegaly
- examine oral cavity, teeth, peri-rectal area, genitals, and skin for signs of infection

Investigations

- CBC and differential: mature neutrophils or bands $>20\%$ of total WBC suggests infection/inflammation
- blood film: Döhle bodies, toxic granulation, cytoplasmic vacuoles in infection
- review other blood counts
- may require bone marrow biopsy if MPN suspected

Treatment

- directed at underlying cause

Neutropenia

Definition

- mild: ANC $1,000-1,500/mm^3$
- moderate: ANC $500-1,000/mm^3$ (risk of infection starts to increase)
- severe: ANC $<500/mm^3$
- profound: ANC $<100/mm^3$ for >7 d

Absolute Neutrophil Count (ANC) =
WBC count \times (%PMNs + %bands)

Beware of fever + ANC $<0.5 \times 10^9/L$ =
FEBRILE NEUTROPENIA

Etiology

Table 6. Etiology of Neutropenia

Decreased Production	Peripheral Destruction	Excessive Margination (Transient Neutropenia)
Infection Viral hepatitis, EBV, HIV, TB, typhoid, malaria Hematological Diseases Idiopathic, aplastic anemia, myelofibrosis, BM infiltration Drug-Induced: Alkylating agents, antimetabolites, anticonvulsants, antipsychotics, anti-inflammatory agents, anti-thyroid drugs Toxins/Chemicals High dose radiation, benzene, DDT Nutritional Deficiency B ₁₂ , folate Idiopathic Constitutional neutropenia, benign cyclic neutropenia, cyclical	Anti-neutrophil antibodies Spleen or lung trapping Autoimmune disorders: RA (Felty's syndrome), SLE Granulomatosis with polyangiitis (formerly Wegener's) Drugs: haptens (e.g. α -methyl dopa)	Idiopathic (most common) Overwhelming bacterial infection Hemodialysis Racial variation (e.g. African or Ashkenazi Jewish descent)

Clinical Features

- fever, chills (only if infection present)
- infection by endogenous bacteria (e.g. *S. aureus*, gram negatives from GI and GU tract)
- painful ulceration on skin, anus, mouth, and throat following colonization by opportunistic organisms
- avoid digital rectal exam

Investigations

- dependent on degree of neutropenia, history, and symptoms
- ranges from observation with frequent CBCs to bone marrow aspiration and biopsy

Treatment

- regular dental care: chronic gingivitis and recurrent stomatitis major sources of morbidity
- febrile neutropenia (see [Infectious Diseases, ID46](#))
- in severe immune-mediated neutropenia, G-CSF may increase neutrophil counts
 - if no response to G-CSF, consider immunosuppression (e.g. steroids, cyclosporine, methotrexate)

Prophylactic Hematopoietic Colony-Stimulating Factors on Mortality and Infection

Ann Intern Med 2007;147:400-411

Purpose: To review the effects of colony-stimulating factor (CSF) on mortality, infections, and febrile neutropenia in patients undergoing chemotherapy or stem-cell transplant (SCT).

Study Selection: 148 RCTs comparing the effects of CSFs to either placebo or no therapy were included. Prophylactic CSFs were given concurrently with or after initiation of chemotherapy.

Results: There were no differences in all-cause mortality or infection-related death between CSF and placebo groups. Compared to placebo or no therapy, CSFs reduced infection rate (median rate 38.9% vs. 43.1%; rate ratio 0.85), microbiologically documented infections (MR 23.5% vs. 28.6%; rate ratio 0.86), and febrile neutropenia (MR 25.3% vs. 44.2%; rate ratio 0.71).

Conclusions: Prophylactic CSFs decrease infection rates and episodes of febrile neutropenia in patients undergoing chemotherapy or SCT, but have no effect on mortality.

G-CSF = Neupogen® = Filgrastim

Presence of smudge cells suggests a lymphoproliferative disorder if persistently elevated above $5.0 \times 10^9/L$ for > 3 mo; consider flow cytometry

Presence of atypical lymphocytes suggests viral infection

Lymphocytosis

Definition

- absolute lymphocyte count $>4 \times 10^9/L$

Etiology

- infection
 - viral infections (majority); particularly mononucleosis
 - TB, pertussis, brucellosis, toxoplasmosis
- physiologic response to stress (e.g. trauma, status epilepticus)
- hypersensitivity (e.g. drugs, serum sickness)
- autoimmune (e.g. rheumatoid arthritis)
- neoplasm (e.g. ALL, CLL, lymphoma)

Investigations

- peripheral smear

Treatment

- treat underlying cause

Lymphopenia

Definition

- absolute lymphocyte count $<1,500/mm^3$

Etiology

- idiopathic CD4+ lymphocytopenia
- radiation
- HIV/AIDS, hepatitis B, hepatitis C
- malignancy/chemotherapeutic agents
- malnutrition, alcoholism
- autoimmune disease (e.g. SLE)

Clinical Features

- opportunistic infections (see [Infectious Diseases](#), ID46)

**Treatment**

- treat underlying cause
- treat opportunistic infections aggressively and consider antimicrobial prophylaxis (see [Infectious Diseases](#), ID48)

Eosinophilia

Definition

- absolute eosinophil count $>500/\text{mm}^3$

Etiology

- primary: due to clonal bone marrow disorder
 - if no primary etiology identified, classified as hypereosinophilic syndrome
 - ♦ 6 mo of eosinophilia with no other detectable causes (often with clonal molecular abnormality)
 - ♦ can involve heart, bone marrow, CNS
- secondary
 - most common causes are parasitic (usually helminth) infections and allergic reactions
 - less common causes:
 - ♦ polyarteritis nodosa, see [Rheumatology](#), RH19
 - ♦ respiratory causes (asthma, eosinophilic pneumonia, Churg-Strauss)
 - ♦ cholesterol emboli
 - ♦ hematologic malignancy: see [Chronic Myeloid Leukemia](#), H40 and [Hodgkin Lymphoma](#), H45
 - ♦ adrenal insufficiency, see [Endocrinology](#), E35
 - ♦ medications (penicillins)

**Basophilia and/or Eosinophilia**

Can be an indicator of CML or other myeloproliferative neoplasm, associated with pruritus due to excessive histamine production

**Treatment**

- treat underlying cause

Agranulocytosis

Definition

- severe depletion of granulocytes (neutrophils, eosinophils, basophils) from the blood and granulocyte precursors from bone marrow

Etiology

- associated with medications in 70% of cases: e.g. chemotherapy, clozapine, thionamides (antithyroid drugs), sulfasalazine, and ticlopidine
 - immune-mediated destruction of circulating granulocytes by drug-induced antibodies or direct toxic effects upon marrow granulocytic precursors

Clinical Features

- abrupt onset of fever, chills, weakness, and oropharyngeal ulcers

Prognosis

- high fatality without vigorous treatment

Investigations/Treatment

- discontinue offending drug
- pan-culture and screen for infection if patient is febrile (blood cultures x2, urine culture, and chest x-ray as minimum, initiate broad-spectrum antibiotics)
- consider bone marrow aspirate and biopsy if cause unclear
- consider G-CSF

Leukemoid Reactions

- blood findings resembling those seen in certain types of leukemia which reflect the response of healthy BM to cytokines released due to infection or trauma
- leukocytosis $>50,000/\text{mm}^3$, marked left shift (myelocytes, metamyelocytes, bands in peripheral blood smear)

Etiology

- important to rule out CML
- differential diagnosis:
